1 In addition to the 134 train accidents shown, there were 80 train accidents at highway grade crossings in which the damage to railway property exceeded $150 but which resulted in no reportable casualties, viz:

Struck by train.—Crossing unprotected, 14 passenger automobiles, 11 motortrucks, 3 other vehicles; crossing protected by visible signal, 4 passenger automobiles, 1 motorbus, 5 motortrucks, 2 other vehicles; crossing protected by audible signal, 1 passenger automobile, 3 motortrucks; crossing protected by audible and visible signal, 1 passenger automobile, 4 motortrucks; crossing protected by watchman, 3 passenger automobiles, 2 motortrucks; crossing protected by gates, 1 passenger automobile, 2 motortrucks.

Ran into side of train.—Crossing unprotected, 6 passenger automobiles, 7 motortrucks; crossing protected by visible signal, 2 motortrucks; crossing protected by audible signal, 1 passenger automobile; crossing protected by audible and visible signal, 1 passenger automobile, 3 motortrucks; crossing protected by watchman, 1 motortruck; crossing protected by gates, 1 motortruck.

Other grade-crossing accident.—Crossing unprotected, 1 obstruction other than a vehicle.

	1930						YEAR 1930			
1	1-7	Corona	FS-j	3-227	59	4	R.E.Russell	Conductor	11	Abrupt stop and slack action of train
2	2-1	Escondida	S-d	232	47	Standing	C.E.Roe	Brakeman	40	Fell to ground while setting hand brake account ratchet wheel key missing on hand brake.
3	2-19	Mongola	FS-j	X-3318-E	70	30	R.C.East	Brakeman	7	Sudden stop due to emergency application of brakes caused by nipple in train line branch pipe on engine rusting out of entrance to distributing valve resulting in nipple breaking off.
4	3-27	Palomas	S-g	2-226	18	20	H.W.Beasley	Fireman	7	Jumped from engine and fell after superheater flue had broken.
5	3-27	Desert	S-j	1-229	70	Standing	S.W.VanStone	Brakeman	5	Stepped on piece of slag while walking alongside train.
6	3-29	Luna	S-j	203	51	Standing	T.Sedillo	Sec.Laborer	45	Fractured leg when thrown from car with tie while unloading ties.
7	4-28	Vaway	FS-j	X-3334-E	99	25	H.F.Provence	Brakeman	7	Airhose burst, 29th car from engine, causing emergency stop.
8	5-6	Corona	S-j	203	57	Standing	W.E.Grumbles	Brakeman	8	Foot fell on foot while handling L.C.L. freight.
9	5-16	Alamogordo	S-j	218	9	2	Non-trespasser		45	Employe of lumber company caught hand between steel running board and end of building when car was moved.
10	6-13	Alamogordo	S-e	201	89	Standing	W.G.Boswell	Fireman	5	Hand scalded when poppet valve on stoker opened.
11	8-9	High Rolls	S-g	213	18	8	S.Gates	Brakeman	30	Fell to ground when slipped getting off engine.
12	11-24	Vaughn	S-j	205	3	5	Non-trespasser		18	Occupant of outfit car injured when car was struck by cars being handled by engine due to switches being improperly lined.
13	12-26	Luna	FS-j	X-3657-E	70	7	R.R.Sole	Conductor	20	Engine derailed by hatch cover of car on track caused rough stop and injured employe in caboose.
	1931						YEAR 1931			
14	1-14	Deming	S-e	X-3666-E	100	10	M.F.Schemeley	Engineer	14	Struck back of finger against some object opening blow-off cock.
15	2-21	Hargis	S-g	2-226	60	12	W.Gebo	Brakeman	20	Claims stepped in hole getting off train.
16	4-5	Vaughn	FS-j	X-3655-W	70	6	S.W.VanStone	Brakeman	45	Sudden stop injured employe in caboose when engineer made emergency application of train brakes.
17	5-23	Icehouse Crossover	FS-j	2-410	100	15	H.F.Provence	Brakeman	18	Slack ran in when engineer made service application of brakes injuring employe in caboose.
18	6-7	Alamogordo	S-e	X-3653-E	91	Standing	W.G.Boswell	Fireman	15	Particles of cinders and foreign matter penetrated eye.
19	6-16	Carne	S-e	2-426	68	40	A.F.Emifeste	Engineer	9	Hot cinder in left eye.
20	6-25	Rodeo	FS-j	X-5003-E	70	15	H.E.Gilvin	Conductor	30	Service application train brakes caused run-in on rear of train injured employe in caboose.
21	7-5	Elwood	S-j	X-3655-E	70	6	C.E.Roe	Brakeman	4	Slipped on piece of slag while running for caboose after closing switch.

18	6-7	Alamogordo	S-e	X-3653-W	91	Standing	W.G.Boswell	Fireman	15	Particles of cinders and foreign matter penetrated eye.
19	6-16	Carne	S-e	2-426	68	40	A.F.Laifeste	Engineer	9	Hot cinder in left eye.
20	6-26	Rodeo	#S-1	X-5003-W	70	15	H.E.Gilvin	Conductor	30	Service application train brakes caused run-in on rear of train injured employe in caboose.
21	7-5	Elwood	S-1	X-3655-W	70	6	C.E.Roe	Brakeman	4	Slipped on piece of slag while running for caboose after closing switch.
22	7-14	Lordsburg	S-f	412	None at time	6	F.C.Ollerton	Fireman	10	Struck hand on stock chute gate.
23	9-4	Animas	S-1	8	21	Standing	W.C.Archer	Brakeman	16	Piece of ice slipped and struck ankle.
24	12-12	Gage	#S-1	X-3317-W	102	10	R.C.Carden	Brakeman	21	Airhose burst 10th car from engine, causing emergency application of brakes and injured employe in caboose.
1932						YEAR 1932				
25	1-26	Mills	S-1	X-3415-E	2	3	B.G.Haire	Conductor	90	Fell from car to ground when brakeman cut cars, moving head out just as conductor stepped from one car to another.
26	3-25	Three Rivers	S-1	2-228	58	Standing	I.W.Sampson	Fireman	30	Fell to ground when stepped off running board of engine.
27	5-19	Arena	S-1	X-5029-W	58	Standing	S.B.Warner	Fireman	15	Foot slipped on head rod of switch, lost balance and fell to ground.

- Caused by sudden stopping, starting, lurch or jerk of car or train

	DATE (a)	LOCATION (b)	I.C.C. CLASS (c)	TRAIN NUMBER (d)	NO. CARS IN TRAIN (e)	SPEED (M.P.H.) (f)	PERSON INJURED NAME (g)	PERSON INJURED OCCUPATION (h)	ESTIMATED DISABILITY (DAYS) (i)	DESCRIPTION OF ACCIDENT (j)
	1932						YEAR 1932 (CONTINUED)			
28	5-31	Temporal	S-j	X-3307-W	100	25	R.E.Hoffman	Brakeman	30	Airhose blew off 14th car from engine, causing brakes to apply in emergency and injured employe in caboose.
29	7-6	Cacura	S-j	X-3657-E	70	5	C.C.Whittington	Conductor	24	Fell between two cars when stubbed foot against obstruction on top of car.
30	8-28	Alamogordo	S-j	X-3304-W	88	15	F.E.Hedrick	Brakeman	10	Particle of hot cinder blew in right eye.
31	10-4	Lordsburg	S-j	980	62	6	W.H.Trickett	D.H.Conductor	30	Thrown in caboose when engine coupled cabooses to train.
32	11-19	Pintado	S-f	X-3665-W	53	15	C.E.Tillery	Roadway machine oper.	30	Boom of burro-crane swung out from car in train, contacting block signal alongside track, causing crane to raise up and when settled back on car injured the employe.
33	11-26	Carrizozo	S-h	994	70	25	2 occupants of automobile		30	Automobile ran into side of train.
34	12-22	Afton	S-e	1-982	69	40	C.B.Hilton	Fireman	7	Cinder in eye account cinders on track struck by engine.
35	12-28	Deming	S-g	X-3655-E	100	Standing	F.R.Hughes	Brakeman	15	Struck knee against ladder when slipped on ice covered ladder on water car.
	1933						YEAR 1933			
36	4-10	North	S-j	X-3695-E	4	Standing	Y.Ortiz	Ex.gang L.b.	15	Rail dislodged on car being unloaded and turned over on employes foot.
37	5-26	North	S-j	X-3702-E	7	2	D.Wooten	Sec. Laborer	12	Finger caught between rail and burro crane boom as rail being loaded on car.
38	7-25	Alamogordo	S-j	X-3304-W	3	10	J.Gomez	Gen.Laborer	8	Thrown out of car by rough coupling during switching operation.
39	10-30	Desert	S-j	994	47	40	J.Moussier	Brakeman	6	Cinder blew in eye.
40	12-6	Polly	S-j	X-3694-E	100	20	A.M.Hardin	Conductor	21	Drawbar pulled out car behind engine causing emergency application of brakes and injury to employe in caboose.
41	12-12	Toboggan	S-j	971	24	12	J.E.Tompkins	Engineer	12	Grain of sand in eye.
42	12-17	Hachita	S-j	X-3019-E	96	15	J.S.McCranie	Brakeman	60	Presumably fell from top of caboose to ground when slack ran in as stop was being made in response to his fusee signal when brakeman was being left.
43	12-22	Carrizozo	S-g	X-2507-E	2	Standing	W.P.Loughrey	Brakeman	8	Fell to ground while descending from top of water car.
44	12-25	Tularosa	S-h	X-3686-E	62	Standing	2 occupants of auto truck		7 and 30	Auto truck ran into side of cars.
	1934						YEAR 1934			
45	3-22	Unknown	S-e	X-3714-E	100	20	V.T.Springer	Fireman	8	Grain of sand in eye.
46	4-19	Kenzin	S-j	X-3664-E	10	4	D.Ramirez	Ex.gang Lab.	10	Struck on side of face by piece of lumber rebounding while unloading rail from train.
47	5-9	Wooten	S-j	970	14	3	Passenger		180	Fell to floor of coach as mixed train was making water stop.
48	5-22	Paxton	S-j	X-3659-E	104	38	S.Gates F.J.Ashe	Conductor Brakeman	10 25	Airhose separated 5th car from engine causing emergency application of brakes and injury to employes in caboose.
49	6-24	Afton	S-g	1-982	70	10	J.W.Raley	Brakeman	14	Stepped on piece of ballast detraining from side ladder of car.
50	7-1	Newman	S-j	994	58	35	J.D.Richardson	Engineer	7	Cinders in eye.
51	8-12	Cuervo	S-j	X-3716-E	17	Standing	C.N.Lemmon	Brakeman	14	Fell to ground from top of between two standing cars.
52	9-3	Crogrande	S-j	970	1	5	O.L.Pruitt	Brakeman	20	Stepped on square edge of tie with toes of right foot and sprained foot.
53	9-3	Hawkins	S-j	X-3655-E	66	4	[illegible]	Brakeman	13	[illegible]

32	11-10	Pintado	S-f	X-3665-E	53	15	C.K.Tillery	Roadway Machine oper.	30	Boom of burro-crane swung out from car in train, contacting block signal alongside track, causing crane to raise up and when settled back on car injured the employe.
33	11-26	Carrizozo	S-h	994	70	25	2 occupants of automobile		30	Automobile ran into side of train.
34	12-21	Afton	S-e	1-982	69	40	C.B.Hilton	Fireman	7	Cinder in eye account cinders on track struck by engine.
35	12-26	Deming	S-g	X-3655-A	100	Standing	F.R.Hughes	Brakeman	15	Struck knee against ladder when slipped on ice covered ladder on water car.
	1933					YEAR 1933				
36	4-10	North	S-j	X-3695-B	4	Standing	Y.Ortiz	Ex.gang Lab.	15	Rail dislodged on car being unloaded and turned over on employes foot.
37	5-26	North	S-j	X-3702-E	7	2	D.Wooten	Sec. Laborer	12	Finger caught between rail and burro crane boom as rail being loaded on car.
38	7-25	Alamogordo	S-j	X-3304-B	3	10	J.Gomez	Gen.Laborer	8	Thrown out of car by rough coupling during switching operation.
39	10-30	Desert	S-j	994	47	40	J.Moussier	Brakeman	6	Cinder blew in eye.
40	12-6	Polly	S-j	X-3694-B	100	20	A.M.Hardin	Conductor	21	Drawbar pulled out car behind engine causing emergency application of brakes and injury to employe in caboose.

112	12-1	Afton	S-g	X-4387-E	66	5	J.Jackson	Water Service helper off duty	45	Fell while detraining from car in moving train.
	1939						YEAR 1939			
113	1-19	Deming	S-g	980	70	Standing	E.R.Layman	Engineer	10	Slipped and fell descending from cab of locomotive.
114	2-2	Montoya	S-j	X-3702-E	70	Standing	R.J.Woods	Brakeman	6	Stepped on rock while enroute to caboose after throwing switch.
115	2-12	Steins	S-j	X-5003-E	56	4	S.M.Stinson	Brakeman	7	Slipped on ice when running ahead to throw switch.
116	6-7	Vaughn	S-j	1-996	47	15	E.P.Dolan	Conductor	10	Lost balance and fell while descending from cupola of caboose.
117	6-15	Alamogordo	S-c	990	58	Standing	R.S.Peterson	Fireman	4	Strained shoulder account ash pan hopper door on engine sticking.
118	9-26	Chapman	S-c	4-980	59	35	[illegible].M.Clack	Fireman	5	Foreign object lodged in eye.
119	10-18	Tularosa	S-j	X-3656-E	67	3	L.J.Benson	Conductor	13	Lost balance and fell in caboose as train being brought to a stop.
	1940						YEAR 1940			
120	1-13	Carrizozo	S-j	X-3734-E	93	-	A.R.Taylor	Brakeman	6	Foreign object in eye.
121	2-13	Santa Rosa	S-j	X-3811-E	98	8	A.R.James J.W.Hunt	Conductor Brakeman	10 10	Cutting lever 37th car from engine lifted by some unknown person causing air to apply in emergency and injured employes in caboose.
122	2-20	Vaughn	S-j	X-3805-E	100	Standing	J.L.Chavez	Coal chute foreman	10	Fell on top of engine tender when block on tender turned over when stepped on.
123	3-13	Alamogordo	S-h	970	16	7	1 occupant of automobile		10	Automobile struck by cut of 18 cars being shoved by engine
124	3-26	Steins	S-j	2-866	61	3	J.E.Pence	Brakeman	20	Foot slipped and turned ankle walking over cattle guard.
125	3-29	Alamogordo	S-j	996	76	6	R.P.Clayton	Brakeman	6	Thrown against hand rail of caboose by adjustment of slack as train was being brought to a stop.
126	4-10	Lordsburg	S-j	X-5023-E	100	8	W.A.Kidd	Brakeman	25	Emergency application of brakes to avoid collision with another engine injured employe in caboose.
127	4-29	Kenzin	S-j	1-981	62	Standing	M.E.Huff	Brakeman	7	Foreign object lodged in eye.
128	5-23	Aden	S-g	3-980	59	6	S.R.Montoya	Extra gang laborer off duty	30	Slipped and fell from outfit car and under wheels of car in train moving on siding.
129	6-7	Cavot (M.P.@1127)	D-c	1-845	60	20	H.D.Wester	Brakeman	180	Broken flange 13th car from engine derailed it and 7 following cars. Brakeman Wester, riding on 17th car and as it started to turn over, he fell off car opposite side.

J - Caused by sudden stopping, starting, lurch or jerk of car or train

	1930							YEAR 1930				
1	1-5	North	Derailment	D-e	229	100	30	None	-	-	$ 270	Broken cast iron wheel 42nd car from caboose, previously overheated, derailed 1 car, damaged 2 others.
2	3-10	Elida	Derailment	D-e	2-228	52	35	None	-	-	990	Loose wheel on 9th car ahead of caboose derailed one car.
3	5-12	Hachita	Miscl. Train	M-b	312	54	2	None	-	-	200	Center sill broke on 9th car from engine starting train.
4	6-1	Myndus	Derailment	D-e	2-426	68	40	None	-	-	207	Broken arch bar 34th car from caboose derailed one car.
5	6-21	Lordsburg	Collision	C-h	X-3312-E	6	15	None	-	-	880	Detached cars collided with standing cabooses during switching move by road crew.
6	6-21	Deming	Derailment	D-d	414	11	6	None	-	-	202	Cocked switch derailed 1 car during switching operation.
7	6-23	Lordsburg	Collision	C-h	3-412	70	4	None	-	-	400	Engine with caboose struck standing train too hard.
8	6-23	Tunis	Miscl. Train	M-b	X-3310-E	101	6	None	-	-	750	4th car from engine buckled due to emergency application of brakes due to train parting between 11th and 12th cars from caboose account defective lock block.
9	8-18	Continental	Derailment	D-c	X-5029-W	62	25	None	-	-	1,481	Burned off journal 24th car from engine derailed it and following two cars.
10	9-19	Hargis	Derailment	D-d	228	52	30	None	-	-	19,801	Broken rail derailed 15th to 31st cars from engine.
11	10-18	Apan	Derailment	D-e	2-312	55	35	None	-	-	20,740	Broken truck side on 28th car from engine derailed it and 14 following cars.
12	11-22	Lordsburg	Collision	C-b	X-3686-A	3	4	None	-	-	500	Engine with three cars collided with standing engine during switching move.
13	12-21	Lordsburg	Collision	C-h	X-3302-E	6	4	None	-	-	550	Engine and cars collided with standing engine during switching move.
14	12-[illegible]	Anapra	Derailment	D-e	312	60	3	None	-	-	221	Open switch point derailed engine.
	1931							YEAR 1931				
15	4-6	Switch Back	Collision	C-i	X-2506-E	4	10	None	-	-	350	Engine and head portion of train collided with standing rear portion due to engineer failing to properly control speed.
16	4-20	Arena	Derailment	D-c	X-5033-W	67	25	None	-	-	300	Engine derailed account broken spring hunger pin.
17	5-29	Rodeo	Derailment	D-d	125	46	5	None	-	-	300	Derailed 5 cars during switching move when rail turned over under car.
18	6-6	Coyote	Other Loco.	L-c	X-226	60	25	None	-	-	350	Main axle broke due to progressive fracture.
19	6-8	Bellaja	Derailment	D-i	213	21	12	None	-	-	350	Derailed 6 cars behind engine, apparently caused by rail on truck on car just behind engine.
20	7-10	Taylor	Derailment	D-c	209	21	30	None	-	-	314	One car derailed due to journal box bolts shearing off.
21	7-30	Deluna	Other Loco.	L-b	232	40	30	None	-	-	350	Left main pin failed due to progressive fracture.
22	9-1	Hachita	Other Loco.	L-b	312	55	15	None	-	-	300	Middle main rod strap broke due to flaw.

1	1-5	North	Derailment	D-c	229	100	30	None	-	-	270	Broken cast iron wheel 42nd car from caboose, previously overheated, derailed 1 car, damaged 2 others.
2	3-10	Elda	Derailment	D-c	2-228	52	35	None	-	-	990	Loose wheel on 9th car ahead of caboose derailed one car.
3	5-12	Hachita	Miscl. Train	M-b	312	54	2	None	-	-	200	Center sill broke on 9th car from engine starting train.
4	6-1	Kyndus	Derailment	D-c	2-426	68	40	None	-	-	207	Broken arch bar 34th car from caboose derailed one car.
5	6-21	Lordsburg	Collision	C-h	X-3312-E	6	15	None	-	-	880	Detached cars collided with standing cabooses during switching move by road crew.
6	6-21	Deming	Derailment	D-d	414	12	6	None	-	-	202	Cocked switch derailed 1 car during switching operation.
7	6-23	Lordsburg	Collision	C-h	3-412	70	4	None	-	-	400	Engine with caboose struck standing train too hard.
8	6-23	Tunis	Miscl. Train	M-b	X-3310-E	101	6	None	-	-	750	4th car from engine buckled due to emergency application of brakes due to train parting between 11th and 12th cars from caboose account defective lock block.
9	8-16	Continental	Derailment	D-c	X-3[illegible]-E	62	25	None	-	-	1,481	Burned off journal 24th car from engine derailed it and following two cars.
10	9-15	Hargis	Derailment	D-d	228	52	35	None	-	-	19,801	Broken rail derailed 15th to 31st cars from engine.
11	10-18	Alpan	Derailment	D-c	2-312	55	35	None	-	-	20,740	Broken truck side on 28th car from engine derailed it and 14 following cars.
12	11-22	Lordsburg	Collision	C-h	X-3680-E	3	4	None	-	-	500	Engine with three cars collided with standing engine during switching move.
13	12-21	Lordsburg	Collision	C-h	X-3302-E	6	4	None	-	-	550	Engine and cars collided with standing engine during switching move.
14	12-31	Ancapra	Derailment	D-e	312	60	3	None	-	-	221	Open switch point derailed engine.
	1931						YEAR 1931					
15	4-6	Delton Back	Collision	C-i	X-2506-E		10	None	-	-	850	Engine and head portion of train collided with standing rear portion due to engineer failing to properly control speed.
16	4-20	Arena	Derailment	D-c	X-3033-E	67	25	None	-	-	300	Engine derailed account broken spring hanger pin.
17	5-25	Rodeo	Derailment	D-d	225	46	3	None	-	-	300	Derailed 5 cars during switching move when rail turned over under car.
18	6-6	Coyote	Other Loco.	L-c	1-226	60	25	None	-	-	350	Main axle broke due to progressive fracture.
19	6-8	Dallas	Derailment	D-i	312	22	12	None	-	-	350	Derailed 6 cars behind engine, apparently caused by rigid truck on car just behind engine.
20	7-4	Taylor	Derailment	D-c	209	21	20	None	-	-	314	One car derailed due to journal the bolts shearing off.
21	7-10	Lazare [illegible]	Other Loco.	L-b	232	40	30	None	-	-	350	Left main pin failed due to progressive fracture.
22	9-7	Hachita	Other Loco.	L-b	312	55	15	None	-	-	300	Middle main rod strap broke due to flaw.
	1932						YEAR 1932					
23	1-4	Alamogordo	Derailment	D-g	X-3016-E	46	12	None	-	-	575	Derailed 25th, 30th, 38th, 43rd and 44th cars from engine account section foreman closing switch rods for inspection spiked right switch point against rail, leaving left point free.
24	1-23	Duran	Other Loco.	L-c	X-3660-E	44	Standing	None	-	-	300	Main driving axle broken account progressive fracture 93%.
25	2-23	Hensin	Derailment	D-d	2-410	71	5	None	-	-	215	Engine derailed in siding account broken rail.
26	3-13	Gamble	Other Loco.	L-c	2-228	52	15	None	-	-	500	Driving wheel tires slid flat due to engineer holding speed of train with independent brake.
27	3-17	Trail Spur	Derailment	D-c	X-3413-E	18	10	None	-	-	190	Derailed 3 cars due to middle cone end of car switching in switch.
28	3-26	Three Rivers	Derailment	D-c	X-3687-E	70	30	None	-	-	1,077	Broken wheel 43rd car from caboose derailed the one car.

	1932							YEAR 1932 (CONTINUED)				
29	6-23	Monument	Other Loco.	L-e	960	61	20	None	-	-	300	Broken main axle due to progressive fracture.
30	7-12	Miriam	Other Loco.	L-e	X-5027-W	48	20	None	-	-	180	Broken main axle due to progressive fracture.
31	7-18	Anapra	Miscl.Train	M-b	982	91	5	None	-	-	250	End of 26th car from engine pulled out due to emergency application of brakes account broken train line.
32	8-8	Orade	Other Loco.	L-b	X-5012-W	70	25	None	-	-	2,422	Loose cross-head key, shearing rivet in key, allowed cross-head key to come out.
33	9-22	Noria	Other Loco.	L-e	X-5004-W	45	25	None	-	-	250	Main axle broken account progressive fracture.
34	10-6	Vaughn	Other Loco.	L-e	933	None at time	2	None	-	-	250	Broken main axle.
35	11-29	Duran	Other Loco.	L-b	X-3665-W	62	30	None	-	-	300	Left main rod broken account old progressive fracture.
	1933							YEAR 1933				
36	1-14	Varney	Miscl.Train	M-b	X-3682-W	67	12	None	-	-	710	Two cars damaged when emergency application of brakes occurred to train becoming uncoupled by engine due to low coupler on engine tender.
37	1-25	Gallinas	Other Loco.	L-e	X-3654-W	70	10	None	-	-	225	Main axle on locomotive broke account progressive fracture.
38	3-20	Alamogordo	Other Loco.	L-e	X-3714-W	78	Standing	None	-	-	250	Broken main driving journal account progressive fracture.
39	4-26	Vaughn	Collision	C-h	994	52	2	None	-	-	250	Rear 36 cars standing train started to move account insufficient hand brakes set, and collided with standing 16 cars attached to engine which had moved ahead.
40	6-2	Steins	Other Loco.	L-b	1-868	40	20	None	-	-	400	Piston broke on engine and knocked front cylinder head out of middle cylinder.
41	7-18	Orogrande	Other Loco.	L-e	X-3713-W	63	25	None	-	-	300	Main axle on engine broke.
42	10-22	Ford	Other Loco.	L-b	X-5027-W	65	30	None	-	-	300	Middle crank pin broke account progressive fracture.
	1934							YEAR 1934				
43	1-26	Deming	Miscl.Train	M-b	1-982	100	6	None	-	-	550	Empty stock car 29th from engine buckled as train being brought to a stop.
44	2-7	Alamogordo	Other Loco.	L-b	X-3700-W	61	30	None	-	-	300	Driving journal cut due to ineffective lubrication.
45	4-9	Carrizozo	Collision	C-h	X-3699-W	3	4	None	-	-	450	Engine and 3 cars collided with other cars during switching move by road crew.
46	4-22	Anapra	Miscl.Train	M-b	X-3667-W	101	20	None	-	-	892	Five cars damaged when emergency application of brakes occurred due to train parting account coupler shank breaking on 10th car from engine.
47	5-29	Tucumcari	Derailment	D-d	975	25	5	None	-	-	176	Derailed 2 cars account defective frog.
48	5-25	Folly	Other Loco.	L-e	992	50	30	None	-	-	300	Main axle broke account progressive failure.
49	6-15	Hargis	Other Loco.	L-b	X-3716-W	90	10	None	-	-	200	Left main crank pin worked loose in wheel fit.
50	7-20	Columbus	Other Loco.	L-e	X-5034-W	63	5	None	-	-	250	Main driving axle broken account progressive fracture.
51	8-29	Leoncita	Derailment	D-e	2-994	52	30	None	-	-	660	Coupler pulled out 3rd car from engine and dropped on track derailing three cars, due to failure of engineer to control slack action in train.

35	11-29	Duran	Other Loco.	L-b	X-3665-W	62	30	None	-	-	300	Left main rod broken account old progressive fracture.
	1933							YEAR 1933				
36	1-14	Varney	Miscl.Train	M-b	X-3682-W	67	12	None	-	-	710	Two cars damaged when emergency application of brakes occurred to train becoming uncoupled by engine due to low coupler on engine tender.
37	1-25	Gallinas	Other Loco.	L-c	X-3654-W	70	10	None	-	-	225	Main axle on locomotive broke account progressive fracture.
38	3-20	Alamogordo	Other Loco.	L-c	X-3714-W	70	Standing	None	-	-	250	Broken main driving journal account progressive fracture.
39	4-26	Vaughn	Collision	C-h	994	52	2	None	-	-	250	Rear 36 cars standing train started to move account insufficient hand brakes set, and collided with standing 16 cars attached to engine which had moved ahead.
40	6-2	Steins	Other Loco.	L-b	1-868	40	20	None	-	-	400	Piston broke on engine and knocked front cylinder head out of middle cylinder.
41	7-18	Oregrande	Other Loco.	L-c	X-3713-W	63	25	None	-	-	300	Main axle on engine broke.
42	10-27	Ford	Other Loco.	L-b.	X-5027-W	65	30	None	-	-	300	Middle crank pin broke account progressive fracture.
	1934							YEAR 1934				
43	1-26	Deming	Miscl.Train	M-b	1-982	100	6	None	-	-	550	Empty stock car 29th from engine buckled as train being brought to a stop.
44	2-7	Alamogordo	Other Loco.	L-b	X-3700-W	61	30	None	-	-	300	Driving journal cut due to ineffective lubrication.
45	4-9	Carrizoso	Collision	C-h	X-3699-W	3	4	None	-	-	450	Engine and 3 cars collided with other cars during switching move by road crew.
46	4-22	Anapra	Miscl.Train	M-b	X-3667-W	101	20	None	-	-	892	Five cars damaged when emergency application of brakes occurred due to train parting account coupler shank breaking on 10th car from engine.
47	5-29	Tucumcari	Derailment	D-d	975	25	5	None	-	-	176	Derailed 2 cars account defective frog.
48	5-25	Pelly	Other Loco.	L-c	992	50	30	None	-	-	300	Main axle broke account progressive failure.
49	6-15	Hargis	Other Loco.	L-b	X-3716-W	90	10	None	-	-	200	Left main crank pin worked loose in wheel fit.
50	7-20	Columbus	Other Loco.	L-c	X-5034-W	63	5	None	-	-	250	Main driving axle broken account progressive fracture.
51	8-29	Leoncita	Derailment	D-c	2-994	52	30	None	-	-	660	Coupler pulled out 3rd car from engine and dropped on track derailing three cars, due to failure of engineer to control slack action in train.
52	10-15	Mastodon	Collision	C-h	X-5033-W	48	6	None	-	-	511	Collision between cars of train during switching move due to failure of engineer to promptly and properly act on stop signals.
	1935							YEAR 1935				
53	1-27	Bowen	Derailment	D-h	3-980	65	10	None	-	-	3,123	Engine and 2 cars derailed due to rocks placed on rails by two boys.
54	2-20	Fronto	Other Loco.	L-c	1-982	97	30	None	-	-	500	Driving axle on engine broke account progressive fracture.
55	5-12	Afton	Derailment	D-c	4-980	70	35	None	-	-	470	Broken axle on 17th car from caboose derailed the car.
56	6-13	Hachita	Miscl.Train	M-b	X-5009-W	65	4	None	-	-	200	Water column damaged due to failure to move spout to proper clearance away from track.
57	7-23	Winkle	Other Loco.	L-b	990	55	30	None	-	-	250	Broken guide bolts on locomotive.
58	9-21	Walnut	Other Loco.	L-b	X-2505-E	4	5	None	-	-	200	Broken main rod strap account progressive failure.
59	11-25	Lanark	Miscl.Train	M-b	984	108	35	None	-	-	166	Knuckles slipped by 81st and 82nd cars from engine due to worn knuckle pin holes, causing emergency application of train brakes resulting in draw bars being pulled out 9th and 18th cars from engine.

	DATE (a)	LOCATION (b)	KIND OF ACCIDENT (c)	I.C.C. CLASS (d)	TRAIN NUMBER (e)	NO. CARS IN TRAIN (f)	SPEED (M.P.H.) (g)	PERSONS INJURED NAME (h)	PERSONS INJURED OCCUPATION (i)	ESTIMATED DISABILITY (DAYS) (j)	AMOUNT OF DAMAGE. (k)	BRIEF DESCRIPTION OF ACCIDENT (l)
	1936							YEAR 1936				
60	3-10	Dona	Other Loco.	L-b	1-980	98	25	None	-	-	$ 465	Middle rod strap broke account 40% progressive fracture.
61	3-22	Cloudcroft	Derailment	D-d	X-2511-W	24	10	None	-	-	756	Car derailed as result of low spot in track and slightly curve worn rail, causing rocking motion of car while moving off 12° to 4° curve on 3.6% descending grade.
62	4-3	Paloma	Other Loco.	L-b	994	49	12	None	-	-	400	Front and middle side rods broke caused by knuckle pin working out due to excessive wear, shearing nut and key.
63	6-7	Aden	Other Loco.	L-c	X-3300-W	61	Standing	None	-	-	350	Main driving axle broken.
64	6-19	Pastura	Other Loco.	L-b	990	53	40	None	-	-	300	Main rod and piston rod bent when guide bolts broke.
65	8-5	Hawks	Derailment	D-g	X-3717-W	38	2	None	-	-	389	Four cars derailed while switching account switch having been previously run through.
66	8-31	Lanark	Miscl.Train	M-b	3-980	64	40	None	-	-	350	Car in train damaged by fire from undetermined origin.
67	9-2	Carrizozo	Derailment	D-d	992	2	4	None	-	-	812	Locomotive derailed account defective condition of rail in track.
68	10-19	Winkle	Other Loco.	L-b	1-994	50	35	None	-	-	450	Guide bolts broke account progressive fracture.
69	11-8	Cavot (MP 1126)	Derailment	D-c	X-5019-W	40	18	None	-	-	520	Broken axle - 13th car ahead of caboose, derailed the car.
70	11-8	Lordsburg	Collision	C-d	X-5021-E	2	2	None	-	-	350	Light engine being moved by roundhouse employes from coal chute to delivery track struck engine and two cars being handled by road crew.
	1937							YEAR 1937				
71	1-13	Ladin	Other Loco.	L-b	1-980	67	35	None	-	-	350	Middle main rod broke account old fracture.
72	2-7	Ulmerria	Derailment	D-c	X-5028-W	61	35	None	-	-	17,955	Car derailed account car journal burned off due to overheating and ran on ties for about ¼ miles.
73	2-16	Coyote	Other Loco.	L-b	X-3686-W	70	35	None	-	-	2,651	Guide bolts failed account progressive fracture.
74	2-24	Hargis	Derailment	D-c	1-992	51	35	None	-	-	1,179	Journal broke on 11th car ahead of caboose derailing car.
75	3-13	Columbus	Derailment	D-c	964	42	25	None	-	-	214	One car derailed account failure of truck side.
76	3-23	Hermanas	Miscl.Train	M-b	X-3304-W	35	30	None	-	-	1,908	Journal failed on car
77	4-27	Kemin	Miscl.Train	M-b	X-5031-W	100	40	None	-	-	175	Train parted, damaging equipment, due to conductor stopping train by use of conductor's valve in caboose.
78	5-19	Santa Rosa	Other Loco.	L-c	X-3699-W	70	15	None	-	-	443	Broken main driving axle due to progressive fracture.
79	6-5	Grade	Collision	C-b	X-5028-W	59	4	None	-	-	600	Engine shoving caboose collided with cut of cars that were to be picked up in train.
80	7-1	Cuervo	Miscl.Train	M-b	X-3716-W	70	12	None	-	-	250	M.of W. car in train damaged when air applied from caboose to stop train.
81	7-3	Lizard	Derailment	D-c	X-5019-W	100	25	None	-	-	868	Four cars derailed account truck bolster and truck frame "locking" on 15th car from caboose.
82	7-8	Paloma	Other Loco.	L-b	990	52	20	None	-	-	250	Left main pin bent account breaking or shearing of tapered pin of combination lever.
83	7-9	Potrillo	Other Loco.	L-c	X-5027-W	32	6	None	-	-	300	Main driving axle broken while switching.
84	8-18	Mongola	Other Loco.	L-c	1-980	69	35	None	-	-	220	Main driving tire broke.
85	8-22	Mongola	Derailment	D-c	3-980	70	35	None	-	-	234	Broken truck side frame derailed 22nd car from caboose.

65	8-5	Hawks	Derailment	D-g	X-3717-W	38	2	None	-	-	389	Four cars derailed while switching account switch having been previously run through
66	8-31	Lamar	Misel.Train	M-b	3-980	64	40	None	-	-	350	Car in train damaged by fire from undetermined origin.
67	9-2	Carrizozo	Derailment	D-d	.992	2	4	None	-	-	812	Locomotive derailed account defective condition of rail in track
68	10-19	Winkle	Other Loco.	L-b	1-994	50	35	None	-	-	450	Guide bolts broke account progressive fracture.
69	11-8	Cavot (MP 1126)	Derailment	D-c	X-5019-W	40	18	None	-	-	520	Broken axle - 13th car ahead of caboose, derailed the car.
70	11-8	Lordsburg	Collision	C-d	X-5021-E	2	2	None	-	-	350	Light engine being moved by roundhouse employes from coal chute to delivery track struck engine and two cars being handled by road crew.
	1937							YEAR 1937				
71	1-13	Ladim	Other Loco.	L-b	1-980	67	35	None	-	-	350	Middle main rod broke account old fracture.
72	2-7	Ulmorris	Derailment	D-c	X-5028-W	61	35	None	-	-	17,955	Car derailed account car journal burned off due to overheating and ran on ties for about 4 miles.
73	2-16	Coyote	Other Loco.	L-b	X-3686-W	70	35	None	-	-	2,651	Guide bolts failed account progressive fracture.
74	2-24	Hargis	Derailment	D-c	1-992	51	35	None	-	-	1,179	Journal broke on 11th car ahead of caboose derailing car.
75	3-13	Columbus	Derailment	D-c	964	42	25	None	-	-	214	One car derailed account failure of truck side.
76	3-23	Hermanas	Misel.Train	M-b	X-3304-W	35	30	None	-	-	1,908	Journal failed on car
77	4-27	Kemsin	Misel.Train	M-b	X-5031-W	100	40	None	-	-	175	Train parted, damaging equipment, due to conductor stopping train by use of conductor's valve in caboose.
78	5-19	Santa Rosa	Other Loco.	L-c	X-3699-W	70	15	None	-	-	443	Broken main driving axle due to progressive fracture.
79	6-5	Grade	Collision	C-h	X-5028-W	59	4	None	-	-	600	Engine shoving caboose collided with cut of cars that were to be picked up in train.
80	7-1	Cuervo	Misel.Train	M-b	X-3716-W	70	12	None	-	-	250	M.of W. car in train damaged when air applied from caboose to stop train.
81	7-3	Lizard	Derailment	D-c	X-5019-W	100	25	None	-	-	868	Four cars derailed account truck bolster and truck frame "locking" on 15th car from caboose.
82	7-9	Palomas	Other Loco.	L-b	990	52	20	None	-	-	250	Left main pin bent account breaking or shearing of tapered pin of combination lever.
83	7-9	Potrillo	Other Loco.	L-c	X-5027-W	32	6	None	-	-	300	Main driving axle broken while switching.
84	8-18	Mongola	Other Loco.	L-c	1-980	69	35	None	-	-	220	Main driving tire broke.
85	8-22	Mongola	Derailment	D-c	3-980	70	35	None	-	-	234	Broken truck side frame derailed 22nd car from caboose.
86	10-21	Oregrande	Other Loco.	L-b	994	70	Standing	None	-	-	250	Cross-head and driving journal damaged.
87	10-31	Strauss	Derailment	D-d	X-3702-W	45	10	None	-	-	250	Derailed 13th car from engine, due to improper elevation in track on turn-out.
	1938							YEAR 1938				
88	3-9	Nondal	Derailment	D-c	X-5031-W	63	35	None	-	-	16,599	Loose wheel 23rd car from engine derailed car and damaged track.
89	4-2	Aden	Derailment	D-c	2-984	69	20	None	-	-	2,703	Car derailed account overheated journal burning off.
90	5-6	Deem	Other Loco.	L-c	2-984	85	35	None	-	-	155	Main driving tire broke account flaw.
91	6-9	Lordsburg	Derailment	D-c	1-984	68	6	None	-	-	478	Broken flange 25th car from caboose derailed it and 2 other cars
92	6-23	Largo	Other Loco.	L-b	X-3717-W	50	30	None	-	-	2,000	Engine damaged account knuckle and main rod wedge breaking.
93	12-6	Wilna	Derailment	D-c	X-3687-W	95	35	None	-	-	5,249	Broken overheated wheel derailed one car.

SPECIFICATIONS FOR FREIGHT BRAKES

Standard

ADOPTED, 1933

Supersedes Test Requirements for Triple Valves for Freight Service adopted 1895, last revised 1911.

Purpose

The purpose of this specification is to define and prescribe requirements for power brakes and appliances for operating power brake systems.

Definitions

For purposes of this specification, terms used herein are defined as follows:

Power Brake.—A combination of parts operated by compressed air and controlled manually, pneumatically or electrically, by means of which the motion of a car or locomotive is retarded or arrested.

Power Brake System.—The power brakes on locomotives and cars of a train so interconnected that they can be operated together and by means of which the motion of the train is retarded or arrested.

Brake Valve.—The valve of the locomotive equipment by means of which operation of the power brake system is controlled.

Equalizing Reservoir.—The small reservoir connected to the brake

Operating Valve.—Device on each car, the operation of which results in:

(a) Admission of air to brake cylinder,
(b) Release of air from brake cylinder, and
(c) Charging of one or more reservoirs.

Service Reduction.—A decrease in brake pipe pressure, usually of from 5 to 25 pounds, at a rate sufficiently rapid to move the operating valve to service position, but at a rate not rapid enough to operate the valve to emergency position.

Service Application.—A brake application which results from one or more service reductions.

Full Service Reduction.—A service reduction sufficient in amount to cause equalization of pressure in brake cylinder with pressure in the reservoir from which compressed air is supplied to brake cylinder.

Full Service Application.—A brake application which results from one or more brake pipe reductions sufficient in amount to cause a full service reduction.

Emergency Reduction.—A depletion of brake pipe pressure at a rate sufficiently rapid to move the operating valve to emergency position.

Emergency Application.—A brake application which results from an emergency reduction.

Emergency Brake Cylinder Pressure.—The force per square inch exerted upon piston in brake cylinder by compressed air which is admitted to brake cylinder as a result of an emergency reduction. Effective emergency brake cylinder pressure is a pressure not less than 15 per cent nor more than 20 per cent greater than the brake cylinder pressure obtained from a full service reduction on the same car and from the same initial pressures.

Test Requirements

Car brake equipment for freight service shall conform to the following requirements when tested on the test rack shown on drawing, Plate No. ___ representing the power brake equipment of a 150-car train. Tests will be made from an initial brake pipe pressure of 70 lbs. at the brake valve and main reservoir pressure of 100 lbs. The brake system leakage will be limited to that which will cause the pressure in the 150th car to be within one pound of the pressure on car 1. Unless otherwise specified, brake cylinder piston travel will be 8 in. and brake cylinder leakage not to exceed 2 lbs. per minute from 50 lbs. pressure.

Charging; Individual Car Test

TR-1. With operating valve in retarded recharge position and with 90 lbs. brake pipe pressure maintained, the auxiliary reservoir should be charged from 0 to 70 lbs. pressure in not more than 340 seconds and not less than 260 seconds, and the emergency reservoir from 0 to 70 lbs. in not more than 340 seconds and not less than 260 seconds.

TR-2. With operating valve blocked in normal charging position and with 90 lbs. brake pipe pressure maintained, the auxiliary reservoir should be charged from 0 to 70 lbs. pressure in not more than 195 seconds and not less than 130 seconds, and the emergency reservoir from 0 to 70 lbs. in not more than 255 seconds and not less than 170 seconds.

Service Application

TR-3. With a service reduction of 5 lbs. in the equalizing reservoir at the brake valve all brakes must apply.

TR-4. An initial 5 lb. equalizing reservoir reduction at the brake valve shall produce substantially 10 lb. brake cylinder pressure throughout the train, including brakes having piston travel in excess of 8 inches.

TR-5. With an equalizing reservoir reduction of 10 lbs., the difference in the time of obtaining substantially 10 lbs. pressure in the brake cylinder of the 1st and 150th brakes shall be nominally 20 seconds or less.

TR-6. A brake pipe reduction of 10 lbs. must result in pressure in each brake cylinder of not less than 15 lbs. nor more than 25 lbs.

TR-7. Quick service activity of the train brakes must cease when the initial quick service action has been completed.

TR-8. A total brake pipe reduction of 28 lbs. must result in equalization of brake cylinder pressure with pressure in the reservoir from which compressed air is supplied to the brake cylinder, and brake cylinder pressure of not less than 48 lbs. nor more than 52 lbs. must be obtained.

Emergency Application

TR-9. When the operating valve acts in emergency it shall so function as to develop nominally 15 lbs. brake cylinder pressure in not more than 1½ seconds and the maximum pressure in nominally 10 seconds.

TR-10. The operating valve shall so function that, when an emergency application is made subsequent to a service application which has

produced not less than 30 lbs. brake cylinder pressure, the maximum brake cylinder pressure shall be attained in nominally 4 seconds from the beginning of emergency action of the valve.

TR-11. With an emergency reduction of brake pipe pressure all brakes, including the 150th, shall start to apply within 8.2 seconds and develop not less than 15 per cent or more than 20 per cent in excess of 50 lbs. brake cylinder pressure within 18.2 seconds from the movement of the brake valve to emergency position.

TR-12. Emergency application shall produce from a charged system between 15 and 20 per cent increase in brake cylinder pressure over that which results from a full service application and irrespective of any degree of prior service application.

TR-13. With brakes Nos. 1, 2 and 3, or any group of three consecutive brakes cut out, an emergency reduction made with the brake valve should cause the remainder of the brakes to operate in emergency and produce normal emergency pressures in the same time as when the brakes are all cut in.

TR-14. Using the piping of the locomotive tender and car 1 of the train rack, with the double heading cock under the brake valve closed and the tender vent valve cut out, the operating valve must give a quick action application when brake pipe pressure is reduced by direct discharge to the atmosphere through a disc—with a ⅛ in. orifice and must not with a 9/32 in. orifice.

Release Operation

TR-15. Both service and emergency brake applications shall be released when the brake pipe pressure is increased to not more than 1¼ lbs. above that of the auxiliary reservoir and irrespective of the increased frictional resistance to release movement of the piston and slide valves after a period of operation in train service.

TR-16. With 15 lbs. service reduction and brake valve exhaust closed, all valves, including the 150th shall move to release within 40 seconds after the brake valve is placed in release position [illegible]

brake cylinder pressure shall be attained in nominally 4 seconds from the beginning of emergency action of the valve.

TR-11. With an emergency reduction of brake pipe pressure all brakes, including the 150th, shall start to apply within 8.2 seconds and develop not less than 15 per cent or more than 20 per cent in excess of 50 lbs. brake cylinder pressure within 18.2 seconds from the movement of the brake valve to emergency position.

TR-12. Emergency application shall produce from a charged system between 15 and 20 per cent increase in brake cylinder pressure over that which results from a full service application and irrespective of any degree of prior service application.

TR-13. With brakes Nos. 1, 2 and 3, or any group of three consecutive brakes cut out, an emergency reduction made with the brake valve should cause the remainder of the brakes to operate in emergency and produce normal emergency pressures in the same time as when the brakes are all cut in.

TR-14. Using the piping of the locomotive tender and car 1 of the train rack, with the double heading cock under the brake valve closed and the tender vent valve cut out, the operating valve must give a quick action application when brake pipe pressure is reduced by direct discharge to the atmosphere through a disc with a $\frac{1}{4}$ in. orifice and must not with a $\frac{5}{32}$ in. orifice.

Release Operation

TR-15. Both service and emergency brake applications shall be released when the brake pipe pressure is increased to not more than $1\frac{1}{4}$ lbs. above that of the auxiliary reservoir and irrespective of the increased frictional resistance to release movement of the piston and slide valves after a period of operation in train service.

TR-16. With 15 lbs. service reduction and brake valve exhaust closed, all valves, including the 150th shall move to release within 40 seconds after the brake valve is placed in release position where it will remain 15 seconds and then be placed in running position.

TR-17. With 15 lbs. service reduction and brake valve exhaust closed, the brake pipe pressure shall be increased 5 lbs. at car 150 within $1\frac{1}{2}$ minutes after the brake valve is placed in release position where it will remain 15 seconds, then placed in running position.

TR-18. The rate of release of pressure from the brake cylinders will be nominally 23 seconds from 50 to 5 lbs.

TR-19. The release valve capacity shall be sufficient to reduce the pressure of both the auxiliary and emergency reservoirs from 70 lbs. to 5 lbs. within 7 seconds.

General Requirements

The following requirements for power brakes and appliances for operating power brake systems for freight trains are specified and prescribed:

Service Application

GR-1. The quick service feature of the brake must produce a substantially uniform time of quick service transmission regardless of the unavoidable variations in frictional resistance of the parts.

GR-2. The brake shall so function as to prevent a degree of wave action in brake pipe pressure sufficient to cause undesired release of any brakes while the brakes are being applied.

GR-3. The degree of stability shall be sufficient to prevent undesired service applications occurring with unavoidable minor fluctuations of brake pipe pressure.

GR-4. The quick service action shall be such as to improve the quick service functioning of the "K" triple valves associated with them.

GR-5. The brake cylinder pressure increase resulting from quick service operation shall be less when the brake is reapplied with pressure retained in the brake cylinder than with applications made when the brake cylinder pressure is zero.

Emergency Application

GR-6. Undesired quick action shall not result with any rate of change in brake pipe pressure which may occur during service application or release of the brakes.

GR-7. Emergency application operation shall always be available irrespective of the existing state or stage of brake application or release.

GR-8. Emergency applications initiated during a release of a previous brake application shall produce a material increase in brake cylinder pressure over that which would result from a full service application made under the same conditions.

Release of Service Applications

GR-9. The brake shall so function as to provide a more rapid rise in brake pipe pressure in the rear portion of the train during release of train brakes than obtains with the "K" equipment.

GR-10. In the normal release of train brakes, individual car brakes shall not start recharging from the brake pipe until its pressure has increased sufficiently to have accomplished the release of adjacent valves.

GR-11. The recharge of auxiliary reservoirs in the forward portion of the train shall be automatically retarded while full release position of the brake valve is being used to initiate the release of train brakes.

Release of Emergency Applications

GR-12. The brake shall so function as to accomplish the release of an emergency application with the same degree of certainty secured in the release of service applications.

GR-13. When releasing brakes following an emergency application, each brake shall so function as to decrease the auxiliary reservoir pressure prior to the actual release.

GR-14. The brake shall function as specified in GR-13 when mixed in trains with present standard "K" equipment.

GR-15. That apparatus conforming to the foregoing requirements shall be so constructed, installed and maintained as to be safe and suitable for service.

General Features Relating to Installation and Maintenance

GR-16. The portions of the car brake which control the brake application and release, and also the brake cylinder, shall be so protected against the entrance of dirt, water and floating dust that the time interval between cleaning and repairs may be extended as compared with standard "K" equipment.

GR-17. Reinforced flanged fittings will be used on the brake pipe tee and for all pipes connecting the operating valve with the brake pipe, brake cylinder and reservoirs.

GR-18. The brake branch pipe tee shall be provided with a lug for rigidly anchoring it to the car underframe to prevent shifting of the brake pipe and avoid strains on the branch pipe.

GR-19. The design of the service and emergency valves shall be such as to permit their removal for cleaning and repair without disturbing pipe joints.

GR-20. The release valve shall permit the release of air from the auxiliary reservoir only or from both the auxiliary and emergency reservoirs by extended movement of the same handle.

GR-21. The operating valve shall be so constructed that by inexpensive adjustment the rate of brake cylinder pressure development may be changed to meet such change in train operating conditions as may develop in the future.

Defendant's Exhibit No. 387 (Witness D.E. Sines)
Apr. 30, 1941

SOUTHERN PACIFIC COMPANY
(Pacific Lines)

DELAYS TO FREIGHT AND PASSENGER TRAINS ASSOCIATED WITH EQUIPMENT OR DEFECTS THEREIN, AS REPORTED BY CONDUCTORS ON TIME RETURNS AND DELAY REPORTS, JANUARY 1 - JUNE 30, 1940 (#)

IN THE SUPERIOR COURT OF THE STATE OF ARIZONA IN AND FOR THE COUNTY OF PIMA

No. 20087

STATE OF ARIZONA, EX REL JOE CONWAY, Attorney General of the State of Arizona, Plaintiff,

vs.

SOUTHERN PACIFIC COMPANY, a corporation, Defendant

Court's Finding of Fact and Conclusions of Law—Filed February 11, 1942

Submitted in Accordance with the Provisions of Section 21-1027 Arizona Code Annotated, 1939

[fol. 6071]

INDEX

	Page
Findings of Fact and Conclusions of Law	3879
Preamble	3887
Special findings of fact	3888
I. Definition of terms	3888
II. Nature of the case: the parties involved	3889
(a) The parties	3889
(b) The issues	3889
III. Description of defendant's lines of railroad	3890
(a) General description of the system	3890
(b) The lines in the affected territory	3891
(1) Location; principal stations; double track	3891
(2) Ruling grades and curvatures	3893
(3) Helper districts	3895
(4) The affected lines well constructed	3896
(c) Defendant's lines in Nevada and Utah; description: comparison with Arizona lines	3896

Page

IV. Character of freight and passenger traffic handled upon defendant's lines in Arizona and adjacent territory; comparison with Nevada traffic 3897
(a) Predominant interstate character of Arizona freight and passenger traffic 3897
(b) Character of commodities transported: need for expedition 3898
(c) Arizona traffic compared with traffic across Nevada 3900
V. The Train-Limit Law: history and text 3901
VI. Recent improvements in defendant's transportation plant, both generally, and in the territory affected by the law. 3902
(a) Improvements in track, roadbed, bridges and other fixed structures 3902
[fol. 6072]
(b) Improvements in locomotives, cars and equipment 3904
(c) Purpose of the improvements made by defendant: adequacy of defendant's present track, structures, and equipment to permit operation of long trains 3907
VII. Defendant's methods of operation, past and present 3909
(a) Operating subdivisions: runs of crews and locomotives: operating rules: inspections 3909
(1) Operating divisions and subdivisions 3909
(2) Runs of crews and locomotives 3911
(3) Operating rules 3912
(4) Inspections 3913
(5) Similarity of operating methods, rules, records, etc., on defendant's lines in Nevada and Utah to those in the affected territory 3914

Page

(b) Lengths of defendant's trains 3915
(1) Train lengths on the system generally 3915
(2) Train lengths in Arizona, past and present: comparison with other portions of the system, and with the system as a whole 3917
(c) Reductions in schedules of freight trains 3920
(d) Effect of the long-train program upon the efficiency and economy of defendant's train operations 3924
(1) As to the system generally 3924
(2) In the Nevada-Utah territory 3927
(3) Defendant's inability to achieve comparable efficiency and economy in the territory affected by the Arizona Train-Limit Law 3929

VIII. Comparison of defendant's methods of operation with those followed on United States railroads generally 3934
(a) Improvements in road and equipment 3934
(b) Increased train lengths 3937
(c) Improved schedules and performance 3939
(d) Increased efficiency and economy 3940
(e) Results of the long-train program from the standpoint of the public, the employes, and the railroad owners 3943

fol. 6073]

(1) Reduction in average transportation charges paid by the public 3943
(2) Increases in average wages paid to employes 3943
(3) Effect on returns to owners of the railroads 3944

Page

(f) Similarity of operating conditions and operating rules on other railroads to those prevailing upon defendant's lines in the affected territory 39

IX. Recent long-train operations of defendant in Arizona: intention to undertake future long-train operations 39

(a) Long-train operations of defendant in Arizona in 1940 39

(b) Future long-train operations contemplated by defendant: changes in plant and equipment 39

X. Effect of the Train-Limit Law upon defendant's operations 39

(a) The redispatching studies 39

(b) Interference with and delays to interstate traffic 39

(1) Terminal delays 39

(2) Delays to trains en route: Meets and passes 39

(3) Delays to and interferences with passenger trains and traffic 39

(4) Summary of effect of delays and interferences 39

(c) Reduction in train lengths: increase in number of trains operated 39

(1) Freight train operations 39

(2) Passenger train operation 39

(d) Increased annual expense of operation, etc., imposed by the law 39

XI. Slack and slack-action in trains: nature, cause and effects 39

(a) Description of draft rigging 39

(b) Action of draft gears 39

(c) Slack and slack-action defined 39

(d) Factors affecting slack-action: Amount developed in operation 39

(e) Slack-action in passenger-train operation 39

(2) Passenger train accidents 3983
(f) Accident statistics—defendant's Pacific Lines 3983
(1) Employes on duty—all classes of service—train and train service accidents 3984
(2) Trainmen on duty—all classes of service 3984
(g) Nevada and Arizona casualty statistics 3985
(1) Propriety and significance of comparison of Nevada-Arizona casualty statistics on defendant's lines 3985
(2) All classes of employes—all classes of service 3986

Page

(3) All classes of employes—road freight trains 398
(4) Road freight conductors, brakemen and flagmen 398
(5) Slack-action casualties to trainmen, Nevada-Arizona 399
(6) Caretakers in cabooses—Nevada-Arizona 399
(7) Serious casualties—Nevada-Arizona 399
(8) Casualties classified—Nevada-Arizona 399
(9) Derailments reportable as train accidents—Nevada-Arizona 399
(h) Comparison of short and long-train periods in Nevada with each other 399
(1) Comparison, Nevada with Arizona—three year periods 399
(i) Casualty statistics — defendant's Los Angeles Division 399
(j) Accident and casualty statistics—defendant's lines in New Mexico 400

[fol. 6075]

(1) Casualties to persons—freight-train operation 400
(2) Train accidents—freight-train operation 400
(3) Passenger-train accidents and casualties 400
(k) Santa Fe casualty statistics—comparing short-train and long-train operations 400
(l) Chesapeake and Ohio Railway—casualty statistics 400
(m) Decrease in casualties—Nevada compared with Arizona 400
(n) Casualties while train standing 400
(o) Passenger-train safety 401

Page

(1) Passenger casualties—Class I railroads of the United States 4010
(2) Passenger casualties—Nevada and Arizona 4010
(p) Grade-crossing accidents 4013
(q) Freight-train derailments — Nevada, Arizona, and New Mexico 4015
(r) Emergency applications of air by engineer 4017
(s) Heavier graduating springs 4017
(t) Arizona long-train operations, 1940 4018
(u) Employes affected by the train-limit law 4019
(v) Increase in accident and casualty hazard inherent in increase of train units 4021
XIII. Analysis of certain contentions advanced by plaintiff 4022
(a) The contention that, with long-train operation, trains would be delayed at meeting and passing points because of inadequate siding capacities 4022
(b) The contention that trains should be limited to 70 cars in order that the members of the crews may see and interpret signals more readily 4023
(c) The contention that members of the crews on long trains are in constant fear of injury, and are thereby rendered less alert and efficient in the performance of their duties 4025
(d) The contention that long trains cannot be properly inspected or supervised while in operation, but that short trains can be and that long-train operation therefore results in greater hazards 4026

(e) The contention that the present type of air-brake equipment is in-

adequate to control the speed of and to stop long trains, but is more efficient and adequate upon short trains 403
XIV. Extent of penalties imposed by the law 403
XV. The permissible number of cars in an interstate train is a subject of national and not local concern 403
XVI. Financial burden imposed by the law a factor in determining its unreasonableness 403
XVII. Further arbitrary effect of the law 403
XVIII. Impairment of defendant's facilities by the law 403
XIX. Financial burden on interstate commerce 402
XX. Substantial allegations sustained 403
Conclusions of law 403
I. Jurisdiction 403
II. The Train-Limit Law invades an exclusive Federal field and thus violates the Commerce Clause of the Federal Constitution 403
III. The law operates with extra-territorial effect 403
IV. The law interferes with and unduly regulates the interstate commerce both within and without Arizona 403
V. The law imposes undue and improper burdens upon interstate commerce 403
VI. The law conflicts with existing Federal legislation 403

[fol. 6077]

VII. The law operates unreasonably and arbitrarily to deprive defendant of its property, in violation of both the Commerce Clause and the Fourteenth Amendment to the Federal Constitution and also in violation of the Due-Process Clause of the Arizona Constitution 403
VIII. Defendant entitled to judgment 403

NOTE: The following findings are supported by the evidence referred to in the annotations to each finding, oral testimony being referred to by the name of the witness and page number of the reporter's transcript, and exhibits by reference to their respective numbers.

[fol. 6078] *Findings of Fact and Conclusions of Law*

Preamble

This cause came on regularly for trial on November 19, 1940, before the above-entitled Court; Honorable Levi S. Udall, Judge of the Superior Court of the State of Arizona, to whom the cause had been duly assigned, presiding and sitting without a jury, a trial by jury having been duly waived by the parties.

Thereafter said trial proceeded from day to day with certain intermissions until and including May 1, 1941. In the course of said trial evidence, both oral and documentary, was offered by each of the parties to the cause.

The parties were represented by counsel, Honorable Joe Conway, Attorney General of the State of Arizona, Wesley E. Polley, Esq., Assistant Attorney General, and Charles L. Strouss, Esq., appearing for the plaintiff, and Knapp, Boyle and Thompson, Henley C. Booth, Esq., and Burton Mason, Esq., for the defendant.

At the conclusion of the trial on said May 1, 1941, it was stipulated and agreed in open Court, by and between said parties, that proposed findings of fact and conclusions of law, together with briefs of argument might be filed with the Court by the parties, or by either party, prior to the final submission of the cause to the Court for its decision; and the Court was then and there duly requested to make and enter written special findings of fact and conclusions of law before rendering judgment. Thereafter, and in due course, such proposed special findings of fact and conclusions of law, and said briefs of argument, were duly filed with the Court by the parties.

[fol. 6079] Now, therefore, having duly considered said proposed findings and conclusions and briefs of argument, together with all the evidence, both oral and documentary, of record herein, and all of the other records, papers, files, and proceedings in this cause, and being now fully advised

in the premises, the Court hereby makes, adopts and enters the following as its special findings of fact and conclusions of law herein:

[fol. 6080] SPECIAL FINDINGS OF FACT

I

Definition of Terms

For the sake of brevity the words "train-limit law", and "the law" (without other separate designation), as used in these findings mean, unless the context otherwise requires, that certain statute of the State of Arizona, enacted in 1912, entitled "An act limiting the number of cars in a train" (being Section 69-119 of the Arizona Annotated Code, 1939), hereinafter set forth at length; which statute prohibits the operation in Arizona of trains of more than 70 freight or other cars, exclusive of caboose, and passenger trains of more than 14 cars.

Trains containing cars in excess of the maxima permitted by said Train-Limit Law are referred to in these findings as "long trains"; and trains coming within the limits fixed by said statute are referred to as "short trains".

The term "interstate trains" means all trains carrying any interstate traffic or commerce, or engaged in interstate transportation.

By the expression "standard long-train operation" is meant the practice of handling freight traffic in freight trains containing substantially more than 70 cars, and passenger traffic in passenger trains of more than 14 cars, whenever the volume, destination, and character of the traffic to go forward by train is such that a long train can be more efficiently and economically operated than a short train; and to handle in short trains such traffic as cannot be conveniently or economically handled in long trains.

By the expression 'the affected territory" is meant the districts, including the lines of the defendant within Arizona [fol. 6081] and in the adjacent portions of California, Texas, and New Mexico, wherein the Train-Limit Law affects or may affect the railroad operations of defendant.

The present tense, as used herein, means all times since and including January 1, 1938.

II

Nature of the Case: The Parties Involved

(a) The Parties.

The plaintiff in this action is the State of Arizona. The suit is brought on behalf of the state, by and at the direction of the Attorney General of Arizona, acting in his official capacity.

Defendant is a corporation duly organized and existing under and by virtue of laws of the State of Kentucky, and a citizen and resident of that state. Defendant is engaged in the operation, as a common carrier in interstate commerce, of lines of railroad in the States of Oregon, California, Nevada, Utah, Arizona, Texas, and New Mexico, and in the transportation of passengers and property from, to, and between points in each and all of said states. Defendant, as such interstate common carrier by railroad, is subject to the provisions of the Act of Congress approved February 4, 1887, and acts amendatory thereof and supplementary thereto, known as Part I of the Interstate Commerce Act.

(b) The Issues.

This suit is a civil action at law, brought for the purpose of recovering from the defendant penalties as provided by said Train-Limit Law; it being alleged in the complaint that defendant operated, on March 2, 1940, a passenger train of [fol. 6082] more than 14 cars, and on April 4, 1940, a freight train of more than 70 cars, and that both such long-train operations were in violation of said law, and subject to the penalties therein prescribed.

Defendant, by its answer, admitted the operation of the aforesaid long trains, though denying that said operations were wilful or otherwise in violation of the law. Said defendant, in and by said answer, further alleged that said law was and is invalid and unconstitutional, as applied to its interstate trains and the interstate traffic carried therein, because in conflict with the Commerce Clause of, and the Due-Process Clause of the XIV Amendment to, the Constitution of the United States, and the corresponding Due-Process Clause (Section 4 of Article II) of the Constitution of Arizona, and also because in conflict with and an infringe-

ment upon certain federal statutes; to-wit, the Boiler Inspection Act, the Safety Appliance Acts, and Section 2 (now Section 25) of Part I of the Interstate Commerce Act.

III

Description of Defendant's Lines of Railroad

(a) General Description of the System.

Defendant's main lines of railroad extend from San Francisco, California, to Portland, Oregon, and from San Francisco, across Nevada, to Ogden, Utah, and also from San Francisco, southeasterly to Los Angeles, California, and thence via Yuma and Tucson, Arizona, to El Paso, Texas, and thence to Tucumcari, New Mexico. At each of said points (other than Tucson and Yuma), as well as at numerous other points, defendant's lines connect with the lines of other interstate rail carriers, and thus enter into and become part of through routes for the transportation of freight between all parts of the United States, and to and from adjacent foreign countries.

[fol. 6083] Defendant's operations extend over 5,148 miles of main lines, and 3,500 miles of branch lines, producing a total system mileage of 8,648 miles of line. Including the miles of second (i. e., alternate or double) tracks, there are 9,524 main-track miles, 6,012 miles of said track miles being on main lines, and 3,512 miles of said track miles on branch lines. Defendant's sidings and yard tracks total 4,145 track miles, thus producing a grand total, for all tracks, of 13,669 track miles.

The above-described lines, generally known as the defendant's Pacific Lines, represent a total investment in roadbed and other fixed properties (not including rolling equipment), as of December 31, 1939, of $729,056,899. The portion of said lines within Arizona, which consists of 1,208 road miles and 1,273 main-track miles, represents a total investment in road and fixed properties only (not including movable equipment), as of December 31, 1939, of $68,876,025.

The total mileage of the main lines between Yuma, Arizona, and El Paso, including the alternate main lines via Phoenix and Douglas, hereinafter more fully described, is 1,069 road miles, representing a total investment, in roadbed

and fixed property only, as of December 31, 1939, of $71,870,183.

Answer, par. III (2).

P. McDonald*, R. 2971; *Judson*, R. 2988.

Exhibits 1, 110, 111, 115, 145, 175.

[fol. 6084] (b) The Line in the Affected Territory.

(1) Location; principal stations; double track:

Defendant's aforesaid main line between Los Angeles and Tucumcari extends easterly from Los Angeles via Colton, Beaumont and Indio, California, and crosses the westerly boundary of Arizona immediately west of Yuma, 250 miles east of Los Angeles. Yuma is a division point at which an extensive freight terminal is maintained, where freight trains originate and terminate, and are made up and broken up. The main line principally used for the handling of freight traffic extends easterly and southeasterly through the cities and stations of Wellton, Gila, Picacho, Tucson, Mescal, Benson, Dragoon, Bowie, and San Simon to the station of Cavot, Arizona, at which point said line crosses the Arizona-New Mexico boundary line. Said line then continues easterly through the cities and stations of Steins, Lordsburg, Deming and Anapra, New Mexico, to El Paso, Texas, and thence northeasterly to Tucumcari, New Mexico. The distance from Cavot to Lordsburg is approximately 23 miles; from Cavot to El Paso, approximately 171 miles. The total length within Arizona of defendant's said main line from Yuma via Gila, Tucson and Bowie, last described, is approximately 392 miles.

In addition to the aforesaid main line, defendant also has an alternate main line in Arizona which departs from the Yuma-Gila-Lordsburg line at Wellton, 37 miles east of Yuma, and runs thence northeasterly to Phoenix, and thence easterly and southeasterly via Mesa, Chandler, and Coolidge to Picacho, a point 46 miles northwest of Tucson, where it joins the Yuma-Gila-Lordsburg line. The distance from Wellton via Phoenix to Picacho is 211 miles.

A second alternate line of defendant leaves the Yuma-Gila-Lordsburg line at Mescal, approximately 40 miles easterly [fol. 6085] from Tucson, and extends via Douglas, Arizona, to Anapra, New Mexico, where it rejoins the Yuma-Gila-Lordsburg line. The distance from Mescal via Douglas to Anapra is 295 miles.

The three main lines just described, considered together, afford to the defendant practically two lines for the entire distance between Yuma and El Paso; but, except for the double-track districts hereinafter mentioned, these lines are all operated as single track.

Defendant's Yuma-Gila-Lordsburg line, as above described, is double-track from Yuma to East Yard, a distance of 4.7 miles; thence single-track for a distance of 16 miles to Dome; thence double-track for a distance of 16.5 miles to a point near Wellton; thence single-track for a distance of 211.2 miles to Stockham; thence double-track for a distance of 42.4 miles to Mescal; thence single-track for a distance of 101.5 miles to Cavot, at which point said line crosses the Arizona-New Mexico boundary, as aforesaid; thence continues as single-track for a distance of 164.8 miles to Anapra; and thence is double-track for a distance of 7.1 miles to El Paso.

The alternate main line via Phoenix consists entirely of single-track, except for about two miles of double-track immediately east and west of the station at Phoenix. The second alternate main line via Douglas consists entirely of single track.

Defendant also has certain branch lines in Arizona, the more important of which are as follows: the Christmas Branch, extending easterly from McQueen on the Phoenix main line, a distance of 87 miles to Christmas; the Nogales Branch, extending southerly from Tucson a distance of 66 miles to Nogales, where it connects with the main line [fol. 6086] of the Southern Pacific Railway Company of Mexico, and thus affords a through route for the transportation of all kinds of traffic to and from points in Mexico; and the Globe Branch, which extends northwesterly 136 miles from Bowie, via Safford, Globe and Miami to Live Oak.

Answer, par. III (2).
Sines, R. 46-50, 61-63, 2512, 4223-4224; *Masson*, R. 1536-1540, 1935-1938; *Kirkbride*, R. 2034-2037.

2046-2047, 4053; *G. C. Baker*, R. 2352, 2358-2360, 2380-2384.

Exhibits 1, 115, 145, 154, 155, 175, 176.

(2) Ruling grades and curvatures:

The term "ruling grade," when employed hereafter in these findings, means that ascending grade, within a particular district or territory, which is of such length and location as to limit the amount of tonnage which a train may handle over such district or territory. Ruling grades are not usually continuous over any district or territory, and in fact are limited in length by topography to comparatively short stretches in any given district. Ruling grades are ordinarily short grades, and are not continuous; and long stretches of level or lesser grades generally prevail on each side of each ruling grade.

Kirk, R. 396-397; *Warfel*, R. 1355-1357.

The above-described main lines, both within and without Arizona, and particularly those portions thereof between Indio, California, and El Paso, Texas, are located for the most part in level territory where the grades are of comparatively little consequence. From Indio eastward to Yuma there is no ruling grade in excess of one per cent in either direction. From Yuma eastward to Gila the grade is generally slightly ascending; and ruling grades opposed [fol. 6087] to either eastward or westward traffic do not exceed .6 per cent: except that from Pembroke to Mohawk eastward, a distance of 4.0 miles, and from Kim to Mohawk westward, a distance of 3.3 miles, the ruling grade is one per cent; and except also that from Lava to Sentinel eastward, a distance of 4.1 miles, the ruling grade is 1.02 per cent. From Gila to Estrella, a distance of 18.9 miles, the line ascends eastward, the ruling grade being 1.02 per cent; and then descends eastward, a distance of 23.2 miles from Estrella to Maricopa, the ruling grade being .83 per cent opposed to westward movement. From Maricopa to Picacho, a distance of 39.7 miles, the line ascends with a maximum ruling grade of .5 per cent, and from Picacho to Tucson, a distance of 46.4 miles, the maximum ruling grade is 0.96 per cent.

From Tucson to Mescal, a distance of 39.7 miles, the line ascends eastward with a maximum ruling grade opposed to

eastward traffic of 1.06 per cent; and thence descends for a distance of 9.0 miles to Benson, with a ruling grade (opposed to westward traffic) of 1.4 per cent. From Benson to Dragoon, 21.3 miles, the line again ascends eastward, the maximum ruling grade opposed to eastward traffic being 1.4 per cent. The line then descends eastward for about 12 miles to a point east of Cochise, the ruling grade (opposed to westward traffic) being 1.1 per cent. At Cochise the grade becomes level, and further east ascends with slight gradient to Willcox, a distance of 8 miles. Between Willcox and San Simon, a distance of 38.5 miles, the maximum ruling grade opposed to eastward traffic is 0.91 per cent, and to westward traffic is 1.0 per cent, these grades controlling for short distances easterly and westerly from a summit at Raso. From San Simon the line ascends eastward for a distance of 14.7 miles to Steins, with maximum ruling grades of 1.4 per cent; the Arizona-New Mexico boundary is crossed during this ascent at the station of Cavot, elevation 4,092 feet, 10.9 miles east of San Simon. [fol. 6088]

From Steins to Lordsburg, 19.4 miles, the line descends for a short distance with a ruling grade of 1.4 per cent opposed to westward traffic, the rest of the distance to Lordsburg being traversed with ruling grades of 1.0 per cent in each direction. From Lordsburg to El Paso, 148 miles, the ruling grades opposed to traffic in either direction are comparatively light and do not exceed one per cent.

On the line from Wellton to Picacho via Phoenix the ruling grades do not exceed one per cent in either direction and in general do not exceed .6 per cent.

On the line from Mescal via Douglas to Anapra the ruling grades are likewise one per cent or less, and for substantial distances do not exceed .8 per cent in either direction.

In general, throughout the territory above-described, curvatures are light, and curves are comparatively infrequent. On the main line from Yuma via Gila and Lordsburg to El Paso, a total distance of approximately 563 miles, only 84.3 miles, or about 15 per cent, consist of curved track; and only about 5.5 miles, or less than one per cent, consist of curves of more than six degrees. On that portion of said Yuma-Gila-Lordsburg line within Arizona, a total distance, as aforesaid, of 392 miles, 84 per cent of the total mileage is straight track, and only 16 per cent curved

track, and only about one per cent of the total mileage consists of curves of more than six degrees. On the Wellton-Phoenix-Picacho line, only 18.5 miles, or less than 9 per cent of the total of 211 miles, consist of curved track. [fol. 6089] On the Mescal-Douglas-Anapra line 51.7 miles, or 17.5 per cent of the total of 295 miles, consist of curves.

Where curved track exists in grade territory upon the lines above described, or elsewhere upon any of defendant's main lines, each of such curves is "compensated"; i. e., the grade is reduced around the curve to an extent such that the effect of the combined resistance to movement of tonnage afforded by the curve itself and by the grade upon the curve, is not greater than the corresponding resistance afforded by grade alone upon an adjacent stretch of "tangent" (straight) track. The compensated grade upon the curve is thus capable of being stated, and in common railroad practice is stated, in terms of the equivalent of rise expressed in per cent of distance along tangent track.

Grades, including ruling grades (as heretofore defined), are usually expressed in per cent of distance, or in feet of rise per mile of distance, and when so expressed in these findings are the "compensated" grades; i. e., they take into account such resistance to tonnage movement as is contributed by curvature as well as actual grade.

Answer, par III (2).

Kirkbride, R. 2038-2040, 2046-2056, 2064-2065, 4044-4050, 4053-4056.

Exhibits 155, 175, 301, 302, 303, 309, 310.

(3) Helper districts:

Those sections of the line where the grade and other physical conditions are such as to require the use of one or more additional locomotives in order to handle trains which elsewhere are normally handled by one locomotive, are customarily referred to as "helper districts." There are four regular freight helper districts for eastward trains [fol. 6090] on defendant's main lines in Arizona, as follows: From Gila to Estrella, 18.9 miles; from Tucson to Mescal, 39.7 miles; from Benson to Dragoon, 21.3 miles; from San Simon to Steins, New Mexico, 14.7 miles. The two freight helper districts from Tucson to Mescal, 39.7 miles, and from Benson to Dragoon, 21.3 miles, are operated as one freight-helper district in actual practice, in that the

additional helper locomotives and the employes operating them run through from Tucson to Dragoon, without detaching from the trains they are helping, during the nine-mile descent from Mescal to Benson.

Helper locomotives are not regularly required or normally used by defendant's westbound freight trains between Lordsburg and Gila, or by freight trains moving in either direction between Yuma and Gila, or Lordsburg and El Paso, or upon the two alternate main lines via Phoenix and Douglas.

Helper locomotives are usually required by westward freight trains and by many westward passenger trains ascending the grade from Indio to Beaumont, California, and by eastward freight trains, and many eastward passenger trains moving from Colton, California, to Beaumont. Helper locomotives are not used or required by trains descending the grades above described in any of the aforementioned territories.

Masson, R. 270; *Dyer*, R. 2022-2024; *Sines*, R. 2589-2590, 2595-2601, 4226, 4427.
Exhibits 155, 175.

(4) The affected lines well constructed:

Defendant's main lines in the affected territory are well constructed and carefully maintained, and fully capable of [fol. 6091] sustaining the heaviest and most powerful locomotives and cars owned or operated by defendant. Said main lines are equipped throughout with approved modern block signals and other numerous safety devices of modern type promoting the safety of operation.

J. B. Baker, R. 1466-1478, 1491-1495, 1509-1528; *Dyer*, R. 2017, 2021, 2022; *Kirkbride*, R. 2065-2131.
Exhibits 110 to 114, 157 to 159.

(c) Defendant's Lines in Nevada and Utah: Description: Comparison with Arizona Lines.

The operating conditions upon defendant's main lines across Nevada and Utah (briefly referred to in sub-paragraph (a) of this finding) are very similar to those upon the above-described lines between Yuma, Arizona and El Paso, Texas. The ruling grades in the Nevada-Utah territory are generally less than one per cent, and the lines

lie for the most part in desert and valley territory, where operating conditions are substantially as favorable as in Arizona and New Mexico; the only notable difference being that the climatic conditions in the winter are much more severe in northern Nevada and Utah. The maximum ruling grade encountered on defendant's main lines in Nevada and Utah, in either direction, is 1.5 per cent. The curvatures on said lines are, as in Arizona, light and relatively infrequent, in that there are long stretches of tangent track and flat curves; however, the percentage of curved track to the total main-line mileage is greater in Nevada than in Arizona, in that about 24.5 per cent of the main line mileage in Nevada consists of curved track.

Said Nevada-Utah lines are well constructed and maintained, in accordance with the same standards which prevail [fol, 6092] in Arizona, and are equipped with the same types of block signals and other modern safety devices in use in Arizona.

Answer, III (2).

Dyer, R. 2009-2010; *Kirkbride*, R. 2056-2064, 2105-2108, 2116-2132, 2134-2136, 2144-2146, 3876-3882, 4034-4064.

Exhibits 110, 156, 157, 158, 159, 301, 302, 303, 306, 307, 308, 309, 310.

IV

Character of Freight and Passenger Traffic Handled upon Defendant's Lines in Arizona and Adjacent Territory; Comparison with Nevada Traffic.

(a) Predominant Interstate Character of Arizona Freight and Passenger Traffic.

A substantial volume of traffic is handled in both the eastward and westward directions, over defendant's main lines in the territory affected by the law. This traffic is predominantly interstate in character.

92.74 per cent of the total revenue freight ton miles carried by all of the defendant's lines in Arizona during the five-year period, 1935-1939, inclusive, related to interstate freight, and only 7.26 per cent of said total related to intrastate freight. In the same five-year period 95.49 per cent of all the revenue passenger miles accumulated

on all of the defendant's lines in Arizona were interstate in character, and only 4.51 per cent were intrastate.

In the years 1938 and 1939, more than 68.5 per cent of all the revenue freight ton miles, and more than 74.0 per cent of all the revenue passenger miles, accumulated upon [fol. 6093] defendant's said Arizona lines, related to "overhead" or "bridge" freight and passenger traffic: that is, traffic originating outside the state, and crossing the state to destinations beyond.

A study of the total freight revenues earned by the defendant's lines in Arizona, such revenues being allocated to the State of Arizona in accordance with the formula prescribed by the Arizona Corporation Commission, developed that the revenues from handling interstate freight were, during said five-year period, 1935-1939, inclusive, 93.07 per cent of the total thus allocated, while the corresponding revenues from Arizona intrastate freight were but 6.93 per cent of said total. A similar study of passenger revenues earned by defendant's lines in Arizona, such earnings being also allocated in accordance with the formula prescribed by the Arizona Corporation Commission, developed that interstate passenger revenues were, during said five-year period, 1935-1939, inclusive, 95.25 per cent of the total thus allocated, and Arizona intrastate passenger revenues were but 4.75 per cent of said total.

64.77 per cent of said total of freight revenues allocated to Arizona for said five-year period accrued to defendant for the handling of bridge or overhead freight traffic, as above defined.

Masson, R. 1911-1947, 2225-2227, 2233, 2246-2252; *Sines*, R. 2500-2509.

Exhibits 141, 142, 143, 144, 145, 146, 147, 148, 167, 170, 189, 190.

(b) Character of Commodities Transported: Need for Expedition.

The interstate traffic handled in defendant's freight trains in the affected territory consists principally of per- [fol. 6094] ishable agricultural products (fresh fruits, vegetables, melons, etc.), livestock, and manufactured products of relatively high intrinsic value. All of these classes of freight must be handled and delivered with the least possible delay.

During the year 1939 defendant handled 261,755 carloads of all kinds of freight, both interstate and intrastate, on its lines in Arizona, of which 104,739 carloads consisted of products of agriculture. 88,658 of said carloads consisted of fruits and vegetables and other perishable agricultural products; and there were 16,001 carloads of livestock, fresh meats, and other animal products. During 1939 defendant handled 190,828 carloads of freight on its lines in New Mexico, of which 96,250 were products of agriculture. 87,126 of said carloads consisted of perishable agricultural products; and there were also 13,273 carloads of livestock, fresh meats, and other animal products.

Approximately 59 per cent of the eastbound cars forwarded to El Paso by defendant during the five years, 1935-1939, inclusive, were loaded refrigerator cars; and about 53 per cent of the westward cars forwarded by defendant from El Paso during the same period were empty refrigerator cars. Such refrigerator cars are designed to be, and in nearly all cases are used for the transportation of various kinds of perishable freight, other than livestock.

Practically all of the traffic handled by defendant eastward into El Paso or westward from that point did, during the period stated, and as a general rule does move over defendant's main lines in Arizona, and by far the greater portion thereof did, and as a general course does originate or terminate at points beyond (west of) Arizona. A substantial proportion of the traffic, other than that handled in refrigerator cars moving across Arizona, and received [fol. 6095] at or forwarded from El Paso by defendant, consists of either livestock or so-called manifest freight. 4278 per cent of all the loaded freight-car mileage accumulated in Arizona in the five years, 1935-1939, inclusive, was accumulated by loaded Pacific Fruit Express refrigerator cars; while 56.21 per cent of all the empty freight-car miles accumulated in Arizona during the same five-year period were accumulated by empty Pacific Fruit Express refrigerator cars.

Such perishable and livestock traffic, as well as the so-called manifest freight, must be handled promptly, in order to avoid damage and shrinkage and permit of orderly marketing, and also, in the case of livestock, to comply with the requirements of the Federal Twenty-eight-Hour Law. Empty westbound refrigerator cars must be handled by

defendant over its lines, particularly the main lines in the affected territory, as speedily as practicable in order to insure a dependable supply of such cars for the loading of the highly perishable agricultural traffic originating in the California and Arizona producing areas.

Kirk, R. 410-414; *Fertig*, R. 870-872; *Cartmill*, R. 1768-1769, 1775-1776; *Mahoney*, R. 1841-1844; *Sines*, R. 63-64, 2500-2509; *Dyer*, R. 2008-2009; *Masson*, R. 2225-2230, 2233, 2246-2252, 3177-3184; *G. C. Baker*, R. 2340-2344, 2670,
Exhibits 167, 168, 170, 175, 189, 190, 216, 217, 218.

(c) Arizona Traffic Compared with Traffic Across Nevada.

The freight traffic handled upon defendant's main lines crossing Nevada and Utah is similar to that handled in and across Arizona; in that it is predominantly interstate in character, and the loaded movement consists principally of perishable agricultural products, livestock and the prod- [fol. 6096] ucts thereof, and manufactured articles of relatively high value, while the empty car movement consists, in large part, of refrigerator cars being returned from eastern markets for further loading in the California and Oregon producing areas. Moreover, the total volume of the freight traffic across Nevada is approximately the same (on the average, about 5 per cent greater) as the corresponding volume of freight traffic in Arizona. About 50 per cent of the cars moved eastward by defendant during the year 1939 over said lines across Nevada and Utah, and to Ogden, Utah, were refrigerator cars carrying perishable freight, while similarly 55 per cent of the cars moving eastward to El Paso during 1939 were loaded refrigerator cars. About 47 per cent of the cars moved westward during the said year from Ogden over said lines were empty refrigerator cars being moved to the producing areas of California and Oregon for further loading, while 49 per cent of the cars moving westward through El Paso were empty refrigerator cars. 38.59 per cent of all the loaded freight-car miles accumulated in Nevada during the five years, 1935-1939, inclusive, were accumulated by loaded refrigerator cars of the Pacific Fruit Express Company. 55.01 per cent of all of the empty freight-car miles accumulated in Nevada during the same five-year period was

accumulated by empty Pacific Fruit Express Company refrigerator cars.

Dyer, R. 2008-2009; *Masson*, R. 2232-2252, 3179-3184; *Sines*, R. 2500-2508, 2535-2537.

[fol. 6097]

V

The Train Limit Law: History and Text

On May 16, 1912, the Governor of the State of Arizona approved an act of the Legislature of that State entitled "An Act limiting the number of cars in a train", which act was afterwards, on referendum at a general State election held November 5, 1912, approved by a majority of the voters of said State voting at said election (Laws, 1913, Referendum, p. 15; Sections 2166-2168, Revised Statutes of Arizona, 1913; Civil Code of Arizona, Section 647, Arizona Revised Statutes, 1928; Section 69-119, Arizona Annotated Code, 1939), and ever since has been and now is in full force and effect. Said act has no preamble, and reads as follows:

"Section 1. It shall be unlawful for any person, firm, association, company or corporation, operating any railroad in the State of Arizona, to run, or permit to be run, over his, their, or its line of road, or any portion thereof, any train consisting of more than seventy freight, or other cars, exclusive of caboose.

"Section 2. It shall be unlawful for any person, firm, association, company or corporation, operating any railroad in the State of Arizona, to run, or permit to be run, over his, their, or its line of road, or any portion thereof, any passenger train consisting of more than fourteen cars.

"Section 3. Any person, firm, association, company or corporation, operating any railroad in the State of Arizona, who shall willfully violate any of the provisions of this act, shall be liable to the State of Arizona for a penalty of not less than one hundred dollars, nor more than one thousand dollars, for each offense; and such penalty shall be recovered, and suits therefore brought by the attorney general, or under his direction, in the name of the State of Arizona, in any county

[fol. 6098] through which such railroad may be run or operated, provided, however, that this act shall not apply in cases of engine failures between terminals.

"Section 4. All acts and part of acts in conflict with the provisions of this act are hereby repealed."

Said act is generally known, and throughout these findings is referred to, as the Arizona Train-Limit Law.

Complaint, par. I.

Answer, par. I (1); par. II (1).

VI

Recent Improvements in Defendant's Transportation Plant, Both Generally, and in the Territory Affected By the Law:

(a) Improvements In Track, Roadbed, Bridges and Other Fixed Structures.

In the years since the enactment of the Train-Limit Law in 1912, and especially since 1923, defendant has made numerous, substantial, permanent improvements in the track, roadbed, bridges and other fixed structures upon its lines of railroad heretofore generally described in paragraph III of these findings, and particularly upon its main lines in the affected territory.

Said improvements have included the following, among other things: The replacement of lighter weights of rail, in main tracks and sidings, by heavier rail, including, particularly in Arizona, replacement of lighter rail in main lines by rail weighing 90 pounds or more per lineal yard; replacement of gravel ballast, in the roadbed, by crushed rock and slag ballast, and the placement of such [fol. 6099] ballast at greater depths under the track than was previously the practice; constant and thorough renewal and replacement of ties, and the use of more ties per mile, of better and more costly types; constant repair and renewal of bridges, trestles and culverts; and replacement, where needed, of wooden bridges, trestles, and culverts by steel or concrete structures; separation of grades at numerous rail-and-highway crossings, and installation of automatic warning signals at numerous other grade

crossings; construction of additional double track; construction of additional yard and terminal facilities at various points; installation of improved types of block signals, and replacement of older types by more modern types; construction, where needed, of interlocking signal plants; and the acquisition in 1924 of the lines of the former Arizona Eastern and El Paso and Southwestern Railroad Companies, following which, in 1924-1926, defendant constructed and reconstructed the lines between Wellton and Picacho via Phoenix, so as to provide the alternate main line via Phoenix heretofore refered to.

The aforesaid improvments have been accomplished only by the expenditure of large sums of money.

During the years 1924 to 1939, inclusive, defendant expended more than $162,000,000 for net additions and betterments (after allowance made for retirements) to the roadbed and fixed structures (not including rolling stock or other movable equipment) upon its railroad system in the states of California, Nevada, Utah, Oregon, Arizona, New Mexico and Texas, known as its "Pacific Lines", and heretofore described in paragraph III of these findings.

In the same period the net investment by defendant (over and above retirements) for permanent improvements made [fol. 6100] to its roadbed and fixed structures in the territory between Yuma and El Paso was more than $21,000,000; which figure does not include any amounts expended by defendant in acquiring the properties formerly owned and operated by the El Paso and Southwestern and Arizona Eastern Railroad companies, as above mentioned.

This net additional expenditure, over and above retirements, made in Arizona alone by defendant for permanent improvements to roadbed and fixed structures, during said period 1924-1939, was more than $18,400,000. None of the above figures includes any sums of money spent by defendant in the acquisition and improvement of rolling stock, or other movable equipment.

In 1912 the sidings and passing tracks on defendant's main line in Arizona were not generally of sufficient capacity to hold freight trains of substantially more than 70 cars, including engine and caboose. While said sidings have been greatly improved, as aforesaid, since 1912, and particularly since 1920, by being relaid with heavier rail, and by

having ties, ballast, and embankments renewed, they have not in general been extended beyond their former capacities.

J. B. Baker, R. 1466-1478, 1491-1495, 1509-1528; *Dyer*, R. 1998; *Kirkbride*, R. 2050, 2093-2131; *Herbert*, R. 2830-2839, 2857-2858.

Exhibits 110, 111, 112, 113, 114, 157, 158, 159, 197, 200, 201.

(b) Improvements in Locomotives, Cars and Equipment.

The locomotives, cars and equipment used on defendant's lines generally, including the lines affected by the law, have been substantially improved during the years since 1912, and notably since 1923.

[fol. 6101] As to the locomotives, such improvements have included the building, purchase, or acquisition by other means, of newer and heavier types of locomotives, capable of rendering speedier and more efficient service and of withstanding more severe service conditions, and having substantially greater hauling capacity, than the locomotives previously in service; and the retirement of the older, smaller, and less efficient types, which have been largely replaced by the newer locomotives. Such newer and heavier locomotives are equipped with the latest and most modern devices, designed to promote safety, efficiency and economy of operation; which devices include, among others, the following: super-heaters, feed-water heaters, air pumps of newer design, air reservoirs of increased capacity, heavier frames and running gears, improved and strengthened brake equipment, back-pressure indicators, automatic stokers for coal-burning locomotives, and power-reverse gears. Many of the older locomotives, where retained in service, have been improved and brought to a higher state of efficiency by placing upon them certain of the devices above enumerated, as well as other devices not herein specifically mentioned.

The locomotives and cars presently in use in freight and passenger service on the lines in Arizona are, in most instances, the same kinds and types as those heretofore or presently in similar service in Nevada and Utah, and include the most modern types owned by defendant. Such locomotives were acquired expressly for the purpose of handling, and in several years of actual operation have demonstrated that they are fully capable of handling in

the Nevada-Utah territory, freight trains consisting of substantially more than 70 cars, either loaded or empty, and passenger trains of more than 14 cars; and, except to the extent that helper locomotives are or may be required on [fol. 6102] certain helper districts in Nevada, the handling of such long trains in said states, by single locomotives of the same types as are now used by defendant in Arizona, is the ordinary, customary, and standard practice. Locomotives of the types now in use in Arizona have recently been, and likewise presently are, in use on those portions of defendant's lines in California and New Mexico, adjacent to the Arizona boundary line, in service similar to that for which they are employed in Arizona; and in such service said locomotives have demonstrated that they are fully capable of handling long freight and passenger trains, as a regular, customary, and standard practice.

Defendant has expended large sums of money in recent years in the building and purchase of said newer and more powerful locomotives. The total so expended by defendant during the period 1922-1939, inclusive, was $46,216,000, which expenditure enabled defendant to acquire during that period 409 new locomotives, having a total tractive power of 34,244,070 pounds. These expenditures were in all instances made pursuant to express authority to that end, granted by the Interstate Commerce Commission under the provisions of Section 20a of the Interstate Commerce Act.

The improvements made since 1912 in the cars in service upon defendant's aforesaid lines of railroad have included the purchase or building of newer cars equipped with the latest and most modern devices and appliances and of stronger construction than the cars previously in service, and the retirement and withdrawal from service of the older, weaker cars, which have been largely replaced by the cars of later types.

All cars now in use for the handling of freight in through and interchange service (i. e., in service involving move-
[fol. 6103] ment over more than one railroad) upon defendant's lines are built of steel or with steel underframes; cars having wooden underframes, largely in use in 1912 and previously, have been entirely withdrawn from such service. Refrigerator cars constitute approximately 50 per cent of the freight cars handled in defendant's freight

trains in the affected territory; and almost all of the refrigerator cars handled by defendant are owned by the Pacific Fruit Express Company, a corporation affiliated with defendant. All such refrigerator cars, and all of the other freight cars owned or used by defendant, are equipped with trucks having cast-steel side frames. The use of the older arch-bar type of truck has been entirely discontinued.

The draft gears and draft rigging on all such cars have been greatly improved. All of the refrigerator cars, and more than 80 per cent of the freight cars of other types owned by defendant and used in through or interchange service, are equipped with modern friction draft gears and modern draft appliances.

Modern, single-plate cast iron wheels are in universal use upon both the freight and refrigerator cars aforesaid, the older, double-plate type of wheel having been replaced.

Numerous improvements have been made in the air-brake mechanism of said cars; examples of such improvements being (1) the installation of heavier graduating springs in the triple valves, as a result of which so-called unintended (undesired) emergency action by the air brakes has been practically eliminated; (2) the development and subsequent adoption (in 1933) of an improved type of freight-brake valve known as the "AB"; which type is now standard upon all new cars built since 1933, and also required (by the interchange code) to be applied on all older cars not later than January 1, 1945. Numerous other improve- [fol. 6104] ments, not herein separately mentioned, have also been made in said freight cars, operated in defendant's trains in the affected territory, and upon its railroad lines generally.

All passenger cars now in use on defendant's main lines, including sleeping and other cars owned by the Pullman Company, are now built entirely of steel, the use in passenger trains of cars having wooden bodies, which was common in 1912 and previously, having been entirely discontinued. The braking appliances, couplers, draft gears and draft rigging, wheels, and other features of said cars have been greatly strengthened and improved, and numerous other devices and improvements, not herein separately mentioned, have been added to such passenger cars, all with the purpose and result of providing greater safety and comfort for the traveling public and employes riding

in such cars, and greater ease, safety and economy of operation of the trains in which such cars are run.

[fol. 6105] (c) Purpose of the Improvements Made By Defendant: Adequacy of Defendant's Present Track, Structures, and Equipment To Permit Operation of Long Trains

The expenditures above referred to, and the improvements and enlargements of defenadnt's transportation plant thereby effected, and the improvements, additions and betterments otherwise made by defendant, both upon its lines generally and particularly in the territory affected by the law, as hereinbefore set forth, were made and undertaken by defendant for the primary purpose of enabling greatest possible safety, efficiency, and economy and to discharge its public duty as a common carrier.

Said expenditures, particularly those made during and since the year 1923, were undertaken by defendant concurrently with and as a part of the general program of betterment of the railroad transportation plant of the said defendant to operate its railroad lines with the United States formulated and agreed upon in 1923 by the United States railroads, including defendant, and hereinafter more fully referred to.

Defendant's track, roadbed, bridges, and other structures upon its main lines in the territory affected by the law are given regular and exacting inspections, and are thoroughly and carefully maintained, and have been at all times herein mentioned and now are in excellent physical condition. They are fully capable of sustaining safely the

weight of the heaviest equipment, whether locomotives, loaded cars, or other movable equipment, owned or operated by the defendant. The locomotives presently in use or available for use in the affected territory are, as before stated, fully capable of handling freight trains consisting of substantially more than 70 cars, either loaded or empty, or both, exclusive of caboose, and passenger trains of more [fol. 6106] than 14 cars, over the main lines in that territory; and the cars operated in said trains are of adequate strength and construction, and equipped with adequate appliances and devices to permit of their being safely operated, in train units of substantially more than 14 or 70 cars, as the case may be. There is no reason, whether from the standpoint of climatic conditions, or track, grades, curvatures, or other operating conditions, or the strength or capacity of road, structures, and equipment now being used and available, why defendant cannot operate and continue to operate upon its main lines in the affected territory, as elsewhere upon its system in comparable or more difficult territory, a very substantial number of freight-train units of many more than 70 cars, exclusive of caboose, and passenger-train units of more than 14 cars. If defendant were relieved of the restrictions of the train-limit law, it would at once undertake, and thereafter continue and expand such long-train operations in the affected territory.

As hereinafter more fully set forth, defendant operated long passenger trains in the affected territory on 62 occasions during the months of March and April, 1940, and also operated some 302 or more long freight trains in said territory during the month of April, 1940; and thereby demonstrated that such long-train operation is wholly practicable in said territory, and results in greater safety, efficiency, and economy.

[fol. 6107]

VII.

Defendant's Methods of Operation, Past and Present

(a) Operating Subdivisions: Runs of Crews and Locomotives: Operating Rules: Inspections.

(1) Operating divisions and subdivisions:

In the operation of its lines generally, defendant has subdivided its system into nine operating divisions; and each of the said divisions is further subdivided into operating subdivisions. The stations at the termini of said subdivisions are usually designated as freight-train terminals, and the through freight trains operated by defendant generally originate at such terminals, moving over the subdivisions to the next succeeding terminals, where their runs terminate.

That portion of defendant's main lines hereinbefore described, which extends between Los Angeles and Yuma, Arizona, forms a part of defendant's Los Angeles Division. The lines between Yuma and Tucson, together with the eastbound main track in the double-track territory between Tucson and Mescal, and the line from Mescal via Bowie to Lordsburg, as well as the Nogales, Christmas and Globe branches have, since July, 1930, constituted the Tucson Division. The westbound main track between Tucson and Mescal, together with the line from Mescal via Douglas to Anapra, and from Lordsburg to Tucumcari via El Paso have, since July, 1930, constituted the Rio Grande Division. Prior to July, 1930, the line between Tucson and Lordsburg, including the Globe branch, was part of the Rio Grande Division, which division then included also the line between Tucson and El Paso via Douglas, but not the line between El Paso and Tucumcari. Said line last mentioned formed a separate division called the New Mexico Division. In July, 1930, the present divisional bound-
[fol. 6108] aries, above described, were established, and the New Mexico and Rio Grande divisions were merged.

All of the lines in Nevada east of the station of Lawton, Nevada, including also the lines in Utah, as well as certain lines in northeastern California, and a portion of the narrow-gauge branch line in Owens Valley of California, are now, and since November, 1929, have been operated as defendant's Salt Lake Division.

That portion of the Salt Lake Division north of Wendel, California, was added to the division in November, 1929, at which time the line from Fernley, Nevada, to Wendel, formerly classed as branch line, was reclassified as main line. The portion of the main line in Nevada between the Nevada-California boundary line and Lawton, Nevada, is a part of defendant's Sacramento Division.

The following stations upon the main lines in the affected territory are designated as freight-train terminals: Los Angeles, Indio, Yuma, Gila, Tucson, Lordsburg, El Paso; upon the Phoenix line, Phoenix; and upon the Douglas line, Douglas. At those points freight trains originate and terminate, and the runs of freight-train and engine crews, and in some instances of the locomotives of such freight trains, begin and end.

Through freight trains arriving at El Paso are largely broken up and reswitched before the cars handled therein receive further movement. Through freight trains arriving at Yuma are also generally, although not always, switched and reconsisted to a substantial extent before further movement takes place; and in particular, locomotives and cabooses are invariably changed at that point. At Gila through freight trains arriving from either direction receive little, if any, substantially reconsisting, other [fol. 6109] than the changing of cabooses and locomotives; and in some instances locomotives are not changed. At Lordsburg, in those instances where schedule and other requirements permit, through freight trains of less than 70 cars arriving from the west are reconsisted into the longer trains permitted by the New Mexico law; and all westbound long freight trains arriving at Lordsburg are reconsisted into short trains in order to conform to the Arizona law. When not thus shortened or lengthened, trains generally pass through the Lordsburg terminal without substantial reconsisting other than the changing of cabooses, and in some instances, of locomotives. All through or local freight trains moving in either direction terminate at Tucson. The locomotives, crews and cabooses on all such trains are changed at that point, and in many instances the trains are substantially reconsisted.

Freight trains operating eastward over the alternate main line between Wellton and Picacho generally originate at Yuma, and move through to Phoenix, where they are largely reconsisted, crews and locomotives being changed;

such trains then move from Phoenix to Picacho, and thence to Tucson, where they terminate. The westward operation over the Phoenix line is similar. Freight trains operating over the alternate main line via Douglas generally originate at either Tucson or El Paso, and run to Douglas, where crews and locomotives change, and said trains then continue to the terminals at El Paso or Tucson, where they terminate.

Defendant's eastbound main-line passenger trains in the affected territory originate at Los Angeles, with the exception of one train operated on alternate days during the winter season, which originates at Phoenix. Such trains carry the same names and numerical identifications throughout their movement over defendant's lines. De-
[fol. 6110] fendant's westbound main-line passenger trains in said territory likewise carry the same names and numerical identifications throughout their movement over defendant's lines. All said westbound trains originate at or east of El Paso, and except for one train operated on alternate days during the winter season, which terminates at Phoenix, all said trains run across Arizona and terminate at Los Angeles. Neither the eastbound nor westbound passenger trains are generally reswitched while enroute, except where necessary to adjust their consists to the 14-car restriction, or to pick up or set out individual cars at intermediate points.

Sines, R. 61-66, 2485-2491, 2531-2533, 2792-2805, 3163, 3169-3170, 3309-3313, 4222-4224; *Kirkbride*, R. 2034-2036; *G. C. Baker*, R. 2340-2342, 2669-2697, 2380-2382; *Herrell*, R. 2732, 2742-2749; *Garverick*, R. 3024; *Herbert*, R. 3069.

Exhibits 154, 155, 185, 186, 199, 214.

(2) Runs of crews and locomotives:

The district between the terminals at Los Angeles and Yuma constitutes a through run for passenger-train and engine crews. Freight-train crews operating on said district are ordinarily changed at Indio. The district between Yuma and Tucson, via either Gila or Phoenix, constitutes a through run for passenger-train crews, but the through runs for freight-train crews are between Yuma and Gila, and Gila and Tucson on the main freight line, and

between Yuma and Phoenix, and Phoenix and Tucson, on the alternate main line via Phoenix. The district between Tucson and Lordsburg constitutes a through freight run for both engine crews and train crews. Engine crews on [fol. 6111] passenger trains also run between Tucson and Lordsburg, changing at the latter point; but train crews on passenger trains run through between Tucson and El Paso. The district between Lordsburg and El Paso constitutes a through freight run for both engine crews and train crews, and also for engine crews of passenger trains. The district between Tucson and Douglas, and likewise the district between Douglas and El Paso, constitute through runs for freight crews, and also for engine crews on passenger trains. Train crews on passenger trains operating via Douglas run through between Tucson and El Paso, without changing at Douglas.

Passenger locomotives generally run through between Los Angeles and El Paso without change, although occasionally such locomotives are "dropped back" (as hereinafter described) at Tucson. Freight locomotives generally run through between Yuma and Tucson, and between Tucson and El Paso, usually "dropping back" at Gila and Lordsburg; i. e., the locomotive, upon arrival, is detached from its train and used on the next succeeding train, being replaced by (and in turn replacing) another locomotive of the same general class and type, assigned to the same character of service. Such "dropping back" permits the locomotives to be inspected, refueled and otherwise serviced between trains, and at the same time avoids any incidental delay to the movement of the trains concerned.

Sines, R. 61-66, 2583-2601, 2606-2607, 3169-3170, 3257, 4223-4224; *Baker*, R. 2670-2684; *Herrell*, R. 2736-2737.

(3) Operating rules:

The operation of defendant's freight and passenger, and other trains, in the affected territory and also upon its [fol. 6112] system generally (including the lines in Nevada and Utah) is governed by written rules, embodied in two books of rules, issued to all employes in train service, and called (1) "Rules and Regulations of the Transportation Department", and (2) "Rules and Regulations Gov-

erning Care and Operation of Air Brake and Air Signal Apparatus". Said Rules and Regulations provide general instructions governing such operation, which are required to be observed by all employes concerned, except where deviations are permitted by written rule or bulletin, to meet special local conditions; and said Rules and Regulations constitute a complete and adequate code, sufficient, if fully complied with and observed by said employes, to insure the safe operation of defendant's trains under all circumstances. Responsibility for the enforcement and observance of said rules rests upon defendant's operating officers.

Dyer, R. 2006-2007; *Cheek*, R. 4608-4609; *Durnil*, R. 4419-4420; *Stevenson*, R. 4621-4624; *Fifield*, R. 5225-5231; *Menzies*, R. 5249-5256.
Exhibits 319, 320.

(4) Inspections:

The operation of defendant's trains, in the affected territory and also upon its system generally (including the lines in Nevada and Utah), is accompanied by systematic inspections of the equipment, in order to make certain that said equipment is in safe operating condition, and free of defects requiring repair or replacement; and such equipment is thoroughly and carefully maintained.

Cars received by defendant from its connections, at interchange points (such as El Paso), are subjected to thorough [fol. 6113] inspections, before being accepted for handling; such inspections being in accord with the code promulgated by the American Railway Association (now the Association of American Railroads). Cars receive further inspections where they pass through terminals, either by car-inspection forces there maintained for that purpose, or by the crews of the trains in which the cars are placed. Cars also receive frequent inspection by train crews while on the road between terminals, and in particular are required to be inspected at designated inspection stops, as well as at all other stops as far as practicable. Refrigerator cars of the Pacific Fruit Express Company, which as before stated comprise a large proportion of the cars handled in the affected territory, undergo a separate, thorough inspection and reconditioning prior to each movement, under load, away from the principal producing areas.

Such inspection and maintenance are for the purpose of insuring that the equipment handled in defendant's trains shall be in the best possible condition, so as to permit said cars to be handled safely, whether in long-train or short-train units; and, as hereinafter shown, said inspection and maintenance are fully adequate to, and do, accomplish that purpose.

Cartmill, R. 1798-1806; *Sines*, R. 2607-2610, 3239; *Browning*, R. 2880, 2863-2884; *Reid*, R. 2936-2942, 2947-2950; *Burke*, R. 2955-2958, 2962-2963; *F. P. McDonald*, R. 2968-2972. See also Finding XIII (d).

Exhibits 137, 203, 204.

(5) Similarity of operating methods, rules, records, etc., on defendant's lines in Nevada and Utah to those in the affected territory:

Defendant's train operations upon its lines in Nevada and Utah are subject to the same code and system of operating [fol. 6114] rules, and are carried on in accordance with the same standards and methods of operating practice, which prevail upon its system generally, and particularly upon its lines in the affected territory.

The same officials who have jurisdiction over defendant's system supervise all said operations. A number of officials of defendant have at different times served as division officers, in immediate charge of operations and maintenance, on the lines in both Arizona and Nevada.

The laws of Nevada and Arizona relating to the numbers and classes of employes required upon trains of various kinds are substantially similar, and their effects, in so far as concerns defendant's train operations in the two states, are practically identical.

The same equipment, including both locomotives and cars, is used interchangeably in both the affected territory and on the lines in Nevada and Utah. As heretofore more fully set forth, traffic in these two territories, as to volume, density, predominate interstate character, distribution between loads and empties, and generally in all other essential characteristics, is closely and substantially similar.

Operating conditions, from the standpoint of those physical characteristics such as grades, curvatures, and the like, are, as previously stated, also shown to be very similar in

the two territories; the only point of difference being that the weather conditions in Nevada and Utah, in the winter months, are much severer than in the affected territory.

The records maintained by defendant, and the numerous statistical and other reports required to be rendered and made by defendant to the Interstate Commerce Commission [fol. 6115] and other public authorities, relating to defendant's operations and the results thereof, are developed, maintained and rendered, in accordance with and pursuant to systems and methods of accounting and reporting which are applicable alike, and without material difference, to both the affected territory and the lines in Nevada and Utah.

Except for the train-limit law, and the modifications of railroad operating practice made necessary in the affected territory by the restrictions of said law, there is no substantial difference in operating methods, or equipment, or the character of the railroad plant and structures generally, or in the nature of the business carried on, as between the lines in the affected territory on the one hand, and the lines in Nevada and Utah on the other. Comprehensive comparisons between Arizona and Nevada, and between the Tucson and Salt Lake Divisions, as to the results and incidents of operations, therefore afford a reliable and highly accurate method of testing and determining the effects and results of the law.

Dyer, R. 2005-2025; *Masson*, R. 2246-2252; *Sines*, R. 52-53, 2474-2475, 3145-3149, 3844-3845, 4221-4222; *Sullivan*, R. 3723; see also annotations to Findings III (c) and IV (c).

Exhibits 8, 9, 170, 184, 191, 195, 212, 260, 305.

(b) Lengths of Defendant's Trains

(1) Train lengths on the system generally:

Prior to about the year 1925 defendant operated comparatively few long freight or passenger trains over any of its lines. Commencing in 1926, and continuing thereafter down to the present time, defendant has followed and now follows, [fol. 6116] upon its entire system (except in the affected territory), the practice of operating a substantial number of long trains, when and where operating and traffic conditions permit or render such practice desirable; and both the average lengths of defendant's trains, expressed in the number of cars contained therein, and the proportion

borne by the number of long trains to the total number of those operated have tended (except in the affected territory aforesaid) to increase from year to year, throughout that period.

In 1922, the average length of all freight trains operated by defendant upon its entire system, including its lines in Arizona, was 42.4 cars, exclusive of caboose. The corresponding figures for later years were as follows: for 1926, 47.7 cars; for 1930, 51.5 cars; for 1934, 51.7 cars; for 1936, 50.8 cars; for 1938, 52.0 cars; for 1939, 53.6 cars.

A study of the lengths of freight trains operated on substantially all of defendant's main lines in the several states (other than Arizona) where it operates, covering some 61,943 trains, operated during four representative months of 1939, shows that long freight trains were in proportion to the total number of trains operated, as follows: In Oregon, 38.16 per cent; in California, 21.74 per cent; in Nevada, 66.20 per cent; in Utah, 85.85 per cent; in Texas, 1.34 per cent; in New Mexico, 9.06 per cent. For the system as a whole, excluding Arizona, long trains constituted 27.03 per cent of the total number operated.

A similar study of system passenger-train operations over the principal main routes, during the year 1939, shows that the percentages of long passenger trains, in relation to the total of through passenger trains operated, were as follows: on the main route from San Francisco across Nevada to Ogden, 43.79 per cent; on the main route from San Fran- [fol. 6117] cisco to Portland, Oregon, 19.76 per cent; on the "Valley Route" from San Francisco, via Fresno, California, to Los Angeles, 15.35 per cent; on the "Coast Route" from San Francisco, via Santa Barbara, California, to Los Angeles, 34.39 per cent; on the route from Los Angeles across Arizona to Tucumcari, for the portion between Los Angeles and Yuma, 7.64 per cent, and for the portion between El Paso and Tucumcari, 3.57 per cent. No longer passenger trains were operated in Arizona by defendant in 1939.

Dyer, R. 2001-2003, 2017, 2026-2027; *Masson*, R. 1947-1954; *Herbert*, R. 2399-2401, 2416-2418, 2429-2430, 2442-2445; *Sines*, R. 2483-2495, 3142-3144; *Fifield*, R. 5180-5183, 5220.

Exhibits, 149, 150, 162, 177, 178, 179, 180, 185, 186, 187, 188, 211.

(2) Train lengths in Arizona, past and present: Comparison with other portions of the system, and with the system as a whole.

In 1912, and prior thereto, defendant operated very few long freight or passenger trains in Arizona. The average main-line freight train in Arizona in 1912 consisted of about 47 cars; the average passenger train of 9 or 10 cars. During the first six months of 1912, only 16, or 0.38 per cent, out of a total of 4187 main-line freight trains operated in Arizona, consisted of 71 cars or more; the longest of said trains (two in number) contained 75 cars each. During the same period, defendant operated no regular passenger trains in Arizona of more than 14 cars, but did on 14 accasions (out of a total of 3118 passenger trains operated) run special trains having 15 or more passenger-train cars each.

In the years between 1912 and 1922, the average lengths of defendant's freight trains in Arizona increased about [fol. 6118] 15 per cent; but since 1922 there has been no improvement. Thus the average number of cars per freight train in 1912 was 48.39; in 1917, 40.82; in 1922, 55.79; in 1927, 51.44; in 1932, 56.76; in 1937, 52.37; in 1938, 55.5; and in 1939, 54.82. For the four-year period 1922-1925, the average was 54.42; for the four-year period 1936-1939, 53.85. The largest annual average of number of cars per train achieved in Arizona was 57.13, for the year 1934.

In Nevada, on the other hand, freight-train lengths have increased substantially since 1912, and more notably since 1922. The average number of cars per freight train in Nevada in 1912 was 40.58; in 1917, 41.07; in 1922, 48.92; in 1927, 69.17; in 1932, 81.06; in 1937, 74.43; in 1938, 78.77; and in 1939, 78.46. For the four-year period 1922-1925 the average in Nevada was 53.09; for the four-year period 1936-1939, 76.28. The largest annual average number of cars per train achieved in Nevada was 86.67, also for the year 1934.

Average freight-train lengths on defendant's system as a whole, even though affected to some extent by the restrictions of the Arizona law, have also increased in recent years, and particularly since 1920. Comparing the Tucson Division main line (which is representative of and includes the greater part of the territory subject to the 70-car restriction) with the Salt Lake Division main line (which is rep-

resentative of and includes substantially all of the Nevada and Utah operations), and also with main-line operations upon the system as a whole, it appears that the system average train length, expressed in number of cars per train, including caboose, increased from 43.2 in 1920 to 52.8 in 1925, and thereafter to 58.5 in 1930, continuing thereafter without substantial variation either upward or downward until and including 1939, when the average was 60.1. On the Tucson Division, the corresponding figure in 1920 was [fol. 6119] 48.1, increasing to 57.9 in 1922, to 59.6 in 1925, and to 61.0 in 1930, and continuing thereafter without substantial variation until 1939, when the average was 59.8. On the Salt Lake Division the corresponding figures were: 1920, 45.0; 1922, 52.0; 1925, 62.4; 1930, 78.1; and 1939, 85.4.

It appears from the foregoing that during the years since 1925, defendant has followed, and now follows the practice of operating a substantial number of long trains upon its lines in Nevada and Utah, the proportion of such trains to all trains operated for the year 1939 having been stated in subparagraph VII (b) (1) of these findings. The continuance of said practice of long-train operation is shown by the upward trend in the average number of cars per freight train in said territory; and said practice has caused the number of freight-train units operated by defendant in the same territory to be relatively reduced in proportion to the total amount of freight traffic handled. Thus, in Nevada during the four years 1922-1925, inclusive, defendant produced 420,672,972 car miles (excluding caboose car miles), and in so doing operated a total of 7,923,768 train miles; whereas in the four years 1936-1939, defendant produced in said state 564,256,341 car miles (excluding caboose car miles), but in so doing operated only 7,397,062 train miles. By comparison, in the years 1922-1925, inclusive, defendant produced in the state of Arizona 378,372,269 car miles (excluding caboose car miles), and operated 6,952,701 train miles in so doing; and in the four years 1936-1939 produced 543,210,212 car miles (excluding caboose car miles), and operated 10,086,237 train miles in so doing.

By reason of the initiation and continuance of the long-train program in Nevada and Utah, defendant has been enabled, during recent years, and particularly since 1930, to handle the interstate freight traffic moving over its lines [fol. 6120] in said territory with a substantially less number of trains, both in aggregate total and as related to the volume

of traffic so handled, than in the years prior to the development and commencement of said program.

The restriction of the law has prevented any similar improvement in the affected territory; on the contrary it has compelled defendant to produce a substantially greater number of train miles than would have been required if long-train operation had been developed there to the same or a similar extent as in Nevada and Utah. Thus, in the years 1925-1939, inclusive, defendant actually produced on the Tucson Division 25,661,903 train miles; whereas, if defendant had disregarded the train limit law, and had obtained thereby the same average train lengths as prevailed on the Salt Lake Division in the same fifteen-year period; it could and would have handled the same volume of traffic, measured in car miles, with 19,337,070 train miles. Defendant was thus compelled by the law to produce in said fifteen-year period 6,324,833 excess train miles, or 32.7 per cent more, than were or would have been necessary if the law had not been observed. In 1938, 564,717 excess train miles, or 37.7 per cent, were thus produced.

Long-train operation of the same character and extent as in Nevada and Utah is entirely feasible upon defendant's lines in Arizona, subject only to the construction (as hereinafter described in detail) of certain additional facilities, and the assignment of more powerful locomotives designed to haul heavier and longer trains. Defendant is fully able and intends at once, if the law's restrictions are removed, to make such changes and provided such locomotives, and thereupon and thereafter to operate long trains in the affected territory, in the same manner as in Nevada, and elsewhere upon its system generally.

[fol. 6121] In 1912, as heretofore stated, comparatively few of the sidings or passing tracks on defendant's lines in Arizona had a capacity of more than about 70 cars, inclusive of engine and caboose; so that the enactment of the train-limit law in that year did not cause defendant to reduce the lengths of its freight and passenger trains then being operated in Arizona to any substantial extent, or otherwise compel changes in defendant's operating methods. Rather, said law then imposed upon defendant, and upon its operations, a continuing and permanent restraint, which ever since 1912 has been effective, against further progress and development in the direction of the increased safety,

efficiency, and economy which, as stated at various places in these findings, are and have been realized through the adoption and continuance of the long-train program upon other portions of defendant's system, and by the United States railroads generally.

(c) Reductions in Schedules of Freight Trains.

In handling the through freight traffic, both eastbound and westbound, which moves over its lines in the affected territory, defendant, in conjunction with its connections at El Paso and Tucumcari, and beyond, maintains and for many years last past has maintained time schedules covering the handling and delivery of such freight.

The eastbound perishable and other freight from California points (other than from the Imperial Valley) is concentrated at Colton, and there placed in the trains for eastward movement. At that point the cars containing perishable and similar freight are usually segregated into [fol. 6122] so-called "Fruit Blocks", which contain from 10 to 100 cars; such blocks are identified by letter and number, and each carries its identification throughout its eastward movement. An eastward train operated in the affected territory, if it includes a fruit block or a part thereof in its consist, is usually identified by the block number.

Perishable freight from the Imperial Valley, and from Yuma and vicinity is concentrated at Yuma, and there made up into blocks and trains; such freight when originating in the Salt River Valley, Arizona, is concentrated at Phoenix. The handling of the Yuma (Y) and Phoenix (A) blocks is in all respects similar to that accorded to the Colton (C) blocks as hereinafter described, except that the overall schedules to eastern destinations are shorter, because of the shorter distances, and also that the departure and "run-off" times for Yuma and Phoenix blocks are somewhat different.

The schedules governing the handling of eastbound perishable blocks are and have been based upon a specified basic departure time at Colton (at present, 3:00 a. m. of the day following loading), from which is computed a specified maximum time en route to Chicago, Illinois, and corre-

sponding times to other large eastern markets; but since several such eastward trains oridinarily leave Colton in the course of a day, and all such trains cannot leave at precisely the same time, the times en route of the fruit blocks which leave after the basic departure hour are shortened, and all such blocks are so handled as to arrive at the Chicago market (or other eastern markets) upon an equality; i. e., trains leaving after 3:00 a. m. (and up to 7:00 p. m.) are operated so as to make up, or "run off", the interval prior to their departure, such interval (up to a present maximum of 16 hours) being known as "run-off time".

[fol. 6123] The schedules participated in by defendant and its connections obligate those carriers to make delivery of the freight handled thereunder at the specified schedule times, under penalty of loss-and-damage claim payments for spoilage or loss of market; and by agreements between the participating carriers, such schedules further obligate defendant to make delivery of freight handled thereunder, to its connections at El Paso and Tucumcari, at definite times determined according to the departure hour at Colton.

The schedules governing the handling of westward traffic over the lines in the affected territory, also maintained by defendant in conjunction with said connections, provide and have provided for definite maximum times en route from Chicago to Los Angeles, with corresponding times from and to other related points. A certain specified proportion of said total time is and has been assigned to the district between El Paso and Yuma. Westward trains handling freight moving under such schedules are usually identified by letter symbols: e. g., the SSW trains (Sunset West), and the GBW trains (Gold Ball West).

Schedules similar to the foregoing are and have been maintained covering the eastward and westward transportation of freight moving to and from points in Arizona.

Contemporaneously with the adoption and development of the long-train program, upon its lines generally, other than the lines in the affected territory, and largely as a result of said long-train program (in that the reduction in the relative number of train units has caused the number of train meets and passings, and other interferences with operation, to be reduced in even greater proportion, and has greatly simplified operations in other ways), defendant and its connections have made several successive reductions [fol. 6124] in the time schedules above referred to; and

in connection therewith defendant has materially shortened the average time, both in intermediate terminals and en route, of the identified trains handling freight under said schedules. Prior to the year 1921 the over-all schedule time for perishable freight, from departure time at Colton to delivery at Chicago, was 189 hours; and there was no provision for run-off time; i. e., the schedule merely contemplated not more than 189 hours' total time in transit. In 1921, the over-all time was reduced to 154 hours, with no provision for run-off. In 1924 said over-all time was reduced, in effect, by including a provision for run-off time not exceeding 3 hours. The result was to reduce the actual elapsed time from Colton departure to arrival at Chicago, to not more than 151 hours. In 1927 the run-off time was increased to 7 hours, thus reducing the net elapsed time to 147 hours.

In 1929 a further reduction was made to 146 hours, the basic departure hour at Colton being 3:00 a. m., but the schedule also continued to provide for 7 hours run-off. Thus the actual scheduled elapsed time to Chicago, based upon 10:00 a. m. departure at Colton, became 139 hours. In 1932, the run-off time was increased to 16 hours, thus reducing the elapsed time to 130 hours. In 1940 a further reduction was made, to the present over-all schedule of 139 hours and 30 minutes, with 16 hours run-off, or a net elapsed time of 123 hours and 30 minutes from departure at Colton.

Each of these reductions in over-all time has been accompanied by a corresponding reduction in the proportion of the time assigned between Yuma and El Paso.

In 1932 the producing area in California, to which defendant and its connections apply and have throughout the period [fol. 6125] since 1926 applied the eastbound schedules above referred to, was substantially enlarged; the effect of such enlargement was to reduce, as to the additional points included, the actual times in transit from points of production to points of final delivery in the east. Recently a further reduction in elapsed time has been made, in that shippers who pre-cool their perishable shipments are not required to release such shipments until 5:00 a. m. on the day following loading, in order to obtain movement on the schedule of that day.

The schedule times applying to the handling of perishable freight originating in the Imperial Valley of California and in Arizona, and handled in the "Y" blocks from Yuma and

the "A" blocks from Phoenix, have also been reduced, in the same degree and at or about the same dates as the schedules from Colton.

The aforesaid westbound schedules applying from Chicago and other related points, to Los Angeles and other Pacific Coast points, over the lines in the affected territory, have also been reduced from time to time; and defendant's proportion of such schedule times, allotted to the El Paso-Yuma district, has been correspondingly reduced, as follows:

From 226 hours, in 1920, to 198 hours and 25 minutes, in 1926; 162 hours, in 1928; 137 hours and 45 minutes, in 1929; 134 hours and 15 minutes, in 1934; 134 hours in April, 1935; 110 hours, in November, 1935; and finally to the present schedule, established in 1939, which provides for 109 hours en route from Chicago, or sixth-morning delivery at Los Angeles.

Perishable shipments from northern California, moving over the Nevada-Utah lines of defendant, are concentrated at Roseville, California; and defendant, with its connections, maintains, and in the past has maintained, both eastbound schedules from Roseville to Chicago and [fol. 6126] related points, and westbound schedules from such points to San Francisco, via said Utah-Nevada line, equivalent to the east- and westbound schedules from and to California points via the Arizona lines, as above set forth.

Such schedules have also been reduced in the past, upon dates and to an extent corresponding to reductions made in the schedules applying via the Arizona lines.

Despite the aforesaid schedule reductions, with the consequent higher speeds and greater difficulty in maintaining on-time performance, such performance has, in the main, been highly satisfactory. In 1939, 1261 out of 1528 identified Colton fruit blocks, or 82.5 per cent, arrived at El Paso upon or ahead of schedule, and 758 out of 800, or 94.8 per cent, of the Colton fruit blocks operated into Tucumcari in said year arrived upon or ahead of schedule. On the Nevada route, in the same year, 1428 out of 1608 Roseville fruit blocks, or 88.8 per cent, arrived in Ogden upon or ahead of schedule. In the same year, 1078 out of 1189 manifest sections operated westward over the Arizona lines, into Los Angeles, or 90.7 per cent, made their schedule arrival times; while 668 out of 700 identified manifest sections operated as the "CS" (California Special) out of Ogden westward

to San Francisco, or 95.4 per cent, made their schedule arrival times at San Francisco.

Exhibits 175, 176.

[fol. 6127] (d) Effect of the Long-Train Program Upon the Efficiency and Economy of Defendant's Train Operations

(1) As to the system generally.

During the aforesaid period of steadily increasing long-train operations upon defendant's system (other than in Arizona and adjoining territory) there has also occurred, as a direct result of said long-train program (and in spite of defendant's inability to carry out said program fully, because of the restrictions of the Arizona Train-Limit Law), a substantial and continuous improvement in the efficiency and economy of defendant's freight-train operations. This improvement was particularly marked during the period between 1924 and 1932, the period of most intensive development of the long-train program. Such improvement has been and is evidenced by a number of important and generally recognized indices of efficiency and economy of operation, which include, among others, the following: Average speeds of freight trains, measured in miles per hour; average gross-ton miles made, per freight-train hour; average net-ton miles made, per freight-train hour; average gross-ton miles per ton of fuel consumed, in operation of freight trains; average cost per thousand revenue-ton miles, for all operating expenses, and for transportation expenses only; average freight revenue per freight-train mile; average cost per thousand gross-ton miles, for certain selected direct operating expenses; average pounds of fuel consumed per thousand gross-ton miles.

The average train speed (meaning the average speed, measured in miles per hour, of the trains, while on the road between terminals, the times at stops between terminals being included, but not the times consumed at terminals) of

all main-line freight trains operated on defendant's system increased from 11.2 miles per hour in 1922, a year of pre-
[fol. 6128] dominating short-train operation, to 16.5 miles per hour in 1932, and to 17.8 miles per hour in 1939; an improvement, contrasting 1939 with 1922, of 58.9 per cent.

The average gross-ton miles made per freight-train hour (meaning the total weight of the cars and their contents, not including any of the weights of locomotives, multiplied by the miles over which such weight was moved, the latter figure being then divided by the number of hours during which the freight trains handling the traffic were in operation), made by main-line freight trains on the system, increased from 20,727 in 1923, to 34,005 in 1932, and to 41,886 in 1939; an improvement, contrasting 1939 with 1923, of 102.1 per cent.

The average net-ton miles per freight-train hour (meaning the total weight of the contents of the cars only, not including any of the weights of the locomotives or of the cars themselves, multiplied by the miles over which such weight was moved, the latter figure being then divided by the number of hours during which the freight trains handling such traffic were in operation) made by all freight trains, both main and branch lines, on the system, increased from 7,258 in 1922 to 8,775 in 1932 and to 12,490 in 1939; an improvement, contrasting 1939 with 1922, of 72.1 per cent.

The average gross-ton miles per ton of fuel (meaning the quotient obtained by dividing the total amount of fuel consumed by locomotives handling freight trains, measured in units equivalent to pounds of coal, into the figure obtained by multiplying the total gross weight, including the weight of locomotives, handled in such trains, measured in thousands of tons, by the total number of miles over which the tonnage was moved), for all freight trains (both main and branch line) on the system, increased from 11,405 [fol. 6129] in 1922, to 15,395 in 1932, and to 17,318 in 1939; an improvement, contrasting 1939 with 1922, of 51.8 per cent.

The average cost per thousand revenue-ton miles, for all operating expenses, for freight-train operations on the system (meaning the figure in cents obtained by dividing, into the total operating expense of freight-train operations, the figure obtained by multiplying the total number of revenue tons of freight handled by defendant, by the miles over which such freight was moved), declined from $11.10 in

1922, to $8.45 in 1932, and to $7.05 in 1939; an improvement contrasting 1939 with 1922, of 36.5 per cent; and from an average of $9.94 for the four years 1922-1925 (all of which were years of predominant short-train operation) to an average of $7.15 for the four years 1936-1939 (which were years of general long-train operation): an improvement of 28.1 per cent.

The average cost per thousand revenue-ton miles, for transportation expenses only, for freight-train operations on the system (said expenses including no costs incurred for maintenance of way, or general overhead, but only those expenses directly incurred in operation of trains), declined from $5.47 in 1922, to $4.34 in 1932, and to $3.82 in 1939; an improvement, contrasting 1939 with 1922, of 43.2 per cent; and from an average of $5.03 for the four years 1922-1925, to an average of $3.95 for the four years 1936-1939: an improvement of 21.5 per cent.

In making comparisons of the direct cost of operations for different periods, for the system, or as between different portions of the system, defendant regularly compiles certain selected direct operating expenses, covering costs of fuel, wages of trainmen and enginemen, engine house expenses, [fol. 6130] other locomotive supplies, and train supplies and expenses. The average cost per thousand gross-ton miles for said expenses (being the quotient obtained by dividing the total weight of the cars and the contents, not including the weight of the locomotives, multiplied by the distance moved, into the total of the freight-train costs covering said selected direct expenses) for all freight trains operated on the system, decreased from 93.4 cents in 1925, to 60.3 cents in 1932, thereafter increasing slightly to 63.6 cents in 1939: an inprovement (reduction) of 31.9 per cent, contrasting 1939 with 1924. For the two-year period 1924-1925, the system average cost per thousand gross-ton miles for said expenses was 92.46 cents; for the two-year period 1928-1929, 70.14 cents: an improvement of 24.14 per cent; for the two-year period 1930-1931, the corresponding average cost was 66.6 cents, and for the two-year period 1938-1939, 65.76 cents: an improvement of 1.26 per cent. The combined total improvement for the two series of two-year periods was 25.4 per cent.

The average pounds of fuel consumed per thousand gross-ton miles (being the quotient obtained by dividing the total amount of the fuel consumed by locomotives handling freight

trains measured in units converted to equivalent pounds of coal, by the figure obtained by multiplying the weight of the cars and contents, not including the weight of the locomotives, by the distance over which such weights were moved) for all freight trains, both main and branch lines, on the system, declined from 158 in 1924 to 115 in 1939. The corresponding average figure for the two-year period 1924-1925 was 154.3, which declined to 136.3 for the two-year period 1928-1929: an improvement of 11.67 per cent. For the two-year period 1930-1931, the corresponding average figure was 131.7, which declined to an average of 117.6 for the two-year period 1938-1939: an improvement of 10.71 per cent. [fol. 6131] The combined total improvement for the two series of two-year periods was 22.38 per cent.

Masson, R. 1957-1965, 2185-2195, 2213-2222; *Herbert* R. 2412-2428, 2438-2442, 2449-2452; *Sines*, R. 2528-2540, 3455-3464.

Exhibits 151, 162, 165, 178, 179, 180, 193, 249.

(2) In the Nevada-Utah Territory:

There has been a similar and, in many cases, somewhat greater, improvement in the efficiency and economy of defendant's freight-train operations in Nevada and Utah, as compared to the system generally; and such improvement has likewise taken place coincident with, and as a result of, the development of the long-train program. This improvement is shown by statistics reflecting the results of defendant's operations in Nevada, and upon the Salt Lake Division.

The average speed, in miles per hour, of all main-line freight trains on the Salt Lake Division, increased from 14.7 in 1922, to 19.7 in 1932, and to 21.4 in 1939; an improvement, contrasting 1939 with 1922, of 45.5 per cent.

The average gross-ton miles per freight-train hour made by main-line freight trains on the Salt Lake Division increased from 29,628 in 1923, to 58,669 in 1932, and to 72,955 in 1939; an improvement, contrasting 1939 with 1922, of 146.4 per cent.

The average net tons of freight, per main-line freight train upon the Salt Lake Division, increased from 784 tons in 1923, to 1161 tons in 1939, an improvement of 48.1 per cent.

The average cost per thousand revenue ton-miles, for all operating expenses, for all freight train operations (both main and branch line) within Nevada, declined from $7.02 [fol. 6132] in 1922 to $4.37 in 1939, an improvement (reduction) of 37.8 per cent; and from an average of $6.18 for the four-year period 1922-1925, to an average of $4.28 for the four-year period 1936-1939; an improvement of 30.7 per cent.

The average cost per thousand revenue ton-miles, for transportation expenses only (i. e., those expenses directly associated with train operation) for all freight train operation within Nevada, declined from $3.45 in 1922 to $2.36 in 1939, an improvement of 31.6 per cent; and from an average of $3.12 for the four-year period 1922-1925, to an average of $2.36 for the four-year period 1936-1939; an improvement of 24.4 per cent.

The average freight revenue per train mile, for all freight trains on defendant's lines within Nevada, increased from $8.33 in 1923, to $10.10 in 1939, an increase of 21.2 per cent, despite a concurrent decrease from $0.238 to $0.204, or 14.3 per cent, in freight revenue per loaded freight-car mile, and a similar concurrent decrease from $12.82 to $9.68, or 24.5 per cent, in freight revenue per thousand ton miles of freight.

The average cost per thousand gross ton miles for certain selected direct expenses, for all freight trains operated on the Salt Lake Division, decreased from 56.0 cents in 1924, to 35.4 cents in 1939; an improvement of 36.7 per cent. The corresponding figure for the two-year period 1924-1925 was 53.85 cents, which declined to 39.91 cents for the two-year period 1928-1929; an improvement of 25.89 per cent. For the two-year period 1930-1931, the corresponding figure was 37.66 cents, which declined to 36.97 cents for the two-year period 1938-1939; an improvement of 1.83 per cent. The combined total improvement for the two series of two-year periods thus analyzed was 27.72 per cent.

The average pounds of fuel consumed per thousand gross-ton miles, for all freight trains operating on the Salt Lake [fol. 6133] Division, declined from 100 pounds in 1924 to 73 pounds in 1939; an improvement of 27.00 per cent. The corresponding figure for the two-year period 1924-1925 was 96.2, which declined to 83.0 for the two-year period 1928-1929; an improvement of 13.72 per cent. For the two-year period 1330-1931, the average was 84.3 pounds, which

declined to 73.9 pounds for the two-year period 1938-1939; an improvement of 12.34 per cent. The combined total improvement for the two series of two-year periods thus analyzed was 26.06 per cent.

Masson, R. 2213-2222; *Herbert*, R. 2406-2428, 2438-2442, 2449-2458; *Sines*, R. 2528-2540, 3455-3464.
Exhibits 161, 165, 177, 178, 179, 180, 181, 193, 249.

(3) Defendant's inability to achieve comparable efficiency and economy in the territory affected by the Arizona Train-Limit Law.

As heretofore stated, and solely because of the restrictions imposed by said train-limit law, defendant has never been able to undertake or carry forward any substantial program or practice of long-train operation in Arizona or in the adjacent territory where said law has extra-territorial effect. In consequence of such inability, and notwithstanding (1) the substantial improvements in its road and equipment, heretofore set forth in Findings VI (a) and VI (b), which improvements were comparable to and proportionately as extensive as those made in Nevada and Utah; (2) the employment of identical operating rules and methods, in both Nevada and Arizona, the only essential differences being those necessarily brought about by compliance with the train-limit law; and (3) substantial similarity in the traffic handled, as to both volume and character, and in operating conditions, in both Arizona and Nevada: defendant has not been able to bring about the [fol. 6134] same improvements in the efficiency and economy (or as hereafter shown, the safety) of its train operations in Arizona, or any improvement comparable to that achieved in Nevada and the adjacent territory.

As set forth at length in subparagraph (b) (2) of this finding, the years following 1925, and until and including 1932, were those in which the long-train program had its most rapid development; and therefore comparisons between the indices of efficiency and economy herein mentioned, over that span of years, give the most definite indications of the effects of the adoption of the long-train program, in the Nevada-Utah territory, and upon the system generally, and likewise reflect the results of defendant's inability to adapt and carry out said program in the affected territory.

The average speed, in miles per hour, of all main-line freight trains on the Tucson Division increased from 14.7 in 1922, to 17.8 in 1932, and to 20.7 in 1939. The improvement, as between 1923 and 1939, was 40.8 per cent; whereas the corresponding improvement on the system generally was 58.9 per cent, and on the Salt Lake Division 45.5 per cent. As between 1922 and 1932, the improvement on the Tucson Division was 21.1 per cent; as compared with an improvement of 34.0 per cent, over the same span of years, on the Salt Lake Division, and of 47.3 per cent on the system generally.

The average gross-ton miles per freight-train hour, made by main-line freight trains on the Tucson Division, increased from 30,665, in 1923, to 38,787 in 1932, and 47,680 in 1939. The improvement, as between 1923 and 1939, was 55.5 per cent; whereas over the same span of years, the corresponding improvement on the system was 102.1 per cent, and on the Salt Lake Division, 146.4 per cent. Comparing 1932 with 1923, the improvement on the Tucson [fol. 6135] Division was 26.7 per cent, whereas the corresponding improvement on the system was 15.8 per cent, and on the Salt Lake Division 98.0 per cent. Comparing 1939 with 1930, the average gross-ton miles per freight-train hour, for all trains, both main and branch line, on the Tucson Division, increased from 36,175, in 1930, to 45,026, in 1939, an improvement of 24.5 per cent. The corresponding improvement on the system was 32.2 per cent, and on the Salt Lake Division, 41.8 per cent.

The average net tons of freight per main-line freight train on the Tucson Division decreased from 758 in 1923, to 575 in 1932, and then increased to 712 in 1939. There was a decrease of 6.1 per cent, comparing 1939 with 1923; whereas the corresponding figures over the same span of years showed, for the system, an improvement (increase) of 10.6 per cent, and for the Salt Lake Division, an improvement of 48.1 per cent. Comparing 1932 with 1923, the decrease on the Tucson Division was 24.1 per cent; there was a decrease of 13.9 per cent on the system generally, but an increase of 9.9 per cent on the Salt Lake Division, in the corresponding figures, over the same span of years. Comparing 1939 with 1932, the corresponding figures show an increase, on the Tucson Division, amounting to 23.8 per cent, whereas on the system generally, the

improvement was 28.4 per cent, and on the Salt Lake Division, 33.4 per cent.

The average cost per thousand revenue ton-miles, for all operating expenses, for all freight-train operations within Arizona, declined from $8.24 in 1922 to $7.26 in 1932, an improvement of 11.9 per cent, and to $6.12 in 1939, an improvement of 25.7 per cent, comparing 1939 with 1922. The corresponding improvement on the system, as between 1922 and 1932, was 30.0 per cent, and as between 1922 and 1939, 36.5 per cent; in Nevada, between 1922 and [fol. 6136] 1932, the corresponding improvement was 36.5 per cent, and between 1922 and 1939, 37.8 per cent. For the four-year period 1922-1925, the corresponding average cost per thousand revenue ton-miles in Arizona was $7.42, which declined to $5.97 for the four-year period 1936-1939, an improvement of 19.5 per cent. The corresponding improvement, over the same span of years, for the system generally, was 28.1 per cent, and for defendant's lines in Nevada, 30.7 per cent.

The average cost per thousand revenue ton miles, for transportation expenses only, for all freight-train operations in Arizona, both main and branch line, increased from $3.23 in 1922 to $3.40 in 1932, and then declined to $2.95 in 1939, an increase of 5.3 per cent, comparing 1932 with 1922, and an improvement of 8.7 per cent, comparing 1939 with 1922. The corresponding improvement on the system, comparing 1932 with 1922, was 20.7 per cent, and comparing 1939 with 1922, 30.2 per cent. In Nevada the corresponding improvement, comparing 1932 with 1922, was 34.5 per cent, and comparing 1939 with 1922, was 31.6 per cent. For the fouryear period 1922-1925, the same index for Arizona showed an average of $3.22, which declined to an average of $3.00 for the four-year period 1936-1939, an improvement of 6.8 per cent. The corresponding improvement on the system generally was 21.5, and for Nevada, 24.4 per cent.

As heretofore found, the boundaries of the Tucson Division were changed in July, 1930, by the addition of the main line between Tucson and Lordsburg, and the branch line between Bowie and Live Oak via Globe and Miami; and in November, 1929, the boundaries of the Salt Lake Division were changed by the addition of the main line between Wendel and Alturas, California, at which time the

former branch line between Fernley, Nevada, and Wendel, was reclassified as main line. These changes of divisional [fol. 6137] limits do not affect any of the comparisons herein set forth, as between the States of Nevada and Arizona, or for the system. In so far as direct comparisons between the two divisions are concerned, the effects of the changes are largely inconsequential, and can be and are entirely eliminated by making comparisons between the divisions by groups and series of years, in the manner hereinafter set forth.

Thus, the average cost per thousand gross-ton miles for certain "selected" direct expenses (as heretofore specified) for all freight trains on the Tucson Division, declined from 62.88 cents for the two-year period 1924-1925, to 50.80 cents for the two-year period 1928-1929: an improvement of 19.21 per cent. The corresponding figure for the two-year period 1930-1931 was 53.63 cents, which increased to 55.39 cents, for the two-year period 1938-1939: an increase of 3.28 per cent. The combined net improvement (decrease) for the two series of two-year periods thus analyzed was 15.93 per cent. The corresponding improvement, over the same spans and groupings of years, was 25.4 per cent for the system, and 27.72 per cent for the Salt Lake Division. The years 1924-1925, thus grouped together for the purposes of this and similar comparisons, are immediately prior to the general adoption of the long-train program; and the comparison with the two years 1928-1929 produces the percentage of change taking place up to but not including the years in which the changes in the divisional boundaries were fully effective. The two years 1930 and 1931 (the figures for 1930 having been restated, so as to reflect for the entire year the operations on the Tucson Division, as if the altered divisional boundaries had prevailed throughout that year) includes the first years after the changes; and a comparison of those two years (1930 and 1931) with the years 1938 and 1939, taken together, [fol. 6138] develops the percentage of change down to the latest years for which complete statistics are available. By adding the percentage of change in the first series to the combined total improvement for the two series of percentage of change in the second series, there is produced a two-year periods. As before stated, this method of comparison automatically eliminates any effect which might follow from the fact that the territorial boundaries of the

two divisions, in the first series of years, are not exactly identical with said divisional boundaries in the later series of years.

The average pounds of fuel consumed per thousand gross-ton miles, for all freight trains, both main and branch, on the Tucson Division, declined from 104.1 pounds, for the two years 1924-1925, to 99.9 pounds for the two-year period 1928-1929, an improvement of 4.03 per cent. The corresponding average, for the two-year period 1930-1931, was 118.7 pounds and for the two-year period 1938-1939, 108.5 pounds, an improvement of 8.59 per cent. The combined total improvement for the two series of two-year periods on the Tucson Division was 12.62 per cent; as compared with an improvement of 22.38 per cent for the system, and of 26.06 per cent for the Salt Lake Division, for the same index, and over the same span and groupings of years.

The gross-ton miles (exclusive of locomotives and tenders) per ton of fuel, for all freight trains, both main and branch, on the Tucson Division, decreased from 18,675 for the year 1930, to 18,590 for the year 1939, a decrease of 0.5 per cent. The corresponding improvement (increase) on the system was 14.2 per cent, and on the Salt Lake Division 15.3 per cent.

Defendant's inability to effect improvements in the efficiency and economy of freight-train operations upon its lines in Arizona, comparable to those achieved upon its [fol. 6139] lines in Nevada and upon its system generally, has been and is largely and directly due to the restrictions upon its operations imposed by the law. The extent of the improvements available, through the adoption of long-train operation in Arizona, is indicated by the analyses and comparisons set forth in subparagraph (d) of this finding. The comparisons made between the results in the years immediately prior to or at the beginning of the adoption of the long-train program on defendant's lines generally, and the results of operations in recent years (i.e., between the results in the years 1922, 1923, 1924 and 1925, on the one hand, and 1938 and 1939, on the other) measure the long-time trends which demonstrate the growth and continuing advantages of such long-train operation. The comparisons between the results of the years immediately following the changes of limits of the Tucson and Salt Lake Divisions, and the results of the operations of more recent years (i.e., of the years 1930 and 1931, on the one hand, and 1938 and

1939, on the other) measure the more recent trends which demonstrate the present and prospective advantages of such long-train operation, and demonstrate as well that the changes in limits of the Tucson and Salt Lake Divisions have not operated and do not operate to impair the propriety of conclusions predicated upon comparisons between the Tucson Division and the system as a whole or other portions thereof, for the years subsequent to 1930. Finally, said comparisons between the results of operation in years immediately prior to or at the beginning of long-train operations on defendant's lines and results for the years at the close of the period of major development of the long-train program (i.e., comparisons between 1922, 1923, 1924 and 1925, on the one hand, and 1930, 1931 and 1932, on the other) show clearly that in the space of a few years the long-train program resulted in substantially greater effi- [fol. 6140] ciency and economy upon the system generally, and particularly the lines in Nevada and Utah, whereas no corresponding improvements were possible of achievement in the affected territory.

Exhibits 151, 160, 161, 162, 163, 164, 165, 177, 178, 179, 180, 181, 193, 249.

VIII

Comparison of Defendant's Methods of Operation with Those Followed on United States Railroads Generally

(a) Improvements in Road and Equipment.

The policy undertaken by defendant, since about the year 1922, as heretofore described, of making and continuing to make improvements in its roadway, structures, and equipment, and of maintaining its transportation plant and facilities in the best possible condition of repair, and of expending large sums of money for such purposes, has been and is typical and representative of the policy generally followed by the major railroads of the United States, considered either as units forming a general national transportation system, or as individual and separate carriers.

The Class I railroads of the United States (a Class I railroad being one having annual gross revenue of at least

$1,000,000; which class thus includes defendant, and its principal connections and competitors) operated 232,026 miles of railroad in 1939, and received total operating revenues in that year amounting to almost four billion dollars. Said Class I railroads have, during said period [fol. 6141] since 1922, built and acquired a great number of new locomotives, of larger sizes than those previously in service, having greater average tractive power per unit, and to a large extent equipped with new and modern devices of the character mentioned in paragraph VI (b) of these findings, designed generally for the safe, efficient, and speedy handling of long trains, both freight and passenger; and said Class I railroads have also, during said period, largely retired and replaced the smaller, older, and less efficient locomotives.

The result is that average tractive power per locomotive, for the locomotives presently in service upon the railroads of the United States, greatly exceeds the average for earlier years. Thus, the average tractive effort per locomotive, for all locomotives in service on the railroads of the United States, was in 1922, 37,441 pounds; in 1939, 50,395 pounds: an improvement of about 34.6 per cent. Between 1924 and 1938 the average tractive power per freight locomotive, for locomotives of Class I railroads only, increased from 46,060 pounds to 55,943 pounds: an improvement of about 21.5 per cent.

Said Class I railroads have also, during said period since 1922, greatly improved their passenger-car and freight-car equipment, both by buying and building or rebuilding new, larger, and stronger cars, and by retiring and replacing the older, smaller, and less efficient cars. In 1922, 68.8 per cent of all of the freight cars in service on the Class I railroads were of steel or steel-underframe construction. In 1938 such cars constituted 95.5 per cent of the total. Those not having steel underframes (i. e., of wooden construction) are no longer used in interchange service. In 1922 the average capacity of the freight cars in service on United States railroads was 43.1 tons; in 1939, 49.7 tons: an improvement of 15.3 per cent.

[fol. 6142] The devices and appliances used upon such passenger and freight cars, including the draft gears and rigging, wheels, brakes and brake appliances, and the other matters referred to in paragraph VI (b) hereof, have been improved, and newer and more modern types of such de-

vices have, to a large and increasing extent, been installed and applied on such cars.

The Association of American Railroads, acting for the carriers as a group, has promulgated a code of rules, which it from time to time amends, specifying the details of the construction and equipment of cars used or usable in interchange service. Observance of these rules is enforced by careful inspections of cars at points of interchange between railroads.

The principal main lines of the United States railroads have been brought to and now are upon substantially the same high standard of construction, maintenance and repair, and adequacy to meet the national transportation demands, which prevail upon the defendant's lines generally and particularly in the affected territory.

Such improvements in road, equipment and plant generally, thus accomplished by the railroad systems of the United States, have been brought about only through the expenditure of enormous sums of money, such expenditures having been made, in many instances, upon express authority of the Interstate Commerce Commission, pursuant to Section 20a of the Interstate Commerce Act.

Said improvements, and the expenditures therefor, were undertaken pursuant to the general program of betterment of the railroad transportation plant of the United States, heretofore referred to, which was formulated and agreed upon in 1923 by the railroads of the United States (includ- [fol. 6143] ing defendant), as members of and constituting the American Railway Association (now succeeded by the Association of American Railroads). Said program, as agreed upon and thereafter carried out, had for its essential purpose the betteerment of railroad service, through improvements in the railroad plant designed to promote and permit speedier, safer, more efficient and more economical railroad transportation.

(b) Increased Train Lengths

Various improved methods of operation which were instituted by the United States railroads contemporaneously with the aforesaid 1923 program of betterment, and were largely made possible thereby, included the adoption and development of the practice of "standard long-train operation", heretofore defined. In consequence thereof, the [fol. 6144] average lengths of freight trains on the railroads of the United States have tended to increase continually; thus, the average number of cars per freight train was, in 1922, 38.4; in 1926, 45.2; in 1930, 48.9; in 1934, 46.2; in 1938, 47.7; and in 1939, 49.1. The recession following 1930 was due largely to a substantial falling off in the total traffic volume in the years after 1930.

The practice of standard long-freight and passenger-train operation is today followed, as the customary and ordinary method of operation, upon substantially every major railroad system throughout the United States. Detailed testimony appears in the record covering the methods followed upon railroad systems which reach into every section of the country; which systems, in 1939, operated a total of 125,885 miles of line, or about 54.25 per cent of the mileage of Class I railroads in the United States, and produced, in said year, more than thirteen billion freight train miles, or about 59 per cent of the total produced by all Class I carriers, and more than thirteen and one-half billion revenue passenger miles, or about sixty per cent of the total produced by all Class I carriers.

With respect to freight-train operation, said detailed testimony shows that freight trains ranging in length from 125 cars up to 160 cars are commonly and regularly operated; that on some systems the standard length of through

freight trains is in excess of 100 cars; that on many main-line districts substantially more than half of all the freight trains run, including the local and turn-around or branch-line trains running only short distances on the main line, are longer than 70 cars; that the operation of long freight trains is a regular and daily practice on each and every railroad covered by said testimony, and over practically every section of the main line of each such railroad.

[fol. 6145] With respect to passenger-train operation, said detailed testimony shows that passenger trains containing 17 cars or more are commonly operated by many railroads; that on many main-line districts substantially more than one-third of all the through passenger trains operated consist of more than 14 cars; that the operation of long pasenger trains is a regular, common, and daily practice on each and every railroad whose passenger operations were discussed, and on practically every section of the main line of each such railroad.

Upon all of the several railroads to which said detailed showing refers, as well as various others whose methods of operation were the subject of more general testimony, said standard long-train method of freight and passenger-train operation is and for at least ten years last past has been the common, standard, and regular practice. The railroads mentioned include substantially all of defendant's principal competitors, and all or nearly all of its principal connections, and many other lines which participate with defendant in joint through routes between points on the Pacific Coast, on the one hand, and the states and cities upon and east of the Missouri and Mississippi Rivers, on the other.

Exhibits 12, 13, 22, 25, 29, 31, 43, 44, 45, 47, 49, 52, 56, 60, 64, 68, 73, 74, 75, 76, 79, 81, 82, 83, 84, 87, 89, 90, 91, 92, 95, 97, 98, 100, 101, 103, 117, 118, 119, 121, 131, 138, 139, 192, 248.

(c) Improved Schedules and Performance

The handling of through freight traffic upon published and agreed time schedules, conforming in general character to the schedules maintained by defendant and its connections, described at length in paragraph VII (c) of these findings, is a general practice of the major railroads of the United States. Freight is transported between all parts of the nation under said schedules, which frequently are participated in by three or more carriers. The institution and maintenance of such schedules has been and is an essential part of an organized and coordinated effort of the country's railroads, directed toward the continuing improvement of service, which had its inception in the aforesaid 1923 program of betterment; and a direct result of the improved operating methods, including particularly the operation of standard long trains, made possible thereby. As improvements in road, equipment, and operating methods became more widespread upon the railroads of the United States during the years following 1923, improvements in and reductions of schedules became possible, and were made. Illustrative of such schedules, and said reductions and improvements therein, are those participated in by defendant and its connections, covering the transporta-[fol. 6147] tion of through freight eastward and westward between Pacific Coast points, on the one hand, and Chicago, Illinois, and related points, on the other.

The record indicates that freight handled under schedules is transported in accordance therewith, and delivered at destination, upon or in advance of schedule time, in more than 95 per cent of all cases.

P. McDonald*, R. 2971; *Sines*, R. 63-64; *G. C. Baker*, R. 2340-2377, 2386-2393, 2715-2722.

Exhibits 22, 175, 176.

(d) Increased Efficiency and Economy

During the period since 1923, and coincident with the substantial increase in train lengths during that period, there has been a marked improvement in the efficiency and economy of operations upon the railroads of the United States generally. This improvement is comparable to that achieved upon defendant's system, other than upon the lines in the affected territory, and particularly the increased efficiency and economy achieved in Nevada and Utah, as more fully set forth in paragraph VII (d) of these findings. Such improvement, as to the railroads of the United States [fol. 6148] as a whole, has been and is a direct result of the aforesaid 1923 program of betterment, and the development and accomplishment thereof in the succeeding years, and of the improved operating methods, particularly the practice of standard long-train operation, which were adopted and developed throughout the years following 1923.

Said improvement in efficiency and economy is particularly shown by both (1) national statistics, relating to efficiency and economy of operations upon the railroads of the United States as a whole, which statistics present certain of the indices heretofore mentioned; and (2) corresponding statistics, relating to the operations of individual typical railroads.

Thus, referring first to national statistics, the average speed of all freight trains, on all Class I railroads, was, in 1922, 11.1 miles per hour; and said average speed increased steadily through the succeeding years to 16.7 miles per hour in 1939: an improvement of 50.5 per cent. The average amount of freight-train service produced per ton of fuel consumed on freight trains of Class I railroads increased during the same period as follows: from 10,750

gross ton miles per ton of fuel consumed for the year 1922, to 15,528 gross ton miles in 1939. The improvement, contrasting 1939 with 1922, was 44.4 per cent.

The average gross ton miles per train hour, for all freight trains of Class I carriers was, in 1922, 16,188; and said average increased rather steadily year by year to 32,808 in 1939: an improvement of 102.7 per cent.

The average expense, per thousand revenue ton miles, for all freight operating expenses, for all Class I rail roads, was, during the four-year period 1922-1925, $8.71; [fol. 6149] and said average declined rather steadily from year to year, to $6.49 for the four-year period 1936-1939: an improvement of 25.5 per cent.

The average expense, per thousand revenue ton miles, for freight transportation expenses only (as heretofore defined), for all Class I railroads, was, for the four-year period 1922-1925, $4.16; and declined progressively to $3.18 for the four-year period 1936-1939: an improvement of 23.6 per cent.

The average expense per passenger-train car mile, for passenger operating expenses, for all Class I railroads, was, for the four-year period 1922-1925, 32.80 cents; and declined to 25.67 cents for the four-year period 1936-1939: an improvement of 21.74 per cent.

The average expense per passenger-train car mile, for passenger transportation expenses, was, for the four-year period 1922-1925, 15.40 cents; and declined to 12.31 cents for the four-year period 1936-1939: an improvement of 20.06 per cent.

The greatly increased efficiency and economy of the operation of the Class I railroads, as a group, is further shown by the fact that in the four-year period 1922-1925 their revenue freight traffic, amounting to 1,554 billion revenue ton miles, was handled with an average annual ownership of 64,792 locomotives and 2,328,741 freight cars; whereas in the four-year period 1936-1939 their revenue freight traffic, amounting to 1,323 billion revenue ton miles was handled with an average annual ownership of 42,885 locomotives and 1,712,936 freight cars; in other words, though the traffic volume was only 15 per cent lighter, it was handled more cheaply, at higher speeds and on faster schedules, and with 34 per cent fewer locomotives and 26 per cent fewer cars.

[fol. 6150] The statistics of record, showing the efficiency and economy achieved by individual carriers (other than defendant) as a result of the long-train practice, relate directly to operations of sixteen important systems: namely, the Chesapeake & Ohio, Boston & Maine, Chicago, Milwaukee, St. Paul & Pacific, Northern Pacific, Missouri Pacific, Erie, Atchison, Topeka & Santa Fe, New York Central, Pennsylvania, Chicago, Burlington & Quincy, Great Northern, Union Pacific, Chicago & Northwestern, Illinois Central, St. Louis Southwestern, and Chicago, Rock Island & Pacific railroads. The lines of these carriers extend into every major territorial subdivision of the country; five of said systems extend from the Pacific Coast to the Mississippi or Missouri Rivers, and each of these transcontinental carriers extends, either with its own lines or those of direct connections, to Chicago, Illinois. Certain of the other lines enumerated are important trunk-line carriers extending from Chicago, or Mississippi River crossings, to the Atlantic Seaboard. The principal north-and-south lines of the Mississippi Valley are likewise represented.

Each of said carriers follows, and for many years last past has followed the practice of standard long-train operation, except to the extent that the Arizona Train-Limit Law prevents and has prevented the Atchison, Topeka & Santa Fe from so doing, upon that part of its lines located in Arizona and adjacent territory where the law has extra-territorial effect. The improvements in the efficiency and economy of operation achieved by these systems, coincident with and as the result (in part, at least) of the long-train practice adopted by them, are typical of the achievement of efficiency and economy of operation, by the rail-[fol. 6151] roads of the United States generally, and particularly by defendant, as heretofore shown.

McDonald, R. 1739-1746, 1762-1765; *Judson*, R. 2975-2977.

Exhibits 10, 11, 12, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 27, 28, 29, 32, 33, 37, 39, 42, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 58, 59, 60, 62, 63, 64, 66, 67, 68, 77, 78, 79, 85, 86, 87, 93, 94, 95, 99, 102, 103, 116, 120, 121, 124, 130, 131, 248.

(e) Results of the Long-train Program from the Standpoint of the Public, the Employes, and the Railroad Owners.

(1) Reduction in Average Transportation Charges Paid by the Public.

Concurrently with the aforesaid improvements in schedules and performance, and as a direct result of the increased efficiency and economy brought about by the aforesaid 1923 betterment program, including the development and continuation of long-train operations, the rates for freight and passenger transportation paid by the railroad patrons have shown continuously decreasing trends. Thus the average revenue per ton-mile, received by all Class I railways of the United States (which average revenue directly reflects the average level of the freight rates charged to and paid by the public for freight transporta-[fol. 6152] tion) was in 1922, 1.177 cents, and in 1939, .973 cents: a decrease of 17.4 per cent. Similarly, the average revenue per passenger-mile, received by all Class I railways of the United States (which average figure directly reflects the average levels of fares paid by the public for railroad passenger transportation) was in 1922, 3.027 cents, and in 1939, 1.840 cents: a decrease of 39.2 per cent.

Parmelee, R. 298-304, 332, 336, 339.

Exhibit 16.

(2) Increases in average wages paid to employes.

Except for a temporary recession in the levels of wages, commencing in 1932 and extending until and including 1934 (the wage levels having been entirely restored in 1935), the average rates per hour for wages paid to all railroad employes of Class I railroads in the United States have shown a generally increasing trend since 1922. In that year

the average hourly rate was 6[illegible]3 cents; in 1939, said rate was 74.9 cents: a percentage increase of 22.1 per cent. Dealing particularly with the wage rates of train and engine-service employes (which are the classes of employes who man the trains to which the train-limit law applies), the average wage-rate per hour for such employes was, in 1922, 79.1 cents, and generally tended to increase, except for the aforesaid temporary recession of 1932-1935, up to 92.2 cents per hour for the year 1939: a percentage increase, comparing 1939 with 1922, of 16.5 per cent.

Parmelee, R. 304-316, 332-336, 339-342.
Exhibits 17-18.

(3) Effect on returns to owners of the railroads.

While the aforesaid 1923 betterment program, as developed and continued through the succeeding years, has [fol. 6153] been accomplished by increasing efficiency and economy (and also, as hereinafter shown, safety) of operations, and likewise by benefits to the shipping and traveling public (through the aforesaid reductions in rates and fares) and to the railroad employes (by reason of the aforesaid increases in wages and wage rates, and the improvement in safety), the owners of the railroads have failed to realize any corresponding benefits, in the shape of returns upon the moneys invested in the properties, particularly during the period since 1929.

During the period following the year 1922, and to and including the year 1929, the Class I railroads of the United States, considered as a group, enjoyed a period of relative prosperity, in that the net income from their operations, available for the betterment of the properties and for the payment of dividends upon the capital stock, represented substantial amounts, culminating in a net income of approximately $897,000,000 for the year 1929. Following the year 1929, said Class I railroads of the United States entered upon a period of severe and continued depression; and the net income declined from said figure of $897,000,000 for the year 1929, to an actual deficit of $139,000,000 in the year 1932. The years 1933, 1934 and 1938 were also years in which substantial deficits were experienced. In the year 1935 there was a net income of $7,500,000; in 1936, $164,000,000; in 1937, $98,000,000; and in 1939, $93,000,000. The rate of return on the prop-

erty investment devoted to carrier purposes, for all Class I railroads as a group, has not in any year since and including 1931 exceeded 2.57 per cent; in the year 1939, such rate of return was 2.25 per cent.

Parmelee, R. 316-325.
Exhibit 19.

[fol. 6154] (f) Similarity of Operating Conditions and Operating Rules on Other Railroads to Those Prevailing upon Defendant's Lines in the Affected Territory.

The operating rules which cover the operations of United States railroads generally, and particularly of those railroads, typical examples of whose operations are separately set forth in the record, are largely modeled upon and in conformity with a standard code of operating rules prepared and promulgated by the Association of American Railroads, and generally used, subject to minor variations because of peculiar or local conditions. The code of operating rules in force on defendant's lines, heretofore mentioned in paragraph VII (a) of these findings, likewise conforms generally to said standard code.

The operating conditions, particularly from the standpoint of maximum and ruling grades, curvature, and distribution of traffic as between through (interstate) and purely local, upon the districts and subdivisions covered by said typical examples of long-train operation are generally similar and, in many instances, closely comparable, to those encountered upon defendant's lines in the affected territory. Said examples include districts where there are single-track, and double-track operations; districts where helper service is used, both regularly and occasionally; districts where the cars moved in one direction are generally loaded, and those in the other direction generally empty; districts where there is a more even balancing of loaded and empty movement in opposite directions; districts where local traffic is negligible, and through traffic is relatively heavy; districts where perishable traffic is handled, in multiple-car units, in heavy volume; districts where operations, and particularly the handling of cars in long trains, must be so conducted as to insure that trains and cars will [fol. 6155] arrive at interchange and gateway points at agreed times; in short, said typical examples cover operations under varied conditions; but each one presents a

situation, the counterpart of which is found, to a greater or less degree, throughout, or at least in some part of, the affected territory.

A further similarity between the operations of the several railroads particularly mentioned in subparagraph (d) of this finding, and those of defendant, both on its system generally and in the affected territory, is found in the fact that perishable commodities, including also livestock and livestock products, form a substantial proportion of the traffic carried by each such railroad, and likewise, as aforesaid, of the traffic handled by defendant, particularly in interstate commerce in and across the affected territory.

Sines, R. 53-54, 2474-2475; *Porter*, R. 193-195; *Wright*, R. 215-222, 229-230, 238-245, 251-252, 256-259, 264-270; *Kirk*, R. 378-379, 390-397, 399-414, 426, 427-430, 442-445, 450-453; *Young*, R. 487-494, 511-513, 540; *LaFountaine*, R. 635-645, 648-651, 661-662, 671-672, 675-682, 685, 688-690, 692-700, 702, 709-714, 840-848; *Burn*, R. 733-736, 751-752; *Gregory*, R. 747-751; *Oakley*, R. 775-777; *Millard*, R. 789-794; *Snell*, R. 813-815; *Albert*, R. 824-826; *Fertig*, R. 855-857, 881-883, 887-889, 895-905, 1068-1070; *Green*, R. 919, 922-924, 938-940, 942-943, 953, 1154; *Kraemer*, R. 958-966, 968-969, 983, 992-994; *Randall*, R. 1018-1022, 1032-1034, 1036, 1051-1055; *Triem*, R. 1081-1086, 1107-1111, 1116-1120, 1129-1130, 1157; *Hammond*, R. 1139-1140, 1165-1173, 1175-1176, 1185, 1189-1191, 1202-1204; *Warfel*, R. 1205, 1210-1216, 1231-1239, 1243-1249, 1256-1263, 1361-1366, 1368-1370; *Kiley*, R. 1292-1294, 1300-1306, 1313-1314, 1485-1486; *Peckenpaugh*, R. 1319-[fol. 6156] 1322, 1324, 1332-1334, 1342-1343, 1349-1354, 1419-1430; *Beale*, R. 1545, 1548-1550, 1560-1580, 1582-1586, 1639-1651; *Wilbur*, R. 1606-1617; *Blanchard*, R. 1657-1677, 1700-1705; *Thomas*, R. 1713-1715, 1722-1735; *McDonald*, R. 1747-1759, 1760-1761, 1765; *Mahoney*, R. 1856-1858, 1863-1865, 1874-1885, 1887-1888, 1903-1909, 1981-1985; *Browning*, R. 2863-2884; *Judson*, R. 2979, 2989-2991, 2996, 3005-3007, 3052-3056.

IX

Recent Long-train Operations of Defendant in Arizona: Intention to Undertake Future Long-train Operations.

(a) Long-train Operations of Defendant in Arizona in 1940.

During the period between March 2nd and April 30th, 1940, both dates inclusive, defendant operated in Arizona 62 long passenger trains, including the passenger train particularly referred to in the complaint herein. During the period April 4th to April 30th, 1940, both dates inclusive, defendant also operated in Arizona some 302 or more long freight trains, including the freight train particularly referred to in the complaint. Each of such long trains was operated at the direction, and with the knowledge, of the responsible officers of defendant having immediate supervision over its train operations in Arizona.

The long passenger trains thus operated accumulated 15,857 passenger-train miles and 243,749 passenger-car miles within Arizona. The long freight trains thus operated [fol. 6157] accumulated 37,257 freight-train miles, and 3,180,278 freight-train car miles within Arizona. The average number of freight cars per freight train, for such long trains, was 85.36. The average length of all of the freight trains, including short trains, operated in Arizona during the month of April, 1940, was 57.85 cars.

The long freight-train operation thus undertaken by defendant during April, 1940, was necessarily upon a limited scale; primarily because the defendant did not undertake, for the purposes of such operation, to make any changes in the assignments of locomotives to its lines in the affected territory, or to transfer to said lines, for use in said long-train operation, the larger and more powerful locomotives which are and would be more appropriate thereto; and also because the great majority of the passing sidings and yard tracks in the affected territory, particularly in the districts west of Lordsburg, do not readily accommodate trains of substantially more than 70 cars, including engine and caboose. For these reasons the aforesaid long freight-train operation was largely confined to the handling

of long trains in the westward direction only; although at different times, during said period, long trains were also operated eastward.

Stipulation of Counsel, R. 30.
Sines, R. 3356-3380, 3427-3431.
Exhibits 234, 235, 246, 295.

(b) Future Long-train Operations Contemplated by Defendant: Changes in Plant and Equipment.

As heretofore stated, defendant plans and intends, when and if the restrictions of the train-limit law are removed, to begin at once the operation of a substantial number of long freight and passenger trains in the affected territory. Initially, and primarily because of the limited lengths of [fol. 6158] many of the sidings in the affected territory, such long freight-train operation will be generally confined to the handling of trains of more than 70 cars in one direction only, at one time. Eventually, and as rapidly as the necessary extensions of siding lengths and other changes in plant and equipment hereinafter mentioned can be made, such long-train operation would and will be expanded and extended until, upon substantially the same scale as presently followed in Nevada and other portions of defendant's system where, as elsewhere stated in these findings, long-train operations prevail.

In order to operate long freight trains freely in both directions in the affected territory, it will be necessary for defendant, and defendant now plans and intends, to build, or extend, yard tracks and sidings at 49 stations (including terminals) in said territory, so as to provide trackage permitting the operation of trains of 100 cars eastward and 125 cars westward as a general practice. The capital cost of such track construction and extensions is $685,985; the annual interest and maintenance charge thereon amounts to $40,009. Defendant also plans and intends, in order to provide the necessary servicing and repair facilities for the larger locomotives (as hereinafter mentioned) to be employed in such long freight-train operation, to reconstruct certain of its present roundhouse and turntable facilities at Tucson and Yuma, and to provide additional repair facilities at El Paso, and additional water-supply facilities at Benson. The aggregate capital expenditure for these purposes amounts to $453,832, involving an annual interest and maintenance charge of $28,137.

In order to conduct long freight-train operations in the affected territory with greater efficiency and economy, and [fol. 6159] with due regard for schedule requirements, and to realize thereby a larger degree of use and usefulness of its entire railroad plant in said territory, defendant plans and intends to provide and assign to such freight-train operation an adequate number of locomotives having sufficient tractive power more readily to handle long freight trains in both directions in said territory. Such locomotives, when so assigned, will replace certain of the other locomotives now in use in said territory. Of all of the types of locomotives owned and operated by defendant, the Articulated-Consolidation type is most suitable to such long-train operation. Locomotives of class 8 of the Articulated-Consolidation type, for brevity known as AC-8 locomotives, have been in service on various portions of defendant's lines since 1939. An earlier class of the same type, known as the AC-6 locomotive, which closely resembles the AC-8 in all essential features, has also been used by defendant on various portions of the system since about the year 1930. In order to handle, in long-train operation, the same volume of freight traffic actually handled in the affected territory in 1938, defendant will be required to assign some thirty AC-8 locomotives to said service. Fifty-one of the various types and classes of locomotives presently assigned to the affected territory will thereby be displaced, and made available for use elsewhere upon defendant's system. The net increase in the gross weight of the locomotives assigned to the affected territory brought about by such replacement, amounts to 1,141,160 pounds; so that the net capital cost to defendant of such locomotive reassignment, based upon the current price of 24.9 cents per pound for locomotives purchased by defendant in 1939, amounts to $284,149. The annual interest and depreciation charge associated with said capital cost is $19,606.

[fol. 6160] Long freight-train operation in the affected territory would and will bring about a reduction in the number of such trains operated, in relation to the traffic moved; as a result of which defendant would and will be able to conduct freight-train operations in the affected territory (if the total volume of such freight traffic were no greater than in 1938) with 21 fewer cabooses. These 21 surplus cabooses represent a capital investment of $71,694;

and an annual charge for interest, depreciation, and maintenance, amounting to $8747. Defendant would and will be relieved of said capital investment, and the corresponding annual charge thereon, as represented by said surplus cabooses, if and when the restrictions of the law are removed.

X

Effect of the Train-limit Law upon Defendant's Operations.

(a) The Redispatching Studies.

In order to determine as precisely as possible the effect of the train-limit law upon its operations, defendant conducted a series of detailed studies of the trains and the traffic handled over its lines in the affected territory, during various recent periods, as follows:

1. The freight trains and traffic handled between Yuma and El Paso during the months of June and August, 1938;

2. The passenger trains and traffic handled between Los Angeles and El Paso during the entire year 1938;

[fol. 6161] 3. The freight trains and traffic handled over the lines between Phoenix and Picacho, including the movement of such traffic between Picacho and Tucson, during the month of December, 1938;

4. The freight trains and traffic handled between Yuma and El Paso during the period April 4th to April 30th, 1940, both dates inclusive.

These several studies are hereinafter referred to for convenience as the "redispatching studies".

The redispatching study of June and August 1938, first above referred to, involved a close and detailed analysis of each of the freight trains actually operated by defendant over the lines between Yuma and Tucson, via Gila, and between Tucson and El Paso, via both Lordsburg and Douglas, as to consist, speed, and other essential features

of operation; and the complete rearrangement, into "redispatched" trains, of the cars and traffic thus actually moved, so as to conform the operations, for the purposes of the study, to the conditions which would prevail if the law were wholly set aside. Said months of June and August, 1938, were and are representative of the entire year, in that June was the month of heaviest traffic volume, and August the month of lightest traffic volume; while the volume of the traffic handled over the lines studied, in the two months taken together, constituted slightly more than one-sixth (17.89 per cent) of the total so handled for the entire year.

In the conduct of said study it was contemplated, for the purposes thereof, that all of the conditions which actually prevailed on said lines during the two months mentioned would have continued to prevail; except to the extent [fol. 6762] that the removal of the limitations imposed by the law would have permitted modifications in defendant's operating methods, and would have warranted certain changes in its equipment and facilities (substantially as set forth in finding IX-b, supra), particularly: (i) the substitution of more powerful locomotives for those actually in use, (ii) necessary changes in and additions to locomotive roundhouse and shop facilities, and (iii) increases in the capacities, measured in numbers of cars, of sidings at certain specified meeting and passing points upon the lines involved.

Said 1938 redispatching study was carefully conducted, expressly for the purposes of the present case, under the direct, personal, supervision of experienced and fully qualified operating and executive officers of defendant, by the chief train dispatchers, who now and for many years last past have supervised the operation and movement of defendant's trains in the affected territory. The results thereof present as precise and accurate a determination as possible of the effects of the law: (1) in requiring additional train service to be operated by defendant in the affected territory; (2) in creating or aggravating delays to and interference with defendant's trains and cars, and the traffic transported therein; and (3) in imposing additional expenses upon defendant's operations in said affected territory.

The passenger redispatching study for the year 1938, second above referred to, was conducted in substantially

the same manner, and by the same persons, as the freight redispatching study for the months of June and August, 1938; however, it was unnecessary for the purposes of said study to assume any such changes in locomotive assignments, or in locomotive roundhouse or shop facilities, or in siding capacities, as in the case of the freight-train redispatching study.

[fol. 6163] The redispatching study covering the Phoenix-Tucson operations, for the month of December, 1938, third above referred to, was conducted in the same manner and with the same care as the other studies, all of the work being personally performed by the chief train dispatcher of the Tucson Division. The month of December, 1938, was selected for said study, because that month represents the period of maximum traffic upon the Phoenix-Picacho portion of the line.

Two separate but closely coordinated redispatching studies were actually undertaken in connection with freight-train movements in the affected territory during the period April 4th to April 30th, 1940. During said 27-day period, defendant conducted long-train operations on a limited scale in certain portions of the affected territory, and as stated in finding IX (a), actually operated in Arizona some 302 freight trains containing more than 70 cars, exclusive of caboose. Such operations, though undertaken without regard to the 70-car restriction, were limited in scope, in that they were carried on with the same locomotive theretofore and thereafter in service in the same territory, and without the benefit of any extensions of sidings, as contemplated in the event the law's restrictions should be removed.

The first of the said 1940 redispatching studies contrasted the limited long-train operations thus actually conducted during April, 1940, with operations as they would have been conducted if the 70-car restriction had been fully observed. Defendant was thus able to and did determine the savings in additional train service, in interferences with operations, and in additional and unnecessary expenses, realized as a result of such limited long-train operation.

[fol. 6164] The second of said 1940 redispatching studies contrasted said limited long-train operations with long-train operations as they would have been conducted with the extended sidings, the enlarged roundhouse and shop facilities, and the more powerful locomotives, as contemplated

in connection with said 1938 redispatching study. The two 1940 redispatching studies, taken together, therefore afford a ready and accurate determination of both the economies and advantages immediately available to defendant, if the restriction be removed, and even though defendant might not at once undertake substantial alterations of its present plant and equipment in the affected territory, and also of those economies and advantages capable of being ultimately realized, if and when the law is no longer effective. In those respects said 1940 studies serve to check and confirm the results presented by the 1938 studies.

Sines, R. 2555-2582, 2594-2632, 2654-2669, 2788-2806, 4161-4163, 4224-4226; *Baker*, R. 2697-2705, 2723-2729, 2780-2786, 2894-2918; *Herrell*, R. 2732-2772, 4065-4072; *Cassady*, R. 2812-2830, 4090-4092, 4096-4099; *Reid*, R. 2942-2947, 2950-2952; *Burke*, R. 2958-2959; *F. P. McDonald*, R. 2964-2967, 2972-2974.

Exhibits 196, 197, 198, 199, 226, 315, 316, 317.

(b) Interference With and Delays To Interstate Traffic.

The enforcement of the train-limit law against defendant results and will continue to result in delay to and interference with the handling and movement of defendant's interstate trains, both freight and passenger, operated in the affected territory, and with the transportation and movement of the interstate passengers, cars and commerce contained therein, both within and without the boundaries of Arizona.

[fol. 6165] Such delays and interferences arise and will continue to arise in the following ways: (1) interferences with and delays to cars and trains at terminals, (2) delays to individual cars, as distinguished from trains, at terminals and other stations, and (3) interferences with and delays to trains while on the line between terminals.

(1) Terminal delays.

The terminal delays occasioned by enforcement of the law, and which are directly and solely due thereto, are usually caused by the necessity of: (i) reducing defendant's long trains, as they approach or arrive at the Arizona state boundary lines, to lengths not exceeding 70 cars; (ii) building up said trains, as they are about to leave or after they

have left Arizona, to the normal lengths prevailing in the adjoining states. Such delays occur in part outside of Arizona, and in that respect the law operates with extra-territorial effect.

About 46.6 per cent of the freight trains moving between Indio and Yuma are long trains; the average length of the eastward trains entering Yuma from California being about 87.3 cars, and of the trains moving westward from Yuma into California about 89.7 cars. As the result of observance of the law in connection with all operations east of Yuma, all of defendant's freight trains moving eastward to and through Yuma must either be made up as short trains at points of origin in California, or reconsisted at Yuma or some point west thereof, so that the operation east of Yuma shall conform to the law; and all said trains, when moving westward as short trains into Yuma, must either be reconsisted at Yuma, so as to avoid running them as short trains in California, with resulting added and unnecessary expense, or else operated out of Yuma westward [fol. 6166] as short trains, to be stopped at some point west of Yuma, and there built up into the longer trains permitted in California.

Some 22.34 per cent of defendant's freight trains moving between Lordsburg and El Paso are long trains; and by reason of the observance of said law, said long trains, when moving westward, must be stopped at Lordsburg and there cut down to the length permitted by the law, being then operated as short trains for a distance of some 23 miles in New Mexico before entering Arizona at Cavot. Eastward long trains operating between Lordsburg and El Paso represent short trains which have moved eastward from Arizona and have been stopped at Lordsburg and there built up into long trains as permitted in New Mexico. In many instances, however, and as indicated by the fact that more than 77 per cent of the freight trains between Lordsburg and El Paso are short trains, schedule requirements prevent the stopping of eastward trains or blocks of cars at Lordsburg, or at any other point west of El Paso, for the period necessary for consolidation into longer trains. The law thus operates to control completely the length of defendant's freight trains between Lordsburg and the Arizona-New Mexico boundary line at Cavot; and, as to a large proportion of defendant's eastward trains, the law affects and largely controls their lengths, not only west of Lords-

burg, but also east thereof, upon defendant's lines in New Mexico and Texas as far east as El Paso. The total distance east of the Arizona boundary where the law thus directly affects train lengths of defendant's freight trains is 171 miles, the distance from Cavot to El Paso.

There are no terminal or other facilities at the exact point where defendant's line crosses the California-Arizona boundary, or at any station immediately west of or closely [fol. 6167] adjacent to said boundary in California, sufficient for the making and breaking up of trains, and storage of cars, all of which operations are necessary if the law is to be complied with literally. Such facilities exist at Yuma, immediately east of the boundary line; but since they are wholly within Arizona, they cannot be used for the purpose of changing from long-train to short-train operation, or the reverse, unless long trains are actually operated into and out of Arizona. In practice, defendant daily operates many long trains into and out of the Yuma terminal, and performs the reconsisting operations with the facilities at said terminal. Plaintiff, through its counsel, has in effect conceded that defendant can, as a practical matter, avoid such operations within Arizona only by causing all its trains between Yuma and the terminals next west of Yuma to be operated as short trains.

There are likewise no terminal or other facilities at or near Cavot (the Arizona-New Mexico boundary), and such facilities could not be constructed at said point except at great expense. The nearest point to said boundary at which the reconsisting and car-storage operations necessary in order to conform to the law can practicably be conducted is Lordsburg, which is 23 miles east of the boundary, and about 148 miles from El Paso. The siding facilities at Lordsburg are fairly adequate for the purpose, and are presently so used. The topography at Cavot is such that even if terminal and storage facilities were constructed there, the operations of changing from long-train to short-train operation, and the reverse, and of storing and setting out cars as required incidental thereto, would be difficult and impracticable, besides involving considerably greater operating expenses, and substantially more delays to trains and cars, than are incurred in the performance of such [fol. 6168] operations at Lordsburg. Moreover, such facilities would be useless for the purpose of reconsisting those eastward freight trains (about 75 per cent of all now oper-

ated) which because of schedule requirements cannot be and are not presently stopped and held for consolidation at Lordsburg.

Exhibits 1, 175, 185, 215, 297.

Yuma delays: All eastward freight trains of defendant entering Arizona stop at Yuma to change crews and cabooses. Such trains, when consisting of more than 70 cars, are also reswitched, the excess cars being cut off, to be stored until sent forward either in trains originating at Yuma, or in later trains arriving at Yuma from the west with less than 70 cars. If it were not for the law, by far the greater proportion of defendant's said eastward long trains could and would move through Yuma without substantial change of consist, or any switching other than that incidental to the changing of locomotives and cabooses, or possibly the addition of cars originating at Yuma. The eastbound trains thus required to be switched in order to conform to the law are delayed at Yuma for varying periods; and the cars set out from said trains and thereafter moved on later trains also suffer substantial delays. All of said delays are solely due to the law, and could and would be avoided and eliminated if the law were set aside.

All westward freight trains of defendant arriving at Yuma are stopped there, and cabooses and locomotives are changed. Such trains are likewise generally consolidated into the longer trains permitted in California, in or- [fol. 6169] der to avoid and, as far as possible, minimize the extra expense of operating additional and unnecessary trains, and to confine such train operations to the State of Arizona. Such reconsisting and consolidation involve delays to the trains and cars affected thereby; and each and all of said delays are created by and are solely due to the law, and likewise could and would be eliminated and avoided if the law were not in effect.

Sines, R. 61-66, 2582, 3169-3170, 3309-3313; *G. C. Baker*, R. 2358, 2380-2382.

Exhibit 215.

Delays at Lordsburg and points east thereof: Defendant's westward freight trains arriving at Lordsburg are

stopped at that point to change cabooses, and also frequently locomotives. If the trains consist of more than 70 cars, the excess cars must be cut off and stored, and moved forward on later trains. These reconsisting operations cause delays to the trains involved, and also to the cars thus shut off and stored for later movement. All of said delays are solely due to the necessity of complying with the law, and could and would be avoided if the law were set aside.

Defendant's eastward freight trains arriving at Lordsburg from Arizona also change cabooses and frequently locomotives at that point. For various reasons, and particularly because of being operated close to definitely scheduled times, about 75 per cent of said eastward trains cannot be stopped at Lordsburg to be consolidated into the longer trains permitted in New Mexico, and they are therefore operated through to El Paso as short trains. The remainder are held at Lordsburg for consolidation, and are operated east of that point as long trains. Such consolidations involve varying delays to the trains and cars in question, which delays are likewise solely due to the law, and [fol. 6170] can and could be avoided only by conforming to the law's restrictions in the territory east of Lordsburg, and between that point and El Paso, a distance of 148 miles, as aforesaid.

Frequently westbound empty freight cars available and due for movement from El Paso via Lordsburg into and across Arizona are required to be held and stored at Lordsburg, because of the impossibility of handling such cars out at once in short trains operating west of that point, or of operating immediately any special trains for the purpose; and in such cases, and whenever the available storage space at Lordsburg is filled, such cars must also be stored at Deming or Strauss, New Mexico, or even at El Paso, until such times as movement to and through Lordsburg is again possible. These delays are wholly extra-territorial in character, and are also due entirely to the restrictions of the law.

Herrell, R. 2742-2749; *Sines*, R. 3168.
Exhibits 1, 175, 185, 215.

(2) Delays to trains en route: Meets and passes.

In the operation of freight and passenger trains over defendant's lines in the affected territory, as well as over

railroads generally, it is frequently necessary for trains to meet and pass each other. The term "meet" is generally understood to refer to the operation whereby two trains proceeding in opposite directions on the same track go by each other. The term "pass" is generally understood to refer to the operation whereby one train, having overtaken one or more preceding trains going in the same direction on the same track, runs around and thereafter precedes the train or trains overtaken. Train meets normally occur only in single-track territory; passes may occur on either single or double track. Whenever a meet or pass occurs, at least one of the trains involved is normally required to [fol. 6171] take siding and stop, and is thus delayed to a certain extent. The greater the number of meets and passes required in the operation of trains over a particular district or subdivision, the greater in the aggregate are the delays to and interferences between the trains affected thereby.

The 1938 redispatching study showed that in that year defendant was compelled to operate 4,304 additional freight trains over its principal main line between Yuma and El Paso via Gila and Lordsburg, which said additional trains were run solely because of the restrictions of the law and would not have been run if it were not for the law; and further, that 16,512 additional meets and passes occurred in said territory in said year, over and above those which would have occurred if long freight-train operation had prevailed; all of which additional meets and passes were therefore solely due to the operation of the aforesaid additional trains, and thus solely due to and occasioned by the law. Expressed in percentages, the law thus compelled an increase in the total number of trains run (both freight and passenger) in said territory, over the number that would otherwise have been necessary, of about 28.4 per cent; whereas the number of meets and passes between all the trains run (both freight and passenger) in said territory was thereby increased about 63.0 per cent.

Exhibts 220, 226, 298.

(3) Delays to and interferences with passenger trains and traffic.

In general, the restrictions of the law create delays to and interference with the movement of passenger trains [fol. 6172] and traffic, in the affected territory, similar to those imposed upon freight traffic; however, because of the nature and character of passenger traffic, and more especially because of the 14-car limit on passenger trains, the law affects such trains at points and over portions of defendant's lines outside as well as within Arizona; and the extra-territorial effects are even greater, relatively, than in the case of freight trains.

Thus, passenger trains approaching Arizona from the east must often be reduced in length, both at points near the Arizona boundary such as Lordsburg and Rodeo, New Mexico, and also frequently at El Paso, the excess cars being either transferred to other scheduled trains operating over the same or alternate routes, or left behind to be picked up by later trains, or in some cases, made into special and extra sections and operated either ahead of or following the regular trains from which such cars were taken. Each train from which cars are taken under such circumstances is frequently further delayed at Tucson, or Yuma, or some point further west, in order to return to it cars which have been separately run across or partly across the state of Arizona.

Eastbound passenger trains moving or intended to move across Arizona also suffer delays and interferences, largely similar to those above described as being imposed upon westbound trains; such delays and interferences taking place both at Yuma and, frequently, at Los Angeles as well.

Cars originating at points en route such as Yuma, Phoenix, Tucson or El Paso, or coming to defendant's line at those or other points in the affected territory for movement in passenger trains across or within Arizona, frequently must be set out, or left behind, or otherwise delayed [fol. 6173] because of being handled in trains or over routes other than those upon which they were intended and scheduled to be moved, solely because their movement in the proper and intended trains would cause the latter to exceed the 14-car limit.

A detailed study and analysis of the passenger trains and traffic handled in the affected territory during the year 1938

developed that on 222 separate occasions, involving 359 different passenger trains, passenger cars had to be switched from their trains, and set out to be picked up by other trains, or moved as extra sections at or from various points in the territory between and including El Paso and Los Angeles; that 315 such cars were set out and 338 such cars picked up (the difference being principally accounted for by head-end cars which were added as "buffers" on extra sections); and that such interferences caused 63 trains to be delayed, an average of 15 mintes each. 19 of the delays or interferences referred to, involving 30 trains, occurred at points outside of Arizona.

Included in the instances enumerated above were various kinds of annoyances and interferences developed by analysis of individual cases, as follows:

Deadhead equipment was delayed at various stations between and including Yuma, Arizona, and El Paso, Texas, in 45 instances, involving 89 trains and 51 cars. The total delay to such deadhead cars was 499 hours 29 minutes, or an average of 9 hours and 47 minutes per car. In 56 instances, involving 112 trains, 67 cars were adversely routed, that is, they were moved by trains or routes other than those originally assigned. In 44 instances, involving 48 trains, 47 car movements were canceled outright, that is, the advertised movement was permanently canceled because prevented by the car limit. In 21 instances, involving 21 trains, helper service was incurred on the Los Angeles Division, [fol. 6174] and there was developed thereby, 1,142 locomotive helper miles which would have been unnecessary were it not for the extra-territorial effects of the law. 200 occupied or loaded cars were delayed at various stations between and including Yuma, Arizona, and El Paso, Texas, by being set out and later picked up, or by failing to be picked up in accordance with schedule, and suffered a total delay of 165 hours, 50 minutes, or an average delay of 50 minutes per car.

The movement of cars over routes or by trains other than those intended compelled defendant to produce, in 1938, 2,203 excess passenger car miles, which excess car-mileage was created by and solely due to the restrictions of the law.

Sines, R. 2492-2499, 2656-2657, 2788-2804, 3327-3340, 4114-4120; *G. C. Baker*, R. 2382-2386.

Exhibits 187, 188, 199, 230.

(4) Summary of effect of delay and interferences.

The effect of the aforesaid delays and interferences occasioned by the law are and will continue to be directly, substantially and seriously to impede the prompt and efficient handling of the interstate freight and passenger traffic carried in the trains operating over defendant's lines in the affected territory, and to hamper seriously, and in many cases to prevent, the on-time delivery of said traffic at destinations and/or points of interchange with defendant's connections.

Detailed studies were made by defendant of the traffic handled over the affected lines during the month of June and August, 1938, and April, 1940; contrasts and comparisons being made between:

(i) The handling over the line, and the times of delivery at El Paso (of eastbound traffic) and Yuma (of [fol. 6175] westbound traffic), of fruit blocks and manifest sections, or parts thereof, and of individual cars, as the same actually took place; and

(ii) The handling en route and at intermediate terminals and the times of delivery at the same points, of the same traffic, as performed by the redispatched trains.

Said studies showed that, if the law were not in effect, the arrival times at El Paso and Yuma of identified blocks and sections, and individual cars, would on the average be substantially earlier than if the law were in effect, and that the times en route over the lines in the affected territory would, on the average, be correspondingly less; that under the law, fewer of the identified blocks and sections arrived at El Paso or Yuma at or ahead of scheduled times, and that many more were late on schedule; that those arriving ahead of schedule did so by smaller time margins, while those arriving late on schedule did so by greater margins, on the average, than if the law were not in effect.

Each and all of the aforesaid delays and interferences, and each and all of the results thereof, whereby freight or passenger traffic is or will or would be delayed or caused to arrive at terminals, interchange points, or other stations, later than such traffic will or would arrive free of the law,

will and would be occasioned by and solely due to the restrictions and impositions of said Train-Limit Law.

Exhibits 227, 228, 237, 238, 243, 244.

[fol. 6176] (c) Reduction in train lengths: Increase in number of trains operated.

(1) Freight train operations.

The enforcement of the law causes and will continue to cause the average and the maximum lengths of defendant's freight trains operated in the affected territory to be greatly reduced, below the average and maximum lengths which would obtain if it were not for the law, and also compels and will continue to compel defendant to operate a substantially larger number of such trains, and correspondingly to produce a substantially greater number of train miles and locomotive miles than would be necessary, if it were not for the law, for the handling of the same traffic volume (expressed in cars or car miles).

Such effects of the law are not confined to Arizona; for the law does and will continue to regulate and control completely the lengths of defendant's freight trains, and the number thereof, operated upon defendant's lines in New Mexico at least as far east as Lordsburg and Rodeo. The law also affects and will continue to affect said train lengths, and the number of trains, as far east as El Paso, Texas.

In the two months (June and August) covered by the 1938 redispatching study, the average lengths of the eastward trains operated over the several freight-train districts between Yuma and El Paso were as follows: from Yuma to Gila, 64.3 cars; from Gila to Tucson, 63.7 cars; from Tucson to Lordsburg, 64.2 cars; from Lordsburg to El Paso, 68.0 cars. If the law had not been in effect, said average train lengths would have been as follows: from Yuma to Gila, 85.2 cars; from Gila to Tucson, 85.9 cars; from Tucson to Lordsburg, 89.1 cars; from Lordsburg to El Paso, 88.7 cars.

[fol. 6177] The average lengths of the westward trains operated in said two-months' period, between terminals, were comparable to but slightly greater than the average lengths of the eastward trains between said points; and if

the law had not been in effect, such average lengths would have increased, to averages comparable to and slightly greater than those of the corresponding eastward trains. The average lengths of the eastward and westward trains operated between Tucson and El Paso via Douglas in said two months was 48.5 cars; if the law had not been effect, the average length of said trains would have been 55.9 cars.

Summarizing, the average length of the trains operated in both directions during the months of June and August, 1938, in the entire district between Yuma and El Paso via Gila and Lordsburg, and between Tucson and El Paso via Douglas, was 64.7 cars; whereas if the law had not been in effect, the average length of said trains would have been 86.6 cars; a percentage increase of 33.8 per cent.

The average length of the trains operated between Tucson and Phoenix in both directions, in December, 1938, was 57.7 cars; if the law had not been in effect, that average would have been 70.2 cars.

The extent of the long freight-train operation, which would have prevailed in the affected territory in 1938, if the law had not been in effect, is as follows: For the Yuma-Gila district, the percentage of short trains would have been 18.23; of long trains, 81.77. For the Gila-Tucson district, the percentage of short trains would have been 17.82; of long trains, 82.18. For the Tucson-Lordsburg district, the percentage of short trains would have been 17.47; of long trains, 82.53. For the Lordsburg-El Paso district, the percentage of short trains would have de-
[fol. 6178] creased from 69.32 to 25.82; the percentage of long trains would have increased from 30.68 to 74.18. The percentage of long trains on the alternate main line, from Tucson to El Paso via Douglas, would have increased from 0.68 to 17.23.

That such an extent of long-train operations in the affected territory would and will be readily achieved is shown by reference to operations in Nevada and Utah for a typical four-months' period of 1939. Between Sparks and Carlin, Nevada, in said period, the percentage of short trains was 27.60; of long trains, 72.40. Between Carlin and the Nevada-Utah line, the percentage of short trains was 11.59; of long trains, 88.41. Between the Ne-

vada-Utah line and Ogden, Utah, the percentage of short trains was 14.14, and of long trains, 85.86.

Coincident with the foregoing increases in train lengths, defendant could, in 1938, have handled the same freight traffic which actually moved over the lines between Yuma and El Paso via Gila and Lordsburg, and between Tucson and El Paso via Douglas, with 4304 fewer freight trains, producing 638,569 fewer freight-train miles, and 798,424 fewer locomotive miles; that is to say, the law, by restricting freight-train lengths and thus causing more trains to be run, compelled defendant to operate 30.8 per cent more freight trains, and to produce 33.1 per cent more freight-train miles, and 35.9 per cent more freight-locomotive miles, than would otherwise have been required: though without any increase in the number of cars handled or car miles produced. Of said 638,569 additional freight-train miles, 151,789, or 23.8 per cent, were produced in the states of New Mexico and Texas, and were caused by and solely due to the extra-territorial effects of the law upon defendant's operations.

On the Phoenix line, the law's restrictions caused defendant, during the month of December, 1938, to operate [fol. 6179] 17 additional freight trains, and to accumulate 2,266 additional freight-train miles, and 2,506 additional locomotive miles; or 17.0 per cent more trains, 19.0 per cent more train miles, and 21.0 per cent more locomotive miles, than were necessary except for the law.

The results of the April, 1940, redispatching studies confirm very closely the results obtained from the 1938 study. Thus, said studies show that with unrestricted freight-train operations (i.e., with AC-type locomotives, and siding extensions and other improved facilities as contemplated in the event the law's restrictions are removed, all as heretofore set forth in detail), defendant would have been able to handle the freight traffic which, during the period April 4 to 27, inclusive, 1940, moved over the lines between Yuma and El Paso via Gila and Lordsburg, and between Tucson and El Paso via Douglas, with 378 fewer freight trains, producing 56,182 fewer freight-train miles, and 74,329 fewer locomotive miles, than would have been necessary if the law had been fully observed. Otherwise stated, compliance with the law during said period would have compelled defendant to operate 26.8 per cent more

freight trains, and to produce 29.0 per cent more freight-train miles, and 33.4 per cent more locomotive miles, than would otherwise have been required. 12,023, or approximately 21.4 per cent of said 56,182 additional freight-train miles, were or would have been produced extra-territorially: i.e., in the states of New Mexico and Texas.

Sines, R. 3169-3172, 3199, 3350-3355, 3402-3413.
Exhibits 186, 214, 215, 220, 226, 233, 234, 235, 236, 240, 242, 245, 259, 299, 315, 316.

(2) Passenger train operations.

The law is completely restrictive in holding the lengths of defendant's passenger trains in the districts between [fol. 6180] Yuma and Lordsburg and Tucson and Rodeo to a maximum of 14 cars, and is generally restrictive, extra-territorially, as far west as Los Angeles, and as far east as El Paso. Thus in 1939, no long passenger trains were operated in either direction between Yuma and Lordsburg or Rodeo; while only 12.19 per cent of the eastward passenger trains from Los Angeles to Yuma, and only 3.08 per cent of the westward passenger trains from Yuma to Los Angeles were long trains. Between Lordsburg and El Paso only 1.30 per cent of the trains were long trains.

Solely because the law thus restricts its passenger trains to the 14-car maximum, defendant is compelled to operate many more such trains than would otherwise be required, and as a result to produce a substantial volume of additional and unnecessary passenger-train miles and locomotive miles. In 1938, as shown by the passenger redispatching study, 33 additional and unnecessary sections of passenger trains were operated in the affected territory, involving the production of 14,218 additional train miles and 18,860 additional locomotive miles. 3,902 of said additional passenger train miles and 5,042 of said additional locomotive miles were produced outside of Arizona.

If it were not for the law, defendant could and would operate many more long passenger trains in the affected territory, corresponding in lengths to the trains operated on other portions of its system. The operation of such long passenger trains in Arizona, and in the affected territory generally, is entirely practicable; as is shown, *first*, by the fact that in 1940 defendant actually operated long passenger trains in Arizona on 62 occasions, producing

within the state 15,857 long-train miles, and 243,749 car miles (the average length of the long trains thus operated having been 15.37 cars, and a considerable number of said [fol. 6181] trains having contained 16 or more cars each); *second*, by the fact that on defendant's principal main lines, other than those across Arizona, passenger trains of more than 14 cars, and in fact frequently containing 17 cars or more, are commonly and regularly operated. The operation of long passenger trains on the main lines of defendant's system generally has heretofore been found to be the usual and ordinary practice. On the line across Nevada and Utah, for example, in the year 1939, long passenger trains constituted 43.79 per cent, and trains of 17 cars or more 18.24 per cent, of the entire number operated.

Sines, R. 2495-2499, 3327-3340, 3346-3349, 3426-3432.
Exhibits 187, 188, 230, 231, 232, 246.

(d) Increased annual expense of operation, etc., imposed by the law:

The enforcement of the law against defendant, and defendant's consequent compulsory compliance therewith, causes and will continue to cause additional operating and other expenses to be imposed upon and incurred by defendant, solely by reason of said law, amounting to not less than $394,900 per year; all of which expense is and will continue to be recurring, and irreparable, and could and would be saved and avoided if defendant were relieved of the law's restrictions.

Said sum of $394,900 per year represents the difference between the operating and other expenses, based upon operations during the year 1938, actually incurred by defendant in the affected territory, under the short-train method of freight and passenger train operation heretofore and presently followed; and the corresponding expenses which would be incurred, also based upon the handling of the 1938 traffic volume, in said affected territory, [fol. 6182] if the law were repealed or set aside, and defendant were thereby enabled to adopt and follow the long-train method of operation.

The following are the items as to which the amounts of the potential savings have been definitely determined and shown of record:

(1) Savings in operating expenses in freight service, said expenses including only those incurred for

locomotive fuel, and trainmen's and enginemen's wages, amounting to $397,515 per year.

(2) Savings in passenger-train operating expenses (said expenses including those incurred for locomotive fuel, trainmen's and enginemen's wages, enginehouse expenses, other locomotive supplies, and locomotive repairs), amounting to $10,884 per year.

(3) Annual interest, maintenance, and depreciation charges, amounting to $8747 per year, upon the additional investment in twenty-one cabooses, which said cabooses are required in the affected territory solely because of the additional freight trains compelled to be run because of the law, and as heretofore found, would not be required if the law were set aside.

These itemized savings in current expenses and charges, totaling $417,146, would be partially offset by increases in annual interest and maintenance charges upon certain equipment and facilities which, as stated in finding IX (b), defendant would construct or acquire in order to conduct long freight-train operations readily, efficiently, and economically; such increased annual charges being as follows:

[fol. 6183] (1) Interest and maintenance charge upon extensions of various yard tracks and sidings in the affected territory, amounting to $40,009 per year.

(2) Interest and depreciation charges upon the increased investment in larger locomotives, which defendant would use in freight service in the affected territory, in lieu of the locomotives presently in use, amounting to $19,606 per year.

(3) Interest and maintenance charges upon the expanded roundhouse, water service, and shop facilities necessary to provide for the proper servicing and maintenance of such larger locomotives, amounting to $28,137 per year.

The total of such offsetting charges amounts to $87,752 per year, which figure, subtracted from the foregoing total of itemized annual savings, amounting to $417,146, leaves a net annual saving in expenses, which defendant could realize by adopting long-train operation in the affected territory, amounting to $329,394.

In addition to said sum of $329,394, defendant also presently incurs further annual expenses, by reason of the law, not included in said sum, over and above those which would be incurred if it were not for the law, on account of repairs to locomotives used in freight service in the affected territory. The record indicates that the added expense for such freight locomotive repairs, which is therefore an additional amount which would be saved by the adoption of long-train operation in said territory, is not less than $65,500 per year. The total amount of the added annual expense which the law thus imposes upon defendant is therefore not less than $394,900.

[fol. 6184] *Extra-territorial portion of the added expense imposed by the law:* A substantial portion of said additional annual expense imposed by the law is and will continue to be incurred outside of Arizona, because associated with or occasioned by the aforesaid changes in or additions to defendant's operations, in those portions of the affected territory lying wholly within California, New Mexico, and Texas, which are brought about or necessitated solely by the restrictions of the law. This extra-territorial expense can be and has been accurately computed, by determining the amount and proportion of the total additional train service (measured in train miles) compelled by the law, which is performed outside of Arizona. The extra-territorial portion of the aforesaid net additional annual expense of $394,900 includes particularly the following:

(1) Additional freight operating expenses, associated 151,789 additional extra-territorial freight-train miles, amounting to $75,712 per year.

(2) Additional passenger operating expenses, associated with 3902 additional extra-territorial passenger-train miles, amounting to $3,319 per year.

The aggregate of said additional extra-territorial expense amounts to $79,031 per year, to which is to be added the additional expense of repairs to freight locomotives incident to the additional freight-train service outside of Arizona compelled by the law; which expense, as indicated by the record, is not less than $15,569 per year.

The total of the compelled additional extra-territorial expense is therefore $94,600.

The redispatching studies for the month of April, 1940, heretofore mentioned, confirm closely the foregoing figures [fol. 6185] of compelled additional annual expense, both in the aggregate, and as incurred outside of Arizona.

Exhibits 209, 224, 225, 229, 231, 232, 250, 251, 252, 253, 254, 256, 257, 258, 259, 299, 317, 318.

XI

Slack and Slack-Action in Trains: Nature, Cause and Effects

(a) Description of draft rigging.

Freight and passenger cars and trains are coupled together by means of devices known as couplers, a coupler being located at each end of each car. Each coupler is attached to a draft gear, the latter being in turn attached to the underframe, which carries the body of the car. The couplers provide non-rigid connections between the several units (the locomotive and cars) which comprise the train. The purpose of the draft gear, as hereinafter more fully explained, is to afford a controlled resistance, effective when required to cushion and absorb the striking and pulling shocks of coupling, starting, stopping, and train movement generally, and thereby to protect the car structure and the lading within the car from injury and damage. The coupler and draft gear, with necessary connections and attachments, are collectively termed the draft rigging.

When freight cars are coupled together, there exists at the coupler faces a small amount of play or free motion (varying from 7/8 inch to 1 1/8 inches), as between each pair of coupled cars. This is provided for in the construction [fol. 6186] of the couplers themselves, and is necessary to the proper operation of freight trains, in that it permits the lateral and vertical movements occurring when trains round curves, pass over dips and humps in track, and, in starting, assists in enabling cars to be moved successively instead of simultaneously, which would be required if couplings were solid.

In addition to the free motion at the coupler faces, there is the controlled motion (heretofore also referred to as "controlled resistance") which exists in the draft gears themselves, and is controlled by the spring-actuated friction members, or by springs alone, which form the essential working parts of the draft gears.

Exhibit 210.

(b) Action of Draft Gears.

Draft gears presently in use on freight cars are of two general types: (1) the friction type, which uses both springs and friction members; (2) the tandem-spring type, which employs heavy springs, but has no friction members. All of defendant's freight cars (including, for this purpose, refrigerator cars owned by Pacific Fruit Express Company) used in interchange service are equipped either with approved types of friction draft gears, or with tandem-spring draft gears; and, as heretofore found, by far the greater proportion of such cars are equipped with friction gears.

Whenever a push or impact, as, for example, in the coupling of cars, or a pull, as for example, in the starting [fol. 6187] of a train, is given to an individual car, that push or pull is transmitted first to the coupler itself, and then through the coupler shank to the draft gear, and thereby causes the draft gear to be compressed. Because of the construction of the draft gear, compression takes place in the case of pull as well as upon push, or so-called "buff". When force is applied to the coupler with sufficient rapidity to produce shock, the draft gear absorbs the shock to the limit of its capacity, and dissipates this shock energy, through the absorptive power of the springs and the heat created by the operation of the friction members. The standard type of friction draft gear required the application of from 300,000 to 500,000 pounds of "buffing" or pulling force at the coupler face, in order to produce complete closure of the draft gear; i.e., in order to produce the maximum amount of motion or "controlled resistance" of which the draft gear is capable. The

total amount of motion of which a standard friction type of draft gear is capable, in the event of the application of force sufficient to cause complete closure, is 2¾ inches from the mean or normal position. The potential motion of a tendem-spring draft gear is about 2 inches, from normal position to complete closure; and this may be developed by application of from 60,000 to 65,000 pounds pressure.

Leriche, R. 74-77, 87; *Cartmill*, R. 1781-1792; *Bohnstengel*, R. 3090-3108, 3111-3113, 3115-3116, 3139-3142; *Barker*, R. 3440-3441.

Exhibits 2, 210, 247.

(c) Slack and Slack-Action Defined.

By the term "slack", as used herein, is meant the amount of the movement, including both the free motion at the coupler faces and the "controlled resistance" in the draft [fol. 6188] gears, which may take place, between the coupled cars of a moving train. By the term "slack-action", as used herein, is meant the accumulated effect of such motion, as it may be created or brought into play as the result of train operations. Slack and slack-action exist and occur in trains of all lengths.

(d) Factors Affecting Slack-action: Amount Developed in Operation.

There are a number of factors affecting the amount and severity of the slack action which may take place in a freight train, at any particular time while the train is in motion. Thus, for example, when a train is in motion, immediately after starting from a standstill, the draft riggings in the head portion of the train will be extended, so as to increase the distance between cars somewhat more than if the cars were standing free. In the center and rear portion of such train, however, the draft gears would be but slightly extended, if at all, although the free slack at the coupler faces would be completely stretched. If an emergency application should take place, even though at or near the head end of the train, the potential slack-action which might be developed could not exceed the amount of the increased distance between cars, created by the compression of the draft gears due to the starting effort of the locomotive, plus the amount by which the draft gears might be compressed in the opposite direction upon stopping, plus whatever free slack might

be developed at the coupler faces. The total amount o slack thus created normally would not exceed, on the aver age, more than about 6 or 7 inches per car throughout th train.

In general, more slack, and consequently greater slack action in the event of an emergency, may be developed whe a train is at low speed, accelerating from a stop, than woul [fol. 6189] be developed in the same train while proceedin at normal road speed between stations; both because o the momentum developed at higher speeds; and furthe because when trains are in motion, the draft gears tend b their action to adjust the slack.

The grade upon which a train is proceeding has a susbtan tial effect upon the slack, and consequently upon the slack action; if a train is proceeding against an adverse grade the tendency is for the slack to be somewhat more stretche than if the train were on level track; whereas if a train i proceeding down-grade, the slack will be bunched or com pressed to a much greater extent than on level track.

Whether a train is accelerating or decelerating likewis has a substantial effect upon the slack, and the consequen slack-action. As above stated, if a train is moving from stop, or is attaining a higher speed, the tendency is for th slack to become somewhat more stretched than if the trai is slowing down, or preparing to stop, or is about to stop.

The speed of the train, the extent to which the slack i extended or bunched, the consist of the train whether al loads or empties, and if partly loads and partly empties, th position of the loads and empties, and the action taken b the engineer, have a very definite effect upon the slack action. It appears that normally the slack-action at th rear of a freight train is more severe, at speeds of 10 mile per hour or less, than at ordinary road speeds of 30 to 4 miles per hour, other conditions as to consist of train, grade and length of train being equal. If a train consists of loads slack-action will be less severe than if the train consists o all empties, because the braking power upon the loaded car is much less, in proportion to the weight thereof, and th momentum of the loads is greater, than in the case o [fol. 6190] empties. If the train consists partly of load and partly of empties, and the loads are at the head end o the train, the slack-action at the rear will be less severe tha if the empties were at the head end of the train and the load behind.

The extent and amount of the slack-action in a freight train in operation, and whether the slack is extended or bunched, are to a large degree within the control of the engineer, who is able, by manipulation of the air brakes, and the power of the engine, and by taking into account the grades upon the track over which the train is running, so to handle the train as to avoid any severe shock or slack-action at the rear of the train, in ordinary operation.

It is not true, as apparently contended by plaintiff, that the amount and severity of slack-action occurring in a freight train depend solely upon the number of cars in the train. Said contention takes into account only the number of cars comprising the train, but fails to take account of any of the other factors affecting slack-action shocks and the severity thereof, heretofore mentioned; namely, grades, speed of trains, consist of trains, whether the cars therein are loaded or empty, and if loaded, the weight of the loads, and the control exercised and exercisable by the engineer.

It is likewise not true that the Train-Limit Law, by restricting the lengths of freight trains, either eliminates or substantially reduces the number or severity of the casualties attributable to slack-action shocks in cabooses or other cars at or near the rear end of trains. The evidence indicates that in the operation of long trains, there have been many instances of severe jerks and jolts occurring at the rear end of the train because of slack-action, and that in-[fol. 6191] juries have been suffered by brakemen and conductors as a result thereof. The record contains many similar instances occurring in connection with the operation of short trains. It is also shown that emergency stops of long trains have taken place, without causing any severe slack-action shocks to the caboose or injuries to the occupants thereof. Emergency stops of short trains have occurred, accompanied by severe slack-action shocks to the caboose and injury to the occupants thereof. The evidence shows that these different results, as herein indicated, on long and short trains arise because of the presence or absence, in the particular operation of the factors directly contributing to and controlling the severity of the slack-action.

(e) Slack-action in Passenger-train Operation.

The couplers and draft gears on passenger cars generally resemble those on freight cars, and perform similar functions. While slack and slack-action therefore also exist and occur upon passenger trains of all lengths, it does not appear from the testimony that the emergency stops or other circumstances by reason of which such slack-action may be developed are more frequent or the resulting shocks any more severe, on long than on short passenger trains; nor does it appear that the slack-action occurring in passenger-train operations, whatever the train length, is of sufficient severity to cause serious injury or damage.

[fol. 6192] From the standpoint of the safety of persons and property, slack and slack-action on passenger trains are of no significance whatever.

XII

Safety of Operation as Affected by Train Lengths: Accident and Casualty Statistics

(a) Accident Reports to Interstate Commerce Commission.

Pursuant to the Accidents Reports Act (36 Stat. 350; U. S. Code, Title 45, Secs. 38 et seq.) the Interstate Commerce Commission has for many years required monthly reports of railway accidents, in considerable detail, on forms prescribed by the Commission and filed under oath by the carrier. Those reports are annually summarized in accident bulletins published by the Commission in statistical form, wherein the accidents so reported are tabulated and segregated in great detail by classes and causes, and in

accordance with the classification of accidents contained in the Commission's rules for reporting accidents.

Reportable railway accidents are divided into three primary groups: train accidents, train-service accidents, and non-train accidents. Reportable train accidents are those—with or without casualties—that arise in connection with the operation or movement of trains, locomotives or cars, and result in damage to the equipment or other railway property in excess of $150, including cost of clearing the [fol. 6193] wreck and local expense of transferring lading (but not damage to lading). Reportable train-service accidents are those that arise in connection with the operation or movement of trains, locomotives or cars, and result in casualties to persons, but not damage to equipment or other railway property in excess of $150 as just defined. Reportable non-train accidents are those that do not result directly from the operation or movement of trains, locomotives or cars.

A casualty is not reportable unless it results in the death of a person, or injury to an employe, either on or off duty sufficient to incapacitate him from performing his ordinary duties for more than three days in the aggregate during the ten days immediately following the accident, or injury to a person other than an employe (which includes passengers) if the injury is sufficient, in the opinion of the reporting officer, to incapacitate the injured person from following his customary vocation or mode of life for a period of more than one day. Train accidents and train-service accidents are reported on a form prescribed by the Commission and designated as Form T, a separate sheet being used for each reportable train accident or train-service accident.

All of the statistical showings of train and train-service accidents received in evidence were based on the statistics of accidents actually reported to that Commission or reportable to that Commission. The Nevada statistics of accidents and casualties on defendant's lines included with those reported to the Commission a few that were reportable under the rules of the Commision, but through inadvertence had not been reported, although a record thereof was in the defendant's files.

Sullivan, R. 3559-3571, 3582, 3611, 3883-3886.
Exhibits 9, 260, 261.

[fol. 6194] (b) Bases for Computing Accident and Casualty Rates:

Train accidents with or without casualties, or casualties alone, may be measured, as to their frequency, on the basis of locomotive miles, train miles, or car miles operated; casualty frequency may also be measured against man hours worked, or man miles traveled. In its published accident statistics the Interstate Commerce Commission measured train accidents against locomotive miles, and casualties against locomotive miles and man hours; in addition to those bases the railroads of the United States, including defendant, use both the train mile and the car-mile basis. Man hours and train miles are commonly used as bases for measuring casualty frequency in relation to the exposure of employes to injury. The car-mile basis is used and is appropriate to determine casualty frequency in relation to the volume of traffic moved. The locomotive mile is also a satisfactory basis for comparing the frequency of casualties sustained in train and train-service accidents in all classes of service, because all classes of train service accumulate locomotive miles; whereas certain classes of service, such as yard service, and light-engine movements, do not accumulate train miles or car miles.

A train mile is the movement of a train a distance of one mile. A locomotive mile is the movement of a locomotive a distance of one mile, under its own power. A car mile is a movement of a unit of car equipment a distance of one mile. Man hours represent the period, expresed in hours of time, that employes are on duty. A man mile represents a mile that an employe actually travels on duty. The term "casualty" as used in these findings includes both deaths and personal injuries, and, unless otherwise specified, means a casualty reportable to the Interstate Commerce [fol. 6195] Commission under its Rules for Reporting Accidents.

Sullivan, R. 3574-3579, 3612-3614, 3659-3661, 3663-3664, 3693, 3720-3723.

(c) National Accident and Casualty Statistics:

Tables are in evidence which were compiled from the published statistics of the Interstate Commerce Commission for the years 1923-1939, inclusive, and which relate to the frequency of reported accidents and casualties on all of the

Class I railroads of the United States. The increase in the length of trains on Class I railroads of the United States during that seventeen-year period has been dealt with in Finding VIII (b) ante.

Exhibits 262 to 271 inclusive, 312.

(1) All Employes:

The tables referred to show that accompanying the increase in the length of trains on Class I railroads from 1923 to 1939, there has been a continuous and marked downward trend in the frequency of casualties to all classes of railroad employes on duty sustained in train and train service accidents; casualty rates being for 1923, 8.24 per million man hours, 22.79 per million locomotive miles, 32.15 per million train miles, and 136.0 per 100 million car miles; and for 1939, 2.87 per million man hours, 5.64 per million locomotive miles, 7.87 per million train miles, and 26.58 per 100 million car miles. For the six year period 1923-1928 the average casualty rates were 7.08 per million man hours, 18.49 per million locomotive miles, 26.02 per million train miles, and 102.04 per 100 million car miles; and these rates declined to the following during the five-year period 1935-1939: 3.12 per million man hours, an improvement of 55.93 [fol. 6196] per cent as compared with the earlier period; 6.15 per million locomotive miles, a corresponding improvement of 66.74 per cent; 8.59 per million train miles, a corresponding improvement of 66.99 per cent; and 30.28 per 100 million car miles, a corresponding improvement of 70.33 per cent.

Sullivan, R. 3571-3574, 3886-3889.
Exhibit 262.

(2) Road Trainmen and Enginemen on Duty, All Classes:

Considering casualties sustained only by road trainmen and enginemen on duty in train and train-service accidents in all classes of service on Class I railroads during the same 17-year period, the 1923 rates were 43.34 casualties per million man hours, 17.38 per million train miles, and 73.52 per 100 million car miles; in 1939, the corresponding rates were 12.87 per million man hours, 4.13 per million train miles, and 13.94 per 100 million car miles. Comparing the rates for the 6-year period 1923-1928 for these casualties with the corresponding rates for the 5-year period 1935-

1939, there were the following improvements: in the rate per million man hours from 32.12, for the earlier period, to 14.16 for the later period, or 55.92 per cent; in the rate per million train miles from 13.54 to 4.64, an improvement of 65.73 per cent; and in the rate per 100 million car miles from 53.11 to 16.35, an improvement of 69.21 per cent. The term "road trainmen and enginemen" includes conductors, brakemen, flagmen, train baggagemen, engineers and firemen, engaged in passenger, freight or work service, but does not include engine hostlers.

Sullivan, R. 3585-3589.
Exhibit 263.

[fol. 6197] (3) Road Freight Trainmen and Enginemen on Duty:

Considering casualties sustained only by road freight trainmen and enginemen on duty in train and train-service accidents on Class I railroads of the United States during the same 17-year period, the casualty rates declined as follows: from 39.55 per million man hours in 1923, to 14.68 in 1939; from 26.83 per million train miles to 6.51; from 70.60 per 100 million car miles to 13.44. Comparing the six-year period 1923-1928 with the five-year period 1935-1939, the improvements in the average casualty rates were as follows: from 34.42 per million man hours in the earlier period, to 15.91 in the later period, or 53.78 per cent; from 21.30 per million train miles to 7.21, or 66.15 per cent; and from 50.68 per 100 million car miles to 15.55, or 69.32 per cent.

Sullivan, R. 3589-3592, 3891.
Exhibit 264.

(4) Road Freight Conductors, Brakemen and Flagmen:

Considering only those casualties sustained by road freight conductors, brakemen and flagmen on duty on Class I railroads of the United States, occurring in train and train-service accidents, it is shown that over the period of 17 years above mentioned there has also been a general downward trend from year to year in the number of such employes killed as well as those injured, whether considered in the absolute number or in the casualty rates measured against either man hours worked or train miles or car miles accumulated. Thus in 1923 there were 12,232 such casual-

ties, 322 being fatal; in 1939 there were 2,380 such casualties, 86 being fatal. In 1923 the casualty rates were: 45.33 per million man hours, 18.02 per million train miles, 47.42 per 100 million car miles; and in 1939 those rates were 20.33 per million man hours, 5.15 per million train miles, and [fol. 6198] 10.64 per 100 million car miles. Comparing the average casualty rates for the five years 1935-1939 with the earlier six years 1923-1928, the improvement or decrease in the casualty rate per million man hours is 48.15 per cent; in the rate per million train miles, 62.72 per cent; and in the rate per 100 million car miles, 66.21 per cent.

Sullivan, R. 3593-3595.
Exhibit 265.

(5) Conductors, Brakemen and Flagmen—Slack Action:

Casualties due to sudden stop, start, lurch or jerk of train or car sustained by road freight conductors, brakemen and flagmen on duty in train-service accidents on all railroads of the United States, when related to the number of freight train miles or freight train car miles accumulated, show a similar substantial and generally continuous downward trend. Thus the casualty rate per million train miles for the six-year period 1923-1928, for this type of accident, was 2.75, and for the five-year period 1935-39, it was 1.05, an improvement or decrease of 61.82 per cent. The corresponding casualty rates per 100 million car miles were for 1923-1928, 6.54; for 1935-1939, 2.27, an improvement of 65.29 per cent. The decrease in the absolute number of the casualties of this type is equally marked. Thus, in 1923, approximately 25,800,000,000 freight-car miles were accumulated, and there were 1,957 casualties to road freight conductors, brakemen and flagmen occurring in train-service accidents caused by sudden stop, start, lurch or jerk of train or car; in 1939 there were approximately 22,400,000,000 freight-train car miles accumulated, but the casualties of the type just described had declined to 399, only three of which were fatal.

The relative unimportance of the type of casualty particularly referred to in this sub-finding is shown by the com- [fol. 6199] parison of the total number of such casualties to the total number of casualties to all classes of employes on duty. In the five-year period 1935-1939 there were 37,346 casualties to all classes of employes on duty, sus-

tained in train and train-service accidents on Class I railroads of the United States. In the same period there were but 2,473 casualties of the so-called "slack-action" type sustained by road freight conductors, brakemen and flagmen, on all railroads (including other than Class I) of the United States. In the year 1939 there were 6,713 casualties to all classes of employes on duty on Class I railroads sustained in train and train-service accidents; but only 399 so-called "slack-action" casualties to road freight conductors, brakemen and flagmen on all United States railroads. The fatalities in train and train-service accidents in 1939 numbered 353; but there were only three "slack-action" fatalities.

Exhibits 262, 266.

(6) Passengers on Trains:

Casualties to pasengers on trains, sustained in train and train-service accidents on Class I railroads of the United States, have likewise shown a generally downward trend during the 17-year period 1923-1939. In the six-year period 1923-1928 the average casualty rate per million passengers carried was 5.16; the average per 100 million passenger miles accumulated was 12.91. In the five-year period 1935-1939 the average casualty rate per million passengers carried was 5.00, an improvement of 3.10 per cent as compared with the earlier period; and per 100 million passenger miles, 1063, an improvement of 17.66 per cent, as compared with the earlier period.

Sullivan, R. 3611-3615.

Exhibit 267.

[fol. 6200] (d) Train Accidents—National:

These acidents involving property damage in excess of $150, with or without reportable casualties, are classified as collisions, derailments, locomotive-boiler accidents, other locomotive accidents, and miscellaneous train accidents. The total number of all types of train accidents in all classes of service, per million train miles, decreased from 17.38 in 1923-1928, to 8.05 in 1935-1939: an improvement of 53.68 per cent; and the number of head-on and rear-end collisions per million train-miles, has been reduced from .50 in 1923-1928 to .19 in 1935-1939: an improvement of 62.00 per cent.

The downward trend from year to year has been fairly

uniform. Fewer trains running on the road provide fewer opportunities for head and rear-end collisions and the number of locomotive boiler and other locomotive accidents necessarily is directly related to the number of locomotive miles run.

Train accidents caused by defects in or failure of equipment on all railroads of the United States, and the casualties to trainmen sustained in such accidents, greatly decreased during the 17 years 1923 to 1939. The total number of train accidents caused by defects in or failures of equipment has been steadily reduced from 11,822 in 1923 to 2,039 in 1939, or 82.75 per cent. Relating the totals by periods of years to the number of train miles operated, produces rates of 6.69 accidents per million train miles in 1923-1928, and of 3.06 in 1935-1939—an improvement or decrease of 54.26 per cent. Trainmen's casualties in these accidents did not exceed in any one of the years one casualty in five million train miles; the rate per million train miles in 1923 being .19, and in 1939, .05—an improvement or decrease of 74 per cent. Illustrating how few casualties [fol. 6201] are sustained in any year by trainmen in all reportable train accidents due to defects in or failures of equipment along with the generally continuous decrease from 1923 to 1939, it appears that in the year 1939, only 5 trainmen were killed, and only 41 trainmen were injured, or at the rate of but one such casualty for each 18,177,800 train miles operated.

Although during the period 1923-1939, covered by the National statistics in evidence, there have been substantial improvements in the road-bed and equipment of American railroads, it is clear from a consideration of all of the evidence in the case that a considerable part of the improvement in casualty rates on those railroads during the same period is directly attributable to the adoption and growth of the standard long-train method of handling freight and passenger traffic, because thereby a substantially less number of train units was operated than would have been operated for the same volume of traffic had not the long-train policy been followed.

Sullivan, R. 3626-3632, 5132-5138.
Exhibits 269, 390.

(e) Commission's Investigation of Train Accidents—National:

The Interstate Commerce Commission has a Bureau of Safety through which it conducts the investigations authorized by Section 3 of the Accident Reports Act. The Bureau summons and examines witnesses, investigates at the scene of the accident and elsewhere, and makes a detailed report and conclusions to the Commission, which officially publishes summaries of those reports quarterly and has done so at least since the year 1927. Such investigations have been held as to more than 90 per cent of col- [fol. 6202] lisions, derailments or other accidents which resulted in fatalities to passengers or employes.

Sullivan, R. 3634-3635.
Exhibits 270, 312.

(1) Freight train accidents:

During the twelve-year period, 1928-1939, the Bureau investigated 1,002 train accidents, all of which are summarized in the Commission's said quarterly reports; of that number 561 involved freight trains, of which 298 were collisions, 206 were derailments and 7 were miscellaneous train accidents. Those accidents involved 728 freight trains, of which 574, or 78.8 per cent, consisted of 70 cars or less; of that 574 trains, 344 or 60 per cent, contained 40 cars or less.

Negligence of employes was the cause assigned by the Bureau for 349 of the accidents investigated involving freight trains, or 62.2 per cent of the 561 freight train accidents investigated. Of the number charged to negligence of employes 409 of the trains involved, or 82.0 per cent, consisted of 70 cars or less. Defects in or failures of equipment were charged with 79 freight-train accidents, an average of sligthly over 6.5 accidents per year, or 14.1 per cent.

Although under Section 3 of the Accident Reports Act the Commission is empowered to make and has frequently made such recommendations as it may deem proper, it did not on any of the quarterly reports for the twelve years 1928-1939, above referred to, find that the length of a train had any bearing on the accident, or that the accident might [fol. 6203] have been avoided had a train been shorter, or

make any recommendations respecting train length. It made recommendations in many other respects.

Sullivan, R. 3636-3646.

Exhibits 270, 312.

(2) Passenger train accidents:

During the six-year period 1934-1939, the Bureau investigated 520 accidents; of that number, 232 involved passenger trains, of which 96 were collisions, 120 were derailments, and 16 were miscellaneous train accidents. Those 232 accidents involved 267 passenger trains, of which 261, or 97.8 per cent, consisted of 14 cars or less; of those 261 trains, 224, or 85.8 per cent, consisted of 11 cars or less.

Negligence of employes was the cause assigned by the Bureau for 112 of said 232 accidents involving passenger trains, or 48.3 per cent thereof. In the accidents charged to negligence of employes, 142 trains were involved; 139 of these trains, 97.7 per cent, consisted of 14 cars or less. Defects in or failures of equipment were charged with 7 passenger-train accidents, or 3 per cent of the total, all of them occurring on short trains. Collisions with vehicles at grade crossings were charged with 42, or 18.1 per cent, of said accidents, involving 43 trains; 42 of these trains, or 97.7 per cent, were short trains.

Six of said passenger train accidents investigated by the Bureau occurred on defendant's lines. In five of said accidents the trains involved, six in number, were short trains. The train involved in the other accident consisted of 16 cars; the accident was caused by a collision with a motor truck which was driven on the track directly in front of the approaching train. Of the five short-train accidents, two [fol. 6204] were charged to negligence of employes, two to collisions with motor vehicles driven on the tracks, and one to malicious tampering with the track.

Sullivan, R. 3646-3654.

Exhibits 271, 312.

(f) Accident Statistics—Defendant's Pacific Lines:

As hereinbefore found, defendant's railway system operations are in seven states, and except in Arizona it has carried forward the standard long freight and passenger train method of operation since its adoption as a policy in 1923.

(1) Employes on duty—all classes of service—train and train service accidents:

The annual totals of locomotive miles in all classes of service on defendant's lines has varied from a low figure of 32,851,000 in 1933 to a high figure of 58,090,000 in 1926. In the six years 1923-1928 the average number of locomotive miles per year was 53,279,000; and in the five years 1935-1939, the corresponding average was 46,305,000.

During the seventeen-year period 1923-1939 the number of casualties to all classes of employes on duty in all classes of service sustained in train and train-service accidents on defendant's lines has shown a generally and substantially declining tendency. Thus, in the year 1923 there were 806 such casualties, 36 of which were fatal; in the year 1939 there were 344 such casualties, 29 of which were fatal. The casualty rate, per million locomotive miles, during the six-year period 1923-1928 was 11.58; during the five-year period 1935-1939, 8.47; an improvement or decrease of 26.86 per cent.

Exhibit 272.

[fol. 6205] (2) Trainmen on duty—all classes of service:

The frequency of casualties to trainmen on duty in all classes of service on defendant's lines sustained in train and train service accidents has also substantially declined since 1923; the absolute number of such casualties has likewise shown a generally and substantially declining tendency. Thus in the year 1923 there were 659 such casualties, 16 of which were fatal; in the year 1939 there were 260, 11 of which were fatal. In the six-year period 1923-1928 the casualty frequency rates for this class of casualties were as follows: per million locomotive miles, 9.47; per million man hours worked, 2061; per 100 million car miles, 49.84. In the five-year period 1935-1939 the corresponding casualty frequency rates were: 7.01 per million locomotive miles, an improvement of 25.98 per cent as compared to the earlier six-year period; 17.61 per million man hours worked, an improvement of 14.56 per cent; and 30.82 per 100 million car miles, an improvement of 38.16 per cent. In 1939 the casualty rates per million man hours and per 100 million car miles (14.21 and 23.34, respectively) were lower than for any prior year of the 17-year period; the rate per million locomotive miles (5.74) was also lower

than for any prior year except 1932, when the rate was almost exactly the same (5.72).

Exhibit 273.

(g) Nevada and Arizona Casualty Statistics:

Tables were received in evidence which included statistics of train and train-service accidents in Arizona reported to the Interstate Commerce Commission. Other exhibits list and furnish the details of each reportable train and train-service accident in Arizona for the 18 years, 1923-1940, inclusive. By the exhibits and the oral testimony explana- [fol. 6206] tory thereof, as well as oral testimony relating to occurrences not resulting in train or train-service accidents, a clear and complete showing has been made of the defendant's operations in Arizona for 18 years, in so far as they have involved accidents or casualties.

The same showing has been made of train and train-service accidents on defendant's lines in Nevada, for the same period, by statistical tables and a detailed showing of all of those accidents reported by defendant to the Interstate Commerce Commission, including also a few such accidents which were reportable but through inadvertence were not reported. There were no reportable accidents in Arizona that were not reported.

In the sub-findings that follow as well as in those that have preceded it will be understood that when an accident or casualty is referred to, an accident or casualty reportable to the Interstate Commerce Commission is meant, unless otherwise stated.

Sullivan, R. 3675, 3681, 3683.
Exhibit 184.

(1) Propriety and significance of comparison of Nevada-Arizona casualty statistics on defendant's lines:

The physical characteristics of defendant's operations in Nevada, and the volume and character of traffic handled, are described in preceding Findings IIIc and IVc. The operating rules are, and in general have been, the same in both Nevada and Arizona, and operating methods differ only in the respect that since 1912 the defendant has generally observed in Arizona the restrictions of the train-limit law; while in Nevada it has operated its freight and passenger trains without such restrictions, and for some

years (Finding VI-b) has followed the "standard long train method of operation" defined in Finding I(c). The [fol. 6207] requirements of the Nevada Full Crew Law and the Arizona Full Crew Law are substantially the same as to the number of trainmen to be employed on trains in the two states.

See annotations to Proposed Findings III (c), IV (c) VII (a) (5).

The defendant's statistical showing of its operations in Nevada, particularly as related to train accidents and train service accidents, is uncontradicted and, when considered with the evidence as to Arizona train and train-service accidents, affords a fair and reliable basis of comparison between operations as a whole, as well as between a passenger-train operation limited to 14 cars, and a freight-train operation limited to 70 cars, exclusive of caboose, and a standard long-train operation, as to the hazard of accident (1) to passengers; (2) to all employes; (3) to freight-train employes; and (4) to freight-train employes from so-called slack action. It clearly appears that the enforcement of the Arizona Train-Limit Law has not been accompanied by any measurable decrease in so-called slack-action casualties, as compared with the standard long-train method of operation, but has been accompanied by a greater proportion or ratio of casualties to passengers, and to all employes, as well as to freight-train employes, from all causes that lead to train and train-service accidents.

From 1929 to 1940 the operation of long freight trains in and through Nevada has greatly predominated. The year 1923 showed a partial beginning of increase in the length of trains in that State, and it assumed greater proportions each year until 1928. Prior to 1926, the operation of short trains greatly predominated.

[fol. 6208] (2) All classes of employes—all classes of service:

Comparing Nevada and Arizona, as to all casualties to all classes of employes on duty, in all classes of service, sustained in train and train-service accidents over the 16-year period from 1923 to 1938, inclusive, the showing is considerably more favorable to Nevada in each of the years when the casualties in absolute number are considered, as well as when they are related to a common basis of measure

ment—the locomotive mile. That is particularly true during the 11 years, 1929 to 1938, inclusive, and 1940. The comparison for the year 1939 would lead to the same result, except that the Nevada casualty rates and totals are greatly distorted because of a derailment of a 14-car passenger train at Harney, Nevada, on August 12, 1939, which was found by the Bureau of Safety of the Interstate Commerce Commission to have been due to malicious tampering with the track, and caused the death of 13 and the injury of 12 employes. During the period 1923 to 1939, all freight trains in Arizona have been restricted by law to 70 cars exclusive of caboose; in Nevada, freight trains of substantially more than 70 cars have greatly predominated since 1929.

Arizona operations show casualty rates, based on the number of train and train-service casualties, to all classes of employes, per million locomotive miles, ranging from 1.2 times higher in 1923, to 4.0 times higher in 1935, and 1.9 times higher in 1940 than the corresponding rates in Nevada. The Arizona rate has been higher in each of the 17 years, 1923-1938, inclusive, and 1940. For the six years 1929-1934 in Nevada, when train lengths were steadily increasing and long trains predominated, the average casualty rate was twice as favorable as in Arizona, where the length of trains, both freight and passenger was restricted by law. For the six years 1935-1940, and despite the distortion due [fol. 6209] to the casualties occurring in the Harney derailment, the Arizona casualty rate was still almost twice (1.86 times) the Nevada rate. The rate of improvement over that period of years has also been more rapid in Nevada than Arizona, the casualty rate on a locomotive-mile basis having improved 46.7 per cent in Nevada, against 38.7 per cent in Arizona, comparing the six-year period 1935-1940 with the six-year period 1923-1928. There were no fatalities to employes on duty in Nevada during 1933, 1934, 1935, or 1938, and only one in 1940; while in Arizona there were: one in 1933, two in 1934, one in 1935, one in 1938, and none in 1940. Considering the 18 years, 1923-1940, inclusive, there were 43 employes on duty killed in Nevada (including 13 killed in the Harney derailment on August 12, 1939), and 33 killed in Arizona; there were 406 employes on duty injured in Nevada, and 968 in Arizona—or 2.4 times as many in Arizona as Nevada; although the locomotive miles during that period were 70,678,000 in Nevada, and 90,734,000 in Arizona. During the six years, 1935 to 1940, inclusive,

there were more than three times as many injured in Arizona as there were in Nevada, although the locomotive miles during that six years were 21,757,000 in Nevada, and 30,970,000 in Arizona.

Sullivan, R. 3688-3691,
Exhibits 274, 275, 276, 289, 290, 391, 392.

(3) All classes of employes—road freight trains:

A comparison between Nevada and Arizona of casualties to all classes of employes on duty, sustained in train and train-service accidents in road freight-train operation for the years 1923 to 1940, inclusive, shows more favorably for Nevada in every year (1) when considered in their absolute number, except in the year 1923, (2) when related to freight-[fol. 6210] train miles, one of the measures of exposure of employes to injury, or (3) when related to freight-train car miles, a satisfactory and accepted basis for relating casualties to the movement of a given amount of traffic. During that eighteen-year period, there were 17 such employes on duty killed in Nevada, and 20 killed in Arizona. There were 291 such employes on duty injured in Nevada, and 526 in Arizona, or 1.8 times as many in Arizona as in Nevada. During the six years, 1929 to 1934, when the average length of freight trains was continually increasing in Nevada, and trains of substantially more than 70 cars predominated, and with practically no change in Arizona, only four such employes (one of them a conductor on a 67-car train struck by a passenger train) were killed in Nevada, against 5 in Arizona; there were 74 injured in Nevada, and 148 in Arizona—or exactly twice as many in Arizona as in Nevada. During the six years 1935-1940, when long-train operation continued to prevail in Nevada, only three such employes (one a conductor on a 57-car train, killed while on the engine detached from the train; the second a brakeman on a 70-car train; and the third a section foreman, killed by being struck by a 63-car train) were killed in Nevada, against 5 in Arizona; there were 53 injured in Nevada, and 132 in Arizona, or nearly 2.5 times as many in Arizona as in Nevada.

When these casualties are related to the number of freight-train miles operated, it is found that the casualty rate is higher in Arizona than in Nevada in every year, and reaches a figure three times as great in the year 1931, 2.4 times as great in 1935, and 1.8 times as great in the six years

1935-1940. The comparison is still more favorable to Nevada in every year, when the casualties are related to the freight-train car miles operated. The difference is not so marked in the years 1923 and 1924, when trains of less than [fol. 6211] 70 cars predominated in Nevada and when the average length of trains was less than in Arizona (1923, Nevada 49.47 cars, Arizona 56.45; 1924, Nevada 52.23 cars, Arizona, 55.49; but in the later years, the casualty rate on a freight-train car-mile basis ranged from 1.5 times as great in the year 1933 to 4.1 times as great in 1931; the rate in 1940 being 2.38 times as great in Arizona as in Nevada. The average rate for the six years 1923-1928 was 1.5 times as high; for the 6 years, 1929-1934, 2.1 times as high; and for the 6 years 1935-1940, 2.5 times as high, in Arizona as it was in Nevada. In both states there has been a downward trend in the casualty rate year after year, with some variations in certain years; but the percentage rate of improvement in the casualty rate in later years as against earlier years, both on a train-mile and on a freight-train car-mile basis, is more favorable in Nevada than in Arizona. Comparing the 6 years, 1929-1934, with the 6 years, 1923-1928, the casualty rate per million train miles decreased 43.4 per cent in Nevada against 35.4 per cent in Arizona, and on the basis of 100 million freight-train car miles, the decrease in Nevada was 54.4 per cent, against 38.4 per cent in Arizona. Comparing 1935-1940 with 1923-1938, the improvement on the train-mile basis was, Nevada 61.5 per cent, Arizona 49.2 per cent; on the car-mile basis, Nevada 71.1 per cent, Arizona 52. per cent.

Exhibits 274, 275, 277, 278.

(4) Road freight conductors, brakemen and flagmen:

As to the relative safety in Nevada and Arizona of Road Freight Conductors, Brakemen and Flagmen on duty, the decrease in casualties years after year, in absolute number as well as when related to the freight-train miles and freight-train car miles operated, has been slightly better [fol. 6212] than when all classes of employes on duty killed and injured in road freight-train operation is considered. During the 18-year period 1923 to 1940, inclusive, 11 Road Freight Conductors, Brakemen and Flagmen on duty have been killed in Nevada, and 15 in Arizona, and 257 have been injured in Nevada and 434 in Arizona—or 1.69 times as

many in Arizona as in Nevada; although the freight traffic, measured in freight-train car miles, was almost five per cent greater in Nevada than in Arizona. In every year except 1923, there were more casualties of this type in Arizona than in Nevada. An analysis of the comparisons between Nevada and Arizona for the last 6 years, 1935 to 1940, years of predominant long-train operation in Nevada, shows 2 killed in Nevada, both on short trains, and 5 killed in Arizona, or more than twice as many in Arizona as in Nevada, although the freight-train car miles were 3.8 per cent greater in Nevada than in Arizona. The casualty rate on a train-mile basis is more favorable in Nevada than in Arizona in every year except 1934, where the difference is only .61 (less than one casualty) per million freight-train miles. For the 6 years 1923-1928, the casualty rate on the freight-train mile basis was 1.3 times as high; for the 6 years 1929-1934, it was 1.5 times as high, and for the 6 years 1935-1940 it was 1.6 times as high in Arizona as in Nevada. The comparison between the two states of the casualty rates on the car-mile basis is more favorable to Nevada for every year except 1923, when the average length of trains was greater in Arizona than in Nevada. For the 6 years 1923-1928, the casualty rate on the freight-train car-mile basis was 1.5 times as high; for the 6 years 1929-1934 it was twice as high; and for the 6 years 1935-1940, it was 2.2 times as high in Arizona as in Nevada. The percentage rate of improvement in the casualty rates has been considerably higher in [fol. 6213] Nevada than in Arizona. Comparing the latest 6 years 1935-1940 with the earliest 6 years 1923-1928, the improvement or decrease in the casualty rate on a train-mile basis in Nevada was 58.8 per cent, against 50.3 per cent in Arizona; and on a car-mile basis in Nevada 69.1 per cent, against 53.3 per cent in Arizona.

Exhibits 278, 279.

(5) Slack-action casualties to trainmen, Nevada-Arizona:

Plaintiff bases its contention that the train-limit law is a safety statute almost entirely on the theory that it will minimize or greatly lessen the so-called "slack-action" or "slack-surge" accident—a form of accident classified by the Interstate Commerce Commission as being caused by a shock incident to a sudden starting, stopping, lurch or jerk of the train. Casualties resulting from this type of accident

are confined almost entirely to road freight conductors, brakemen and flagmen on duty, occur most frequently when they are in the caboose, occasionally when on top of the train, and infrequently when they are on the side of a car or caboose, or attempting to board or leave a car or caboose. The train-limit law has been observed long enough, and under such circumstances, as to afford a fair basis for judging whether a law limiting the length of a freight train to 70 cars, exclusive of caboose, can be said to be reasonably effective in the prevention or minimization of slack accidents and incident casualties. It clearly appears, and it is hereby found, that said law has not had that effect in Arizona, as to the defendant's freight-train operations in that state, either when they alone are considered, or when they are compared with defendant's freight-train operations in Nevada.

There is in evidence a reliable statistical comparison of defendant's freight-train operations as between the states [fol. 6214] of Nevada and Arizona, and as to the occurrence of "slack-action" casualties, for the 18-year period, 1923-1940, inclusive.

Considering the casualties in their absolute number during that period, there were more on short trains, in Arizona, than there were on long trains in Nevada; there being 101 such casualties, including one killed, on short trains, in Arizona, and 94 casualties, none of whom were killed, on long trains in Nevada. Analyzing the combined total number of this particular type of casualty occurring in both states, it is shown that there were 125 such short-train casualties; 101 in Arizona and 24 in Nevada (including 2 killed, one in Arizona and one in Nevada); against 96 such long-train casualties (none fatal), 94 in Nevada and 2 in Arizona; or 31 per cent more casualties on short trains than on long trains. During the 12 years 1929-1940, inclusive, there were 61 casualties of this type in Nevada and 62 in Arizona, although the traffic measured in freight-train car miles was 5 per cent greater in Nevada.

This type of casualty is of comparatively infrequent occurrence. There were no reportable casualties from "slack" and "slack-surge" accidents in Nevada during the eleven months, October 13, 1930, to September 20, 1931; none during the six months December 18, 1932, to June 22, 1933; none during the five months, March 1, 1935 to August

12, 1935; none during the five months January 11 to June 21, 1937; none during the 11 months, December 6, 1937 to November 17, 1938; none during the eight months February 14 to October 10, 1939. There was but one reportable slack or slack-surge accident to a conductor, brakeman, or flagman on Defendant's lines in Nevada during the period of almost two years from October 13, 1930, to July 13, 1932. In Arizona there were no such casualties during the seven months from May 29 to December 28, 1932; none during the [fol. 6215] thirteen months from October 29, 1933, to November 26, 1934; none during the twelve months from July 20, 1935, to July 5, 1936; none during the six months from December 25, 1937, to June 16, 1938; and none during the ten months from August 6, 1938, to June 1, 1939. There was only one such casualty in Arizona during the period of sixteen and one-half months from October 29, 1933 to March 9, 1935.

Another index of infrequency is the high percentage of days in the year when no accidents of this type causing casualties have occurred. In Nevada there were 359 such days in 1929; 358 in 1930; 364 in 1931; 361 in each of 1932, 1933, 1934, 1936 and 1937; 362 in each of 1935, 1939, and 1940; and 363 in 1938. Reduced to a percentage basis, it thus appears that on about 98.9 per cent of the days of the twelve-year period 1929-1940, no casualties of this class occurred in Nevada. In Arizona there were 360 such days in 1929; 354 in 1930; 357 in 1931; 362 in 1932; 361 in 1933, 1935 and 1939; 364 in 1934; 363 in 1936 and 1938; 358 in 1937, and 365 in 1940. On a percentage basis, there were about 98.8 per cent of the days during the twelve-year period, upon which no casualties of this class occurred in Arizona.

The casualty rate for said type of accident, on either a train-mile basis or car-mile basis for any one year, fluctuates greatly on account of the relatively small number of such accidents, and the infrequency with which they occur: for example, the casualty rate, on a train-mile basis, for the year 1939, was 1.65 in Nevada, and 1.56 in Arizona, a difference of only .09 casualty per million train miles in favor of Arizona. However, on a car-mile basis of comparison, the difference of .72 casualty per 100 million freight-train car miles (Nevada, 2.08, and Arizona, 2.80) is more favorable to Nevada.

[fol. 6216] Comparing the six years, 1935-1940, inclusive, with the earlier six years, 1923-1928, inclusive, there has

been a decrease of 30 casualties of this type in Nevada, and a decrease of 17 casualties in Arizona. On a train-mile basis, previously described as one of the commonly used measures of exposure of employes to injury, the casualty rates show a 43.3 per cent improvement in Nevada, and 44.6 per cent improvement in Arizona. On a freight-train car-mile basis, a recognized and proper measure of the casualty frequency against volume of traffic moved, the decrease in Nevada was 57.5 per cent, and in Arizona 47.7 per cent. For the 12 years, 1923-1934, inclusive, when short-train operations predominated for the earlier years, and the length of trains was steadily increasing until the operation of long trains became predominant in the later 6 years in Nevada, the average casualty rate, per million train miles was only slightly higher: .91 casualty (less than one) more, in Nevada than in Arizona; and per hundred million car miles the Nevada rate was .47 casualty less. When the comparison between Nevada and Arizona is confined to the 6 years, 1935-1940, inclusive, the casualty rate, based on the number of freight-train car miles operated, is less favorable in Nevada than Arizona, by but .24 (less than one-fourth casualty) per 100 million car miles.

The findings in this paragraph as well as the other evidence on the subject support the conclusion of fact, which is hereby adopted, that the "slack" or "slack-surge" accident is clearly shown to be a minor factor in determining whether the train-limit law here considered is a reasonable exercise of the state's police power.

Sullivan, R. 4023-4024.
Exhibits 274, 275, 280.

[fol. 6217] (6) Caretakers in cabooses—Nevada-Arizona:

Persons carried under contract in freight-train cabooses are usually livestock caretakers and messengers accompanying banana and other perishable shipments. In Nevada, during the 17-year period 1923-1939, there was one such casualty—a caretaker was injured in 1925, while walking over the top of a 54-car train; but no one was injured from slack action. During the same period there were 11 of such persons injured in Arizona on short trains, six of them by slack action on trains of 70 cars or less.

Sullivan, R. 3738-3743.
Exhibit 285.

(7) Serious casualties—Nevada-Arizona:

Comparing the freight-train operations in the two states for the period 1923-1939, as to their production of fatalities or amputation of limbs of freight conductors, brakemen and flagmen in train and train-service operations, it is found that there were, in Nevada, eleven deaths and four amputations, none of which occurred on a long train, except one amputation; while during the same period in Arizona there were nineteen deaths and four amputations, all of which occurred on short freight trains. Slack action was assigned as the cause of one death in Nevada, on a 60-car train, and one amputation. That cause was assigned for one death in Arizona on a 64-car train, and one subsequent fatality on a 66-car train; no amputation.

Exhibits 274, 275, 281.

(8) Casualties classified—Nevada-Arizona:

In further confirmation of the creation of additional hazard to road freight conductors, brakemen and flagmen [fol. 6218] by operating more train units than are necessary to carry a given amount of freight traffic the evidence shows:

Road Freight-train Operation

Casualties to Road Freight Conductors, Brakemen and Flagmen

Period	Total casualties		Operating hand brakes		Getting on or off cars or locomotives		Miscellaneous train accidents and miscellaneous train-service accidents	
	Nevada	Arizona	Nevada	Arizona	Nevada	Arizona	Nevada	Arizona
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
1923-1928	151	214	5	24	30	47	98	130
1929-1934	65	123	1	12	6	26	49	79
1935-1940	52	112	4	16	9	27	35	61
Totals, 18 years	268	449	10	52	45	100	182	270

The classifications of causes are those used by the Interstate Commerce Commission in its Rules for Reporting Accidents. "Operating hand brakes" and "Getting on or off cars or locomotives" are directly related to the number of train units operated. "Miscellaneous train acci-

dents" and "Miscellaneous Train Service Accidents" include practically all of the so-called "slack-action" accidents. The "casualties" shown in cols. (4) to (9) inclusive, included 5 deaths in Nevada in the first period, none in the second, and one in the third; and 4 deaths in Arizona in the first period, 2 in the second, and 3 in the third; in Nevada one death on a 60-car train, and in Arizona one death on a 66-car train and one on a 64-car train resulted from slack-action accidents.

Sullivan, R. 3695-3697, 3596.
Exhibits 274, 275, 278, 279.

[fol. 6219] (9) Derailments reportable as train accidents—Nevada-Arizona.

The claim is made by plaintiff that the law under review tends to minimize derailments caused by defects in or failure of equipment, and consequent damage to equipment and hazard to life and limb. By comparing the derailments in Arizona and Nevada, during the 18-year period 1923-1940, reported to the Interstate Commerce Commission as having been caused by defects in or failures of freight-car equipment, it is found that the following appears:

Derailments Caused by Defects in or Failures of Freight-Car Equipment

A Period	B Number		C Damage to property	
	Nevada	Arizona	Nevada	Arizona
1923-1928	37	58	$40,096	$120,839
1929-1934	15	21	10,879	38,946
1935-1940	18	27	51,036	42,616
Total, 18 years 1923-1940	70	106	102,011	202,401
	D Per million train miles			
1923-1928	2.80	4.09	$3,038	$8,513
1929-1934	1.43	1.69	1,041	2,963
1935-1940	1.63	1.81	4,623	3,849
Total, 18 years 1923-1940	2.02	2.51	2,941	4,785
	E Per 100 million car miles			
1923-1928	4.79	7.85	$5,193	$16,354

1935-1940	2.09	3.26	5,938	5,147
Total, 18 years 1923-1940	2.93	4.64	4,266	8,864

[fol. 6220] Whatever effect improvements in track, roadbed, cars and appurtenances may have had during those years in lessening the hazard of derailment has been experienced equally in both states.

Of the 70 derailments in Nevada, 35 occurred on long trains and 35 on short trains—which results in there having been 141 of the 176 derailments in both states—1923-1940—chargeable to defects in or failure of freight-car equipment on short trains, as against 35 on long trains.

In 1935 there were no reportable derailments in Nevada from these causes, although 1,596,000 freight-train miles and 123,508,000 freight-train car miles were operated. In Arizona there were 3 reportable derailments with an aggregate damage of $12,274, but with no casualties; the accident rate and amount of damage being 1.43 ($5,845) and 2.53 ($10,353) on the basis of one million freight-train miles and one hundred million freight-train car miles respectively.

Sullivan, R. 5129-5132.

Exhibits 286, 287, 288, 389.

(h) Comparison of Short and Long-Train Periods in Nevada with Each Other.

From the evidence it clearly appears that there has been a marked improvement during the 18 years, 1923-1940, inclusive, in the rate of casualties of employes engaged in road freight-train operation in Nevada, coincident with the increase in the length of freight trains hereinbefore found.

An exhibit was received based on reportable casualties to all classes of employes on duty in train and train-service accidents resulting from the operation of road freight trains, and covering two periods: (a) The three years, 1923, [fol. 6221] 1924 and 1925, when short freight-train operation was predominant, the average during those years being 52.73 cars per train, and (b) the years 1937, 1938 and 1939, when long-train operation was predominant, the freight trains averaging 78.06 cars per train. In the first period, while 6,556,000 freight-train miles were operated, 345,672,000 freight-car miles were made by cars in those trains. In the second period, due to the increase in the length of trains, the total freight-train miles dropped to 5,468,000, while the freight-train car miles increased to 426,822,000, a lesser number of trains handling a greater

number of cars. During the first period there were five deaths, four of them of brakemen while working on trains of less than 55 cars, and one of them a railroad police officer who fell from a 60-car train. In the first period there were 106 reportable injuries to train and enginemen, 96 of which were to freight conductors, brakemen and flagmen; there were also three other employes injured. In the second period there was one death where a conductor of a 57-car train fell from the gangway of the moving engine, which was detached from the train; there were 31 train and enginemen injured, of whom 28 were freight conductors, brakemen and flagmen, and there was one other employe injured. The total casualties for the two periods were 114 in the first period, and 33 in the second; as stated, in the second period a lesser number of train miles produced a greater number of car miles than in the first period.

On recognized bases for measuring frequency of casualties: the first period produced 16.71 per million locomotive miles, or 2.88 times as many as the 5.81 that were produced during the second period; in the first period there were 17.39 casualties per million train miles, or 2.88 times as many as the 6.04 in the second period. In the first period, per hundred million freight-car miles, there were 32.98 casualties, or 4.27 times as many as the 7.73 produced in [fol. 6222] the second period. On a percentage basis, the improvement in the second period over the first was, per million locomotive miles, 65.23 per cent; per million train miles, 65.27 per cent; and per hundred million freight-car miles, 76.56 per cent.

Sullivan, R. 3730-3731.
Exhibits 275, 277, 282.

(1) Comparison, Nevada with Arizona—three-year periods.

It is also contended by plaintiff that decreases in casualty rates are to be credited to improvements in roadbed, bridges, equipment, etc. hereinbefore described. As hereinbefore found those improvements, as well as operating rules, operating conditions, and character of traffic, during the years 1923-1940, were practically the same on defendant's lines in both Nevada and Arizona, the only fundamental difference between the two states being that created by the restrictions of the Arizona Train-Limit Law. While

the factors claimed by plaintiff to account for improvement in casualty rates have, no doubt, increased the safety of operation of all classes of trains, the evidence clearly shows —comparing defendant's Nevada and Arizona operations— that the improvement in casualty rates is only partly due to improvements in road and equipment. Comparing total casualties and casualty rates for the two states, for the three-year periods 1923-1925 and 1938-1940, the following comparisons are established:

[fol. 6223] Casualties—Road Freight Trains—All Employes on Duty—Train and Train Service Accidents

	A. Period	B. Average length freight trains		C. Casualties		D. Per million train miles		E. Per 100 million car miles	
		Nevada	Arizona	Nevada	Arizona	Nevada	Arizona	Nevada	Arizona
(1)	1923-1925	52.73	53.88	114	133	17.39	22.75	32.98	42.22
(2)	1938-1940	79.88	56.19	27	58	4.90	7.60	6.14	13.53
	Ratio					3.55	2.99	5.37	3.12
	Improvement %, comparing line (1) with line (2)					71.82	66.59	81.38	67.96

The table next above clearly shows that the standard long-train operation on Defendant's lines in Nevada is a safer operation, when all classes of employes employed in or subject to injury by road freight-train service are considered, than the restricted operation in Arizona.

That conclusion is borne out by a comparison of the statistics of train and train-service accidents occurring on the defendant's line in the states of Nevada, New Mexico, and on the Los Angeles Division, California, as well as by the experience of the Atchison, Topeka & Santa Fe Railway, as summarized in Finding XII(k) hereof, and that of the Chesapeake & Ohio Railway summarized in Finding XII(l) hereof.

The act under review purports to be in the interest of safety of all employes, not of the protection of one class of employes from the hazard of one class of accidents.

Exhibits 277-282.

(See, also, proposed Findings III(c), IV(c), VII(a)(5).)

[fol. 6224] (i) Casualty Statistics — Defendant's Los Angeles Division.

Defendant introduced in evidence an exhibit listing all of the reportable casualties sustained by employes on duty and by non-trespassers (i.e., all persons other than trespassers) in train and train-service accidents occurring upon or in connection with the operation of road freight trains upon defendant's Los Angeles Division, during the 11-year period 1930-1940; said exhibit showing also the number and rate of occurrence of such casualties, both by classes of persons and by years.

Plaintiff introduced a list of freight-train accidents occurring on the Los Angeles Division, but made certain errors in its compilation, and failed to offer any other related statistical showing in connection therewith. Except for said errors, plaintiff's said showing confirms substantially the testimony submitted by defendant.

During the 11 years 1930-1940, there were 460 accidents on the Los Angeles Division, which occurred in connection with the operation of road freight trains and involved reportable casualties to employes and other non-trespassers. Fifty persons were killed in these accidents, 11 of whom were employes; and 504 persons were injured, 291 of whom were employes; or a total of 302 casualties to employes and 252 casualties to non-trespassers; 236 of said non-trespasser casualties were sustained by occupants of motor vehicles, 38 of such persons being killed and 198 injured.

The average length of all freight trains, both main and branch line, operated on the Los Angeles Division during the 11-year period 1930-1940 was 55.13 cars. The corresponding figure for Arizona for the same period was 55.33 cars; for Nevada 76.58 cars. The record does not show [fol. 6225] the proportion of long trains to all trains run on the Los Angeles Division, during the 11-year period 1930-1940. It does appear, however, that approximately 25.8 per cent of the trains run on certain main lines of that division, during four typical months of 1939, were long trains.

Of the total of 302 employe casualties above referred to, 189 (or 62.6 per cent) occurred on short trains, and 113 (or 37.4 per cent) on long trains. Of the total of 252 non-employe casualties above referred to, 228 (or 90.5 per cent) occurred on or in connection with the operation of short

trains, and only 24, or 9.5 per cent, on long trains. During the 5-year period 1936-1940 there were 167 employe casualties, of which 112, or 67.1 per cent, occurred on short trains; and there were 140 non-employe casualties, of which 127, or 90.7 per cent, occurred on short trains. Of the total of 554 casualties which were sustained during the 11 years 1930-1940 by persons other than trespassers, as aforesaid, 417, or 75.3 per cent, occurred upon or in connection with short trains, and only 137, or 24.7 per cent, on long trains; while during the 5 years 1936-1940, out of a total of 307 such casualties, 239, or 77.8 per cent, were on or in connection with short trains, and only 68, or 22.2 per cent, on long trains.

Of the 236 casualties sustained by occupants of motor vehicles during said 11-year period, 215 or 91.1 per cent, were sustained in connection with the operation of short trains, and only 21, or 8.9 per cent, in connection with the operation of long trains.

There is no sufficient showing to enable direct comparisons to be made between the Los Angeles Division, on the one hand, and either Arizona or Nevada, on the other, as to either the total number or the frequency rates of accidents and casualties occurring in freight-train operation. Any such comparisons, in so far as they involve casualties [fol. 6226] to employes, and particularly those sustained by conductors and brakemen on duty, are further disturbed and rendered inaccurate by reason of the fact that the requirements of the Full-Crew Law of California compel the employment of substantially more brakemen, particularly on long trains, than in Arizona or Nevada, and thus cause many more employes to be exposed to the hazard of injury in the event of accidents to such trains.

It appears, from the accident and casualty showing for the Los Angeles Division, and it is hereby found, that from the standpoint of the safety of persons, including employes on duty and the general public (other than trespassers), there is no especial or unusual hazard produced by or associated with the operation of long freight trains on that division, that is not also produced by or associated with the operation of short trains thereon, or that such hazards as do exist would be in any degree or to any extent reduced or eliminated if all trains were short.

Sullivan, R. 3998-3999.

Exhibits 185, 277, 351 to 361, 365, 386.

(j) Accident and Casualty Statistics—Defendant's Lines in New Mexico.

(1) Casualties to Persons—Freight-train operation.

Defendant introduced an exhibit containing a list of all of the accidents occurring in road freight-train operation on its lines in New Mexico, during the 11 years 1930-1940, in which reportable casualties were sustained by employes, or other persons not including trespassers. This exhibit also shows both the absolute number, and the frequency rates of such casualties, by years and groups of years, and by classes of persons involved, and also the casualties occurring upon or in connection with short-train and long-train operations, respectively.

[fol. 6227] Plaintiff introduced certain exhibits listing and describing in detail the reportable freight-train accidents and casualties occurring on defendant's New Mexico lines during the period above referred to; but plaintiff's compilation contains certain errors, and moreover was not accompanied by or related to any statistical showing. Plaintiff's evidence relative to New Mexico freight-train casualties, except for the errors above mentioned, tends to confirm and corroborate the showing made by defendant.

During said 11-year period 1930-1940, there were 139 accidents involving reportable casualties to persons other than trespassers, which occurred on or in connection with the operation of road freight trains on defendant's lines in New Mexico. Said 139 accidents resulted in 145 casualties, one person being killed and 144 injured. 129 employes were injured, but none was killed. 15 non-trespassers were injured and one was killed. 11 of said non-trespasser casualties, including the one fatality, were sustained by occupants of motor vehicles.

Of said total of 145 casualties, 111, or 76.5 per cent, were sustained in connection with the operation of short trains; 34, or 23.5 per cent, in connection with the operation of long trains; of the 70 such casualties which occurred during the 5 years 1936-1940, 55, or 78.6 per cent, were on short trains; and 15, or 21.4 per cent, were on long trains.

The record indicates that during four typical months of the year 1939, long trains constituted 9.06 per cent of all the freight trains operated on defendant's main lines in New Mexico. It also appears that during the first six

months of 1940, 25.5 per cent of the trains operated on the main line between Lordsburg and El Paso were long trains. The average length of all freight trains, both main and branch line, operated in New Mexico during the 11 years [fol. 6228] 1930-1940 was 55.19 cars; as compared to average lengths, during the same period, of 55.03 cars in Arizona and of 76.58 cars in Nevada.

Of the total of 129 employe casualties above referred to, 98, or 75.9 per cent, were on short trains; and during the 5-year period 1936-1940, 49 out of 61 casualties, or 80.3 per cent, were on short trains. Of the 16 casualties to non-trespassers other than employes, which occurred during the 11-year period 1930-1940, 13 occurred in conjunction with short-train operation. The 3 casualties sustained in connection with long-train operation all occurred at one time and in one accident, when an automobile ran into the side of an 89-car train, which at the time was moving at a speed of four miles per hour.

Casualties to employes, occurring in freight-train operation in New Mexico, are and have been substantially less in both number and frequency than in Arizona, although generally somewhat more frequent, in relation to train miles operated or car miles produced, than in Nevada. Thus, in said 11-year period, there were the following numbers and frequency rates of casualties to all classes of employes on duty sustained in train and train-service accidents occurring in road freight-train operation in said three states: in New Mexico, 129, at the rate of 7.97 per million train miles, 12.84 per 100 million car miles; in Arizona, 251, at the rates of 10.03 per million train miles and 18.10 per 100 million car miles; in Nevada, 113, at the rates of 5.89 per million train miles and 7.69 per 100 million car miles.

Considering only casualties to road freight conductors and brakemen on duty, there were, during said 11-year period, in New Mexico, 92 such casualties (67 of which occurred on short trains), at the rates of 5.05 per million train [fol. 6229] miles and 9.16 per 100 million car miles; whereas in Arizona there were 203 such casualties, at the rates of 8.11 per million train miles and 14.66 per 100 million car miles; and in Nevada, 101 such casualties, at the rates of 5.26 per million train miles and 6.87 per 100 million car miles.

Considering only casualties to road freight conductors and brakemen, caused from sudden stopping, starting, lurch, and jerk of train, there were, during said period, 29 such casualties in New Mexico, 11 of which occurred on short trains, the frequency rates being 1.59 per million train miles, and 2.89 per 100 million car miles; whereas there were in Arizona, during said 11 years, 56 such casualties, the rates being 2.24 per million train miles and 4.04 per 100 million car miles; and in Nevada, 52 casualties, the rates being 2.71 per million train miles and 3.54 per 100 million car miles.

Exhibits 185, 277, 279, 280, 338, 364, 387, 397.

(2) Train accidents—Freight-train operation.

Defendant also submitted an exhibit showing, by number and in detail, the reportable train accidents occurring upon or in connection with the operation of road freight trains upon its lines in New Mexico during the 11 years 1930-1940, and showing also the frequency of such accidents in the aggregate and by classes. There were 120 such train accidents occurring during said 11-year period. Only one of said accidents involved a casualty: a brakeman on a 60-car train was injured when 8 cars of the train were derailed by a broken flange on one of the cars.

The frequency rates of such New Mexico train accidents were: 6.59 per million train miles, and 11.95 per 100 million car miles. In Arizona, during the same 11-year period, [fol. 6230] there were 232 such train accidents, and the frequency rates were: 9.24 per million train miles, and 16.72 per 100 million car miles. In Nevada, during the same period, there were 133 such accidents, and the frequency rates were: 6.94 per million train miles and 9.05 per 100 million car miles.

12 of said New Mexico train accidents were collisions, all of them involving short trains, and all being ascribed to the negligence of employes. 46 of said train accidents were derailments; 39 occurred on short trains, and only 7 on long trains. 29 of said derailments were due to defects in or failures of cars or car bodies, 23 occurring on short trains and 6 on long trains. 48 of said train accidents were classed as locomotive accidents, 41 occurring on short trains and 7 on long trains. The remaining 14 accidents were miscellaneous train accidents, 6 occurring on short trains

and 8 on long trains. 98, or 81.7 per cent, of said 120 train accidents occurred on short trains; and only 22, or 18.3 per cent, on long trains.

Exhibits 280, 289, 290, 340 to 349, 388.

(3) Passenger-train accidents and casualties.

Plaintiff introduced in evidence a list of casualties to passengers and passenger employes occurring in train and train-service accidents on defendant's lines in New Mexico, but did not offer any statistical showing in connection therewith. Only two of the accidents thus listed by plaintiff occurred on long passenger trains; in one case a brakeman on a 16-car train sustained eight days' disability because of a foreign object in his eye; and in the other a passenger on a 15-car train suffered a probable 21-day disability, when he lost his hand hold and fell from an upper berth while the train was standing.

[fol. 6231] It does not appear that the length of the train had anything to do with any accident or casualty occurring in passenger-train operation on defendant's lines in New Mexico during the period covered by plaintiff's showing.

Exhibits 362, 368.

(k) Santa Fe Casualty Statistics—Comparing Short-train and Long-train Operations.

As part of its system operations the Atchison, Topeka & Santa Fe Railway Company operates a standard steam railway from Los Angeles, California to Chicago, Illinois, which passes through Needles, California, 12 miles west of the Arizona line, Winslow, Arizona, and Gallup, Belen and Clovis, New Mexico. The distance from Needles to Gallup is 419.7 miles, 385.7 of which are through Arizona, and from Gallup, through Belen, to Clovis, is 383.9 miles. The character of freight traffic and equipment handled through Arizona and New Mexico on that main line is substantially the same as that handled by defendant through Arizona and New Mexico, through interstate freight traffic greatly preponderating. That railroad has observed the train-limit law, the effect of which is to control the length of freight trains in both directions between Needles and Gallup, the nearest freight-train terminal east of Arizona (22 miles from the state line), and to shorten the length of east bound freight trains between Gallup and Belen (a freight-train terminal)

a distance of 144 miles. Between Belen and Clovis (a freight-train terminal), a distance of 240 miles, standard long freight-train operation is predominant, and has been for a number of years. There is no New Mexico state law that limits the length of freight trains. The evidence shows an exclusively short-train operation between Needles and Gallup (419.7 miles), a standard long-train operation between Gallup and Belen (144 miles) somewhat modified as [fol. 6232] to eastbound freight trains by the effect of the Arizona law, and an unrestricted and unmodified standard long-train operation between Belen and Clovis (240 miles).

Casualties on the above portions of the Santa Fe lines, resulting to road freight trainmen and enginemen on duty, from the operation of through, local and mixed road freight trains, and occurring while on, or getting on or off, road freight trains, as such casualties were reported to the Interstate Commerce Commission by the carrier, and their relation to train and car miles are found to be:

Period	Average Number cars per train		Casualties					
			Enginemen		Trainmen		Total	
	Clovis-Gallup	Gallup-Needles	Clovis-Gallup	Gallup-Needles	Clovis-Gallup	Gallup-Needles	Clovis-Gallup	Gallup-Needles
6 yrs. 1923-1928	69 7	52 4	15	9	44	97	59	106
6 yrs. 1929-1934	73 5	56 8	5	11	29	55	34	66
5 yrs. 1935-1939	69 2	55 6	8	5	18	42	26	47
17 years 1923-1939	70 8	54 8	28	25	91	194	119	219

Period	Frequency of Casualties			
	Per million freight-train miles		Per 100 million freight-car miles	
	Clovis-Gallup	Gallup-Needles	Clovis-Gallup	Gallup-Needles
6 yrs. 1923-1928	8 19	10 15	11 75	19 36
6 yrs. 1929-1934	5 85	7 72	7 92	13 60
5 yrs. 1935-1939	4 21	5 40	6 07	9 71
17 years. 1923-1939	6 20	7 91	8 75	14 44

[fol. 6233] There were two deaths (due to a locomotive boiler explosion) on a long train, and 11 deaths from accidents on short trains; none was due to slack action. The character and extent of operation in the two districts is illustrated by a comparison of the traffic movements in the

first year, 1923, with the peak year, 1929, and the last year, 1939, as follows:

Year and Territory	Average cars per train	Freight-train miles (thousands)	Freight-car miles (thousands)
1923			
Gallup-Clovis	64.76	1,175	76,115
Needles-Gallup	44.96	1,961	88,156
1929			
Gallup-Clovis	72.69	1,309	95,156
Needles-Gallup	57.06	1,794	102,366
1939			
Gallup-Clovis	71.7	1,251	89,761
Needles-Gallup	56.2	1,755	98,712

All reportable casualties due to sudden stop, start, lurch or jerk of the trains described in the heading of the table are included in its description of the casualties it covers.

This evidence shows, and it is hereby found, that over a period of 18 years the casualty frequency to road freight trainmen and enginemen on duty, while on or getting on or off road freight trains has been less favorable on the train-mile basis and substantially less favorable on the car-mile basis in Arizona where trains have operated under the restrictions of the law, than in the immediately adjacent territory of New Mexico where train length is unrestricted and where conditions of operation and volume of [fol. 6234] traffic are greatly similar, the only dissimilarity being in the length of trains.

J. P. McDonald, R. 1752-1758, 1760-1761; *Mahoney*, R. 1847-1849, 1851-1852, 1856-1858, 1876-1880.

Exhibits 124, 126, 132, 133, 134, 138, 140, 153, 296, 300.

(1) Chesapeake and Ohio Railway—Casualty Statistics

The Chesapeake and Ohio Railway is a Class I railroad of 3,117 miles of road operating in the states of Virginia, West Virginia, Kentucky, Ohio, Indiana and Illinois, and the District of Columbia. The railroad consists of both heavy or mountainous grade and relatively light or water grade, the heavier grades varying from 1.5% to 2.67%. A large proportion of the mileage consists of double track, and the main lines are equipped with block signals, most of which are automatic signals although there are some manual block signals; a portion of the automatic block signal territory has the additional protection of automatic train control.

Depending upon the character and availability of traffic, facilities, and grade conditions, both long and short trains

are operated. However, long trains greatly preponderate on the main-line subdivisions. During a typical four-week period of the year 1939, out of 3200 freight trains operated on seven main-line subdivisions, 2843, or 88 per cent, were long trains, and 1,722, or 53.8 per cent, consisted of 141 cars or more. The operation of freight trains of 160 cars is a common practice on this railroad.

The system freight operations of the Chesapeake and Ohio were large, and the increase in freight-train lengths progressive and pronounced, from 1924 to 1938, as during the same period the reductions in accidents and casualties [fol. 6235] to employes were also continuous and substantial, as shown by the following tables (the 1938 statistics being the latest available from the published reports of the Interstate Commerce Commission at the time the witnesses from the Chesapeake and Ohio testified):

Year	Freight Revenue Ton miles (millions)	Average Freight Cars Per Train
1924	16,527	53 5
1928	21,183	61 7
1934	17,613	77 9
1938	16,054	77 3

Years	Total Casualties		Casualty Rates Per Million Car miles	
	All Employes	Trainmen & Enginemen	All Employes	Trainmen & Enginemen
1924-27	2281	1974	61	55
1928-31	1250	1070	34	30
1932-35	723	613	24	22
1936-38	495	424	20	18
Improvement, 1936-38, compared with 1924-27			62 21%	67 27%

During the period 1924 to 1938 there was, in particular, a continuous and substantial reduction in the number and frequency of derailments due to various causes, including particularly those due to defects in or failures of equipment, as shown by the following table:

Years	Derailments			Frequency of Derailments	
	All Causes	Due to Negligence of Employes	Due to Defects in or Failures of Equipment	Per 100,000 Train miles	Per 1,000,000 Car miles
1924-27	1,554	200	570	1 68	42
1928-31	723	109	346	87	19

[fol. 6236] (m) Decrease in Casualties — Nevada Compared with Arizona

Coincident with the increase, as hereinbefore found in Finding VII (b), in the percentage of long freight trains operated in Nevada, there has been a continuous and marked decrease in reportable casualties in train and train-service accidents resulting from the operation of road freight trains. The evidence of those casualties in Nevada for the eighteen years 1923-1940 is complete. During the same eighteen-year period in Arizona, which is also fully covered by evidence showing all of the same classes of accidents and casualties in that state, and also showing that the average and maximum train lengths, as hereinbefore found, remained relatively constant, the decrease in the casualties in train and train-service accidents resulting from the operation of road freight trains has been much smaller than in Nevada.

Considering said eighteen years in three periods, the first consisting of the six years 1923-1928, the second of the six years 1929-1934, and the third of the six years 1935-1940, the following is shown by the record:

All Classes of Employes on Duty;

Road Freight Train Operation:

	Rates per million train miles		Rates per 100 million car miles	
	Nevada	Arizona	Nevada	Arizona
1923–1928	13 18	18 03	22 54	34 65
1929–1934	7 46	11 64	10 27	21 35
1935–1940	5 07	9 16	6 52	16 54
Improvement, 1929–34 compared with 1923–28	43 4%	35 4%	54 4%	38 4%
Improvement, 1935–40 compared with 1923–28	61 5%	49 2%	71 1%	52 3%

[fol. 6237]

Road Freight Conductors, Brakemen, and Flagmen on Duty

	Rates per million train miles		Rates per 100 million car miles	
	Nevada	Arizona	Nevada	Arizona
1923–28	11 44	15 07	19 56	28 96
1929–34	6 22	9 36	8 56	17 17
1935–40	4 71	7 49	6 05	13 53
Improvement, 1929–34 compared with 1923–28	45 6%	37 9%	56 2%	40 7%
Improvement, 1935–40 compared with 1923–28	58 8%	50 3%	69 1%	53 3%

Road Freight Conductors, Brakemen and Flagmen on Duty, Caused From Sudden Starting, Stopping, Lurch or Jerk of Train

Exhibits 277, 279, 280.

(n) Casualties While Train Standing.

Not all casualties in train and train-service accidents occur while trains are in motion. Of the 308 reportable casualties in Nevada sustained by all classes of employes on duty in train and train-service accidents in road freight-train operation during the 18 years 1923-40, 73, or 23.7 per cent, occurred while the trains were standing; and 53 of the 73 occurred on short trains. Of the 546 reportable [fol. 6238] casualties in Arizona, similarly sustained by all classes of defendant's employes on duty in train and train-service accidents in road freight-train operation, 177, or 32.4 per cent, occurred while the trains were standing. All were on short trains.

Of the 109 casualties sustained in train and train-service accidents by all persons (other than trespassers) while on or getting on or off passenger trains on defendant's lines in Nevada during the 17 years 1923-39, 18, or 16.5 per cent, occurred while the trains were standing. Of the 239 corresponding casualties occurring in Arizona during the same 17-year period, 77, or 32.2 per cent, occurred while the trains were standing.

Casualties occurring while trains are standing are closely related to the number of trains operated, but have no relation to the length of the train. An unnecessary increase in the number of trains operated, either freight or passenger or both, increases the hazard of all those classes of casualties which take place while trains are standing. It is hereby found that the train-limit law, by causing such unnecessary increase in the number of trains operated, increases the hazard of casualties occurring while trains are standing, both in absolute number, and in proportion to all

casualties sustained in train and train-service accidents.

Exhibits 274, 275, 277, 291, 292.

(o) Passenger-train Safety:

(1) Passenger Casualties—Class I Railroads of the United States.

Under the rules of the Interstate Commerce Commission governing the reporting of accidents, the death of a passenger in a train or train-service accident is always report-
[fol. 6239] able, and an injury to a passenger is reportable if sufficient to incapacitate the injured person from following his customary vocation or mode of living for a period of more than one day.

The published statistics of the Commission relating to casualties to passengers in train and train-service accidents, Class I railroads of the United States, for the years 1923-1939, inclusive, show that during that period the number of passengers killed decreased from 102 in 1923 to 27 in 1939, and the number of passengers injured, from 5,538 in 1923 to 2,489 in 1939. The number of revenue passengers carried decreased during that period from about 987,000,000 in 1923 to about 451,000,000 in 1939; and the number of passengers carried one mile from about 38,000,000,000 in 1923 to about 22,500,000,000 in 1939. On a frequency basis the rates are exceedingly small. In the six-year period 1923-1928, the frequency of casualties per million passengers carried was 5.16. In the five years 1935-1939, it was 5.0: an improvement of 3.10 per cent. In the first period the frequency of casualties per 100 million passenger miles was 12.91, and in the second period, 10.63, an improvement of 17.66 per cent.

The 1935-1939 casualty rate of 10.63 casualties per hundred million passenger miles was equivalent to a passenger travelling about 9,407,000 miles for each reportable casualty.

Sullivan, R. 3611-3613.

Exhibit 267.

(2) Passenger Casualties—Nevada and Arizona.

During the seventeen-year period 1923-1939 defendant has operated its passenger trains in Arizona in units of not more than 14 cars, as required by the train-limit law. In

Nevada, on the other hand, defendant has operated free of [fol. 6240] any such restriction, and has in fact operated a substantial number of long passenger trains, particularly in more recent years. The volume and character of the passenger traffic in the two states has heretofore been found to be closely comparable; and other conditions are likewise so closely comparable (except for the train-limit law) as to render a comparison between the two states, over said period of seventeen years, a full and sufficient test of the effectiveness of the Arizona limitation upon passenger-train lengths as a regulation in the purported interest of safety of passengers or employes or others upon or affected by the operation of passenger trains.

During the six-year period 1923-1928, defendant carried approximately 2,600,000 revenue passengers in Nevada, and 2,844,000 in Arizona. It accumulated in said six years 630,000,000 revenue-passenger miles, and 9,361,000 passenger-train miles in Nevada; and 765,000,000 revenue-passenger miles, and 10,572,000 passenger-train miles in Arizona. In Nevada, in said period, six passengers were injured, two employes were killed and 14 injured, and three other non-trespassers were injured: a total of 25 casualties to persons, other than trespassers, sustained while on or getting on or off passenger trains. In Arizona, during said period, one passenger was killed, 36 were injured; one employe was killed, and 47 were injured; and five other non-trespassers were injured: a total of 90 casualties to persons, other than trespassers, while on or getting on or off passenger trains in Arizona. The casualty rate for passenger casualties was in Arizona more than five times as great as in Nevada; for employe casualties, on a passenger-train mile basis, 2.65 times as great as in Nevada; for all casualties as described above, except to trespassers, on a passenger-train mile basis, 3.19 times as great in Arizona as in Nevada.

[fol. 6241] During the six-year period 1929-1934 defendant carried approximately 1,592,000 revenue passengers in Nevada, and 2,000,000 in Arizona. It accumulated in said six years 434,000,000 revenue-passenger miles, and 7,649,000 passenger-train miles in Nevada; 602,000,000 revenue-passenger miles and 9,592,000 passenger-train miles in Arizona. In said six-year period, in Nevada, no passengers were killed, but nine were injured; one employe

was killed, and three were injured; and three other non-trespassers were injured: a total of 16 reportable casualties to persons on or while getting on or off passenger trains. The corresponding totals for Arizona were: one passenger killed and 29 injured; 3 employes killed and 24 injured; 5 other non-trespassers injured: a total of 62 such casualties. The casualty rates for passenger casualties were in Arizona, during said period, approximately 2.6 times as great as in Nevada; for employe casualties, on the train-mile basis, 5.4 times as great as in Nevada; and for all casualties as described, on the train-mile basis, three times as great in Arizona as in Nevada.

In the period 1935-1939 there occurred (on August 12, 1939) in Nevada the Harney derailment (involving a 14-car train), previously referred to. Said derailment, which was caused solely by malicious tampering with the track, occasioned the deaths of nine passengers and thirteen employes and one other non-trespasser, and the injury of eighteen passengers and twelve employes. The record indicates that the defendant had no responsibility for this accident, and no means of avoiding or anticipating it; moreover, neither the accident nor the casualties therein appear to have borne any relation to the length of the train. The inclusion of the Harney casualties in the statistics for the period 1935-1939 tends to distort the comparison, and to what extent to present the showing for Nevada less favor-[fol. 6242] ably than would be normal. Nevertheless, and even including said Harney casualties, it appears that in the five-year period 1935-1939, during which defendant carried approximately 1,480,000 revenue passengers, and accumulated 492,000,000 passenger miles, and 6,148,000 passenger-train miles in Nevada, there were in Nevada a total of 9 passengers killed and 24 injured; 13 employes killed and 17 injured; one non-trespasser killed and four injured, or a total of 68 reportable casualties of the classes above described; whereas, in Arizona, in which state defendant during said period carried approximately 1,980,000 passengers and accumulated 621,000,000 revenue passenger miles and 8,000,000 passenger-train miles, one passenger was killed and 45 injured; 39 employes were injured; and two other non-trespassers were injured, or a total of 87 reportable casualties of the classes above described. Despite the distorting influence of the inclusion of the Harney

casualties, the passenger casualty rates in Arizona were slightly greater than in Nevada during the five-year period 1935-1939; the employe casualty rates were practically identical, and the casualty rate for all persons on a passenger-train mile basis was but 2 per cent greater in Nevada than in Arizona.

Considering the entire seventeen-year period, there were 239 casualties to persons (other than trespassers) while on or getting on or off passenger trains in Arizona, and 109 in Nevada. The passenger casualty rate for the seventeen-year period was approximately twice as great in Arizona as in Nevada. The employe casualty rate, on the passenger-train mile basis, was 1.88 times as great in Arizona as in Nevada. The casualty rate to all persons, on the passenger-train mile basis, was 1.8 times as great in Arizona as in Nevada.

It is hereby found, that the Arizona 14-car limitation upon passenger trains bears no reasonable relation nor any [fol. 6243] relation whatever to the safety of travelers or of employes, or of others lawfully upon defendant's passenger trains in Arizona.

Sullivan, R. 3768-3769, 3775-3776.
Exhibits 291, 292.

(p) Grade-crossing Accidents.

It is common knowledge that, with the increase in the number of motor vehicles owned and operated for both private and business purposes, and the improvement of highways permitting greater speed, efficiency and comfort in the operation of motor vehicles and greater practicability of long-distance travel, collisions between vehicles of various types and railroad trains, engines or cars at railroad grade crossings occur with alarming frequency.

On the lines of the defendant in Arizona there were, as of December 31, 1939, 654 crossings at grade on public highways over defendant's track. Eighty-four of these crossings are in or closely adjacent to the various towns and cities upon said lines. None of said 654 crossings at grade is protected by mechanical crossing gates; but 36 are protected by audible and visible signals other than fixed signals, and one by a watchman on duty a part of the 24 hours each day. By comparison, there were in Nevada, as of December 31, 1939, 211 public crossings at grade over defend-

ant's lines. Four of these were protected by watchmen, and 20 by audible and visible signals; the remainder by fixed signs only.

In addition to said public crossings there are, on defendant's lines in Arizona and Nevada, numerous private crossings at grade, the use of which is governed by agreements between the users and the railroad or restricted by gates located in the fence lines.

[fol. 6244] Casualties to all classes of persons, in highway grade-crossing accidents in which automobiles were involved, on all steam railroads of the United States, declined in absolute number and in proportion to the number of automobiles registered, during the period 1923-1939; but the rate of such casualties, as measured against the train miles accumulated, remained almost constant. Thus in the years 1923-1928, there was an average of 7,843 such casualties per year; the rate per 10,000 automobiles registered was 3.85; and per million train miles, 6.41. In the years 1929-1934, the yearly average was 6,093; the rate per 10,000 automobiles registered was 2.41, and per million train miles, 6.40. In the five years, 1935-1939, the yearly average was 5,718; the rate per 10,000 automobiles registered was 1.98, and per million train miles, 6.58. Over the seventeen-year period, the average rate per million train miles was 6.45, and in no year was there any very substantial variation from this average. About 34.6 per cent of the accidents occurring during the five years 1935-1939 were caused by automobiles striking the sides of trains.

Of the 112,207 casualties occurring on all railroads of the United States during said seventeen years, 27,792, or 24.8 per cent were fatal.

Assuming the traffic over a grade crossing, be it either vehicles or persons, to be the same, the hazard of grade-crossing accidents involving trains increases proportionately with the increased number of trains using the crossing.

The statistics of grade-crossing accidents for the states of Arizona, Nevada, and New Mexico, set forth in exhibits introduced by plaintiff, indicate that the frequency rate of such accidents as related to the number of motor vehicles registered, is slightly lower in Arizona than in either of the [fol. 6245] other states, but fail to show the frequency of such accidents, as related to train movements, in any of said states. In the absence of such a showing, plaintiff's said ex-

hibits do not afford a satisfactory basis for any findings upon the question whether the Train-Limit Law reduces or increases the hazard of grade-crossing collisions.

It is found that there exists a hazard of collisions at grade crossings between trains, engines or cars, on the one hand, and vehicles on the other, that, assuming the same use of the crossings by vehicles to continue, will increase somewhat in proportion to the additional number of freight trains, engines or cars operated over the grade crossing, whether in road or in switching movements. Such collisions are a source of casualties not only to the drivers and occupants of vehicles, but also to the train and engine crews and other persons on the train or engine involved in the accident.

The Train-Limit Law, by requiring a greater number of trains to be run than would otherwise be necessary, increases the hazards of casualties to the public, and also to defendant's employes, incident to grade-crossing accidents in Arizona and the adjacent affected territory.

Herbert, R. 2830-2839, 2857-2859, 3816-3820; *Sullivan*, R. 3616-3626, 4002.

Exhibits 200, 201, 268, 293, 334, 335, 336.

(q) Freight Train Derailments—Nevada, Arizona, and New Mexico

There has been a reduction in the frequency rates of derailments caused by defects in or failures of freight-car equipment in road freight trains, including mixed trains, taking place on defendant's lines in both Arizona and [fol. 6246] Nevada; such derailments are substantially less frequent, whether considered from the train-mile or the car-mile basis, in Nevada than in Arizona. Classifying reportable derailments caused by such defects, according to the classifications of accidents prescribed by the Interstate Commerce Commission, they fall into seven general classes: (1) trucks, (2) wheels and axles, (3) air brakes and appurtenances, (4) hand brakes and brake rigging, (5) couplers, (6) draft rigging, and (7) car bodies and other parts of equipment.

During the six years 1923-1928, reportable derailments from such causes were, in Nevada, 37 in number, and at the rates of 2.80 per million train miles and 4.79 per 100 million car miles; in Arizona they were 58 in number, and

at the rates of 4.09 per million train miles and 7.85 per 100 million car miles.

During the six years 1935-1940, such derailments were, in Nevada, 18 in number, and at the rates of 1.63 per million train miles, and 2.09 per 100 million car miles; in Arizona, 27 in number, and at the rates of 1.81 per million train miles, and 3.26 per 100 million car miles.

For the 18-year period 1923-1940, there were, in Nevada, 70 such accidents, the rate being 2.02 per million train miles, and 2.93 per 100 million car miles; in Arizona, 106 such accidents, the rates being 2.51 per million train miles, and 4.64 per 100 million car miles. Of the 70 Nevada derailments, 35 occurred on short trains. All the Arizona derailments were also on short trains. There were no Nevada derailments due to defects in or failures of freight car equipment in the years 1932 and 1935; and only one in the year 1939. In Arizona, there was no year without such a derailment, though only one occurred in 1932.

[fol. 6247] The reportable damage from such derailments was: in Nevada, 1923-1928, $40,096; 1935-1940, $51,036; 1923-1940, $102,011; in Arizona, 1923-1928, $120,839; 1935-1940, $42,616; 1923-1940, $202,401. There were three trainmen casualties in the 70 Nevada derailments, none fatal; there were two employe casualties, both being fatal in the 106 Arizona derailments. Of the total of 176 derailments in the two states, 141 occurred on short trains, and 35 on long trains.

Comparing the totals and frequency rates of such derailments in New Mexico, with the corresponding showing for Arizona and Nevada, the following appears: In the 11-year period 1930-1940, there were in New Mexico 29 such derailments, at the rates of 1.59 per million train miles, and 2.89 per hundred million car miles; in Arizona, 42, at ratio of 1.68 per million train miles; and 3.03 per hundred million car miles; in Nevada, 31, at rates of 1.62 per million train miles, and 2.11 per hundred million car miles. Of the 102 such derailments in the 3 states, only 24 (6 in New Mexico, and 18 in Nevada) were on long trains; and 78, or 76.5% of the total, were on short trains.

Giving full consideration to the substantial improvements in roadbed and equipment as heretofore stated, it is hereby found that the arbitrary limitation of freight trains on defendant's lines in Arizona to 70 cars, exclusive of

caboose, has resulted and continues to result in an increased hazard of train accidents over that resulting from the standard long-train method of operation, and a consequent increase in the hazard of casualties to those who are subject to the hazard of train accidents.

Sullivan, R. 3748.

Exhibits, 286, 287, 288, 289, 290, 388, 389.

[fol. 6248] (r) Emergency Applications of Air by Engineer

It was asserted on behalf of plaintiff that a definite casualty hazard exists on long freight trains because of emergency applications of the air brakes by engineers in the locomotives.

It appears that since October 4, 1936, there has been no reportable casualty to any one of defendant's employes in Nevada attributable in whole or in part to said cause. From January 6, 1923, to October 4, 1936, there were twelve such casualties; five on long trains, and seven on short trains. In Arizona, during the eighteen-year period 1923-1940 there were nine such casualties, all on short trains, the latest occurring Jan. 18, 1933.

The evidence shows that the application of the air brake in emergency by an engineer on a freight train is a comparatively rare occurrence. The necessity for the use of the air brake in emergency by the engineer is directly related to the number of trains operated, and not to the length of the train.

Fifield, R. 5218; *Menzies*, R. 5244-5245.

Exhibits 274, 275.

(s) Heavier Graduating Springs

Out of 53 casualties attributed to slack action, other than incident to break-in-twos, air hose and brake pipe failures, and engineers' emergency applications, on both long and short trains on defendant's lines in Nevada, during 18-year period 1923-1940, 16 such casualties resulted from undesired emergency applications of the air brakes, presumably due, judging by the circumstances and there being no evidence to the contrary, to a light graduating spring in the triple valve, which is part of the air brake mechanism underneath the car. The five of these casualties which occurred on short trains occurred prior to 1926. Eight of the

11 casualties which occurred on long trains occurred prior [fol. 6249] to 1929, the 9th in 1933, the 10th in 1935, and the 11th in 1937.

In Arizona there were 67 such casualties on defendant's lines during said 18-year period, from causes other than break-in-twos, air hose and brake pipe failures, and engineers' emergency applications, all but two of which occurred on short trains. Twenty-five of said 67 casualties resulted from undesired emergency applications of the air brakes, likewise presumably due, as in Nevada, to a light graduating spring in the triple valve of the car where the emergency application initiated. Twenty-one of said 25 casualties occurred prior to May 16, 1930; the remaining four, including two occurring on a long train at Yuma, took place in 1937.

The evidence shows without contradiction that by 1929 the use of a heavier graduating spring, which largely prevents such undesired emergency action, as above described, has become practically universal, and after January 1, 1935, compulsory on cars offered in interchange as well as standard on all defendant's cars and on all cars of the Pacific Fruit Express Company.

The 16 casualties in Nevada above referred to formed 13.5 per cent of the total of 118 casualties attributed to slack action occurring on both long and short trains in said state during the 18-year period 1923-1940. The 25 Arizona casualties above referred to formed 24.3 per cent of the 103 slack-action casualties in said state during said period. It is found that slack-action accidents on either long or short trains, due to this particular cause, are no longer to be considered a factor of material consequence in train operation.

Leriche, R. 78-79; *Cartmill*, R. 1817-1818; *Durnil*, R. 4462-4463; *Cooper*, R. 4533; *Shaw*, R. 4935; *Fifield*, R. 5211.

Exhibits 2, 135, 203, 204, 274, 275, 280.

[fol. 6250] (t) Arizona Long-Train Operations, 1940

During the period March 2-April 30, 1940, as heretofore found, defendant on 62 occasions operated long passenger trains in Arizona, accumulating 15,587 long passenger-train miles, and 243,749 passenger-car miles in such long trains. There were seven accidents, resulting in seven casualties.

on or in connection with the operation of passenger trains during said period. All of the trains involved in said accidents were trains operated in conformity with the train-limit law, and all but one were trains of 14 cars or less. The one such train which exceeded 14 cars consisted of 26 cars, two short trains having been consolidated between terminals, because of an engine failure. There were no accidents or casualties on any of the 62 long trains operated as aforesaid during said period.

During the month of April, 1940, as heretofore found, defendant operated some 302 long freight trains in Arizona. Said long trains accumulated 37,257 train miles, and 3,180,278 car miles; the average length was 85.36 cars. During said month the short trains operated by defendant in Arizona accumulated 199,761 train miles and 10,533,262 car miles, and had an average length of 52.73 cars.

There were seven accidents on or in connection with the operation of defendant's freight trains in Arizona in April, 1940; four resulted in casualties. All but one of these accidents involved short trains. That one accident occurred when a brakeman fell, alighting from the caboose on a 91-car train, said caboose being at the time detached from the train and handled alone by the engine.

It is hereby found that defendant's long freight and passenger train operations in Arizona in 1940 were conducted [fol. 6251] without causing or incurring any accident or casualty which could or would have been prevented or minimized in any degree if the train-limit law had been observed; that all the accidents occurring during said period either occurred on trains operated in full conformity with the law, or (in one case) in circumstances where the length of the train had no bearing whatsoever.

The experience of defendant's said Arizona long-train operations confirms the conclusion, drawn from the other evidence of record herein, that long-train operations can and could and would be conducted and carried on, upon defendant's lines in Arizona, with substantially greater safety than if the limitations of the law were fully observed.

Sullivan, R. 3785-3788, 3793-3796.
Exhibits 246, 294, 295.

(u) Employes Affected by the Train-Limit Law

The defendant's employes in Arizona who are affected, in various aspects of their employment, by the Train-Limit

Law, are largely employes of the Tucson Division. Certain employes of the Rio Grande Division, employed on that portion of the Tucson-Douglas-El Paso line which is within Arizona, are also affected to some extent.

Insofar as concerns the opportunity for employment, said law directly affects only those train and engine service employes who are engaged in main-line freight and passenger train service; in that said law, by compelling a relatively larger number of trains to be run than otherwise would be required, causes a corresponding increase in the number of such employees actually engaged in manning such trains.

There were, as of 1939, some 2,693 employes on the Tucson Division. 644 of said employes, or 23.9 per cent of the [fol. 6252] entire number, are train and engine service employes engaged in main and branch line (as distinguished from yard) service. Said total of 644 employes represents the entire number whose employment or opportunities for employment can be said to be affected by the law.

Insofar as concerns safety of employment, all said train service employes, and as well all employes whose duties require them to be or go upon the tracks, are affected by the law; in that by increasing the relative number of trains run, said law increases the hazards of train and train-service accidents to which such employes are subject, and particularly (among others) the following hazards: (1) of being struck and run down while on or near the tracks in the course of duty, (2) of being involved and injured in head and rear-end collisions; (3) of being involved in locomotive accidents; (4) of being injured in grade-crossing accidents; (5) of slipping or falling while getting on or off trains. The classes of employes whose safety is thus impaired by the law include, in particular: all section men, signal men, road-masters, gang, bridge and section foremen, and bridge builders (numbering some 818 employes, or about 30 per cent of the total number); and all train and engine service employes (numbering, including those in yard as well as in road service, some 834, or about 31 per cent of the total).

The plaintiff's contention that the law promotes safety of employment relates only to potential slack-action injuries to train service employes (not including enginemen) upon main line freight trains. It does not appear to be contended that the law promotes the safety of any employes on passenger trains, or on the engines of freight trains, or any employes on branch line trains. There were, as of 1939, only

[fol. 6253] 299 conductors and brakemen in through freight service, and only 32 such employes in local freight service; or a total of 331 employes whose safety, according to plaintiff, is in any manner enhanced by the law. As contrasted with this number, there are 1652 employes, or approximately five times as many, whose safety of employment is definitely shown to be impaired by the law.

Sines, R. 2544-2549.
Exhibits 194, 313.

(v) Increase in Accident and Casualty Hazard Inherent in Increase of Train Units

The evidence clearly shows that the frequency of train and train service accidents is directly related to the number of train units operated, and that when more train units are run than are necessary to handle a given amount of traffic, the hazard of accident in the handling of such traffic is correspondingly increased.

As found in Finding X(c) hereof, a limitation of freight trains on defendant's lines in Arizona to not more than 70 cars exclusive of caboose, and of passenger trains to not more than 14 cars, results in defendant being compelled to operate substantially more freight and passenger trains to carry a given volume of traffic than it would operate under the standard long-train method of operation. In 1938 the number of freight trains operated on the Yuma-Gila-Lordsburg line alone, under compulsion of the law was, as found in Finding X hereof, 4304 greater, or an increase of 30.8 per cent more, than the number actually necessary if it was not for the law. Such increased number of trains substantially increased the number of starts and stops of freight trains, and the number of meetings and passings of freight and passenger trains. In 1938, as found in Finding X(b) hereof, the additional number of train meets and [fol. 6254] passings required totalled about 16,500. Such additional number of trains also necessitated additional light engine movements in substantial number, and a substantially increased number of switching movements in yards.

Such additional number of trains also required a substantially greater number of telegraphic and telephonic train orders and messages directly relating to the movement of trains, and thereby increased the hazard of train and

train service accidents resulting from misunderstanding or forgetfulness of train orders. Such an additional number of trains increased the number of employes required to move the same amount of freight and passenger traffic, and thereby increased the hazard of casualties due to failure to observe rules or signals, slipping, falling or being run over while getting on or off trains, and other classes of casualties related to the number of train units operated. Additional trains to those necessary to handle the traffic under standard long-train operation also increase accidents and casualties in yards, accidents to employes such as section men and signal maintainers, grade-crossing accidents, and head-end and rear-end collisions. The additional locomotives that are operated to handle the additional trains increase the hazard of every accident or casualty that is related to the number of locomotives operated.

Viewing the evidence in its most favorable aspect for the plaintiff, it clearly appears and is found that, if short-train operation may or should result in any decrease in the number or severity of the "slack" or "slack-surge" type of accidents or casualties, such decrease is substantially more than offset by the increased number of accidents and casualties from other causes that follow the arbitrary limitation [fol. 6255] of freight trains to 70 cars, exclusive of caboose, and passenger trains to 14 cars, to handle the same volume of freight and passenger traffic that can be and is practicably and efficiently handled without such limitation. Thus the Arizona Train-Limit Law not only bears no reasonable relation to safety but, to the contrary does, and if enforced will continue to, impair and lessen substantially the safety of defendant's train operations in Arizona and the adjacent affected territory.

XIII

Analysis of Certain Contentions Advanced by Plaintiff

(a) The Contention that, with Long-Train Operation, Trains Would Be Delayed at Meeting and Passing Points because of Inadequate Siding Capacities

Plaintiff appears to contend that if long-train operation were carried on in the affected territory, trains would be delayed at meeting and passing points because of the fact that long freight trains would, in many instances, exceed

the present capacities of the sidings; so that, according to plaintiff, a meet or pass could be accomplished only by the operation known as "sawing by"; and that such operation causes delays to trains involved and to other following and approaching trains.

The testimony does not sustain or support this contention. The only type of "saw-by" referred to in the testimony is that involving a meet or pass between trains, one of which is longer and the other shorter than the siding at which the meet or pass takes place. The delay to trains incurred by this type of saw-by is negligible, and does not in any event involve more than ten minutes of delay to either train.

[fol. 6256] Moreover, while there are at present comparatively few long-train sidings between Yuma and Lordsburg, sidings exist at seven stations between Lordsburg and El Paso at which trains of more than 100 cars can be accommodated; and as heretofore found, defendant plans and intends if and when long-train operation is undertaken, to extend sidings and increase siding capacities in the affected territory to the extent necessary to permit long trains to meet and pass each other in the same manner as on other portions of defendant's lines where such long-train operations are conducted. Until longer sidings can be provided, defendant contemplates operating long trains in one direction or the other, but not in both directions at the same time.

Such limited long-train operation is entirely practicable with present siding facilities, and does not and would not involve or create any substantial delays to trains or traffic. On the contrary, by reducing the number of trains operated and in consequence the number of meets and passes, it would and does tend to that extent to eliminate delays, and to expedite the trains and the traffic carried therein.

Exhibits 197, 234 to 239, inclusive.

(b) The Contention that Trains Should Be Limited to 70 Cars in Order that the Members of the Crews May See and Interpret Signals more Readily

It was claimed by plaintiff that the distance of the caboose from the engine cab in a long train makes it extremely dif-

ficult and at times impossible for an engineer, fireman or head brakeman in the engine cab to see a signal from the [fol. 6257] caboose. Those signals are given manually in the day time, and by lantern at night. In an emergency the conductor or brakeman in the caboose has the privilege, and is encouraged to, and frequently does, light a red fusee at night, which is a certain and effectual way of conveying a stop signal to the engineer.

Under defendant's operating rules there is but one signal that needs to be used by a conductor or brakeman in a caboose while the train is in motion, and that is the stop signal. Frequently brakemen are at or near the middle of long trains, or some distance from the caboose, and the signal can be relayed. But when any stop signal has not been complied with by the engineer, and it is evident to the conductor that the signal has not been seen, the conductor has, under the rules, the right, and it is his duty, in case of any emergency, to use the conductor's valve in the caboose, which has the effect of applying the air brake in emergency first on the caboose, then on the car next ahead, and so on serially, car by car, toward the head of the train. There can be no severe slack-action shock in the caboose in such a case.

The evidence shows that no reportable casualty has resulted during the 18 years, 1923-1940, on defendant's lines in Nevada or Arizona, or during the 11 years, 1930-1940, in New Mexico or on the Los Angeles Division, California, from the use of the conductor's valve in the caboose, and no witness stated that any such casualty had occurred elsewhere. The application of the conductor's valve may and occasionally does result in break-in-twos of freight trains, but no reportable casualty resulting from such a break-in-two was testified to.

When the train is at a standstill and a "proceed" or "back-up", or other signal is to be given from the ground or the top of the train to the engineer, no accident can result [fol. 6258] if the engineer does not see the signal. The signal is repeated until he does see and acknowledge it, and in extreme cases the brakeman is sent forward to a point where the engineer can see such a signal.

No reportable train or train-service accident, occurring while a train was in motion, has occurred in Arizona or Nevada during the period 1923-1940, due to failure to observe or properly to interpret signals. Only one reportable train

accident assigned to this cause has occurred in said states during the same 18-year period. No casualties were involved in said accident, which involved only the movement of a helper engine, and two cars and a caboose, the remainder of the train being at a standstill at the time.

It is evident, and it is hereby found, that the Arizona Train-Limit Law is not a reasonable regulation, in the interest of greater safety of operation, with respect to the giving and receiving of signals while trains are standing or in motion.

Exhibits 274, 275, 289, 290, 386, 387.

(c) The Contention that Members of the Crews on Long Trains are in Constant fear of Injury, and are thereby Rendered Less Alert and Efficient in the Performance of their Duties.

The plaintiff appears to contend that the trainmen, who in the course of their duties, may be called upon to ride in the cabooses on long trains in Arizona or New Mexico, are in constant fear of injury from "slack-action" accidents, and are consequently rendered less alert and efficient in the performance of their duties, with resulting detriment to [fol. 6259] the safe operation of all trains; that the law, by limiting trains to 70 cars, eliminates such fear, because it tends to prevent slack-action accidents.

While two conductors, employed by defendant and appearing as witnesses for plaintiff, testified that they were at times fearful of slack-action, while riding in cabooses of long trains, the record fails to show that either the witnesses so testifying, or any other employes, were thereby rendered less alert or efficient in the performance of their duties, or that their physical condition or the safety of train operation has been or would be adversely affected thereby.

There is no basis whatever for the claim that the limiting of trains to 70 cars does or will prevent slack-action accidents, and thereby eliminate such alleged fear. As heretofore stated, the record shows that, over the 12-year period, 1929-1940, slack-action accidents, and reportable casu-

alties occasioned thereby, are and have been somewhat more frequent, measured on a car-mile basis, in Arizona, where the 70-car limit prevails, than in Nevada, where long-train operation has predominated throughout said period. This type of casualty was also substantially more frequent in Nevada, during the years of predominant short-train operation, than in the subsequent years of predominant long-train operation (1926-1940). In Arizona during the twelve years (1929-1940) immediately last past, there were 62 reportable slack-action casualties, all but two of which occurred upon short trains.

The alleged fear or apprehension of long trains expressed by plaintiff's said witnesses is wholly unsubstantial and without foundation. These witnesses have by their own choice worked for many years in the long-train territory between Lordsburg and El Paso, though having ample [fol. 6260] seniority to hold equivalent positions and perform equivalent work in the short-train districts between Yuma and Lordsburg.

Exhibits 274, 275, 280, 395.

(d) The Contention that Long Trains cannot be Properly Inspected or Supervised while in Operation, but that Short Trains can be and that Long-Train Operation Therefore Results in Greater Hazards.

Plaintiff appears to contend that the duty of inspecting trains at stops, and of supervising the same while in motion, for the purpose of detecting and locating defects in or failures of cars and the appliances thereon, cannot be completely or satisfactorily performed by trainmen upon long trains, but can be more adequately performed on short trains; that additional hazards of train operation thus result from the operation of long trains, which do not occur in the operation of short trains. This contention is not sustained or supported by substantial testimony; on the contrary, the evidence shows that the claim is not well founded.

The rules and practices in force in the affected territory afford ample opportunity for the inspection of cars of long freight and passenger trains at terminals, and at other

points en route where stops are made, either for the purpose of inspection alone, or also for the purpose of taking water, cooling wheels, and other incidental purposes, or in the case of passenger trains to receive and discharge passengers, mail, baggage or express; and such inspections can be made and adequate supervision exercised while such [fol. 6261] trains are in operation, both at and when leaving stations, and while running over the road between stations.

In freight-train operation each brakeman in the crew has a particular station on the train where he normally rides, unless some occasion or duty causes him to ride elsewhere. Thus, the head brakeman usually rides upon the locomotive or some car closely adjacent; the swing brakeman frequently rides in the caboose, but may be anywhere upon the train; the rear brakeman (flagman) and, usually, the conductor ride in the caboose. Each brakeman is required to and does maintain careful watch over the running of those cars within the range of his vision. It is the duty of the engineer and fireman likewise to keep watch over those portions of the train which can be seen from the engine.

The duties of observation and inspection of trains in operation can be and are as efficiently performed on long trains as on trains of less than 70 cars. Thus in Nevada, where a conductor and the same number of brakemen are employed as in Arizona upon a freight train of 50 cars or more, and where long-train operation was undertaken on a substantial scale in about 1925, and has predominated since about 1929, the reportable derailments due to defects in or failures of freight-car equipment were 4.79 per 100 million car miles in the 6-year period 1923-1928, 1.97 during the 6-year period 1929-1934, and 2.09 during the 6-year period 1935-1940. For the 11 years 1930-1940 such derailments were at the rate of 2.11 per 100 million car miles. The total number of such derailments during the 6-year period 1935-1940 was only 18, 9 of which were on short trains; during the 11-year period 1930-1940, 31, of which 11 were on short trains.

[fol. 6262] In Arizona, by comparison, and in spite of the asserted greater opportunity to detect such defects in freight-car equipment running in short trains, and thereby to prevent such accidents, the reportable derailments due to defects in or failures of freight-car equipment were at

the rate of 7.85 per 100 million car miles in the 6-year period 1923-1928, 2.93 in the 6-year period 1929-1934, and 3.26 in the 6-year period 1935-1940. The rate during the 11-year period 1930-1940 was 3.03. There were 27 such derailments in Arizona during the 6-year period 1935-1940, and 42 during the 11-year period 1930-1940, all on short trains. Both the actual number, and the frequency rate of such derailments, were about 50 per cent greater in Arizona than in Nevada during the 6-year period ending in 1940.

In New Mexico, during the 11-year period 1930-1940, there were 29 such derailments, and the frequency rate was 2.89 per 100 million car miles. 23 of said derailments in New Mexico occurred on short trains, and only 6 on long trains.

During the first six months of the year 1940, during which period defendant operated 1,900 short freight trains and 652 long freight trains over the district between Lordsburg, New Mexico, and El Paso, Texas, and 741 short passenger trains and 18 long passenger trains over the same district, 123 delays and occurrences having to do with the operation of freight cars in such freight trains, and 3 delays and occurrences having to do with the operation of passenger cars in such passenger trains, were discovered and detected; practically all by members of train crews, either during inspections at terminals, or while standing at stations, or upon observation while the trains were in motion. These defects and occurrences were reported by the train conductors upon their time return and delay reports. 88 of [fol. 6263] said 123 defects and occurrences were on trains of 70 cars and less. The 1,900 short freight trains aforesaid accumulated 17,851,722 car miles, an average of 202,860 car miles for each reported defect of every kind.

35 of the 123 defects and delays thus reported occurred on long freight trains. Said 652 long trains accumulated 96,766 train miles and 9,100,000 car miles: an average of 260,000 car miles for each such reported defect. Only 3 of said reported defects resulted in accidents reportable to the Interstate Commerce Commission: 1, occurring on a 95-car train, resulted in damage of $5,005; 1, on a 99-car train, resulted in damage of $225, and 1, on a 100-car train, resulted in damage of $200. There were no reportable personal injuries associated with any of said defects or occurrences.

The 3 such delays reported by conductors on passenger trains all occurred on short trains. The 741 short passenger trains operated during said 6 months' period, in said territory between Lordsburg and El Paso, accumulated 1,270,376 passenger-car miles, or an average of 423,459 car miles per delay. The 18 long passenger trains, upon which no delays or defects were reported, accumulated 42,448 car miles.

Although plaintiff called a number of witnesses to testify respecting freight and passenger-train operation in the affected territory, none of said witnesses testified or referred to any reportable accident or casualty occurring upon a long train, as to which it was claimed by the witness, or made to appear, that it could have been avoided or the effects minimized, if the train had been operated within the restrictions set forth in the Train-Limit Law. None of said witnesses testified or referred to any derailment or other accident, caused by or attributed to a defect in or failure of [fol. 6264] the equipment or applicances upon a freight or passenger car in a long train, as to which it was claimed or made to appear, either directly or by reasonable inference, that the accident could have been averted, or the effects thereof minimized, through detection of the defect while the train was in motion, or at a standing inspection, or at a rolling inspection leaving a stop, if the train had been within the limits prescribed by the Train-Limit Law, rather than a long train.

The record shows, and it is hereby found, that the inspection of all trains, including long trains, both by car forces at terminals where such forces are provided, and by train crews at terminals and while on the road, and the supervision of such trains while in motion, are adequate and satisfactory; that sufficient time and opportunity for such inspections are provided; and that the alleged additional hazards, claimed to be due to inadequate or incomplete inspections or supervision of long trains, do not exist in any part of the affected territory, and would not exist or be created if long-train operation were adopted in Arizona as the customary and standard practice.

Durnil, R. 4401, 4408-4424, 4440-4443, 4447-4450, 4462-4463; *Cheek*, R. 4619; *Stevenson*, R. 4638-4639; *Ash*, R. 4788-4790, 4805-4813, 4840-4844; *Fail*, R. 4863-4866, 4876-4879, 4880-4882, 4888-4891; *Shaw*,

R. 4918-4922, 4924-4927; *Menzies*, R. 5244-5246; also, annotations to. See, Finding VII (a) (4). *Exhibits* 286, 287, 288, 388, 389, 397.

[fol. 6265] (e) The Contention That the Present Type of Air-Brake Equipment is Inadequate to Control the Speed of and to Stop Long Trains, But is More Efficient and Adequate upon Short Trains.

Plaintiff appears to contend that the type of air-brake equipment now in use, or available for use, upon locomotives and cars comprising defendant's freight trains does not and would not operate efficiently to control the speed of and to stop long trains upon the lines in the affected territory, but that said air-brake equipment is and would be more nearly efficient and adequate for such purposes, if such trains were to continue to be limited to not more than 70 cars, exclusive of caboose, as provided by the law. Plaintiff's said contention is not sustained or supported by substantial evidence, and is indeed clearly and wholly opposed to the great weight of the uncontradicted testimony.

Plaintiff produced, among its witnesses, some nine train-service employes of defendant, seven of whom gave general testimony respecting train operations in various portions of the affected territory, including the lines between Lordsburg and El Paso. Six of said nine witnesses were conductors, and three were engineers. One of said engineers works almost exclusively in passenger service, and gave no testimony respecting freight-train operation. The other two engineers work principally in freight service, one of them between Lordsburg and Tucson (i. e., in a short-train district), and the other between Lordsburg and El Paso (i. e., in a district where long trains are run in substantial numbers).

The engineer working between Lordsburg and El Paso testified that he had handled many long trains, and admitted that the controlling of such trains simply required more care by engineers. He referred to but one instance [fol. 6266] where he had experienced difficulty in controlling or stopping a long train; in that instance, the train was in fact safely brought to a stop at the station, and thereafter handled through to the terminal, without any further difficulty, or any accident or casualty whatsoever.

The engineer working between Lordsburg and Tucson, though engaged principally in handling short trains, also handled certain long trains between those points during April, 1940. He stated that he had used greater care in handling said trains, but admitted that he had handled the same without any greater difficulty, in so far as concerned his ability to control or stop them, than if they had been short trains.

The aforesaid six conductors called by plaintiff failed to refer to any instance where the engineer on any freight train upon which they were employed was unable to control the speed of or to stop the train, no matter what its length. Two of said conductor witnesses were actually in charge of the two long trains specifically mentioned in the complaint in this cause; but neither witness even suggested that any difficulty or unusual circumstance had arisen in the handling of said trains.

Plaintiff also called an engineer employed by the Atchison, Topeka & Santa Fe Railway Company, who, though testifying generally on the subjects of air brakes and brake-appliances in freight trains and the control of such trains by locomotive engineers, failed to refer to any instance when he, or any other engineer within his knowledge, had been unable to control or to stop a long freight train by means of the present type of air brakes. It appears that this engineer, though having sufficient seniority to obtain and hold a regular freight assignment in Arizona (i. e., in short-train territory) has exercised his seniority to obtain and hold a preferred position in freight service in Cali- [fol. 6267] fornia (i. e., in territory where long trains are regularly and frequently operated).

Defendant called as witnesses upon said topic two locomotive engineers of long experience in the handling of both long and short trains. Both of these witnesses are now employed by defendant as road foremen of engines, one on the Coast Division in California, where numerous long trains are operated; the other on the Tucson Division, where short-train operation prevails. Each of these witnesses testified that the handling of long trains by engneers, and particularly the controlling and stopping of said trains with the present types of air brakes, though requiring somewhat more care by the engineers, involved no greater difficulties than in the case of short trains. This testmony

was not challenged or controverted in any way by plaintiff or its witnesses.

As heretofore found, defendant operated some 302 long freight trains in Arizona during April, 1940. There is no evidence that any of the engineers handling said long trains were unable at any time to control or to stop them, or that any substantial difficulties were encountered in their operation. As to many of said trains, the record affirmatively shows that the handling was without any difficulty or other notable incident.

[fol. 6268]

XIV

Extent of Penalties Imposed by the law

Section 3 of said Train-Limit Law provides for a penalty of not less than $100.00 nor more than $1,000.00 for each violation thereof; that is to say, for each long train operated in Arizona. If defendant had followed the long-train operating practice in Arizona during the year 1938, it would have operated, upon its main lines in that state, approximately 7800 long freight trains, and approximately 360 long passenger trains. Defendant would thus have been liable, if such long-train operation had been followed, for cumulative penalties ranging from approximately $816,000 to approximately $8,160,000. Said sums last mentioned fairly represent the range and amount of the cumulative annual penalties for which defendant would be liable, under the terms of the law, if it were to disregard and violate the same, and were to adopt and follow the practice of standard long-train operation in Arizona.

Exhibits 214, 246.

XV

The Permissible Number of Cars in an Interstate Train Is a Subject of National and Not Local Concern

The permissible number of cars in an interstate train is a subject of national, and not local, concern; it is a subject which, if any regulation thereof be needed, requires a gen-

eral system of uniformity of regulation; and it is a subject which, if regulated at all, should and must be regulated by Congress, and not by the several states. For it is wholly impracticable to construct and maintain railroad terminals [fol. 6269] exactly on state lines or to split up or consolidate through trains except at terminals. If other states should regulate train lengths in accordance with their respective notions as to what should be proper or desirable within their respective boundaries, all such regulations would necessarily have substantial extra-territorial effect as does the Arizona Train-Limit Law, and to comply with these conflicting provisions would seriously impede, delay, embarrass and interfere with through interstate train operation. If other states should adopt either the Arizona limitations, or different and conflicting limitations based on their several notions as to the proper length of railroad trains, the efficiencies and economies which have resulted, as hereinbefore found, from standard long freight-train operation, would be lost, and much of the enormous investment that made such operation possible would be rendered non-productive.

XVI

Financial Burden Imposed by the Law a Factor in Determining Its Unreasonableness

The additional expense, as hereinbefore found, that defendant is compelled to incur, by reason of compliance with the Train-Limit Law is a factor that may and should be, and has been, taken into consideration as a factor, but not the sole or controlling factor in finding (as is hereby found) that the law, considered as an exercise of the police power of the state in an ostensible attempt to promote public safety, the safety of travelers and the safety of railroad employes is, in so far as defendant is concerned, unreasonable, arbitrary, and without any reasonable relation to its purported objects, or to those claimed by plaintiff. Viewed entirely apart from the effect of the law on interstate com- [fol. 6270] merce, as hereinbefore found, and from the financial burden on such commerce imposed thereby, the law has created, now creates, and as long as it may continue in effect, will perpetuate a financial burden on defendant that is, under any fair and reasonable view of the evidence, entirely out of proportion to and far in excess of any safety

to the public; to travelers upon defendant's railroad, or to employes of defendant, that is or can or will be promoted thereby.

XVII

Further Arbitrary Effect of the Law

As to defendant's operations into, across, and out of Arizona, the Train-Limit Law is further arbitrary and unreasonable in that by its terms it applies and is made to apply to any and all trains in all circumstances, except those described in the proviso in Section 3 of the Act, whether a train be of all loaded cars, or all empty cars, or partly of loaded and partly of empty cars, each car being treated as a unit regardless of its construction, type, length, weight or condition or whether loaded or empty.

XVIII

Impairment of Defendant's Facilities by the Law

The necessary effect of the Train-Limit Law, as applied and enforced against defendant, is, has been and will continue to be substantially and continuously to impair the use and usefulness of the facilities used and usable by defendant in the transportation of interstate commerce, both passengers and property, into, out of, across and through the State of Arizona.

[fol. 6271]

XIX

Financial Burden on Interstate Commerce

The additional and unnecessary expense, as heretofore found, of defendant's compliance with the Train-Limit Law, has been and is and will and would continue to be a substantial, direct and continuing burden upon defendant as an interstate common carrier by railroad, and upon the interstate commerce carried on by defendant into, out of, across, and through the State of Arizona by means of its trains.

XX

Substantial Allegations Sustained

Each and all of the substantial allegations of fact set forth in parts I, II, and III of defendant's answer herein is sustained and established by the evidence.

[fol. 6272] CONCLUSIONS OF LAW

I

Jurisdiction

This is a civil suit in the nature of an action at law, in which the State of Arizona, as plaintiff, is seeking to recover from the defendant, a railroad corporation operating lines of railroad within said state, certain statutory penalties as provided in and by the Arizona Train-Limit Law (Sec. 69-119, Arizona Annotated Code, 1939) with respect to two alleged violations of said statute by defendant. This Court therefore has jurisdiction over the subject matter of the action, and of the parties hereto.

II

The Train-Limit Law Invades an Exclusive Federal Field and Thus Violates the Commerce Clause of the Federal Constitution

Said Train-Limit Law is unconstitutional and void as to interstate trains, which term includes substantially all of the trains operated in both directions over defendant's main lines in Arizona, because regulation of the permissible number of cars in an interstate railroad train passing from one state to another, or passing from one state through another into a third, or passing through a number of states, or passing over lines within a single state, is a subject over which exclusive legislative jurisdiction was and is vested in Congress by the Commerce Clause (Subdivision 3 of Section 8 of Article I) of the Constitution of the United States; the subject of the length and consist of interstate trains being one which requires a general or national system and uniformity of regulation, if such regulation should for any reason be required.

[fol. 6273] III

The Law Operates with Extra-Territorial Effect

Said Train-Limit Law is further unconstitutional and void, and in violation of said Commerce Clause, because its necessary, practical, and inevitable effect is, and will continue to be, to regulate the length of the interstate rail-

road trains operated over defendant's lines, not only within Arizona, but also in adjoining portions of the States of California and New Mexico, and in the State of Texas.

IV

The Law Interferes with and Unduly Regulates the Interstate Commerce Both Within and Without Arizona

Said Train-Limit Law is further unconstitutional and void and in conflict with said Commerce Clause because its necessary, practical and inevitable effect is, and will continue to be, directly, substantially, and unreasonably to interfere with and to regulate the operation of defendant's interstate trains in Arizona, and also in California, New Mexico, and Texas, and to delay and interfere with the continuous movement of said interstate trains between Arizona and other states; and also because its necessary and inevitable effect is, and will continue to be, to impair unreasonably the usefulness of the facilities employed, as well as their use by defendant, in the transportation of interstate commerce from, to and across the State of Arizona.

[fol. 6274]

V

The Law Imposes Undue and Improper Burdens Upon Interstate Commerce

Said Train-Limit Law is further unconstitutional and void, and in conflict with said Commerce Clause, because its necessary and inevitable effect is, and will continue to be to impose direct, substantial and unreasonable financial burdens upon the interstate commerce carried on by defendant, both within Arizona, and also in the adjacent States of California, New Mexico and Texas, and to impair the use and usefulness of the transportation facilities employed by defendant in the carriage of interstate commerce from, to and across the State of Arizona.

VI

The Law Conflicts With Existing Federal Legislation

To the extent to which said Train-Limit Law has, or may have, or is intended, or claimed, to have the effect of limiting the number of cars in a train to the maximum number

which can safely be controlled or stopped in one train, by the use of the types of air brakes and their appurtenances now employed on such trains, or by any other form of train-control or other safety devices, said law is further void and unenforceable against defendant, because it attempts to and does enter a legislative field already entered and therefore occupied by Congress, and thereby conflicts with and infringes upon existing legislation enacted by Congress pursuant to its powers under the Commerce Clause of the Constitution: the Congress having, under the provisions of the Safety Appliance Act, as amended (45 U. S. Code, Sections 1, 9) and the provisions of Sec- [fol. 6275] tion 25 of Part I of the Interstate Commerce Act, (49 U. S. Code 1, Section 25) delegated to the Interstate Commerce Commission full and complete authority to investigate and determine the adequacy of the air brakes, and their appurtenances, and each and all other forms of train control, automatic train-stop, and other safety devices used or proposed to be used on locomotives, cars, and trains operated in interstate commerce, and by order to prescribe the form and type thereof and from time to time to issue such amendatory and supplementary orders as said Commission may deem necessary or desirable in the exercise of the power thus delegated to it, which power and authority said Commission has duly exercised; the Congress having more particularly, in and by such statutes, necessarily empowered said Commission to determine whether the types of air brakes and their appurtenances presently used or proposed to be used upon trains in interstate commerce are or will be adequate and effective, safely and properly to control and to stop trains of the lengths now being operated or proposed to be operated by defendant in interstate commerce, both within and without the State of Arizona.

VII

The Law Operates Unreasonably and Arbitrarily to Deprive Defendant of Its Property, in Violation of Both the Commerce Clause and the Fourteenth Amendment to the Federal Constitution and Also in Violation of the Due-Process Clause of the Arizona Constitution

Said Train-Limit Law is further unconstitutional and void, and in violation of both the aforesaid Commerce

Clause of the Federal Constitution, and the Due-Process [fol. 6276] Clause of the Fourteenth Amendment to said Federal Constitution, and also in violation of the Due-Process Clause set forth in Section 4 of Article II of the Constitution of the State of Arizona, in that it operates, and will continue to operate, arbitrarily and unreasonably to deprive defendant of its property without due process of law, because:

(a) Said law fixes maximum lengths very much lower than those which generally obtain elsewhere throughout the United States, under operating conditions substantially similar to those upon defendant's main lines in Arizona;

(b) Said law makes no allowance for grade or other operating conditions, or for the construction, type, weight, or lengths of the cars composing the trains, or whether such cars are loaded or empty, or if loaded the weights of the loads therein;

(c) Said law imposes a great, substantial, and wholly unreasonable burden of expense upon, interference with, and delay to, interstate commerce, and impairs the use and usefulness of defendant's transportation facilities;

(d) Said law bears no reasonable relation to health or safety, and does not and will not either eliminate or to any substantial extent reduce any existing hazard, but on the contrary does and will create certain hazards which do not now and would not otherwise exist, and increases other hazards and dangers of railroad operation in numerous respects.

[fol. 6277]

VIII

Defendant Entitled to Judgment

Defendant is entitled to judgment in its favor, adjudging and declaring:

(a) That said Train-Limit Law is wholly void, invalid and unenforceable, as to said defendant, and each and all of its trains carrying any interstate commerce or traffic, or engaged in interstate transportation;

(b) That defendant is not liable to plaintiff by reason of any of the matters or circumstances alleged in the complaint herein, or otherwise, either for the amounts de-

manded as penalties in said complaint, or in any other sum or amount whatever;

(c) That said complaint and each count thereof be dismissed; and that said plaintiff take nothing by its action; and

(d) For its costs of suit herein incurred.

Dated and filed this the 11th day of February 1942.

Levi S. Udall, Presiding Judge in the Above Entitled Case.

[fol. 6278] Approved as to form February 11, 1942, Charles L. Strouss.

IN THE SUPERIOR COURT OF THE STATE OF ARIZONA IN AND FOR THE COUNTY OF PIMA

No. 20087

STATE OF ARIZONA, ex rel, Joe Conway, Attorney General of the State of Arizona, Plaintiff,

vs.

SOUTHERN PACIFIC COMPANY, a corporation, Defendant

JUDGMENT—Filed Feb. 11, 1942

This cause having come on regularly for trial on the 19th day of November, 1940, before the Honorable Levi S. Udall, Judge of the Superior Court, to whom said cause had duly been especially assigned; and Honorable Joe Conway, Attorney-General of Arizona, W. E. Polley, Esq., Assistant Attorney General, and Charles L. Strouss, Esq., having appeared for plaintiff; and Cleon T. Knapp, Esq., James P. Boyle, Esq., B. G. Thompson, Esq., Henley C. Booth, Esq., and Burton Mason, Esq., having appeared for defendant; and the case having been duly tried before said Court, sitting without a jury, a trial by jury having been duly waived pursuant to Rule 38 of the Rules of the Superior Court; and the case having been thereafter duly briefed, argued and submitted for decision; and the Court having heretofore, pursuant to Superior Court Rule 52, found the facts herein specially and stated separately its

conclusions of law, and having caused said Special Findings of Fact and Conclusions of Law to be entered of record herein, wherein and whereby, among other things, it was and is hereby found and held:

[fol. 6279] 1. That this Court has jurisdiction over the subject matter of this suit and of the parties hereto;

2. That that certain statute of the State of Arizona, known as the Arizona Train-Limit Law, being Section 69-119 of the Official Arizona Annotated Code, 1939, which statute is set forth in full in the complaint of the plaintiff herein, is unconstitutional and void, because:

First: Said statute invades the exclusive legislative field of Congress, as limited and defined by the Commerce Clause (par. 3, of Sec. 8, Art. 1) of the Constitution of the United States;

Second: Said statute imposes direct, unreasonable and unlawful burdens upon, and interferes with, delays and obstructs interstate commerce, in violation of said Commerce Clause;

Third: Said statute impairs the use and usefulness of the transportation facilities employed by defendant as a common carrier engaged in interstate commerce;

Fourth: Said statute is in conflict with and infringes upon, and amounts to an unlawful attempt to supplement, the power-brake provisions of the Federal Safety Appliance Acts, and the safety-device provisions of Section 25 of the Interstate Commerce Act, which Federal statutes operate upon the same subject matter and are directed to the same objects as said Train-Limit Law and by which said statutes Congress has completely and exclusively occupied the field of regulation of train lengths;

[fol. 6280] Fifth: Said statute operates unreasonably and arbitrarily to deprive defendant of its property, without due process of law, in violation of both the Due-Process Clause of the Fourteenth Amendment to the Constitution of the United States, and

the Due-Process Clause set forth in Section 4 of Article 2 of the Constitution of the State of Arizona;

3. That defendant is entitled to judgment in its favor, adjudging and declaring that said Train-Limit Law is wholly void, invalid and unenforceable; that said defendant is not liable to plaintiff for the amounts demanded as penalties in said complaint, or otherwise; and that said plaintiff take nothing by its action:

Now, therefore, it is hereby ordered, adjudged and decreed:

(a) That said Train-Limit Law is wholly void, invalid and unenforceable, as to said defendant, and each and all of its trains carrying any interstate commerce or traffic, or engaged in interstate transportation, upon each and all of the grounds hereinbefore set forth;

(b) That defendant is not liable to plaintiff by reason of any of the matters or circumstances alleged in the complaint herein, or otherwise, either for the sums demanded as penalties in said complaint, or for any other sum or amount whatever;

(c) That plaintiff take nothing by its action;

(d) That defendant do have and recover from plaintiff its costs of suit herein, in the sum of $

Dated: This 11th day of February, 1942.

Levi S. Udall, Judge of the Superior Court of the State of Arizona.

[fol. 6281] [File endorsement omitted]

IN THE SUPERIOR COURT OF THE STATE OF ARIZONA IN AND FOR THE COUNTY OF PIMA

No. 20087

STATE OF ARIZONA, ex rel, Joe Conway, Attorney General of the State of Arizona, Plaintiff,

vs.

SOUTHERN PACIFIC COMPANY, a corporation, Defendant

MEMORANDUM OPINION—Filed Feb. 11, 1942

This suit, brought by the State of Arizona at the relation of the Attorney General, is a civil action, seeking to recover from the defendant railroad company, which is an interstate carrier, penalties for violations of what is known as the Arizona Train-Limit Law. The complaint contains two causes of action; one charges the operation on March 2, 1940, of a passenger train containing sixteen cars; and the other alleges that on April 4, 1940, a freight train containing ninety-one cars was unlawfully operated. Both trains were operated west out of the Tucson yards. The defendant frankly admitted the operations complained of, but sought to avoid the penalties by asserting that the law in question was and is invalid and unconstitutional as applied to its interstate trains and traffic, because in conflict with various provisions of the State and Federal constitutions, which sections are hereinafter more particularly referred to.

The trial of these issues commenced November 19, 1940, and closed May 1, 1941, there being a number of intervening recesses; in all forty-six court days out of thirteen different weeks were consumed in the trial. Seventy-three different witnesses testified, many of whom came from all [fol. 6282] parts of the United States, and some 402 exhibits were offered in evidence.

The law under attack was enacted by the Legislature of the State of Arizona and approved by the Governor on May 16, 1912. A referendum was invoked and at a general State election, held November 5, 1912, the law was approved by a majority of the voters. It now appears as Section 69-119, Arizona Code Annotated, 1939. Since its adoption in 1912

this law, with but few exceptions and over short periods, has been enforced by the State and its terms complied with by the defendant. A notable exception is that by sufferance of the State the operations from the California-Arizona line into the Yuma yards has never been treated as within the purview of the law.

Briefly, the law provides that it shall be unlawful for a freight train consisting of more than seventy cars, exclusive of caboose, or a passenger train containing more than fourteen cars to be operated in the State of Arizona, and it provides a penalty of not less than $100.00, nor more than $1,000.00 for each violation thereof. The law when passed was entitled, "An Act Limiting the Number of Cars in a Train", without any preamble reciting its basic purpose. This Court will assume, for the purpose of determining this matter, that the law was enacted under the inherent police power of the State to promote and provide greater safety of persons and property, for it is fundamental that the State can only interfere in matters affecting interstate commerce where the health, safety or welfare of its citizens may so require, and then only when the law is reasonably adapted to accomplish the end sought to be attained.

The sole question, then, before the Court is as to the constitutionality of the Arizona Train-Limit Law as applied to defendant's interstate operations under the conditions as they have been shown to exist during the period covered by the record in this case. For, even though the law may have been constitutional when enacted in 1912, it does not prevent the Court from a re-examination to de- [fol. 6283] termine whether conditions may have changed so as to render it arbitrary and unreasonable, considered in the light of the changes. This record discloses that the present conditions, upon which the plaintiff must rely, are vastly and fundamentally different from those existing when the law was passed. Both the rolling equipment and the fixed plant have been practically completely changed, this through the medium of extensive improvement and reconstruction. Operating methods have been substantially modified. The volume and character of the traffic are quite different from that which was carried in 1912. As a matter of fact, the law had no appreciable adverse effect on defendant's operations when enacted, for the reason that freight trains then averaged but forty-seven cars and only 0.38%

of the trains had more than seventy cars. Passenger trains only averaged nine or ten cars. By September of 1913 the entire Southern Pacific system in Arizona had only some two miles of its track protected by block signals.

In determining the constitutional questions raised in this case I have constantly kept in mind the admonition of the present Chief Justice of the United States, wherein he said: "The power of courts to declare a statute unconstitutional is subject to a guiding principle of decision which ought never to be absent from judicial consciousness. This is that the Courts are concerned only *with the power to enact statutes, not with their wisdom.* For the removal of unwise laws from the statute-books appeal lies not only to the courts but to the ballot and to the processes of democratic government."

There can be no question but what the presumption is in favor of every legislative act, and the whole burden of proof lies on him who denies the constitutionality. The defendant here has been required to assume that full burden. The constitutional invalidity must be manifest and if it rests upon disputed questions of fact, the invalidating facts must be proved.

[fol. 6284] Here there is being called in question the validity of a statute which has been upon our books for more than twenty-eight years. It was not only passed by the Legislature, but subsequently approved by the people themselves in a referendum. More recently the Fifteenth Legislature made a special appropriation of a substantial amount to defend and sustain this law. This Court fully appreciates the delicacy of the situation and the great responsibility of rendering a judgment thereon. It is sometimes said that the court assumes a power to overrule or control the action of the people, or their representatives. This is a misconception. Our constitutions are the supreme laws of the land ordained and established by the people. All legislation must conform to the principles they lay down. When an act of a State Legislature is appropriately challenged in the courts as not conforming to the constitutional mandate the judicial branch of the Government has only one duty—to lay the article or articles of the constitution which are invoked beside the statute which is challenged and to decide whether the latter squares with the former. All the court does, or can do, is to announce its considered judgment upon the question. The only

power it has, if such may be called, is the power of judgment. This court neither approves nor condemns any legislative policy. Its delicate and difficult office is to ascertain and declare whether the legislation is in accordance with, or in contravention of, the provisions of the Constitution; and, having done that, its duty ends.

For some five and a half months I listened to the evidence adduced from the witness stand. In the intervening months, to refresh my memory, I have read the eighteen volumes comprising the Reporter's Transcript, which contains more than a million words; the numerous exhibits have been re-examined, the comprehensive briefs submitted by counsel for both parties, the last of which [fol. 6285] reached me on December 20, 1941, have been carefully studied and the hundreds of cases therein cited examined and it is now my matured conclusion that the Arizona Train-Limit Law is unconstitutional and void and I would be unworthy of the position that I hold if I did not have the courage to so declare it, irrespective of the effect of the ruling upon the parties, or those heretofore benefited thereby.

It should be remembered that this case is unique in at least two respects: It is the first train limit case to reach the State courts; second, it is the first time in the United States that the evidence in such a case has been taken before a trial judge. There are only four cases that are squarely in point, they are: The first Arizona case, the Nevada case, the Oklahoma case, and the Louisiana case. In the latter case no opinion was filed and, hence, it does not appear as a reported case. All of the four cases were brought in the Federal Court and determined by a special three-judge court. The evidence was either taken by a special master or the matter submitted on affidavits as in the Oklahoma and Louisiana cases. Admittedly none of the decisions in the four cases above referred to are controlling upon this Court. The Oklahoma law was sustained by a divided Court, while the courts in the other three cases declared the law under attack as unconstitutional. The first Arizona case was appealed to the Supreme Court of the United States and reversed on a jurisdictional ground without passing upon the merits. However, the opinions are of value in their logic and reasoning in passing upon identical questions as those here presented.

As a brief review of this type of legislation, the testimony of Dr. Parmelee, who is the Director of the Bureau of Railway Economics of the Association of American Railroads, shows that though forty-four different bills attempt-
[fol. 6286] ing to regulate the length of trains have been introduced in thirty-five different states, it was only in Arizona (1912), Nevada (1935), Louisiana (1936) and Oklahoma (1937) that such laws were actually passed. Three such measures were defeated in Congress. Only Arizona and more recently Oklahoma have actually operated under such laws. The Nevada and Oklahoma statutes affected only the length of freight trains, no mention being made of passenger-train operations.

As a part of its comparative showing as to costs and methods of operation, casualties, etc., the defendant presented the National picture of railroading by witnesses, who are outstanding in their respective fields, from sixteen of the Class I roads of the United States. The railroads from which these witnesses came, perform fifty-nine per cent of the freight service, sixty per cent of the passenger service, and operate fifty-four per cent of the Class I railroad mileage of America. This evidence clearly establishes that "long-train" operating practice is the customary and ordinary practice throughout the United States and that improvements in efficiency, economy and safety are an accomplishment and necessary result of the adoption of that practice. This type of operation is unquestionably more economical and efficient than "short-train" operations. Freight train expenses vary invers-ly with train length. Furthermore, long-train operations permit improved schedules and performance by elimination of short-train interference. Operating conditions, including grades and curves on defendant's lines, in Arizona were not shown to be essentially different from those in other parts of the United States. As a matter of fact, eighty-four per cent of defendant's main lines in Arizona are tangent (straight) track, and of the sixteen per cent that is curved only one per cent has curves of more than six degrees. Between March 2d and April 30th, 1940, the defendant's operations were carried on without regard to the restrictions of the
[fol. 6287] train-limit law, during which period some sixty-two long passenger trains and some 302 long freight trains were operated without particular incident. This further

indicates that long-train operations can be successfully carried out over the Arizona lines.

I shall not attempt in this opinion, as no good purpose could be served thereby, to make an analysis of the evidence, as that will be covered by the findings of fact filed this day. Nor shall I attempt to review and differentiate the numerous cited cases which lay down the principles of law governing these matters. I shall content myself with stating some of the principal reasons leading to the conclusion announced.

There is a field of regulation of interstate activities which, under the commerce clause, is exclusively reserved to the National Government, and I am firmly convinced that the subject of the length of trains engaged in interstate traffic falls within that class. This for the reason that the subject matter is national in its character, requiring uniformity of regulation by a single authority. If each state was at liberty to regulate the conduct of carriers while within its jurisdiction, the confusion likely to follow could not but be productive of great inconvenience and unnecessary hardship. The very purpose of the commerce clause was to insure uniformity of regulation of interstate commerce against conflicting and discriminating state legislation, such as the law in question. The absence of any act of Congress on the subject of train lengths is equal to its declaration that commerce in that matter shall be free. In other words, the inertia of government should be on the side of freedom of commerce, rather than on the side of restraint of commerce. The determination of this entire case might well be decided upon this exclusive federal field doctrine, which is in effect saying that Arizona never had the right to pass this legislation in the first instance.

[fol. 6288] There is a second so-called "joint" field of regulation, relating to those matters which require diversity of treatment according to local conditions, where the states may act within their respective jurisdictions, unless and until Congress sees fit to exercise its paramount authority. But even if the law in question were found not to fall in the "exclusive Federal field", but rather in the "joint field" of regulation, still the law must be stricken down for the reason that in my opinion Congress has, by the enactment of the Safety Appliance Act, Boiler Inspection Act, etc., coupled with the broad powers delegated to

the Interstate Commerce Commission, fully "occupied" this joint field of regulation. This would automatically oust the State of any power to supplement or expand such regulations any more than it could annul or amend them. Clearly if the law is necessary as a safety measure because "long trains" cannot be properly controlled and stopped with the present types of air brakes, then it gets over into a field already occupied by the Congress through the passage of the safety acts above referred to. Engineer Thrace Cooper of the Santa Fe System called by the State testified: "Your ability to control slack in a train rests solely on your ability to apply and release the brakes throughout the train."

There is still another infirmity to overcome: Any laws enacted by the State in the concurrent field must not be unreasonable or arbitrary and must not *substantially or directly* regulate, obstruct, impede or burden interstate commerce; *incidental or indirect interference* being all that is permitted.

The heavy direct burden cast by the law upon interstate commerce can not be seriously questioned and the impairment of the efficient use of defendant's property is of itself an unlawful taking of that property without due process of law, which is a violation of both the State and Federal con-
[fol. 6289] stitutions. The fact that it costs the defendant in excess of $300,000.00 a year to comply with this law would not or itself, standing alone, warrant invalidating the law, providing it was otherwise valid and bore some reasonable relation to the purpose for which it was enacted. The cost of compliance, however, with a statute of this kind is an element for appropriate consideration in determining whether the statute is arbitrary, capricious or repugnant to due process, and this factor has been so considered in arriving at a decision in this case.

The record here also amply discloses that the law causes real interference with, and delay to, interstate commerce, practically to the extent that Arizona operations create a bottle-neck. Actually ninety-three per cent of the freight traffic and ninety-five of the passenger business of the defendant in Arizona is interstate commerce. Furthermore, the law certainly imposes a great, substantial and wholly unreasonable burden of expense upon this interstate traffic. To hold in this case that interstate commerce was only

incidentally or indirectly involved would be less than realistic, for the interference and regulation is *substantial, continuous, direct and unavoidable*, as is pointed out in detail in the findings of fact. What is even more serious from the standpoint of those who seek to uphold the Act is its extra-territorial effect. The challenged law lays hands upon interstate commerce moving over defendant's lines long before it reaches the physical boundaries of Arizona, and continues directly to affect and regulate that commerce long after it has left Arizona. As a practical matter, it nearly controls the length of passenger trains from Los Angeles to El Paso, and of freight trains from Yuma to Lordsburg, the latter point being twenty-three miles East of the State line, and frequently on to El Paso, 171 miles beyond Arizona's boundary. Under the decided cases it is fatal for any police power statute to operate with extra-[fol. 6290] territorial effect, and under the guise of the police power no state may thus directly interfere with interstate commerce.

Even if the proponents of the law were able to clear all of the other hurdles heretofore discussed, there would then arise the hotly contested question as to whether this train-limit law actually bears any reasonable relation to safety. The Statute was unquestionably enacted under the police power, which is that undefined branch of government which bears the same relation to the State that the principle of self defense bears to the individual. Police power is founded upon public necessity and only public necessity can justify its exercise. If the law in question does not promote the safety of employees and travelers upon the defendant's railroad lines, and others who are affected by said operations, then it must fall.

There need be no speculation as to the effect of the law (as would be the case if this were a recently enacted statute whose prospective effect might be problematical) for the reason that the Interstate Commerce Commission, by its regulations, and the Congress by legislative enactment, have required this defendant and all other railroads to file detailed monthly reports of accidents and casualties occurring in connection with their operations. Furthermore, all of the more serious accidents are investigated by a representative of the Commission.

The defendant established the fact that operating conditions on its lines across the Salt Lake Division, through

the State of Nevada, where "long-train operations" are the rule, are entirely comparable in practically every respect to the operations on the Tucson division, in the State of Arizona. These latter operations being restricted by the law in question.

Detailed exhibits as to accidents and casualties of all types and classes were introduced in evidence. These exhibits covered operations particularly in Nevada and Ari- [fol. 6291] zona, as well as showing the National picture as a whole. From this evidence the Court is able to draw an irrefutable and striking comparison as to casualties under the "long" and "short" train operations.

Considering, first, passenger-train operations, the record shows that the casualty rates in Arizona, on the train-mile or any other recognized basis, are nearly twice what they are in Nevada. The Santa Fe operations in Arizona show the same trend. Surely the ultimate test of increased hazard is to be found in the actual record of casualties covering a twenty-eight year period.

From the standpoint of the safety of persons and property, slack and slack-action casualties on passenger trains are of no significance whatever.

Long-train method of operation prevails in passenger service all over the United States, except in Arizona, and the statistics demonstrate, from the safety angle, that the fourteen-car limit has no logical or reasonable basis. Furthermore, long passenger-train operations in Arizona are entirely practicable and would result in greater efficiency, economy and safety.

Hence, certainly as applied to passenger-train operations, the challenged law bears no reasonable relation to its claimed object of safety, and instead of promoting that object actually increases many hazards, and creates many others which would not exist if the law were not enforced.

In passing it might not be amiss to call attention to the splendid stride that has been made throughout the United States in recent years in reducing casualties. Arizona to a limited extent has shared in these reductions. This record shows that on the Class I roads the casualty rate for the years 1935-1939 was 10.63 per hundred million passenger miles, which is another way of saying that there was a casualty to a passenger for every 9,407,000 miles of traffic.

Considering next freight-train operations: The same [fol. 6292] careful records are kept of these operations as

is required by the I. C. C. of passenger-train operations, which includes reporting all train accidents where the damage exceeds $150.00, of all train service accidents and non-train accidents resulting in casualties to persons. If an employe is injured to the extent that he is incapacitated for work for a three-day period, within ten days after the accident it is classified as a casualty and becomes reportable. If a passenger is incapacitated for one day it is reportable as a casualty. (The term casualty includes fatalities. As a matter of fact ninety per cent of accidents resulting in fatalities to passengers or trainmen are investigated by a representative of the I. C. C., and it is rather significant that they have failed to find or report in any one year that the length of trains had anything to do with the number of casualties.

Furthermore, this record contains exhibits comparing the defendant's freight-train operations in Arizona with its operations in Nevada and New Mexico, as well as the Class I roads of America. The element of speculation, as to the result of long and short-train operations, is therefore largely eliminated. From all of which it appears very definitely that there are more accidents and they occurred more frequently in proportion to trains handled or traffic moved in short-train territory than in long-train territory. Reference is made to the findings of fact for details to support this statement.

The frequency of train and train-service accidents, which includes grade-crossing accidents, appears to be directly related to the number of train units operated and that when more train units are run than are necessary to handle a given amount of traffic, the hazard or accidents in the handling of such traffic is correspondingly increased. When one considers that in the year 1938, for instance, that 30.8% or 4,304 more freight trains were operated between Yuma and El Paso than were actually necessary if it had not been [fol. 6293] for this law, it becomes apparent why the casualty rate is higher in Arizona.

Also it is clear that the reason defendant is unable to effect improvements in the efficiency and economy of its freight-train operations in Arizona comparable to those achieved in neighboring states, or upon its system generally, is primarily due to the restrictions imposed by the Arizona law.

In arriving at a decision in this case I have not overlooked, nor minimized, the type of casualty caused by the sudden start, stop, lurch and jerk of the train or car, commonly known as slack-action casualties, which are so dreaded by every trainman. While slack action cannot be prevented, it must be controlled. A certain amount of slack is absolutely necessary to train operations. It cannot be denied that the addition of each car to a train adds just that much more potential slack, which must be effectively handled by the engineer if serious accidents are to be avoided. To the credit of the locomotive engineers of the United States, be it said that they have, with the improved equipment and devices furnished them, manifested greater skill and exercised more care in handling these longer trains with their heavier locomotives to the extent that over a seventeen-year period (1923-1939) only six per cent of the over-all casualties were caused by this type of accident. It must also be remembered that there are many factors besides length of train causing slack-action casualties, such as: grades, speed of train, consist of train and whether loaded or empty. The record shows many severe casualties of this type on short trains. Limiting trains to the Arizona maxima has had no perceptible limiting effect on even that class of accidents, but if it had, surely it would not be argued that the law was aimed at a definite class of hazards, to-wit: slack-action accidents, which represents but six per cent of the whole, and that the law must stand regardless of its effect on all the other [fol. 6294] classes of accidents representing ninety-four per cent of the casualties, all of which showed material increase due to the effect of the law.

Essentially then the question is not whether a given number of long trains may be operated with fewer casualties than an equal number of short trains, but rather whether the long-train method of moving the entire volume of traffic results in fewer casualties, of all classes, than the movement of the traffic in a larger number of trains of restricted length.

In determining then whether the law bears any reasonable relation to safety, only the over-all result in casualties of the entire operation should be considered and when thus weighed it is clear that the law not only does not in-

crease safety of train operations in Arizona, but that as a matter of cold fact it makes these short-train operations more dangerous.

Thus the Arizona Train-Limit Law not only bears no reasonable relation to safety but, to the contrary, does, and if enforced will continue to, impair and lessen substantially the safety of defendant's train operations in Arizona and the adjacent affected territory.

Defendant established that if the law were invalidated it contemplated the undertaking of an immediate program to build or extend its sidings and yard tracks at forty-nine different stations so as to provide suitable trackage permitting the efficient operation of long trains. Furthermore, larger locomotives of the AC-8 type, having much greater tractive power, would be assigned to the Tucson division. This change in motive power would also necessitate reconstructing certain roundhouses and turntables and providing additional repair facilities. It was estimated that these changes would involve the expenditure of more than a million dollars.

Before closing this opinion, may I say that the arduous [fol. 6295] task of the Court has been made much easier by the very able and comprehensive manner in which the Attorneys for both of the parties have briefed both the law and the facts; I compliment each of you on the skill manifested. This assistance has been appreciated, as has all of the courtesies which were extended throughout the long trial.

At the close of the trial both parties requested the Court to make findings of fact and conclusions of law. Thereupon the Court asked that counsel for the parties submit proposed findings, which request in due time was complied with. Being now of the opinion that the findings of fact submitted by the defendant, consisting of some 200 printed pages, are well supported by the record, the Court therefore adopts in toto these findings of fact and conclusions of law as its own. These have been signed and are now filed with the Clerk as a compliance with Section 21-1027, A. C. A., 1939.

It necessarily follows from what has been said that the Court considers the Train-Limit Law as being wholly void, invalid and unenforceable as to the interstate operations of the defendant, by reason of being in conflict with the

Commerce Clause and the Due Process Clause (Fourteenth Amendment) of the Constitution of the United States, as well as the Due Process Clause of the Constitution of the State of Arizona. The Defendant is, therefore, entitled to judgment, dismissing the Plaintiff's Complaint, and each count thereof, and for its costs of suit herein expended. It is so ordered.

Done in open Court this 11th day of February, 1942.

Levi S. Udall, Presiding Judge in the above Entitled Case.

[fol. 6296] [File endorsement omitted]

IN THE SUPERIOR COURT OF THE STATE OF ARIZONA IN AND FOR THE COUNTY OF PIMA

NOTICE OF APPEAL—Filed April 9, 1942

[Title omitted]

Notice is hereby given that the above named plaintiff, State of Arizona, appeals to the Supreme Court of the State of Arizona from the judgment rendered and entered in the above entitled Court in the above entitled cause on the Eleventh (11th) day of February, 1942, in favor of the above named defendant, Southern Pacific Company, a corporation, and against said plaintiff, State of Arizona, and from the whole thereof.

Dated this 8th day of April, 1942.

Joe Conway, Attorney General, W. E. Polley, Assistant Attorney General; Charles L. Strouss, Of Counsel.

[fol. 6297] IN THE SUPREME COURT OF ARIZONA

No. 4525

STATE OF ARIZONA, ex rel. Joe Conway, Attorney General of the State of Arizona, Appellant,

vs.

SOUTHERN PACIFIC COMPANY, a Corporation, Appellee

Appeal from the Superior Court of Pima County. Honorable Levi S. Udall, Judge. Judgment Reversed.

Joe Conway, Attorney General, Earl Anderson, Assistant Attorney General, Charles L. Strouss, of Counsel, all of Phoenix, Arizona, Attorneys for Appellant.

Cleon T. Knapp, James P. Boyle, B. G. Thompson, all of Tucson, Arizona; Henley C. Booth, Burton Mason, both of San Francisco, California; Attorneys for Appellee.

OPINION—Dec. 23, 1943

STANFORD, J.:

This action is brought under the provisions of Section 69-119, Arizona Code Annotated, 1939, (Laws, 1913, Referendum, p. 15; Sections 2166-2168, Revised Statutes of Arizona, 1913, Civil Code; Section 647 Revised Code of Arizona, 1928), being the act commonly called the Train Limit Law, and was brought for the purpose of recovering from defendant penalties as provided by the act. The charge in the complaint is that on March 12, 1940, the defendant [fol. 6298] operated a passenger train of more than 14 cars, and on April 4, 1940, the defendant operated a freight train of more than 70 cars, in violation of said law.

The aforesaid statute reads as follows:

"Section 1. It shall be unlawful for any person, firm, association, company or corporation, operating any railroad in the state of Arizona, to run, or permit to be run, over his, their, or its line of road, or any portion thereof, any train consisting of more than seventy freight or other cars, exclusive of caboose.

"Section 2. It shall be unlawful for any person, firm, association, company or corporation, operating

any railroad in the state of Arizona, to run, or permit to be run, over his, their, or its line or road, or any portion thereof, any passenger train consisting of more than fourteen cars.

"Section 3. Any person, firm, association, company or corporation, operating any railroad in the state of Arizona, who shall wilfully violate any of the provisions of this act, shall be liable to the state of Arizona for a penalty of not less than one hundred dollars, nor more than one thousand dollars, for each offense; and such penalty shall be recovered and suits therefor brought by the attorney general, or under his direction, in the name of the state of Arizona, in any county through which such railway may be run or operated, provided, however, that this act shall not apply in cases of engine failures between terminals.

"Section 4. All acts and parts of acts in conflict with the provisions of this act are hereby repealed."

The case was tried in Tucson, Pima County, Arizona, before the Honorable Levi S. Udall, Judge of the Superior Court of Apache County, Arizona, to whom it had been assigned.

By the judgment rendered it was held that the Train Limit Law of Arizona, as set forth in the sections above quoted, was unconstitutional and void because:

[fol. 6299] "First: Said statute invades the exclusive legislative field of Congress, as limited and defined by the Commerce Clause (par. 3, of Sec. 8, Art. 1) of the Constitution of the United States;

"Second: Said statute imposes direct, unreasonable and unlawful burdens upon, and interferes with, delays and obstructs interstate commerce, in violation of said Commerce Clause;

"Third: Said statute impairs the use and usefulness of the transportation facilities employed by defendant as a common carrier engaged in interstate commerce;

"Fourth: Said statute is in conflict with and infringes upon, and amounts to an unlawful attempt to supplement, the power-brake provisions of the Federal Safety Appliance Acts, and the safety-device provi-

sions of Section 25 of the Interstate Commerce Act, which Federal statutes operate upon the same subject matter and are directed to the same objects as said Train-Limit Law and by which said statutes Congress has completely and exclusively occupied the field of regulation of train lengths;

"Fifth: Said statute operates unreasonably and arbitrarily to deprive defendant of its property, without due process of law, in violation of both the Due-Process Clause of the Fourteenth Amendment to the Constitution of the United States, and the Due-Process Clause set forth in Section 4 of Article 2 of the Constitution of the State of Arizona;"

Appellee has admitted the operation of the trains as alleged in the complaint, but alleged that each of said trains consisted in a large part of cars moving in Interstate Commerce and carrying interstate traffic, and in further explanation of appellee's case, we quote as follows:

"* * * and denied that either of said operations was a wilful violation of the law. For a further separate and affirmative defense to the complaint, appellee alleged that the law was and is void, invalid and unconstitutional, because in violation of the Commerce Clause (Article I, Section 8, para: 3) of the Constitution of the United States, the Due-Process Clause of Section 1 of the 14th Amendment of the Constitution of the United States, and the corresponding Due-Process Clause set forth in Article II, Section 4, of the Constitution of Arizona, in that: (a) the law undertakes to regulate a subject-matter of national concern which, if required [fol. 6300] to be regulated at all, is subject to regulation only by Congress pursuant to the powers granted by the Commerce Clause; (b) the necessary effect of the law is to regulate appellee's train operations extraterritorially, that is to say, beyond the boundaries of Arizona; (c) the law directly and substantially interferes with, delays, and regulates appellee's interstate train operations in Arizona and the adjacent states; (d) the law imposes direct and substantial burdens upon the appellee's interstate train operations; (e) the law, to the extent that it has, or is intended or claimed to have, the effect of limiting the number of cars in a

train to that number which can be safely and effectively controlled or stopped by the use of air brakes and other appurtenances now in use on such trains, is in conflict with and an infringement upon existing Federal legislation having the same or similar purposes, enacted by Congress pursuant to its powers under the Commerce Clause; (f) the law deprives appellee of its property unreasonably and arbitrarily, in violation of the due-process clauses of the State and Federal Constitutions above referred to, for the reason, among others, that it bears no reasonable relation to health or safety, its ostensible objects, and does not eliminate or reduce any present hazard, but on the contrary creates certain hazards which would not otherwise exist, and increases other hazards of railroad operation in numerous respects."

In 1912, the year Arizona became a state, several measures were referred, under the Constitutional Act of Initiative and Referendum, to the people after their passage by the legislature. Among those measures, besides the one in question, the Train Limit Law, each had to do with the regulation through the police power of the state of railroads in Arizona for the health and safety of its employees and traveling public. That will be observed, first, by the act regulating the number of men to be employed on trains and engines; second, by the act regulating head lights on all locomotives (for example, in this particular act, it was required that locomotive engines used in the transportation of trains over railroads should install electric head lights of a certain power); and third, by the act to require certain tests of service before a person could serve as a locomotive [fol. 6301] engineer or train conductor. It can be easily seen that all of these acts, including the one in question in this action, were made the laws of this state for the purpose of the safety and protection of employees and of the people being transported over the railroads in our state.

Appellee contends in its brief, as it did by a statement before the court in argument that "it is much more probable that the law was advocated and passed as a measure to promote and preserve—make static—the employment of railroad trainmen. Certainly that is its most obvious practical (but extra-legal) purpose and, as experience has shown, one of its principal results." We have just quoted

the title to other acts, as well as this one, enacted in the year 1912 by the State Legislature. All of them have to do with the regulation of the handling of trains in order to protect the employees or traveling public as will be seen by the various acts, and no other reason could possibly be assigned to those acts, including, as stated, the one in question here. The case of State vs. Pate, (N. M.), 138 Pac. (2d) 1006, states: "The courts do not inquire into the motives of the legislature."

16 C. J. S. page 277, Sec. 100, has the following to say in connection with legislative acts:

> "It will be presumed that the legislature, in passing a statute, acted advisedly and with full knowledge of existing facts and conditions on which its legislation is based, and that no general laws are ever passed either through want of information on the part of the legislature or because it was misled by false representations of interested parties. It will also be presumed that the legislature carefully investigated and properly determined that the interests of the public required the enactment of particular legislation. So, the court will presume that the legislature in enacting [fol. 6302] a regulatory measure had adequate knowledge of the evils sought to be corrected and did not act arbitrarily or unreasonably."

In State vs. Wisconsin Telephone Co., 172 N. W. 225, 169 Wis. 198, it is said:

> "The term 'police power' is very elastic and is used to express different meanings at different times. In its broadest sense, it has been said to include 'all legislation and almost every function of civil government.'"

The case of Salem Lodge vs. Swaile, 197 N. E. 837, 209 Ind. 347, expresses the opinion that when a subject lies within the police power of the state, debatable questions as to reasonableness are not for the courts, but for the legislature which is entitled to form its own judgment, and its action within its range of discretion cannot be set aside because compliance is burdensome.

In the case of State vs. Superior Court, 174 Pac. 973, 103 Wash. 409, it is stated:

> "Indeed, it may be said that, where the police power is set in motion in its proper sphere, the courts have no

jurisdiction to stay the arm of the legislative branch of the government, for it is operating in its own particular field, where even the courts are powerless to insist upon a procedure consistent with the forms of the common law."

Dwelling for the present on the contention of the appellee that the law is in conflict with the Fourteenth Amendment, we refer to the case of Barbier vs. Connolly, 113 U. S. 923, reading as follows:

"* * * But neither the Amendment, broad and comprehensive as it is, nor any other amendment was designed to interfere with the power of the State, sometimes termed its 'police power,' to prescribe regulations to promote the health, peace, morals, education and good order of the people, and to legislate so as to increase the industries of the State, develop its resources and add to its wealth and prosperity. From the very necessities of society, legislation of a special character, having these objects in view, must often be [fol. 6303] had in certain districts, such as for draining marshes and irrigating arid plains. Special burdens are often necessary for general benefits, for supplying water, preventing fires, lighting districts, cleaning streets, opening parks, and many other objects. Regulations for these purposes may press with more or less weight upon one than upon another, but they are designed, not to impose unequal or unnecessary restrictions upon anyone, but to promote, with as little individual inconvenience as possible, the general good. Though, in many respects, necessarily special in their character, they do not furnish just ground of complaint if they operate alike upon all persons and property under the same circumstances and conditions. Class legislation, discriminating against some and favoring others, is prohibited; but legislation which, in carrying out a public purpose, is limited in its application, if within the sphere of its operation it affects alike all persons similarly situated, is not within the Amendment."

Appellee has brought to the attention of the court six certain cases in which it places great reliance. The first one is the case of A. T. & S. F. Ry. Co., et al., vs. LaPrade

(1933) 2 Fed. Supp. 855. This case was tried by one Circuit Judge and two District Judges. In this case counsel in their brief have to say:

> "The conclusions expressed by that opinion were given no effect solely because of the holding of the United States Supreme Court in Ex parte LaPrade (1933), 289 U. S. 444; 77 L. ed. 1311, which decided that the suit had abated because of the substitution of the incoming attorney general for the original defendant. The Supreme Court considered no other question."

The second is the Southern Pacific Company vs. Mashburn, (1937), 18 Fed. Supp. 393. This case was tried before one Circuit Judge and two District Judges. That case was decided against the validity of the Nevada law which was patterned after the Arizona law.

The third case was Texas & New Orleans R. Co., vs. Martin, et al., (1936). This is known as the Louisiana case and was heard by one Circuit Judge and two District Judges. It is an unreported case but the court made permanent the interlocutory injunctions issued prohibiting interference of the railroad in that state.

[fol. 6304] The fourth case is the case of M. K. & T. R. Co., vs. Williamson, 36 Fed. Supp. 607, known as the Oklahoma case. That case is like the Nevada Train Limit case except that it has reference to freight trains only. This case was heard and decided by the two Circuit Judges, District Judge Vaught dissenting.

The fifth case is State, etc. vs. A. T. & S. F. Ry. Co. et al., 125 Kans. 586; 264 Pac. 1056, a Kansas case heard by the State Supreme Court. The state, through its Public Service Commission, attempted to compel, by mandamus proceedings, the railroad company to put into effect certain orders prescribed by it relating to manual signals to be used by train crews and relating to the air and power brake system, and in part, the holding of that state court was that such an order could not be enforced by mandamus where no showing was made that a better system had been devised. The unanimous judgment was rendered for the railroad company.

The sixth case is Southern Pacific Company vs. Railroad Commission of California, 10 Fed. Supp. 918. In that case the Railroad Commission of California had ordered that

certain trains moving between certain points during the six winter months be operated with an additional caboose, to be placed midway in the train. The opinion in this case was given by one Circuit and two District Judges upholding the railroad company.

In connection with the foregoing six cases we quote a statement, or contention, of the appellee herein as follows:

> "It will be noted that the four Federal train-limit cases were heard before twelve different Federal judges, five of whom were Circuit judges and seven [fol. 6305] District judges. Three of the Circuit judges and all of the District judges, or ten Federal judges in all, have agreed that state train-limit laws exactly or essentially similar to the challenged law are invalid, upon precisely the same constitutional grounds urged in the present case. Only two of these twelve judges have taken a contrary view.
>
> "Three of the ten Federal judges mentioned have also concurred in reaching the same result with respect to a state regulation not differing in principle from a train-limit law; although, of course, neither the volume of the traffic affected, the character and extent of the interference imposed, nor the financial burden was as severe and widespread as in the train-limit cases."

The State of Oklahoma, one of our latest additions to statehood in the union, no doubt was desirous of enacting laws that would be progressive, that would be for the safety of the traveling public through its state and for the employees on its trains. Regardless of the reasoning of the appellee herein, as above set forth, as to the total number of various judges who have in the aggregate given opinions that would overwhelm the Oklahoma case, nevertheless the Oklahoma case was not tried by state judges and it is the latest case quoted by appellee herein, and while this court is not bound to follow, it is certainly most fitting to do so.

There are something like 325 cases cited by the two parties to this action, and it would be impossible to make reference to all of them. The case of M. K. & T. R. Co., vs. Williamson, supra, is replete with the cases cited by both sides in this case, and Circuit Judge Bratton, who wrote the opinion in that case, gave expression of the court to most all the cases cited in the case. In that case, like the one at bar,

the railroad company was compelled, among other things, to expend great sums of money in order to comply with the restrictions placed by the State of Oklahoma, and by in- [fol. 6306] junction the railroad company sought to be relieved of the necessity of such great additional expense. We quote from said case as follows:

"It is contended with emphasis that the statute, applied to the business of plaintiff, is not a safety measure reasonably enacted in the exertion of the police power of the state, but is merely an attempt to regulate, delay and burden interstate commerce, in violation of the Commerce Clause. The supreme, plenary and complete power of Congress to regulate interstate commerce is without limitation or restriction, except that prescribed in the Constitution; and within the reach of that paramount authority lies the power to protect such commerce against substantial dangers, burdens or obstructions, no matter the source from which the encroachment springs. Gibbons v. Ogden, 9 Wheat. 1, 6 L. Ed. 23; Minnesota Rate Cases (Simpson v. Shepard), 230 U. S. 352, 398, 33 S. Ct. 729, (citing many other cases.) Coming to apply the well-recognized doctrine many state and municipal enactments have been held invalid. (citing cases).

"But every state statute having some relation to interstate commerce is not to be condemned on that ground. A state is free in the exertion of its police power to enact reasonable measures in the interest of the health, safety and welfare of its people, including employees of railroads, passengers on trains, and others, even though interstate commerce may be incidentally or indirectly involved. * * * It is crystal clear that the general principle running through all of these cases is that a state statute, enacted in the exercise of the police power, and bearing some reasonable relation to the health, safety, or well-being of the people of the state, is not to be overturned by judicial decree, even though by its necessary operation it affects interstate commerce in an incidental or indirect manner, but not otherwise. * * *.

"Plaintiff relies upon the due process clause of the Fourteenth Amendment. It is obvious that to comply with the statute plaintiff will be required to expend

additional sums in the operation of its business. The cost of compliance with a statute of this kind is an element for appropriate consideration in determining whether the statute is arbitrary, capricious, or repugnant to due process; but, standing alone, it is not always enough to warrant judicial determination of invalidity. Missouri Pacific Railway Co. v. Kansas, 216 U. S. 262, 30 S. Ct. 330, 54 L. Ed. 472; Lehigh Valley Railroad Co. v. Board of Public Utility Commissioners, 278 U. S. 24, 49 S. Ct. 69, 73 L. Ed. 161, 62 A. L. R. 805; Missouri Pacific Railroad Co. v. Norwood, supra. The facts presented are not sufficient to distinguish or set apart this case from those to which reference has been made in which statutes enacted in the exercise of the police power of the state were sustained, although interstate commerce was incidentally and indirectly affected and the expenditure of additional sums was necessitated.

[fol. 6307] "The remaining contention to be considered is that the statute must fall because Congress has occupied the field; that the act infringes and is in conflict with legislation heretofore enacted by Congress pursuant to its powers under the Commerce Clause. To sustain the contention, plaintiff relies upon paragraphs 10 to 17 and paragraph 21 of section 1, and section 26, of the Interstate Commerce Act, as amended, 49 U. S. C. A. Pars. 1, 26; and sections 1 and 9 of the Safety Appliance Act, as amended, 45 U. S. C. A. Pars. 1, 9. Paragraph 10, section 1, of the Interstate Commerce Act, as amended, defines the term 'car service'; paragraph 11 makes it the duty of a railroad company to furnish safe and adequate car service, and to enforce just and reasonable rules, regulations, and practices in respect of car service; paragraph 12 relates to the distribution of cars for the transportation of coal; paragraph 13 authorizes the Commission to require railroads to file with it their rules and regulations relating to car service, and empowers the Commission to direct that such rules and regulations be incorporated in the schedules showing rates, fares and charges for transportation; paragraph 14 authorizes the Commission to establish rules, regulations, and practices touching car service; paragraph 15 is addressed to the furnishing of car service and the use of facilities in case of short-

age of equipment, congestion of traffic, or other emergency, paragraph 16 empowers the Commission to make just and reasonable directions in respect to the handling, routing, and movement of traffic over other lines; paragraph 17 requires railroad companies to obey orders of the Commission concerning car service, and provides a penalty for disobedience; and paragraph 21 vests in the Commission authority to require any railroad to provide itself with safe and adequate facilities for performing its car service, and fixes a penalty for refusal or neglect to comply with such an order; and section 26 authorizes the Commission to order a railroad to install automatic train-stop or train-control devices or other safety devices, and fixes a penalty for the refusal or neglect to comply with such an order. Section 1 of the Safety Appliance Act, as amended, provides that no railroad company shall use on its line any locomotive in moving interstate traffic not equipped with a power driving-wheel brake and appliances for operating the train-brake system, and that no train shall be run in such traffic that does not have a sufficient number of cars in it equipped with such power and train brakes that the engineer on the locomotive can control its speed without requiring brakemen to use the common hand brake for that purpose; and section 9 provides that whenever a train is operated with power or train brakes not less than fifty per cent of the cars shall have their brakes used and operated by the engineer, that all power-braked cars in the train which are associated together with such fifty per cent shall have their brakes so used and operated that the Interstate Commerce Commission may, from time to time, [fol. 6308] increase the minimum percentage of cars required to be operated with power or train brakes, and that failure to comply with any such requirement shall subject the company to a penalty.

"In respect to the regulatory power of the state and the occasions for its exercise, the general subject of commerce has been divided into three separate and distinct classes. They are those in which the power of the state is exclusive, those in which the state may act in the absence of legislation by Congress, and those in which the action of Congress is exclusive and therefore the state cannot act at all (citing cases). The

reasonable limitation of the length of trains in the interest of public safety falls within the second class. As to that class, the exercise of the paramount power of Congress is necessary to take from the state its subordinate power to legislate. Covington & Cincinnati Bridge Co. v. Kentucky, supra; Western Union Telegraph Co. v. James, supra. And mere congressional delegation of power to the Interstate Commerce Commission to act in respect to that class does not require the state to yield. It is only after action by the Commission that the state is shorn of its power (citing cases). But the intent of Congress to exert its superior authority and thus exclude or supersede state legislation concerning the same matter is not to be lightly inferred. It must be fairly manifested (citing cases). And, it is within the power of Congress to limit its regulation to only part of a given field, thus leaving the remainder open to action by the state (citing cases).

"The acts of Congress relied upon fail to make specific reference to the length of trains as an element of safety, and it is not contended that the Interstate Commerce Commission has acted or asserted its authority to act in respect of the matter under the powers which Congress has delegated to it. True, some if not all of the statutes concern themselves with various aspects of safety in the operation of trains. But, fairly construed, they do not contain any provision from which it can be reasonably implied that Congress intended to exert the paramount character of its authority in relation to the length of trains in such manner as to exclude or supersede state action. And until an intent to exercise such superior authority has been indicated, the state is free to legislate in the exertion of its police power . . . ."

It has come to our attention that the Interstate Commerce Commission in relation to the Transportation Act of 1940 has recently commented on that Act as follows:

"It is unnecessary to decide whether Congress has occupied the field of safety regulation with respect to [fol. 6309] the operation of trains or with respect to the length of trains. In any event, that is a question for the courts. The question before us is whether, in view of the emergency found to exist, we were author-

ized by law to suspend the operation of State laws limiting the number of cars in a train."

The emergency referred to, of course, has reference to the suspension of the Train Limit Law for the duration of the war, and to which this state has unhesitatingly yielded. From the case of People vs. Letford, 79 Pac. (2d) 274, 102 Colo. 284, we quote the following:

> "In approaching the question of the validity and constitutionality of the statute, it is well to keep in mind certain fundamental rules. When an act of the Legislature is attacked on the ground of unconstitutionality, the question presented is not whether it may be voided but whether it is possible to uphold it. Denver v. Knowles, 17 Colo. 204, 30 P. 1041, 17 L. R. A. 135. Every presumption will be indulged in favor of the legislation and only clear and demonstrable usurpation of power will authorize judicial interference with legislative action. Green v. Frazier, 253 U. S. 233, 40 S. Ct. 499, 64 L. Ed. 878. The rule was well stated by the Supreme Court of Massachusetts in Re Wellington et al., Petitioners, 16 Pick. 87, 26 Am. Dec. 631, and quoted with approval by us in Milheim v. Moffat Tunnel District, 72 Colo. 268, 273, 211 P. 649, 651, as follows: 'When called upon to pronounce the invalidity of an act of legislation passed with all the forms and solemnities requisite to give it the force of law, courts will approach the question with great caution, examine it in every possible aspect and ponder upon it as long as deliberation and patient attention can throw any new light on the subject, and never declare a statute void, unless the nullity and invalidity of the act are placed, in their judgment, beyond reasonable doubt.' "

The trial court took from the 19th day of November to the first of the following May in the trial of this cause, excepting some recesses. There were 886 assignments of error and 39 propositions of law presented to us, and of the many scores of cases cited by both appellant and appellee, this court has read as many as possible to be consistent in rendering justice to both sides. The matter has engrossed the attention of this court, as time would permit, [fol. 6310] since its presentation in April, 1943, until this time, but the opinion, condensed as it is in the foregoing

pages, expresses our reason for holding that the findings and judgment of the trial court to the effect that the Train Limit Law is unconstitutional were in error.

We cannot impugn the motives of the legislature of our state, and in this particular case the purpose of the citizenry of our commonwealth by disturbing the enactment of this law made by them until we find that it is in violation of a law to which the state must yield.

The judgment is reversed.

R. C. Stanford, Judge.

Concurring:

A. G. McAlister, Chief Justice.

[fols. 6311-6312] Ross, J.:

I dissent. My reasons will be given later. Illness prevents my doing so at this time.

I think the judgment of the lower court should be affirmed.

Henry D. Ross, Judge.

[fol. 6313] IN THE SUPREME COURT OF ARIZONA

No. 4525

STATE OF ARIZONA, ex Rel. JOE CONWAY, Attorney General of the State of Arizona, Appellant,

vs.

SOUTHERN PACIFIC COMPANY, a Corporation, Appellee

Appeal from the Superior Court of Pima County. Honorable Levi S. Udall, Judge

Judgment reversed in opinion of December 23, 1943.

Joe Conway, Attorney General, Earl Anderson, Assistant Attorney General, Charles L. Strouss, of Counsel, all of Phoenix, Arizona, Attorneys for Appellant.

Cleon T. Knapp, James P. Boyle, B. G. Thompson, all of Tucson, Arizona; Henley C. Booth, Burton Mason, both of San Francisco, California, Attorneys for Appellee.

DISSENTING OPINION—January 13, 1944

Ross, J. (Dissenting):

When the opinion in this case was handed down on December 23, 1943, I was unable, because of illness, to give my reasons for dissenting. I now do so.

The validity of the Arizona Train Limit Law (section 69-119, Arizona Code 1939) as applied to interstate transportation of persons and property is the question for decision. Such law undertakes to penalize any railroad in [fol. 6314] the State of Arizona that runs over its lines, or any part thereof, any train consisting of more than 70 freight, or other cars, exclusive of caboose, or any passenger train of more than 14 cars.

The act is silent as to its purpose. If it was enacted to protect the safety, health and well-being of railroad employees, or the traveling public, it does not so recite, as in the Williamson case (36 Fed. Supp. 607) cited in the majority opinion.

The laws observance until now by the interstate railroads operating in Arizona, as the evidence and findings conclusively show, has not only cost such utilities large sums of money but, also, has delayed and interfered with their business of transportation of goods and persons, at both the east and west boundaries of the state, without any material benefit to the traveling public, in the way of safety or health, or of the employees unless it be that more of them thereby have secured employment, increasing the operating expenses of the roads.

One sure result of a compliance with the law has been to force interstate companies to operate many more trains in the conduct of their business than the safety and well-being of the employees would seem to require, greatly increasing their costs.

Under the law, a fruit or cattle train made up in California for the Kansas City or Chicago Markets, if it consists of more than 70 cars, must, when or before it reaches, Yuma, Arizona, be broken down to the limit of 70 cars before it proceeds through Arizona. When this same train has crossed Arizona it may be rebuilt to the California length and proceed on its course to the point of destination. The traffic from the east to California must also conform [fol. 6315] to this arbitrary rule at the state's boundary. In effect, the law limits length of trains from California and New Mexico to and through Arizona and practically outside of the state.

The regulation of the length of interstate trains, if permissible, is by reason of the state's right under the constitution to pass laws for the protection of its people's lives, safety, health and well-being and to do that the state may

enter the field appropriated under the federal constitution to the federal government, when such field has not been wholly occupied by that government. Powers belonging under the constitution to the federal government but not exercised may in all proper cases be exercised by the state for its use and protection, and a state law to that end will be valid and enforceable.

The Train Limit Law, if an allowable state regulation originally, is no longer allowable for the following reasons:

1. The danger to life and health in the operation of long trains, because of the improvement in the operating services as shown by the evidence and findings, has been greatly minimized, if not wholly done away with.

2. That because of such improvement, if the Train Limit Law was ever a valid police regulation, it now, under the evidence, serves but one purpose, to wit, the employment of more employees and trains, with the expense and hazards incident thereto.

3. It invades the field of regulation occupied by the Congress in its legislation providing for safety appliances in railroad operations (Virginian Ry. v. United States (1915), 223 Fed. 748) and the safety provisions of the Interstate Commerce Act.

[fol. 6316] 3. In ExParte No. 156, November 8, 1943, the Interstate Commerce Commission refused to modify its Service Order No. 85, theretofore entered, suspending during the war the operation of state laws limiting the number of cars in trains, stating, among other things:

> "If state laws limiting the number of cars in trains are to be held valid (a question we do not decide), it would be possible for each state to set a different number of cars as the maximum to be hauled in a train. A state might even limit the length of trains to one car, although such a law would be clearly arbitrary and unreasonable. Higher limits might be set by states and found reasonable, but lack of uniformity would place a serious burden on interstate commerce. • • •
>
> "The fact that freight trains in excess of 70 cars and passenger trains in excess of 14 cars are safely operated in states without train-limit laws 'is convincing evidence of its safety, except where unusual operating conditions exist.' • • •

"We find that these state laws were and are in fact rules and regulations with respect to car service within the meaning of section 1, paragraph (10) and (15); that Service Order No. 85 was and is in accord with the national transportation policy * * * and is fully authorized by section 1 * * * of the Interstate Commerce Act."

The Interstate Commerce Commission refused to modify or change said Service Order No. 85 for the reasons (a) that it was a valid order made pursuant to act of Congress and (b) because as a matter of fact "freight trains in excess of 70 cars and passenger trains in excess of 14 cars are safely operated in states without train-limit laws", which " 'is convincing evidence of its safety, except where unusual operating conditions exist.' " This finding of fact by the Commerce Commission is fully and well supported by the evidence taken in this case and is in accord with the learned trial court's findings.

[fols. 6317-6318] Four states, Arizona, Nevada, Louisiana and Oklahoma, have enacted train limit laws. The laws in the first three named states have been passed upon and declared to be invalid (Atchison, T. & S. F. Ry. Co. v. La Prade, 2 Fed. Supp. 855; Southern Pacific Co. v. Mashburn, 18 Fed. Supp. 393; Texas & New Orleans R. Co. v. Martin et al (1936, unreported), No. 428-Equity), in Oklahoma it was sustained by a divided court (Missouri-Kansas-Texas R. Co. v. Williamson, 36 Fed. Supp. 607). The rulings of these courts is another very cogent reason why the Train Limit Law should not be sustained. These decisions were by three-judge federal courts and were unanimous in holding the law invalid, except in the state of Oklahoma. In other words, of the 12 judges presiding in these cases 10 joined in declaring the law invalid and two (in the Oklahoma case) sustained the law.

I think the judgment of the lower courts should be affirmed.

Henry D. Ross, Judge.

[fol. 6319] IN THE SUPREME COURT OF THE STATE OF ARIZONA

MANDATE—Filed in Superior Court Jan. 15, 1944

To the Honorable the Superior Court of the State of Arizona in and for the County of Pima

Greeting: whereas, lately in the Superior Court of the State of Arizona in and for the County of Pima, before you in a cause between: State of Arizona, ex rel. Joe Conway, Attorney General of the State of Arizona, Plaintiff, vs. Southern Pacific Company, a corporation, Defendant, No. 20087, the said Superior Court made and entered its judgment on February 11, 1942, as follows:

"Now, therefore, it is hereby ordered, adjudged and decreed:

(a) That said Train-Limit Law is wholly void, invalid and unenforceable, as to said defendant, and each and all of its trains carrying any interstate commerce or traffic, or engaged in interstate transportation, upon each and all of the grounds hereinbefore set forth;

(b) That defendant is not liable to plaintiff by reason of any of the matters or circumstances alleged in the complaint herein, or otherwise, either for the sums demanded as penalties in said complaint, or for any other sum or amount whatever;

(c) That plaintiff take nothing by its action;

(d) That defendant do have and recover from plaintiff its costs of suit herein, in the sum of $

Dated: This 11th day of February, 1942.
Levi S. Udall, Judge of the Superior Court of the State of Arizona."

[fol. 6320] as by the inspection of the record of the said Superior Court, which was brought into the Supreme Court of the State of Arizona by virtue of an appeal by plaintiff agreeably to the law in such case made and provided fully and at large appears.

[fol. 6321] And whereas, in April, in the year of our Lord one thousand nine hundred and Forty-three, the said

cause came on to be heard before the said supreme court, and was submitted for decision after argument of counsel.

On consideration whereof, it was on the 23rd day of December in the year of our Lord one thousand nine hundred and forty-three, ordered by this Court that the judgment of the said Superior Court in this cause, entered February 11, 1942, be, and the same is hereby reversed. Costs in this court to said appellant State of Arizona of and from said appellee Southern Pacific Company on cost bill duly filed and allowed.

Whereupon, appellee filed its motion for rehearing, on consideration of which, with the reply and objections of appellant, it was, on January 13, 1944, ordered that the motion for rehearing be denied.

[fol. 6322] You therefore are hereby commanded that such proceedings be had in said cause, as according to right and justice, and to law, ought to be had, the said Appeal notwithstanding.

Witness, the Honorable A. G. McAlister, Chief Justice of the Supreme Court of the State of Arizona, the Fourteenth day of January, in the year of our Lord one thousand nine hundred and Forty-four.

Costs of no cost bill filed.

Eugenia Davis, Clerk of the Supreme Court of the State of Arizona.

IN THE SUPERIOR COURT OF THE STATE OF ARIZONA IN AND FOR THE COUNTY OF PIMA

No. 20087

STATE OF ARIZONA, ex rel. JOE CONWAY, Attorney General of the State of Arizona, Plaintiff,

vs.

SOUTHERN PACIFIC COMPANY, a corporation, Defendant

JUDGMENT ON MANDATE OF SUPREME COURT—Filed Feb. 5, 1944

The above entitled cause coming on regularly before the Court this 5th day of February, 1944, on the opinion and

mandate of the Supreme Court of the State of Arizona,

It is now ordered, adjudged and decreed:

1. That the Arizona Train Limit Law is constitutional and valid.

2. That plaintiff have and recover judgment against the defendant:

(a) on plaintiff's first cause of action, in the amount of $250.00;

(b) on plaintiff's second cause of action, in the amount of $250.00;

(c) for plaintiff's costs herein in the amount of $ none.

Dated this 5th day of February, 1944.

Levi S. Udall, Judge.

[Title omitted]

PETITION FOR APPEAL FROM THE SUPREME COURT OF THE STATE OF ARIZONA TO THE SUPREME COURT OF THE UNITED STATES—Filed March 8, 1944

To the Honorable, the Chief Justice of the Supreme Court of the State of Arizona:

Southern Pacific Company, a corporation, your petitioner, respectfully shows:

1. Petitioner is the appellee in the above entitled cause.

2. The above named appellant filed a complaint in the Superior Court of the State of Arizona, in and for the County of Pima, on the 19th day of April, 1940, against your petitioner as defendant, seeking to recover penalties for two asserted violations of Section 69-119, Arizona Revised Code Annotated, 1939, the statute of Arizona known as the Arizona Train Limit Law. After trial of said cause in said Superior Court judgment therein was rendered in favor of your petitioner as defendant, adjudging said Train Limit

Law to be unconstitutional because in violation of the Constitutions of the United States and the State of Arizona. [fol. 6325] 3. An appeal was thereupon taken from said judgment to the Supreme Court of the State of Arizona. Said Supreme Court is the highest court of the State of Arizona and therefore the highest court of said State in which a decision in this suit could be had. Upon said appeal said judgment was reversed, by a decision rendered by said Supreme Court of Arizona on the 23rd day of December, 1943. Thereafter your petitioner filed its motion for rehearing, which was denied by said Supreme Court of Arizona on the 13th day of January, 1944. Thereupon the mandate of said Supreme Court duly issued, addressed to said Superior Court, directing further proceedings to be had in conformity with said decision dated December 23, 1943.

4. In obedience to the decision and mandate of the Supreme Court of Arizona, said Superior Court, on February 5, 1944, rendered and entered its judgment, declaring said Arizona Train Limit Law to be valid and constitutional, and imposing upon your petitioner as defendant penalties in the aggregate sum of $500.00, for and on account of the asserted violations of said Train Limit Law set forth in the complaint in this cause.

5. In said cause there is drawn in question the validity of a statute of the State of Arizona, on the ground of its being repugnant to the Constitution, laws or treaties of the United States, and the decision is in favor of its validity; in that your petitioner, as defendant in the Superior Court, and as appellee in the proceedings before the Supreme Court of Arizona, has at all times maintained, from the outset of the cause, and as a matter of affirmative defense to the complaint in said cause, and now maintains, that the Arizona Train Limit Law, the statute of Arizona aforesaid upon which the prosecution is predicated, infringes upon and violates the Commerce Clause (Article I, Section 8, Paragraph 3) of, and the Due Process Clause of the 14th Amendment (14th Amendment, Section 1) to, the Constitu- [fol. 6326] tion of the United States, and also infringes upon and is in conflict with certain federal statutes enacted by Congress pursuant to its powers under the Commerce Clause, to wit, the Federal Safety Appliance Act (45 U. S. Code, Sections 1, 9), and the Safety Section (Section 25) of

Part I of the Interstate Commerce Act (49 U. S. Code, Part I, Section 25).

6. Petitioner further represents and shows that the decision of the Supreme Court of Arizona, herein dated December 23, 1943, and the judgment of the Superior Court herein dated February 5, 1944, entered in obediencee to said mandate of said Supreme Court of Arizona, were and each of them was erroneous, in that this Court failed to hold and decide that said Arizona Train Limit Law was and is wholly unconstitutional and void, because in violation of each and all of the provisions of the Constitution of the United States hereinbefore referred to, and also an infringement upon and in conflict with the statutes of the United States hereinbefore particularly referred to.

Wherefore, petitioner prays for the allowance of an appeal from the Supreme Court of the State of Arizona (the highest court of said State) to the Supreme Court of the United States, in order that the decision of said Supreme Court of the State of Arizona may be examined and reversed, and also prays that a transcript of the record, proceedings and papers in this case, duly authenticated by the Clerk of the Superior Court of the State of Arizona, in and for the County of Pima (being the clerk of the court possessed of the record), may be sent to the Supreme Court of the United States, as provided by law.

Petitioner, desiring the appeal to be a supersedeas, prays an order touching the security to be required of it, and the approval of such bond as required in the case.

The errors upon which your petitioner claims to be en- [fol. 6327] titled to an appeal are those above indicated, and are fully set forth in the assignment of errors filed herewith.

Dated March 7th, 1944.

Cleon T. Knapp, James P. Boyle, B. G. Thompson, Tucson, Arizona; C. W. Durbrow, Burton Mason, San Francisco, California, Attorneys for Petitioner and Proposed Appellant in the Supreme Court of the United States.

[fol. 6328] [File endorsement omitted]

IN THE SUPREME COURT OF ARIZONA

[Title omitted]

ASSIGNMENTS OF ERROR—Filed March 8, 1944

Southern Pacific Company, a corporation, the above named appellee, assigns the following errors in the record and proceedings in this cause:

1. The Supreme Court of the State of Arizona erred in its decision and opinion herein, dated December 23, 1943, in failing to hold and conclude that that certain statute of the State of Arizona, known as the Arizona Train Limit Law (enacted in 1912, and now codified and republished as Section 69-119, Arizona Annotated Code, 1939), which statute prohibits, under penalty, the operation within the State of Arizona of trains of more than 70 freight or other cars, exclusive of caboose, or passenger trains of more than 14 cars, is wholly void, invalid and unconstitutional, and in violation of the Commerce Clause (Article 1, Section 8, Paragraph 3) of the Constitution of the United States, because said Train Limit Law undertakes to and does regulate a subject matter over which exclusive legislative jurisdiction was and is vested in the Congress of the [fol. 6329] United States by said Commerce Clause and thereby invades the exclusive legislative field of Congress; in that the subject of the length and consist of interstate trains is one which requires a general or national system and uniformity of regulation, if such regulation should for any reason be required.

2. The Supreme Court of the State of Arizona erred further, in its decision and opinion aforesaid, in failing to hold and conclude that said Train Limit Law is invalid and unconstitutional, and in violation of said Commerce Clause, because its necessary and inevitable effect is to regulate and control the length and consist of the interstate railroad trains operated over appellee's lines extraterritorially, that is to say, not only within Arizona, but also in adjoining portions of the States of California and New Mexico, and in the State of Texas.

3. The Supreme Court of the State of Arizona erred further, in its decision and opinion aforesaid, in failing to hold

and conclude that said Train Limit Law is invalid and unconstitutional, and in violation of said Commerce Clause, because its necessary, practical, and inevitable effect is, and continues to be, directly substantially, and unreasonably to interfere with, delay, regulate and obstruct the operation and movement of appellee's interstate trains, both within and without Arizona, and to impair the use and usefulness of the transportation facilities employed by appellee in the transportation of interstate commerce from, to, and across the State of Arizona.

4. Said Supreme Court of the State of Arizona erred further, in its opinion and decision aforesaid, in failing to hold and conclude that said Train Limit Law is invalid and unconstitutional, and in violation of said Commerce Clause, because its necessary and inevitable effect is, and continues to be, to impose direct, substantial, and unreasonable financial burdens upon the interstate commerce carried on by appellee both within and without Arizona, and thus further [fol. 6330] to impair the use and usefulness of the transportation facilities employed by appellee in the transportation of interstate commerce from, to, and across the State of Arizona.

5. Said Supreme Court of the State of Arizona erred further, in its opinion and decision aforesaid, in failing to hold and conclude that said Train Limit Law, to the extent that it has, or may have, or is intended or claimed to have, the effect of limiting the number of cars in a train to the maximum number which can be safely controlled or stopped in one train, by the use of the types of air brakes and their appurtenances now employed on such trains, or by any other form of train-control or other safety devices, is void and unenforceable against appellee, because it attempts to and does enter a legislative field already entered, and therefore occupied by Congress, and thereby conflicts with and infringes upon existing legislation enacted by Congress pursuant to its powers under the Commerce Clause of the Constitution: The Congress having, under the provisions of the Safety Appliance Act, as amended (45 U. S. Code, Sections 1, 9) and the provisions of Section 25 of Part I of the Interstate Commerce Act (49 U. S. Code I, Sec. 25), delegated to the Interstate Commerce Commission full and complete authority to investigate and determine the ade-

quacy of the air brakes and their appurtenances, and each and all other forms of train control, automatic train-stop, and other safety devices used or proposed to be used on locomotives, cars, and trains operated in interstate commerce, and by order to prescribe the form and type thereof and from time to time to issue such amendatory and supplementary orders as said Commission may deem necessary or desirable in the exercise of the power thus delegated to it, which power and authority said Commission has duly exercised; and the Congress having, more particularly, in and by such statutes, necessarily empowered said Commis[fol. 6331] sion to determine whether the types of air brakes and their appurtenances presently used or proposed to be used upon trains in interstate commerce are or will be adequate and effective, safely and properly to control and to stop trains of the lengths now being operated or proposed to be operated by appellee in interstate commerce, both within and without the State of Arizona.

6. Said Supreme Court of the State of Arizona erred further, in its opinion and decision aforesaid, in failing to hold and conclude that said Train Limit Law is invalid and unconstitutional, and in violation of said Commerce Clause, and also in violation of the Due Process Clause of the 14th Amendment to the Constitution of the United States in that said Train Limit Law operates and will continue to operate arbitrarily and unreasonably to deprive appellee of its property without due process of law; because said law fixes maximum lengths very much lower than those which generally obtain elsewhere throughout the United States, under operating conditions substantially similar to those upon appellee's lines in Arizona; makes no allowance for grade or other operating conditions, or for the construction, type, weight, or lengths of the cars composing the trains, or whether such cars are loaded or empty, or if loaded, the weights of the loads therein; imposes a great, substantial, and wholly unreasonable burden of expense upon, interference with, and delay to interstate commerce, and impairs the use and usefulness of appellee's transportation facilities; and bears no reasonable relation to health or safety, and does not and will not either eliminate or to any substantial extent reduce any existing hazard, but on the contrary does and will create new and increases existing hazards and dangers of railroad operation.

7. Said Supreme Court of the State of Arizona erred further, in its opinion and decision aforesaid, in holding and concluding that said Train Limit Law is valid and con-
[fol. 6332] stitutional, and that the "findings and judgment of the trial court to the affect that the Train Limit Law is unconstitutional were in error,"

8. To the extent that the aforesaid opinion and decision of said Supreme Court of the State of Arizona are, or may be, intended or construed to be a disapproval or reversal of the findings of fact (as distinguished from the conclusions of law) made and adopted by the trial court (the Superior Court of the State of Arizona, in and for the County of Pima) in this cause, or of any part or portion of said findings of fact, said Supreme Court of Arizona erred further in its said opinion and decision, in holding and deciding that said findings of fact of the trial court, or any of them, were or are in any respect in error, or that other and inconsistent or opposing findings of fact were or are required and proper upon the basis of the evidence of record in this cause; such holding by said Supreme Court of the State of Arizona, to the extent that its opinion and decision are or may be construed as herein indicated, having constituted a denial to the appellee of due process of law, within the meaning of the Due Process Clause of the 14th Amendment to the Constitution of the United States.

9. Said Supreme Court of the State of Arizona erred further, in and by its opinion and decision aforesaid, in reversing the judgment in favor of appellee duly rendered and entered on February 11, 1942, by said trial court, wherein and whereby said trial court declared that said Train Limit Law is invalid and unconstitutional upon each and all of the grounds of such invalidity specified in the foregoing assignments of error numbers one to six, inclusive; and in issuing its mandate to said trial court, dated January 14, 1944, wherein and whereby it ordered and directed said Superior Court to enter judgment against appellee, and in favor of appellant.

For which errors this petitioner prays that the said opinion and decision of the Supreme Court of the State of
[fol. 6333] Arizona, dated December 23, 1943, and said judgment of the Superior Court of the State of Arizona, in and for the County of Pima, dated February 5, 1944, en-

tered by said Superior Court in obedience to the aforesaid opinion and decision of said Supreme Court of the State of Arizona and the mandate of said Supreme Court issued pursuant thereto, in the above entitled cause, be reversed, and judgment rendered in favor of the said appellee.

Dated: March 7th, 1944.

Cleon T. Knapp, James P. Boyle, B. G. Thompson, Tucson, Arizona; C. W. Durbrow, Burton Mason, San Francisco, California, Attorneys for Southern Pacific Company, a corporation, (petitioner, and proposed appellant in the Supreme Court of the United States).

ORDER ALLOWING APPEAL—Filed March 8, 1944

The petition of Southern Pacific Company, a corporation, the above named appellee, for an appeal in the above cause to the Supreme Court of the United States from the Supreme Court of the State of Arizona, and the assignment of errors filed therewith and the record in said cause having been considered, it is

Ordered that an appeal be and is allowed to the Supreme Court of the United States from the Supreme Court of the State of Arizona, as prayed in said petition, and that the Clerk of the Superior Court of the State of Arizona, in and for the County of Pima, being the Clerk of the Court possessed of the record, shall prepare and certify a transcript of the record and proceedings in the above cause, and transmit the same to the Supreme Court of the United States within sixty (60) days from the date hereof.

It is further ordered that said petitioner, Southern Pacific Company, a corporation, shall give good and sufficient security in the sum of $2,000.00, that said petitioner shall prosecute said appeal to effect, and if said petitioner fail [fol. 6335] to make its plea good, it shall answer for all damages and costs.

The said petitioner now presenting a surety bond, in the sum of $2,000.00, with the Saint Paul-Mercury Indemnity Company, a corporation, named as surety, it is

Ordered that the same be and is hereby approved, and that this appeal shall operate as a supersedeas.

Dated March 7th, 1944.

A. G. McAlister, Chief Justice of the Supreme Court of the State of Arizona.

[fols. 6336-6340] Bond on appeal for $2,000.00, filed March 8, 1944, omitted in printing.

[fols. 6341-6342] Citation in usual form showing service on Joe Conway, et al. omitted in printing.

PRAECIPE FOR TRANSCRIPT OF RECORD—Filed March 2, 1944

To the Clerk of the Superior Court of the State of Arizona, in and for the County of Pima:

As the Clerk of the Court possessed of the record in the above entitled cause, you are hereby requested to prepare and certify a transcript of the record in said cause to be filed in the Supreme Court of the United States, pursuant to an appeal to said Supreme Court of the United States heretofore allowed in said cause on the 7th day of March, 1944, and to include in said transcript of record in the order given below the following and no other papers and exhibits, to-wit:

1. The complaint of the State of Arizona as plaintiff herein.

2. The order of the Superior Court staying the plaintiff from prosecuting any other proceedings to

enforce the provisions of the Arizona Train Limit Law.

[fol. 6344] 3. The answer of Southern Pacific Company as defendant herein.

4. The full and complete reporter's transcript of the proceedings had at the trial of the cause, consisting of typewritten pages numbered from 1 to 5309, inclusive, bound into eighteen volumes.

5. All original exhibits tendered in evidence by either party and received in evidence by the trial court, being 379 exhibits, identified by the following numbers:

1-13, both inclusive; 15-39, both inclusive; 42-202, both inclusive;
204 and 205; 207-220, both inclusive, 222-328, both inclusive;
334-370, both inclusive; 382-397, both inclusive; 399-402, both inclusive;

and excluding therefrom twenty-three exhibits which were marked for identification and not received in evidence, the same being exhibits identified by numbers as follows:

14, 40, 41;
203, 206, 221;
329-333, both inclusive; 371-381, both inclusive; and 398.

6. The findings of fact and conclusions of law made and adopted by the Superior Court, under date of February 11, 1942, and filed on said February 11, 1942, and bearing the style and designation "Court's Findings of Fact and Conclusions of Law".

7. The judgment of the Superior Court, rendered and entered on February 11, 1942.

8. The memorandum opinion of the Superior Court, rendered and filed on February 11, 1942.

9. The notice of appeal from the judgment of the Superior Court, filed on April 9, 1942.

10. The opinion of the Supreme Court of the State of Arizona, dated December 23, 1943.

[fol. 6345] 11. The dissenting opinion of Honorable Henry D. Ross, Judge of the Supreme Court of Arizona, dated January 13, 1944.

12. The mandate of the Supreme Court of Arizona, directed to the Supreme Court, dated January 14, 1944.

13. The judgment of the Superior Court, entered in obedience to said mandate of the Supreme Court, dated February 5, 1944.

14. The petition of Southern Pacific Company for the allowance of an appeal to the Supreme Court of the United States.

15. The assignment of errors filed by Southern Pacific Company as appellant, in connection with said appeal.

16. The statement with respect to jurisdiction filed by Southern Pacific Company in connection with said appeal; and each and every other statement or document filed under authority of Rule 12 of the Rules of the Supreme Court of the United States.

17. The order of the Chief Justice of the Supreme Court of the State of Arizona, allowing the appeal to the Supreme Court of the United States, and fixing the bond upon such appeal.

18. The bond upon appeal to the Supreme Court of the United States.

19. The citation upon appeal to the Supreme Court of the United States.

20. The statement served upon the State of Arizona, as proposed appellee, directing attention to the provisions of paragraph 3 of Rule 12 of the Rules of the Supreme Court of the United States, together with the acknowledgment of service, in the name and on behalf of the State of Arizona, as appellee, of the documents served upon it pursuant to the [fol. 6346] *the* provisions of paragraph 2 of Rule 12 of said Rules of the Supreme Court of the United States.

21. This praecipe for transcript of record.

Dated March 7, 1944.

STATE OF CALIFORNIA,
City and County of San Francisco, ss:

Burton Mason, of lawful age, being first duly sworn, on his oath deposes and says that he is one of the attorneys of record for Southern Pacific Company, a corporation, the appellant named in the foregoing Statement of Points to be Relied Upon, and as such attorney makes and files this affidavit of service; that on the 17th day of April, 1944, he served upon Joe Conway, Esq., as Attorney General of Arizona, and upon Earl Anderson, Esq., as Assistant Attorney General, and upon Charles L. Strouss, Esq., (each and all of whom reside and have their offices in Phoenix, Maricopa County, State of Arizona), in their capacities as attorneys for the appellee named in said statement, one copy each of the Statement of Points to be Relied Upon by appellant in said cause, as filed with the Clerk of the Supreme Court of the United States pursuant to Paragraph 9 of Rule 13 of the Rules of said Supreme Court, by enclosing said copies of said Statement in sealed envelopes respectively addressed to said attorneys for appellee, and

depositing the same in the United States post office at the City of San Francisco aforesaid, with the postage thereon fully prepaid; that on the 17th day of April, 1944, there was and is a regular and established daily mail service, from the City of San Francisco aforesaid, to the City of Phoenix, Arizona.

/Burton Mason.

Subscribed and sworn to before me this 17th day of April, 1944. A. T. Whittle, Notary Public in and for the City and County of San Francisco, State of California.

STIPULATION AS TO PRINTING OF RECORD—Filed April 22, 1944

It is hereby stipulated, by and between the above-named appellant and its attorneys, and the above-named appellee and its attorneys, that the entire record in the above entitled case is deemed necessary to be printed for the consideration of the Court, except the following documents and papers, which the Clerk is requested to omit from such printing, viz:

Exhibits received in evidence, and identified by number as follows:

8, 9, 152, 153, 175, 300-304, both inclusive, 306-312, both inclusive, 319, 320, 430-349, both inclusive, 352-361, both inclusive, 385, and 399-402, both inclusive.

Exhibits offered but not received in evidence, marked for identification by numbers as follows:

371-381, both inclusive, and 398.

It is further stipulated that the documents and papers above mentioned to be omitted from the printed record shall be preserved by the Clerk and may be referred to by counsel or the Court, if deemed necessary, during the course of the

[fol. 6357] argument, or in brief, or otherwise during the disposition of the cause.

Dated April 5, 1944.

Southern Pacific Company, a corporation, Appellant, Cleon T. Knapp, C. W. Durbrow, Burton Mason, Attorneys for Appellant. State of Arizona, Appellee, Joe Conway, Attorney General; Earl Anderson, Assistant Attorney General; Charles L. Strouss, of Counsel; Attorneys for Appellee.

SUPREME COURT OF THE UNITED STATES

OCTOBER TERM, 1943

No. 878

SOUTHERN PACIFIC COMPANY, A CORPORATION,
Appellant,

vs.

STATE OF ARIZONA, EX REL. JOE CONWAY, ATTORNEY GENERAL OF THE STATE OF ARIZONA,
Appellee.

UPON APPEAL FROM THE SUPREME COURT OF THE STATE OF ARIZONA.

APPELLANT'S STATEMENT WITH RESPECT TO JURISDICTION.

I. **The statutory provision believed to sustain jurisdiction** is Section 237(a) of the Judicial Code of the United States (28 United States Code, Section 344(a)).

II. **The statute of the State of Arizona, the validity of which is involved,** is commonly known as the Arizona Train Limit Law. It was enacted in 1912 by the Arizona legislature, and approved by the Governor of that State on May 16, 1912 (Sections 2166-2168, Revised Statutes of

Arizona, 1913; Section 647, Revised Code of Arizona, 1928; now codified and republished as Section 69-119, Arizona Code Annotated, 1939). Said statute, as originally enacted, had no preamble or statement of purpose. Its title and text were as follows:

"*An Act limiting the number of cars in a train.*

"Section 1. It shall be unlawful for any person, firm, association, company or corporation, operating any railroad in the State of Arizona, to run, or permit to be run, over his, their, or its line of road, or any portion thereof, any train consisting of more than seventy freight, or other cars, exclusive of caboose.

"Section 2. It shall be unlawful for any person, firm, association, company or corporation, operating any railroad in the State of Arizona, to run, or permit to be run, over his, their, or its line of road, or any portion thereof, any passenger train consisting of more than fourteen cars.

"Section 3. Any person, firm, association, company or corporation, operating any railroad in the State of Arizona, who shall willfully violate any of the provisions of this act, shall be liable to the State of Arizona for a penalty of not less than one hundred dollars, nor more than one thousand dolars, for each offense; and such penalty shall be recovered, and suits therefor brought by the attorney general, or under his direction, in the name of the State of Arizona, in any county through which such railroad may be run or operated, provided, however, that this act shall not apply in cases of engine failures between terminals.

"Section 4. All acts and parts of acts in conflict with the provisions of this act are hereby repealed."

When said statute was codified and republished as Section 69-119 of the Arizona Code Annotated, 1939, the section numbers, together with all of Section 4, were omitted, and Sections 1 and 2 were combined into one sentence.

III. **The Judgment sought to be reviewed upon this appeal** was rendered by the Superior Court of the State of Arizona, in and for the County of Pima, on February 5, 1944, in obedience to the mandate of the Supreme Court of Arizona, dated January 14, 1944; which mandate was issued by said Supreme Court, pursuant to its opinion and decision dated December 23, 1943, and its order, dated January 13, 1944, denying the motion for rehearing duly filed in this cause by the above-named appellant, as appellee before said Supreme Court of Arizona.

The application for the allowance of this appeal was presented to the Chief Justice of the Supreme Court of Arizona on the 7th day of March, 1944.

IV. **The nature of this case is as follows:**

The appeal herein is from a final judgment of the Superior Court of Arizona, in and for the County of Pima, rendered and entered by said Superior Court in obedience to the mandate and direction of the Supreme Court of Arizona, following a final decision by said Supreme Court and its denial of a motion for rehearing filed by the present appellant, in a civil action at law theretofore commenced and continued in said Superior Court, in which action the State of Arizona, the present appellee, was the plaintiff, and Southern Pacific Company, the present appellant, was the defendant; the nature of the case and the proceedings had therein being more fully described as follows:

On April 19, 1940, said State of Arizona, as plaintiff, acting by and through its Attorney-General of Arizona, commenced the aforesaid action against the above-named appellant, as defendant, by filing a complaint in the Superior Court of said State, in and for Pima County, seeking to recover from appellant penalties for two alleged violations of the Arizona Train Limit Law, the state statute

set forth in paragraph II of this statement. In due course appellant, as defendant, filed its answer to said complaint. In said answer, after admitting the operation of a freight train of more than 70 cars, exclusive of caboose, and a passenger train of more than 14 cars, within Arizona, as set forth in said complaint, said appellant further alleged, as a matter of affirmative defense, that said Train Limit Law was and is wholly invalid and unconstitutional, as applied to appellant's railroad operations in Arizona and elsewhere, because in violation of the Commerce Clause (Article I, Section 8, Paragraph 3) of the Constitution of the United States, and the Due Process Clause set forth in Section I of the 14th Amendment to the Constitution of the United States, and the corresponding Due Process Clause (Article II, Section 4) of the Constitution of Arizona.

In its answer appellant also alleged in detail the facts upon which its said affirmative defense was predicated, and included therein a prayer for a judgment declaring the Train Limit Law to be invalid and unconstitutional upon each and all of the grounds therein set forth. Reference is hereby made to Part III of said answer, and likewise to the prayer for relief appended to said answer, and particularly to Paragraphs 10, 11, and 12 of said Part III, which embody the specific allegations of unconstitutionality upon which appellant has relied from the outset of this case, and still relies. A copy of said paragraphs 10, 11, and 12 is attached as Appendix A to this statement.

The case duly came on for trial upon the issues as made by the complaint and the answer, before Hon. Levi S. Udall, Judge of the Superior Court of Arizona, sitting without a jury, a trial by jury having been duly waived by the parties. Forty-six court days were required for said trial. An extensive record of oral and documentary testimony was

compiled. Practically all of said testimony was devoted to the development of the facts relevant and material to the issues of constitutionality presented by the pleadings. No other substantive issues were presented to the trial court.

Following the trial and submission of the case, the trial court on February 11, 1942, made and entered its special findings of fact, and its conclusions of law, which findings and conclusions were separately stated, and pursuant thereto, on the same date, rendered and entered its judgment in favor of appellant as defendant, declaring the Arizona Train Limit Law to be invalid and unconstitutional upon each and all of the grounds asserted by appellant in its answer. On said February 11, 1942, the trial court also delivered and filed its memorandum opinion, a complete copy of which is attached to this statement, as Appendix B, wherein it set forth in some detail the reasons for its findings, conclusions, and judgment.

The grounds of said decision and judgment of the trial court are summarized in the judgment as follows:

> "That that certain statute of the State of Arizona, known as the Arizona Train-Limit Law, being Section 69-119 of the Official Arizona Annotated Code, 1939, which statute is set forth in full in the complaint of the plaintiff herein, is unconstitutional and void, because:
>
> "*First:* Said statute invades the exclusive legislative field of Congress, as limited and defined by the Commerce Clause (par. 3, of Sec. 8, Art. 1) of the Constitution of the United States;
>
> "*Second:* Said statute imposes direct, unreasonable and unlawful burdens upon, and interferes with, delays and obstructs interstate commerce, in violation of said Commerce Clause;
>
> "*Third:* Said statute impairs the use and usefulness of the transportation facilities employed by defendant as a common carrier engaged in interstate commerce;

"*Fourth:* Said statute is in conflict with and infringes upon, and amounts to an unlawful attempt to supplement, the power-brake provisions of the Federal Safety Appliance Acts, and the safety-device provisions of Section 25 of the Interstate Commerce Act, which Federal statutes operate upon the same subject matter and are directed to the same objects as said Train-Limit Law and by which said statutes Congress has completely and exclusively occupied the field of regulation of train lengths;

"*Fifth:* Said statute operates unreasonably and arbitrarily to deprive defendant of its property, without due process of law, in violation of both the Due-Process Clause of the Fourteenth Amendment to the Constitution of the United States, and the Due-Process Clause set forth in Section 4 of Article 2 of the Constitution of the State of Arizona;"

On April 9, 1942, the State of Arizona took an appeal from said judgment of the trial court to the Supreme Court of Arizona. Said Supreme Court of Arizona is the court created by the Constitution of said State, for the purpose, among others, of hearing and deciding appeals from the superior courts of said State, and is the highest court and the only court of said State of Arizona having jurisdiction to hear, determine, and finally decide such appeals, and is the highest court of said State in which a decision of this suit could be had. No other court of said State has any power, under the Constitution and statutes of Arizona, to review, reverse, or modify a decision or judgment rendered by said Supreme Court of Arizona.

Reference is hereby made to Article 6, Section 1, of the Constitution of Arizona, which vests the judicial power of the State in the Supreme Court, the superior courts, and such other courts as may be provided by law; to Section 4 of the same article of said Constitution, which defines the jurisdiction of said Supreme Court, and particularly de-

clares that it shall have appellate jurisdiction in all actions and proceedings; and to Section 21-1702 of the Arizona Code Annotated, 1939, which provides for the review by said Supreme Court of judgments entered by the superior courts of the State.

Following the submission of this case to said Supreme Court of Arizona, upon the above-mentioned appeal, said Court on December 23, 1943, announced and entered its opinion and decision, which was concurred in by two of the three judges comprising said Court, wherein and whereby it reversed the judgment of the trial court dated February 11, 1942. In and by its said opinion and decision, said Supreme Court of Arizona held and declared, as the sole grounds of its decision, that said Arizona Train Limit Law is valid and constitutional, and that the judgment of the trial court to the effect that said Train Limit Law is unconstitutional was in error. A full and complete copy of said opinion is attached to this statement as Appendix C.

On January 7, 1944, the above named appellant (as appellee before said Supreme Court of Arizona) duly filed with said Court a motion for rehearing of the case. Said motion for rehearing was denied by said Court on January 13, 1944; and upon January 14, 1944, said Court issued its mandate to the trial court, ordering and directing further proceedings to be had in the cause in conformity with its decision and opinion of December 23, 1943. A copy of said mandate is included in the record on appeal, and a copy is also attached to this statement as Appendix D.

On said January 13, 1944, there was also rendered and filed the separate dissenting opinion of Honorable Henry D. Ross, one of the members of said Court. A copy of said dissenting opinion is attached to this statement as Appendix E.

On February 5, 1944, the trial court rendered and entered final judgment in this cause, in obedience to the afore-

said mandate and direction of the Supreme Court of Arizona, in favor of the original plaintiff, the State of Arizona, and against the present appellant as the original defendant. In said judgment of February 5, 1944, said trial court declared that the Arizona Train Limit Law is valid and constitutional, and imposed upon appellant a penalty of $250.00 for each of the two violations of said Train Limit Law described in the original complaint, or a total penalty of $500.00. A copy of said judgment dated February 5, 1944, is attached to this statement as Appendix F.

The cause is now brought to this Court, by direct appeal from the final decision of the Supreme Court of Arizona, as rendered on December 23, 1943, and the final judgment of the trial court entered on February 5, 1944, in obedience to said decision and mandate of the Supreme Court of Arizona.

V. **The grounds upon which it is contended that the federal questions involved are substantial** are as follows:

(A) The invalidity, on the ground of violation of the Federal Constitution by the State statute (the Arizona Train Limit Law) upon which the suit is based, has been and is the principal ground of defense presented, urged, and relied upon by appellant.

(B) Such invalidity of the Train Limit Law has been asserted, as the essential basis of said defense, from the outset of the case (namely, in the answer originally filed) and continuously throughout the trial and upon the subsequent appeal to the Supreme Court of Arizona.

(C) In support of its said defense of invalidity, appellant as defendant adduced the testimony of some 60 witnesses, and offered in evidence 316 exhibits, 311 of which were received. Appellee, as plaintiff adduced the testimony of 13 witnesses, and offered in evidence 86 exhibits, 68 of which were received. Substantially all of appellee's evidence was likewise addressed to the basic issue of invalidity.

(D) The trial court found and held that said defense of invalidity of said statute, under the Constitution of the United States, was sustained by the evidence and the law, including the decisions of the Supreme Court of the United States, and on February 11, 1942, rendered judgment for appellant accordingly. As previously stated, one of the three judges comprising the Supreme Court of Arizona agreed with said decision and judgment of the trial court, and upon appeal voted for its affirmance.

(E) There are no decisions of this Court which directly declare that a State statute limiting the lengths of trains operated by railroad common carriers in interstate commerce to a fixed maximum number of cars per train is valid under the Constitution and laws of the United States, or which are otherwise so clearly or directly in point upon the issues arising under the Constitution of the United States, presented in this case and upon this appeal, as to foreclose any further debate upon or discussion of said issues.

There are, on the contrary, many decisions of this Court which sustain appellant's position upon each and all of said issues under the Constitution of the United States: in that this Court has held and decided that State statutes or regulations having effects and results not distinguishable from those flowing from appellant's enforced compliance with the Arizona Train Limit Law were and are unconstitutional and void, because in violation of the Commerce Clause of, or the Due Process Clause of the 14th Amendment to, the Constitution of the United States: the same constitutional provisions upon which appellant relies in the present case:

(1) In particular, this Court has many times held and decided that a state statute cannot be sustained as valid, under said Commerce Clause, if it undertakes (as does the Arizona Train Limit Law) to regulate a subject matter, such as the lengths of railroad trains operating in continuous movement in interstate commerce, which requires

a general or national system and uniformity of regulation, if such regulation should for any reason be required—because such subject is not within the field of regulation permitted to the states, but instead belongs to and falls within the field of regulation exclusively vested in and reserved to Congress under said Commerce Clause:

Hall v. *DeCuir* (1877), 95 U. S. 485;
Minnesota Rate Cases (1912), 230 U. S. 352, 399-400;
Kelly v. *Washington* (1937), 302 U. S. 1, 9, 14-15;
Milk Control Board v. *Eisenberg Farm Products* (1939), 306 U. S. 346, 351;
Edwards v. *California* (1941), 314 U. S. 160, 174, 176.

Compare:

Parker v. *Brown* (1942), 317 U. S. 341, 362-363.

(2) This Court has likewise held that a state cannot validly enact a statute which, by necessary and inevitable effect, substantially and directly regulates (as the Arizona Train Limit Law admittedly does) the conduct of interstate commerce extra-territorially, that is to say, in other states:

Hall v. *DeCuir* (1877), 95 U. S. 485, 488;
Bowman v. *C. & N. W. Ry. Co.* (1888), 125 U. S. 465, 486;
South Covington R. Co. v. *Covington* (1915), 235 U. S. 537, 547-548.

Compare:

Olmsted v. *Olmsted* (1910), 216 U. S. 386, 395;
Home Insurance Co. v. *Dick* (1930), 281 U. S. 397, 410;
Baldwin v. *Seelig* (1935), 294 U. S. 511, 521;
Magnolia Petroleum Co. v. *Hunt* (Dec. 20, 1943), October Term, 1943, No. 29.

(3) This Court has likewise held and decided that a state law or regulation which, even though claimed to have

been enacted in the interest of public safety or convenience or some other object associated with the police power of the state, in fact directly, substantially, and unreasonably obstructs, burdens, and interferes with interstate commerce (as does the Arizona Train Limit Law), is in violation of the Commerce Clause, and therefore invalid.

Kansas City S. R. Co. v. *Kaw Valley District* (1914), 233 U. S. 75, 79;

Seaboard Airline R. Co. v. *Blackwell* (1917), 244 U. S. 310;

M-K & T. R. Co. v. *Texas* (1918), 245 U. S. 484, 488;

St. Louis-San Francisco R. Co. v. *Railroad Commission* (1921), 254 U. S. 535, 537;

La Coste v. *Dept. of Conservation* (1924), 263 U. S. 545, 550;

Foster-Fountain Packing Co. v. *Haydel* (1929) 278 U. S. 1;

Compare:

Minnesota Rate Cases (1912), 230 U. S. 352, 400;

Milk Control Board v. *Eisenberg Farm Products* (1939), 306 U. S. 346, 351;

Edwards v. *California* (1941), 314 U. S. 160, 174, 176.

(4) This Court has further held and decided that when Congress has undertaken to regulate with respect to a particular phase or subject matter of interstate commerce, any state statute purporting to regulate the same subject matter, whether already existing or thereafter enacted, forthwith becomes void and of no effect, because the states are powerless either to annul, augment, or supplement the congressional regulation.

Erie R. Co. v. *New York* (1914), 233 U. S. 671;

New York Central R. Co. v. *Winfield* (1917), 244 U. S. 147;

Pa. R. Co. v. *Public Service Commission* (1919), 250 U. S. 566, 569;

Napier v. *Atlantic Coast Line R. Co.* (1926), 272 U. S. 605, 612;

Chesapeake & Ohio R. Co. v. *Stapleton* (1929), 279 U. S. 587, 592;

Kelly v. *Washington* (1937), 302 U. S. 1, 10-13;

Welch Co. v. *New Hampshire* (1939), 306 U. S. 79, 85.

The challenged Train Limit Law is claimed by the appellee to be necessary as a safety measure, because trains longer than permitted by the law (70 freight, or 14 passenger cars) assertedly cannot be safely controlled while in motion or stopped by the use of the present types of air brakes. The Federal Safety Appliance Act (45 U. S. Code, Sections 1, 9), and the Safety Section of Part I of the Interstate Commerce Act (49 U. S. Code, Part I, Section 25), require that trains of interstate railroads be equipped with air brakes, adequate to control and stop them safely, and that trains longer than can be thus controlled shall not be run. The Interstate Commerce Commission has issued its own regulations covering the subject matter, acting pursuant to the authority conferred by Congress. Compare:

Virginian Railway Co. v. *U. S.* (1915), 233 Fed. 748;

U. S. v. *Great Northern R. Co.* (1916), 229 Fed. 927;

Pa. R. Co. v. *U. S.* (1917), 241 Fed. 824;

New York Central R. Co. v. *U. S.* (1924), 265 U. S. 41, 46.

The Federal Safety Appliance Act has been declared by this Court to have been enacted in order to promote safety of railroad operation.

Johnson v. *Southern Pac. Co.* (1904), 196 U. S. 1, 17;

New York Central R. Co. v. *U. S.* (1924), 265 U. S. 41, 45-46;

Tipton v. *A. T. & S. F. Ry. Co.* (1935), 78 Fed. (2d) 450; (1936), 298 U. S. 141;
U. S. v. *California* (1936), 297 U. S. 175.

(5) This Court has further held and declared that a state law or regulation, although purporting to have been enacted under the police power, must be held invalid, in violation of the Due Process Clause of the 14th Amendment to the Constitution of the United States, if it is shown that said law bears no reasonable relation to its claimed or purported object, but instead is arbitrary and capricious, and the cost of obedience, when considered with other factors of the case, is wholly out of proportion to any possible benefits.

Mugler v. *Kansas* (1887), 123 U. S. 623, 661;
Minnesota v. *Barber* (1890), 136 U. S. 313, 319;
Norfolk & Western R. Co. v. *Public Service Commission* (1924), 265 U. S. 70, 74;
Liggett v. *Baldridge* (1928), 278 U. S. 105;
Lehigh Valley R. Co. v. *Commissioners* (1928), 278 U. S. 24, 33;
A. T. & S. F. R. Co. v. *Railroad Commission* (1931), 283 U. S. 380, 395-396;
Southern Ry. Co. v. *Virginia* (1933), 290 U. S. 190;
Nebbia v. *New York* (1934), 291 U. S. 502, 525;
N. C. & St. L. R. Co. v. *Walters* (1935), 294 U. S. 405.

The trial court's findings demonstrate that the challenged law does not in fact promote safety of railroad train operation, because it does not remove or measurably reduce any hazard associated with such operation, but on the contrary increases certain of the hazards attendant upon such operation, and creates certain other hazards which would not otherwise exist; that it necessarily and inevitably imposes upon appellant, as a result of enforced compliance with its provisions, a great and wholly uncompensated burden of

expense and interference. These findings are based upon evidence received at the trial, the truth and competence of which was not challenged by appellee.

(F) The great weight of authority in the inferior federal courts, in cases where the same or substantially similar state regulations have been assailed as invalid under the Constitution of the United States, directly upholds the contentions of appellant with respect to the Arizona Train Limit Law.

Thus, in

A. T. & S. F. Ry. Co. v. *La Prade* (1933), 2 Fed. Supp. 855, a special three-judge court for the District of Arizona, in suits brought to enjoin the enforcement of the Arizona Train Limit Law, unanimously held said law to be invalid and unconstitutional, upon the precise federal grounds now urged by appellant herein.

The conclusions expressed in that opinion were given no effect, solely because of the holding of this Court (*Ex Parte La Prade* (1933), 289 U. S. 444) that the suit in the district court had abated because of the substitution of the incoming attorney general for the original defendant. No question was presented to or passed upon by this Court, other than the propriety of said substitution.

In *Southern Pacific Co.* v. *Mashburn* (1937), 18 Fed. Supp. 393, a special three-judge Court for the District of Nevada also unanimously held invalid the Nevada Train Limit Law, enacted in 1935, which prohibits the operation in that state of railroad trains of more than 70 cars, exclusive of caboose; again upon precisely the same federal grounds now urged by appellant in the present suit. A permanent injunction was issued accordingly.

A special three-judge court for the Eastern District of Louisiana also unanimously held invalid the Louisiana Train Limit Law, enacted in 1936, prohibiting the operation

of freight trains of more than 70 cars, exclusive of caboose, and passenger trains of more than 16 cars. The case is unreported, but identified upon the records of that court as:

Texas & New Orleans R. Co. v. *Martin, et al.* (1936), No. 428-Equity.

In *M-K-T Ry. Co.* v. *Williamson* (1941), 363 Fed. Supp. 607, a special three-judge court for the District of Oklahoma, with one member dissenting, held the Oklahoma Train Limit Law, enacted in 1937 (which forbids the operation of trains of more than 70 cars), to be valid, against an attack based upon the same grounds urged in the instant case; except that the opinion of that court indicates that it was not contended in the suit that the law should be held invalid because of extra-territorial effect: a point which is here strongly relied upon.

In *Southern Pacific Co.* v. *Railroad Commission of California* (1935), 10 Fed. Supp. 918, a special three-judge court for the Northern District of California held invalid, under the Commerce Clause, and the Due Process Clause of the 14th Amendment, an order of the Railroad Commission of California requiring the plaintiff company to place an additional caboose on each of its freight trains of more than 57 cars operating over its main line between Roseville, California, and the California-Nevada boundary, during the six winter months. The grounds of decision were substantially identical with the grounds of invalidity of the Arizona Train Limit Law here urged; and the court referred with approval to the decision of the special court for the District of Arizona in *A. T. & S. F. Ry. Co.* v. *La Prade*, 2 Fed. Supp. 855.

No appeal was ever taken from the decisions of the several district courts in the cases referred to in this paragraph; and except for the decision of the District Court for Arizona involving the Arizona Train Limit Law, each of

said decisions became final and has ever since been observed.

Summarizing, there have been four cases in the federal district courts involving the validity of state train limit laws, heard before twelve different federal, circuit, and district judges. Ten of said judges have taken the view that state train limit laws, exactly or essentially similar to the Arizona law, are invalid upon precisely the same constitutional grounds urged in the present case. Only two of the twelve judges have taken the contrary view.

(G) The opinion and decision of the Supreme Court of Arizona show that that Court intended to determine, and necessarily determined, the issues in this case which arise under the Constitution of the United States, as well as those arising under the Constitution and laws of Arizona; and further show that the decision does not rest upon an independent state ground adequate to support it.

The trial court's judgment clearly and distinctly held the Train Limit Law invalid, not only under the State Constitution, but also under the Federal Constitution and statutes: the several grounds of invalidity are separately set forth therein. The Supreme Court of Arizona recognized that the trial court's judgment was predicated upon these several grounds, for in the opinion (p. 2) it quoted from the text of that judgment; and thereafter it concluded its opinion by declaring (p. 14) "that the findings and judgment of the trial court to the effect that the Train Limit Law is unconstitutional were in error," and reversed said judgment.

That reversal operated to overturn the trial court's judgment in its entirety; that is to say, the trial court's conclusions upon the issues under the Federal Constitution, as well as under the state constitution, were reversed and set aside. If the reversal had been restricted to the state issue only, with intent not to pass upon the federal issues, the

trial court's conclusions (as expressed in its judgment) that the challenged law is invalid under the Federal Constitution would not have been affected; so that the judgment, to the extent that it constituted a decision of the federal issues, would have remained unimpaired, and the challenged law would have continued to stand adjudged to be invalid. The only way in which the Supreme Court of Arizona could have reversed the trial court's judgment without qualification (as it did) was by holding that that judgment was erroneous in its disposition of the federal issues, as well as the state issue. If the state issue only had been decided, then the conclusion that "the judgment is reversed," set forth in the last sentence of the opinion, would have had no adequate support; it becomes a complete and effective reversal of the trial court's judgment because, and *only* because, it is supported by the court's determination of the federal issues.

The scope of the decision, and the Court's intentions in this behalf, are also shown by its reference to and quotation from the majority opinion in the *Oklahoma Train-Limit Case: M-K-T Ry. Co.* v. *Williamson*, 36 Fed. Supp. 607. These quotations (pp. 10-12 of the opinion) set forth the conclusions of the special district court for Oklahoma, upon the various grounds of attack under the Federal Constitution directed against the Oklahoma Train-Limit Law. Except that the question of extra-territorial effect was not there involved, these are largely the same grounds as urged in the instant case, and are exclusively federal in character.

It is submitted that the decision of the Supreme Court of Arizona constituted a determination of issues arising under the Federal Constitution, which determination was necessary to the decision, and that said decision does not rest upon an independent state ground adequate to support it irrespective of said federal grounds of decision.

VI. *The following decisions of this Court are believed to sustain the jurisdiction of the Court in the premises:*

C. B. & Q. R. R. Co. v. *Drainage Commissioners* (1906), 200 U. S. 561, 580-581;
West Chicago Street Ry. Co. v. *Chicago* (1906), 201 U. S. 506, 519-520;
Second Natl. Bank v. *First Natl. Bank* (1917), 243 U. S. 600;
Whitney v. *California* (1927), 274 U. S. 357, 360-361;
Bryant v. *Zimmerman* (1928), 278 U. S. 63, 68;
Milheim v. *Moffat Tunnel Dist.* (1923), 262 U. S. 710, 716;
Abie State Bank v. *Bryan* (1931), 282 U. S. 765, 773;
Senn v. *Tile Layers Union* (1937), 301 U. S. 468, 476;
Cheseboro v. *Los Angeles County Dist.* (1939), 306 U. S. 459, 462-463;
Tulee v. *Washington* (1942), 315 U. S. 681, 682;
Standard Oil Co. v. *Johnson* (1942), 316 U. S. 481, 483;
Largent v. *Texas* (1943), 318 U. S. 418, 421.

Dated March 7th, 1944.

Respectfully submitted,

CLEON T. KNAPP,
Tucson, Arizona;
C. W. DURBROW,

San Francisco, California,
Attorneys for Appellant.

JAMES P. BOYLE,
B. G. THOMPSON,
Of Counsel.

APPENDIX A.

Paragraphs 10, 11 and 12, of Part 3 of Defendant's Answer in State of Arizona, Etc., Plaintiff, v. Southern Pacific Company, Defendant. Superior Court of Arizona, Pima County, No. 20087.

"10. *The Train-Limit Law violates the Commerce Clause of the Federal Constitution.*

Said Train-Limit Law is unconstitutional and void, as to each and all of the interstate trains of the defendant, in that it conflicts with and violates the Commerce Clause (Paragraph 3 of Section 8, Article I) of the Constitution of the United States; because:

(a) The permissible number of cars in an interstate railroad train passing from one state to another, or passing from one state through another into a third, or passing through a number of states, is a subject over which exclusive legislative jurisdiction was and is vested in Congress by said Commerce Clause;

(b) The necessary effect of said law is: (1) to impose a direct and substantial burden upon, and directly and substantially to interfere with, delay, and regulate, the operation of defendant's interstate freight and passenger trains across and within Arizona, as well as in California and New Mexico; (2) to determine the number of interstate trains to be run by defendant, not only within Arizona, but also within adjoining portions of California and New Mexico; and (3) to impair the usefulness of the facilities used, as well as those usuable, by the defendant in the carriage of interstate commerce across, through, into, and out of, the State of Arizona.

11. *The Train-Limit Law violates the Due-Process Clauses of the Fourteenth Amendment to the Federal Constitution and Article II, Section 4, of the State Constitution.*

Said Train-Limit Law is further unconstitutional and void, and in violation of the aforesaid Commerce Clause

of the Constitution, and also operates unreasonably and arbitrarily to deprive defendant of its property without due process of law, in violation of the Due-Process Clause of the Fourteenth Amendment to the Constitution of the United States, and the Due-Process Clause set forth in Section 4 of Article II of the Constitution of the State of Arizona, because:

(a) It fixes maximum train lengths very much lower than those which generally obtain elsewhere throughout the United States, under operating conditions substantially the same as those on defendant's main lines in Arizona;

(b) It makes no allowance for grade or other operating conditions, or for the construction, type, weight, or length of the cars composing the train, or whether such trains are loaded or empty, and if loaded the weight of the load;

(c) It imposes a great and substantial burden of expense upon, interference with, and delay to, interstate commerce and impairs the usefulness of defendant's transportation facilities; and

(d) It bears no reasonable relation to health or safety.

12. *The Train-Limit Law conflicts with Federal Legislation.*

Said Train-Limit Law is further void, invalid, and unenforceable, for the reason that it is in conflict with, and/or an infringement upon, legislation heretofore enacted by Congress, pursuant to its powers under the Commerce Clause of the Constitution, in the following respects:

(a) To the extent that said Train-Limit Law is or may be intended to prevent the use of heavy locomotives in the State of Arizona, and thus to regulate locomotive sizes, it is an infringement upon and in conflict with statutes enacted by Congress pursuant thereto, having the same or a like purpose, to wit, the Boiler Inspection Act of February 17, 1911 (36 Stat. 913), as amended in 1913, (38 Stat. 1192) and in 1924 (43 Stat. 659), being Sections 23 to 35, inclusive, of Title 45 of the United States Code,

wherein and whereby full power over the size, design, weight or construction of locomotives was delegated to and is now vested in the Interstate Commerce Commission;

(b) To the extent to which said Train-Limit Law is intended to or has or may have the effect of limiting the number of cars in a freight or passenger train to the maximum number which properly and with reasonable safety can be controlled in one train by the type of air brakes and their appurtenances now used on such trains, or by any other form of train-control devices or other safety devices, it is void, in that it attempts to and does enter a legislative field already entered and therefore completely occupied by Congress; the Congress having, under the Commerce Clause, by the enactment of the power-brake provisions of the Safety Appliance Act, as amended (Sections 1 and 9 of Chapter 1 of Title 45 of the United States Code), and the provisions of Section 26 of the Interstate Commerce Act (Section 26 of Chapter 1 of Title 49, of the United States Code), delegated to the Interstate Commerce Commission full and complete authority to investigate and determine the adequacy of the air-brakes, and their appurtenances, and other forms of train-control and other safety devices, used or proposed to be used upon locomotives and cars operated in interstate commerce, and by order to prescribe the form and type of such air-brakes, appurtenances and other train-control and safety devices, and from time to time to issue such amendatory and supplementary orders as it may deem necessary or desirable in the exercise of the power and jurisdiction thus conferred by Congress; and the Congress having, in particular, in and by said statutes, necessarily empowered said Interstate Commerce Commission to determine whether the types of air-brakes, and their appurtenances, presently used or proposed to be used upon trains in interstate commerce, are or will be adequate and effective, safely and properly to control and to stop trains of the lengths now being operated in interstate commerce, both in the State of Arizona and elsewhere, by the defendant and by other railroad common carriers throughout the United States."

APPENDIX B.

IN THE SUPERIOR COURT OF THE STATE OF ARIZONA IN AND FOR THE COUNTY OF PIMA

No. 20087.

STATE OF ARIZONA, ex rel., Joe Conway, Attorney General of the State of Arizona, *Plaintiff*,

vs.

SOUTHERN PACIFIC COMPANY, a corporation, *Defendant*.

Memorandum Opinion.

This suit, brought by the State of Arizona at the relation of the Attorney General, is a civil action, seeking to recover from the defendant railroad company, which is an interstate carrier, penalties for violations of what is known as the Arizona Train-Limit Law. The complaint contains two causes of action; one charges the operation on March 2, 1940, of a passenger train containing sixteen cars; and the other alleges that on April 4, 1940, a freight train containing ninety-one cars was unlawfully operated. Both trains were operated west out of the Tucson yards. The defendant frankly admitted the operations complained of, but sought to avoid the penalties by asserting that the law in question was and is invalid and unconstitutional as applied to its interstate trains and traffic, because in conflict with various provisions of the State and Federal constitutions, which sections are hereinafter more particularly referred to.

The trial of these issues commenced November 19, 1940, and closed May 1, 1941, there being a number of intervening recesses; in all forty-six court days out of thirteen different weeks were consumed in the trial. Seventy-three different witnesses testified, many of whom came from all parts of the United States, and some 402 exhibits were offered in evidence.

The law under attack was enacted by the Legislature of the State of Arizona and approved by the Governor on May 16, 1912. A referendum was invoked and at a general State election, held November 5, 1912, the law was approved by a

majority of the voters. It now appears as Section 69-119, Arizona Code Annotated, 1939. Since its adoption in 1912 this law, with but few exceptions and over short periods, has been enforced by the State and its terms complied with by the defendant. A notable exception is that by sufferance of the State the operations from the California-Arizona line into the Yuma yards has never been treated as within the purview of the law.

Briefly, the law provides that it shall be unlawful for a freight train consisting of more than seventy cars, exclusive of caboose, or a passenger train containing more than fourteen cars to be operated in the State of Arizona, and it provides a penalty of not less than $100.00, nor more than $1,000.00 for each violation thereof. The law when passed was entitled, "An Act Limiting the Number of Cars in a Train", without any preamble reciting its basic purpose. This Court will assume, for the purpose of determining this matter, that the law was enacted under the inherent police power of the State to promote and provide greater safety of persons and property, for it is fundamental that the State can only interfere in matters affecting interstate commerce where the health, safety or welfare of its citizens may so require, and then only when the law is reasonably adapted to accomplish the end sought to be attained.

The sole question, then, before the Court is as to the constitutionality of the Arizona Train-Limit Law as applied to defendant's interstate operations under the conditions as they have been shown to exist during the period covered by the record in this case. For, even though the law may have been constitutional when enacted in 1912, it does not prevent the Court from a re-examination to determine whether conditions may have changed so as to render it arbitrary and unreasonable, considered in the light of the changes. This record discloses that the present conditions, upon which the plaintiff must rely, are vastly and fundamentally different from those existing when the law was passed. Both the rolling equipment and the fixed plant have been practically completely changed, this through the medium of extensive improvement and reconstruction. Operating methods have been substantially modified. The volume and character of the traffic are quite different from that which

was carried in 1912. As a matter of fact, the law had no appreciable adverse effect on defendant's operations when enacted, for the reason that freight trains then averaged but forty-seven cars and only 0.38% of the trains had more than seventy cars. Passenger trains only averaged nine or ten cars. By September of 1913 the entire Southern Pacific System in Arizona had only some two miles of its track protected by block signals.

In determining the constitutional questions raised in this case I have constantly kept in mind the admonition of the present Chief Justice of the United States, wherein he said: "The power of courts to declare a statute unconstitutional is subject to a guiding principle of decision which ought never to be absent from judicial consciousness. This is that the Courts are concerned only *with the power to enact statutes, not with their wisdom.* For the removal of unwise laws from the statute books appeal lies not only to the courts but to the ballot and to the processes of democratic government."

There can be no question but what the presumption is in favor of every legislative act, and the whole burden of proof lies on him who denies the constitutionality. The defendant here has been required to assume that full burden. The constitutional invalidity must be manifest and if it rests upon disputed questions of fact, the invalidating facts must be proved.

Here there is being called in question the validity of a statute which has been upon our books for more than twenty-eight years. It was not only passed by the Legislature, but subsequently approved by the people themselves in a referendum. More recently the Fifteenth Legislature made a special appropriation of a substantial amount to defend and sustain this law. This Court fully appreciates the delicacy of the situation and the great responsibility of rendering a judgment thereon. It is sometimes said that the court assumes a power to overrule or control the action of the people, or their representatives. This is a misconception. Our constitutions are the supreme laws of the land ordained and established by the people. All legislation must conform to the principles they lay down. When an act of a State Legislature is appropriately challenged in the

courts as not conforming to the constitutional mandate the judicial branch of the Government has only one duty—to lay the article or articles of the constitution which are invoked beside the statute which is challenged and to decide whether the latter squares with the former. All the court does, or can do, is to announce its considered judgment upon the question. The only power it has, if such may be called, is the power of judgment. This court neither approves nor condemns any legislative policy. Its delicate and difficult office is to ascertain and declare whether the legislation is in accordance with, or in contravention of, the provisions of the Constitution; and, having done that, its duty ends.

For some five and a half months I listened to the evidence adduced from the witness stand. In the intervening months, to refresh my memory, I have read the eighteen volumes comprising the Reporter's Transcript, which contains more than a million words; the numerous exhibits have been re-examined, the comprehensive briefs submitted by counsel for both parties, the last of which reached me on December 20, 1941, have been carefully studied and the hundreds of cases therein cited examined and it is now my matured conclusion that the Arizona Train-Limit Law is unconstitutional and void and I would be unworthy of the position that I hold if I did not have the courage to so declare it, irrespective of the effect of the ruling upon the parties, or those heretofore benefited thereby.

It should be remembered that this case is unique in at least two respects: It is the first train limit case to reach the State courts; second, it is the first time in the United States that the evidence in such a case has been taken before a trial judge. There are only four cases that are squarely in point, they are: The first Arizona case, the Nevada case, the Oklahoma case, and the Louisiana case. In the latter case no opinion was filed and, hence, it does not appear as a reported case. All of the four cases were brought in the Federal Court and determined by a special three-judge court. The evidence was either taken by a special master or the matter submitted on affidavits as in the Oklahoma and Louisiana cases. Admittedly none of the decisions in the four cases above referred to are controlling upon this Court. The Oklahoma law was sustained by a divided Court, while

the courts in the other three cases declared the law under attack as unconstitutional. The first Arizona case was appealed to the Supreme Court of the United States and reversed on a jurisdictional ground without passing upon the merits. However, the opinions are of value in their logic and reasoning in passing upon identical questions as those here presented.

As a brief review of this type of legislation, the testimony of Dr. Parmelee, who is the Director of the Bureau of Railway Economics of the Association of American Railroads, shows that though forty-four different bills attempting to regulate the length of trains have been introduced in thirty-five different states, it was only in Arizona (1912), Nevada (1935), Louisiana (1936) and Oklahoma (1937) that such laws were actually passed. Three such measures were defeated in Congress. Only Arizona and more recently Oklahoma have actually operated under such laws. The Nevada and Oklahoma statutes affected only the length of freight trains, no mention being made of passenger-train operations.

As a part of its comparative showing as to costs and methods of operation, casualties, etc., the defendant presented the National picture of railroading by witnesses, who are outstanding in their respective fields, from sixteen of the Class I roads of the United States. The railroads from which these witnesses came perform fifty-nine per cent of the freight service, sixty per cent of the passenger service, and operate fifty-four per cent of the Class I railroad mileage of America. This evidence clearly establishes that "long-train" operating practice is the customary and ordinary practice throughout the United States and that improvements in efficiency, economy and safety are an accomplishment and necessary result of the adoption of that practice. This type of operation is unquestionably more economical and efficient than "short-train" operations. Freight train expenses vary inversely with train length. Furthermore, long-train operations permit improved schedules and performance by elimination of short-train interference. Operating conditions, including grades and curves on defendant's lines, in Arizona were not shown to be essentially different from those in other parts of the

United States. As a matter of fact, eighty-four per cent of defendant's main lines in Arizona are tangent (straight) track, and of the sixteen per cent that is curved only one per cent has curves of more than six degrees. Between March 2d and April 30th, 1940, the defendant's operations were carried on without regard to the restrictions of the train-limit law, during which period some sixty-two long passenger trains and some 302 long freight trains were operated without particular incident. This further indicates that long-train operations can be successfully carried out over the Arizona lines.

I shall not attempt in this opinion, as no good purpose could be served thereby, to make an analysis of the evidence, as that will be covered by the findings of fact filed this day. Nor shall I attempt to review and differentiate the numerous cited cases which lay down the principles of law governing these matters. I shall content myself with stating some of the principal reasons leading to the conclusion announced.

There is a field of regulation of interstate activities which, under the commerce clause, is exclusively reserved to the National Government, and I am firmly convinced that the subject of the length of trains engaged in interstate traffic falls within that class. This for the reason that the subject matter is national in its character, requiring uniformity of regulation by a single authority. If each state was at liberty to regulate the conduct of carriers while within its jurisdiction, the confusion likely to follow could not but be productive of great inconvenience and unnecessary hardship. The very purpose of the commerce clause was to insure uniformity of regulation of interstate commerce against conflicting and discriminating state legislation, such as the law in question. The absence of any act of Congress on the subject of train lengths is equal to its declaration that commerce in that matter shall be free. In other words, the inertia of government should be on the side of freedom of commerce, rather than on the side of restraint of commerce. The determination of this entire case might well be decided upon this exclusive federal field doctrine, which is in effect saying that Arizona never had the right to pass this legislation in the first instance.

There is a second so-called "joint" field of regulation, relating to those matters which require diversity of treatment according to local conditions, where the states may act within their respective jurisdictions, unless and until Congress sees fit to exercise its paramount authority. But even if the law in question were found not to fall in the "exclusive Federal field," but rather in the "joint field" of regulation, still the law must be stricken down for the reason that in my opinion Congress has, by the enactment of the Safety Appliance Act, Boiler Inspection Act, etc., coupled with the broad powers delegated to the Interstate Commerce Commission, fully "occupied" this joint field of regulation. This would automatically oust the State of any power to supplement or expand such regulations any more than it could annul or amend them. Clearly if the law is necessary as a safety measure because "long trains" cannot be properly controlled and stopped with the present types of air brakes, then it gets over into a field already occupied by the Congress through the passage of the safety acts above referred to. Engineer Thrace Cooper of the Santa Fe System called by the State testified: "Your ability to control slack in a train rests solely on your ability to apply and release the brakes throughout the train."

There is still another infirmity to overcome: Any laws enacted by the State in the concurrent field must not be unreasonable or arbitrary and must not *substantially or directly* regulate, obstruct, impede or burden interstate commerce, *incidental or indirect interference* being all that is permitted.

The heavy direct burden cast by the law upon interstate commerce can not be seriously questioned and the impairment of the efficient use of defendant's property is of itself an unlawful taking of that property without due process of law, which is a violation of both the State and Federal constitutions. The fact that it costs the defendant in excess of $300,000.00 a year to comply with this law would not of itself, standing alone, warrant invalidating the law, providing it was otherwise valid and bore some reasonable relation to the purpose for which it was enacted. The cost of compliance, however, with a statute of this kind is an element for appropriate consideration in determining whether

the statute is arbitrary, capricious or repugnant to due process, and this factor has been so considered in arriving at a decision in this case.

The record here also amply discloses that the law causes real interference with, and delay to, interstate commerce, practically to the extent that Arizona operations create a bottle-neck. Actually ninety-three per cent of the freight traffic and ninety-five of the passenger business of the defendant in Arizona is interstate commerce. Furthermore, the law certainly imposes a great, substantial and wholly unreasonable burden of expense upon this interstate traffic. To hold in this case that interstate commerce was only incidentally or indirectly involved would be less than realistic, for the interference and regulation is *substantial, continuous, direct and unavoidable*, as is pointed out in detail in the findings of fact. What is even more serious from the standpoint of those who seek to uphold the Act is its extra-territorial effect. The challenged law lays hands upon interstate commerce moving over defendant's lines long before it reaches the physical boundaries of Arizona, and continues directly to affect and regulate that commerce long after it has left Arizona. As a practical matter, it nearly controls the length of passenger trains from Los Angeles to El Paso, and of freight trains from Yuma to Lordsburg, the latter point being twenty-three miles East of the State line, and frequently on to El Paso, 171 miles beyond Arizona's boundary. Under the decided cases it is fatal for any police power statute to operate with extra-territorial effect, and under the guise of the police power no state may thus directly interfere with interstate commerce.

Even if the proponents of the law were able to clear all of the other hurdles heretofore discussed, there would then arise the hotly contested question as to whether this train-limit-law actually bears any reasonable relation to safety. The Statute was unquestionably enacted under the police power, which is that undefined branch of government which bears the same relation to the State that the principle of self defense bears to the individual. Police power is founded upon public necessity and only public necessity can justify its exercise. If the law in question

does not promote the safety of employees and travelers upon the defendant's railroad lines, and others who are affected by said operations, then it must fall.

There need be no speculation as to the effect of the law (as would be the case if this were a recently enacted statute whose prospective effect might be problematical) for the reason that the Interstate Commerce Commission, by its regulations, and the Congress by legislative enactment, have required this defendant and all other railroads to file detailed monthly reports of accidents and casualties occurring in connection with their operations. Furthermore, all of the more serious accidents are investigated by a representative of the Commission.

The defendant established the fact that operating conditions on its lines across the Salt Lake Division, through the State of Nevada, where "long-train operations" are the rule, are entirely comparable in practically every respect to the operations on the Tucson division, in the State of Arizona. These latter operations being restricted by the law in question.

Detailed exhibits as to accidents and casualties of all types and classes were introduced in evidence. These exhibits covered operations particularly in Nevada and Arizona, as well as showing the National picture as a whole. From this evidence the Court is able to draw an irrefutable and striking comparison as to casualties under the "long" and "short" train operations.

Considering, first, passenger-train operations, the record shows that the casualty rates in Arizona, on the train-mile or any other recognized basis, are nearly twice what they are in Nevada. The Santa Fe operations in Arizona show the same trend. Surely the ultimate test of increased hazard is to be found in the actual record of casualties covering a twenty-eight year period.

From the standpoint of the safety of persons and property, slack and slack-action casualties on passenger trains are of no significance whatever.

Long-train method of operation prevails in passenger service all over the United States, except in Arizona, and the statistics demonstrate, from the safety angle, that the fourteen-car limit has no logical or reasonable basis. Fur-

thermore, long passenger-train operations in Arizona are entirely practicable and would result in greater efficiency, economy and safety.

Hence, certainly as applied to passenger-train operations, the challenged law bears no reasonable relation to its claimed object of safety, and instead of promoting that object actually increases many hazards, and creates many others which would not exist if the law were not enforced.

In passing it might not be amiss to call attention to the splendid stride that has been made throughout the United States in recent years in reducing casualties. Arizona to a limited extent has shared in these reductions. This record shows that on the Class I roads the casualty rate for the years 1935-1939 was 10.63 per hundred million passenger miles, which is another way of saying that there was a casualty to a passenger for every 9,407,000 miles of traffic.

Considering next freight-train operations: The same careful records are kept of these operations as is required by the I. C. C. of passenger-train operations, which includes reporting all train accidents where the damage exceeds $150.00, of all train service accidents and non-train accidents resulting in casualties to persons. If an employe is injured to the extent that he is incapacitated for work for a three-day period, within ten days after the accident it is classified as a casualty and becomes reportable. If a passenger is incapacitated for one day it is reportable as a casualty. (The term casualty includes fatalities.) As a matter of fact ninety per cent of accidents resulting in fatalities to passengers or trainmen are investigated by a representative of the I. C. C., and it is rather significant that they have failed to find or report in any one year that the length of trains had anything to do with the number of casualties.

Furthermore, this record contains exhibits comparing the defendant's freight-train operations in Arizona with its operations in Nevada and New Mexico, as well as the Class I roads of America. The element of speculation as to the result of long and short-train operations, is therefore largely eliminated. From all of which it appears very definitely that there are more accidents and they occurred more frequently in proportion to trains handled or traffic

moved in short-train territory than in long-train territory. Reference is made to the findings of fact for details to support this statement.

The frequency of train and train-service accidents, which includes grade-crossing accidents, appears to be directly related to the number of train units operated and that when more train units are run than are necessary to handle a given amount of traffic, the hazard or accidents in the handling of such traffic is correspondingly increased. When one considers that in the year 1938, for instance, that 30.8% or 4,304 more freight trains were operated between Yuma and El Paso than were actually necessary if it had not been for this law, it becomes apparent why the casualty rate is higher in Arizona.

Also it is clear that the reason defendant is unable to effect improvements in the efficiency and economy of its freight-train operations in Arizona comparable to those achieved in neighboring states, or upon its system generally, is primarily due to the restrictions imposed by the Arizona law.

In arriving at a decision in this case I have not overlooked, nor minimized, the type of casualty caused by the sudden start, stop, lurch and jerk of the train or car, commonly known as slack action casualties, which are so dreaded by every trainman. While slack action cannot be prevented, it must be controlled. A certain amount of slack is absolutely necessary to train operations. It cannot be denied that the addition of each car to a train adds just that much more potential slack, which must be effectively handled by the engineer if serious accidents are to be avoided. To the credit of the locomotive engineers of the United States, be it said that they have, with the improved equipment and devices furnished them, manifested greater skill and exercised more care in handling these longer trains with their heavier locomotives to the extent that over a seventeen-year period (1923-1939) only six per cent of the over-all casualties were caused by this type of accident. It must also be remembered that there are many factors besides length of train causing slack-action casualties, such as: grades, speed of train, consist of train and whether loaded or empty. The record shows many severe casualties of

this type on short trains. Limiting trains to the Arizona maxima has had no perceptible limiting effect on even that class of accidents, but if it had, surely it would not be argued that the law was aimed at a definite class of hazards, to-wit: slack-action accidents, which represents but six per cent of the whole, and that the law must stand regardless of its effect on all the other classes of accidents representing ninety-four per cent of the casualties, all of which showed material increase due to the effect of the law.

Essentially then the question is not whether a given number of long trains may be operated with fewer casualties than an equal number of short trains, but rather whether the long-train method of moving the entire volume of traffic results in fewer casualties, of all classes, than the movement of the traffic in a larger number of trains of restricted length.

In determining then whether the law bears any reasonable relation to safety, only the over-all result in casualties of the entire operation should be considered and when thus weighed it is clear that the law not only does not increase safety of train operations in Arizona, but that as a matter of cold fact it makes these short-train operations more dangerous.

Thus the Arizona Train-Limit Law not only bears no reasonable relation to safety but, to the contrary, does, and if enforced will continue to, impair and lessen substantially the safety of defendant's train operations in Arizona and the adjacent affected territory.

Defendant established that if the law were invalidated it contemplated the undertaking of an immediate program to build or extend its sidings and yard tracks at forty-nine different stations so as to provide suitable trackage permitting the efficient operation of long trains. Furthermore, larger locomotives of the AC-8 type, having much greater tractive power, would be assigned to the Tucson division. This change in motive power would also necessitate reconstructing certain roundhouses and turntables and providing additional repair facilities. It was estimated that these changes would involve the expenditure of more than a million dollars.

Before closing this opinion, may I say that the arduous task of the Court has been made much easier by the very able and comprehensive manner in which the Attorneys for both of the parties have briefed both the law and the facts; I compliment each of you on the skill manifested. This assistance has been appreciated, as has all of the courtesies which were extended throughout the long trial.

At the close of the trial both parties requested the Court to make findings of fact and conclusions of law. Thereupon the Court asked that counsel for the parties submit proposed findings, which request in due time was complied with. Being now of the opinion that the findings of fact submitted by the defendant, consisting of some 200 printed pages, are well supported by the record, the Court therefore adopts in toto these findings of fact and conclusions of law as its own. These have been signed and are now filed with the Clerk as a compliance with Section 21-1027, A. C. A., 1939.

It necessarily follows from what has been said that the Court considers the Train-Limit Law as being wholly void, invalid and unenforceable as to the interstate operations of the defendant, by reason of being in conflict with the Commerce Clause and the Due Process Clause (Fourteenth Amendment) of the Constitution of the United States, as well as the Due Process Clause of the Constitution of the State of Arizona. The Defendant is, therefore, entitled to judgment dismissing the Plaintiff's Complaint, and each count thereof, and for its costs of suit herein expended. IT IS SO ORDERED.

Done in open Court this 11th day of February, 1942.

LEVI S. UDALL,
Presiding Judge in the Above Entitled Case.

APPENDIX C.

December 23, 1943.

IN THE SUPREME COURT OF THE STATE OF ARIZONA.

No. 4525

STATE OF ARIZONA ex Rel. JOE CONWAY, Attorney General of the State of Arizona, *Appellant*,

vs.

SOUTHERN PACIFIC COMPANY, a Corporation, *Appellee*.

Appeal from the Superior Court of Pima County. Honorable Levi S. Udall, Judge. Judgment Reversed.

Joe Conway, Attorney General; Earl Anderson, Assistant Attorney General; Charles L. Strouss, of Counsel, all of Phoenix, Arizona, Attorneys for Appellant.

Cleon T. Knapp, James P. Boyle, B. G. Thompson, all of Tucson, Arizona; Henley C. Booth, Burton Mason, both of San Francisco, California, Attorneys for Appellee.

STANFORD, *J.*:

This action is brought under the provisions of Section 69-119, Arizona Code Annotated, 1939, (Laws, 1913, Referendum, p. 15; Sections 2166-2168, Revised Statutes of Arizona, 1913; Civil Code; Section 647 Revised Code of Arizona, 1928), being the act commonly called the Train Limit Law, and was brought for the purpose of recovering from defendant penalties as provided by the act. The charge in the complaint is that on March 12, 1940, the defendant operated a passenger train of more than 14 cars, and on April 4, 1940, the defendant operated a freight train of more than 70 cars, in violation of said law.

The aforesaid statute reads as follows:

> "Section 1. It shall be unlawful for any person, firm, association, company or corporation, operating any railroad in the state of Arizona, to run, or permit to be

run, over his, their, or its line of road, or any portion thereof, any train consisting of more than seventy freight, or other cars, exclusive of caboose.

"Section 2. It shall be unlawful for any person, firm, association, company or corporation, operating any railroad in the state of Arizona, to run, or permit to be run, over his, their, or its line or road, or any portion thereof, any passenger train consisting of more than fourteen cars.

"Section 3. Any person, firm, association, company or corporation, operating any railroad in the state of Arizona, who shall wilfully violate any of the provisions of this act, shall be liable to the state of Arizona for a penalty of not less than one hundred dollars, nor more than one thousand dollars, for each offense; and such penalty shall be recovered and suits therefor brought by the attorney general, or under his direction, in the name of the state of Arizona, in any county through which such railway may be run or operated; provided, however, that this act shall not apply in cases of engine failures between terminals.

"Section 4. All acts and parts of acts in conflict with the provisions of this act are hereby repealed."

The case was tried in Tucson, Pima County, Arizona, before the Honorable Levi S. Udall, Judge of the Superior Court of Apache County, Arizona, to whom it had been assigned.

By the judgment rendered it was held that the Train Limit Law of Arizona, as set forth in the sections above quoted, was unconstitutional and void because:

"First: Said statute invades the exclusive legislative field of Congress, as limited and defined by the Commerce Clause (par. 3, of Sec. 8, Art. 1) of the Constitution of the United States;

"Second: Said statute imposes direct, unreasonable and unlawful burdens upon, and interferes with, delays and obstructs interstate commerce, in violation of said Commerce Clause;

"Third: Said statute impairs the use and usefulness of the transportation facilities employed by defendant as a common carrier engaged in interstate commerce;

"Fourth: Said statute is in conflict with and infringes upon, and amounts to an unlawful attempt to supplement, the power-brake provisions of the Federal Safety Appliance Acts, and the safety-device provisions of Section 25 of the Interstate Commerce Act, which Federal statutes operate upon the same subject matter and are directed to the same objects as said Train-Limit Law and by which said statutes Congress has completely and exclusively occupied the field of regulation of train lengths;

"Fifth: Said statute operates unreasonably and arbitrarily to deprive defendant of its property, without due process of law, in violation of both the Due-Process Clause of the Fourteenth Amendment to the Constitution of the United States, and the Due-Process Clause set forth in Section 4 of Article 2 of the Constitution of the State of Arizona:"

Appellee has admitted the operation of the trains as alleged in the complaint, but alleged that each of said trains consisted in a large part of cars moving in Interstate Commerce and carrying interstate traffic, and in further explanation of appellee's case, we quote as follows:

"* * * and denied that either of said operations was a wilful violation of the law. For a further separate and affirmative defense to the complaint, appellee alleged that the law was and is void, invalid and unconstitutional, because in violation of the Commerce Clause (Article I, Section 8, para. 3) of the Constitution of the United States, the Due-Process Clause of Section 1 of the 14th Amendment of the Constitution of the United States, and the corresponding Due-Process Clause set forth in Article II, Section 4, of the Constitution of Arizona, in that: (a) the law undertakes to regulate a subject-matter of national concern which, if required to be regulated at all, is subject to regulation

only by Congress pursuant to the powers granted by the Commerce Clause; (b) the necessary effect of the law is to regulate appellee's train operations extra-territorially, that is to say, beyond the boundaries of Arizona; (c) the law directly and substantially interferes with, delays, and regulates appellee's interstate train operations in Arizona and the adjacent states; (d) the law imposes direct and substantial burdens upon the appellee's interstate train operations; (e) the law, to the extent that it has, or is intended or claimed to have, the effect of limiting the number of cars in a train to that number which can be safely and effectively controlled or stopped by the use of air brakes and other appurtenances now in use on such trains, is in conflict with and an infringement upon existing Federal legislation having the same or similar purposes, enacted by Congress pursuant to its powers under the Commerce Clause; (f) the law deprives appellee of its property unreasonably and arbitrarily, in violation of the due-process clauses of the State and Federal Constitutions above referred to, for the reason, among others, that it bears no reasonable relation to health or safety, its ostensible objects and does not eliminate or reduce any present hazard, but on the contrary creates certain hazards which would not otherwise exist, and increases other hazards of railroad operation in numerous respects."

In 1912, the year Arizona became a state, several measures were referred, under the Constitutional Act of Initiative and Referendum, to the people after their passage by the legislature. Among those measures, besides the one in question, the Train Limit Law, each had to do with the regulation through the police power of the state of railroads in Arizona for the health and safety of its employees and traveling public. That will be observed, first, by the act regulating the number of men to be employed on trains and engines; second, by the act regulating head lights on all locomotives (for example, in this particular act, it was required that locomotive engines used in the transportation

of trains over railroads should install electric head lights of a certain power); and third, by the act to require certain tests of service before a person could serve as a locomotive engineer or train conductor. It can be easily seen that all of these acts, including the one in question in this action, were made the laws of this state for the purpose of the safety and protection of employees and of the people being transported over the railroads in our state.

Appellee contends in its brief, as it did by a statement before the court in argument that "it is much more probable that the law was advocated and passed as a measure to promote and preserve—make static—the employment of railroad trainmen. Certainly that is its most obvious practical (but extra-legal) purpose and, as experience has shown, one of its principal results." We have just quoted the title to other acts, as well as this one, enacted in the year 1912 by the State Legislature. All of them have to do with the regulation of the handling of trains in order to protect the employees or traveling public as will be seen by the various acts, and no other reason could possibly be assigned to those acts, including, as stated, the one in question here. The case of *State* vs. *Pate*, (N. M.), 138 Pac. (2d) 1006, states: "The courts do not inquire into the motives of the legislature."

16 C. J. S. page 277, Sec. 100, has the following to say in connection with legislative acts:

> "It will be presumed that the legislature, in passing a statute, acted advisedly and with full knowledge of existing facts and conditions on which its legislation is based, and that no general laws are ever passed either through want of information on the part of the legislature or because it was misled by false representations of interested parties. It will also be presumed that the legislature carefully investigated and properly determined that the interests of the public required the enactment of particular legislation. So, the court will presume that the legislature in enacting a regulatory measure had adequate knowledge of the evils sought to be corrected and did not act arbitrarily or unreasonably."

In State vs. Wisconsin Telephone Co., 172 N. W. 225, 169 Wis. 198, it is said:

> "The term 'police power' is very elastic and is used to express different meanings at different times. In its broadest sense, it has been said to include 'all legislation and almost every function of civil government.'"

The case of Salem Lodge vs. Swaile, 197 N. W. 837, 209 Ind. 347, expresses the opinion that when a subject lies within the police power of the state, debatable questions as to reasonableness are not for the courts, but for the legislature which is entitled to form its own judgment, and its action within its range of discretion cannot be set aside because compliance is burdensome.

In the case of State vs. Superior Court, 174 Pac. 973, 103 Wash. 409, it is stated:

> "Indeed, it may be said that, where the police power is set in motion in its proper sphere, the courts have no jurisdiction to stay the arm of the legislative branch of the government, for it is operating in its own particular field, where even the courts are powerless to insist upon a procedure consistent with the forms of the common law."

Dwelling for the present on the contention of the appellee that the law is in conflict with the Fourteenth Amendment, we refer to the case of Barbier vs. Connelly, 113 U. S. 923, reading as follows:

> . . . . But neither the Amendment, broad and comprehensive as it is, nor any other amendment was designed to interfere with the power of the State, sometimes termed its 'police power,' to prescribe regulations to promote the health, peace, morals, education and good order of the people, and to legislate so as to increase the industries of the State, develop its resources and add to its wealth and prosperity. From the very necessities of society, legislation of a special character, having these objects in view, must often be had in certain districts, such as for draining marshes and ir-

rigating arid plains. Special burdens are often necessary for general benefits, for supplying water, preventing fires, lighting districts, cleaning streets, opening parks, and many other objects. Regulations for these purposes may press with more or less weight upon one then upon another, but they are designed, not to impose unequal or unnecessary restrictions upon anyone, but to promote, with as little individual inconvenience as possible, the general good. Though, in many respects, necessarily special in their character, they do not furnish just ground of complaint if they operate alike upon all persons and property under the same circumstances and conditions. Class legislation, discriminating against some and favoring others, is prohibited; but legislation which, in carrying out a public purpose, is limited in its application, if within the sphere of its operation it affects alike all persons similarly situated, is not within the Amendment."

Appellee has brought to the attenion of the court six certain cases in which it places great reliance. The first one is the case of A. T. & S. F. Ry. Co., et al., vs. LaPrade (1933) 2 Fed. Supp. 855. This case was tried by one Circuit Judge and two District Judges. In this case counsel in their brief have to say:

"The conclusions expressed by that opinion were given no effect solely because of the holding of the United States Supreme Court in Ex parte LaPrade (1933), 289 U. S. 444; 77 L. Ed. 1311, which decided that the suit had abated because of the substitution of the incoming attorney general for the original defendant. The Supreme Court considered no other question."

The second is the Southern Pacific Company vs. Mashburn, (1937), 18 Fed. Supp. 393. This case was tried before one Circuit Judge and two District Judges. That case was decided against the validity of the Nevada law which was patterned after the Arizona law.

The third case was Texas & New Orleans R. Co. vs. Martin, et al. (1936). This is known as the Louisiana case

and was heard by one Circuit Judge and two District Judges. It is an unreported case but the court made permanent the interlocutory injunctions issued prohibiting interference of the railroad in that state.

The fourth case is the case of M. K. & T. R. Co. vs. Williamson, 36 Fed. Supp. 607, known as the Oklahoma case. That case is like the Nevada Train Limit case except that it has reference to freight trains only. This case was heard and decided by the two Circuit Judges, District Judge Vaught dissenting.

The fifth case is State, etc. vs. A. T. & S. F. Ry. Co. et al., 125 Kans. 586; 264 Pac. 1056, a Kansas case heard by the State Supreme Court. The state, through its Public Service Commission, attempted to compel, by mandamus proceedings, the railroad company to put into effect certain orders prescribed by its relating to manual signals to be used by train crews and relating to the air and power brake system, and in part, the holding of that state court was that such an order could not be enforced by mandamus where no showing was made that a better system had been devised. The unanimous judgment was rendered for the railroad company.

The sixth case is Southern Pacific Company vs. Railroad Commission of California, 10 Fed. Supp. 918. In that case the Railroad Commission of California had ordered that certain trains moving between certain points during the six winter months be operated with an additional caboose, to be placed midway in the train. The opinion in this case was given by one Circuit and two District Judges upholding the railroad company.

In connection with the foregoing six cases we quote a statement, or contention, of the appellee herein as follows:

> "It will be noted that the four Federal train-limit cases were heard before twelve different Federal judges, five of whom were Circuit judges and seven District judges. Three of the Circuit judges and all of the District judges, or ten Federal judges in all, have agreed that state train-limit laws exactly or essentially similar to the challenged law are invalid, upon precisely the same constitutional grounds urged in the present

case. Only two of these twelve judges have taken a contrary view.

"Three of the ten Federal judges mentioned have also concurred in reaching the same result with respect to a state regulation not differing in principle from a train-limit law; although, of course, neither the volume of the traffic affected, the character and extent of the interference imposed, nor the financial burden was as severe and widespread as in the train-limit cases."

The State of Oklahoma, one of our latest additions to statehood in the union, no doubt was desirous of enacting laws that would be progressive, that would be for the safety of the traveling public through its state and for the employees on its trains. Regardless of the reasoning of the appellee herein, as above set forth, as to the total number of various judges who have in the aggregate given opinions that would overwhelm the Oklahoma case, nevertheless the Oklahoma case was not tried by state judges and it is the latest case quoted by appellee herein, and while this court is not bound to follow, it is certainly most fitting to do so.

There are something like 325 cases cited by the two parties to this action, and it would be impossible to make reference to all of them. The case of M. K. & T. R. Co. vs. Williamson, supra, is replete with the cases cited by both sides in this case, and Circuit Judge Bratton, who wrote the opinion in that case, gave expression of the court to most all the cases cited in the case. In that case, like the one at bar, the railroad company was compelled, among other things, to expend great sums of money in order to comply with the restrictions placed by the State of Oklahoma, and by injunction the railroad company sought to be relieved of the necessity of such great additional expense. We quote from said case as follows:

"It is contended with emphasis that the statute, applied to the business of plaintiff, is not a safety measure reasonably enacted in the exertion of the police power of the state, but is merely an attempt to regulate, delay and burden interstate commerce, in violation of the

Commerce Clause. The supreme, plenary and complete power of Congress to regulate interstate commerce is without limitation or restriction, except that prescribed in the Constitution; and within the reach of that paramount authority lies the power to protect such commerce against substantial dangers, burdens or obstructions, no matter the source from which the encroachment springs. Gibbons v. Ogden, 9 Wheat. 1, 6 L. Ed. 23; Minnesota Rate Cases (Simpson v. Shepard), 230 U. S. 3252, 398, 33 S. Ct. 729, (citing many other cases). Coming to apply the well-recognized doctrine many state and municipal enactments have been held invalid (citing cases).

"But every state statute having some relation to interstate commerce is not to be condemned on that ground. A state is free in the exertion of its police power to enact reasonable measures in the interest of the health, safety and welfare of its people, including employees of railroads, passengers on trains, and others, even though interstate commerce may be incidentally or indirectly involved. * * * It is crystal clear that the general principle running through all of these cases is that a state statute, enacted in the exercise of the police power, and bearing some reasonable relation to the health, safety, or well-being of the people of the state, is not to be overturned by judicial decree, even though by its necessary operation it affects interstate commerce in an incidental or indirect manner, but not otherwise. * * *.

"Plaintiff relies upon the due process clause of the Fourteenth Amendment. It is obvious that to comply with the statute plaintiff will be required to expend additional sums in the operation of its business. The cost of compliance with a statute of this kind is an element for appropriate consideration in determining whether the statute is arbitrary, capricious, or repugnant to due process; but, standing alone, it is not always enough to warrant judicial determination of invalidity. Missouri Pacific Railway Co. v. Kansas, 216 U. S. 262, 30 S. Ct. 330, 54 L. Ed. 472; Lehigh Valley Railroad Co. v. Board of Public Utility Commis-

sioners, 278 U. S. 24, 49, S. Ct. 69, 73 L. Ed. 161, 62 A. L. R. 805; Missouri Pacific Railroad Co. v. Norwood, supra. The facts presented are not sufficient to distinguish or set apart this case from those to which reference has been made in which statutes enacted in the exercise of the police power of the state were sustained, although interstate commerce was incidentally and indirectly affected and the expenditure of additional sums was necessitated.

"The remaining contention to be considered is that the statute must fall because Congress has occupied the field; that the act infringes and is in conflict with legislation heretofore enacted by Congress pursuant to its powers under the Commerce Clause. To sustain the contention, plaintiff relies upon paragraphs 10 to 17 and paragraph 21 of section 1 and section 26, of the Interstate Commerce Act, as amended, 49 U. S. C. A. Pars. 1, 26; and sections 1 and 9 of the Safety Appliance Act, as amended, 45 U. S. C. A. Pars. 1, 9. Paragraph 10, section 1, of the Interstate Commerce Act, as amended, defines the term 'car service'; paragraph 11 makes it the duty of a railroad company to furnish safe and adequate car service, and to enforce just and reasonable rules, regulations, and practices in respect of car service; paragraph 12 relates to the distribution of cars for the transportation of coal; paragraph 13 authorizes the Commission to require railroads to file with it their rules and regulations relating to car service, and empowers the Commission to direct that such rules and regulations be incorporated in the schedules showing rates, fares and charges for transportation; paragraph 14 authorizes the Commission to establish rules, regulations, and practices touching car service; paragraph 15 is addressed to the furnishing of car service and the use of facilities in case of shortage of equipment, congestion of traffic, or other emergency; paragraph 16 empowers the Commission to make just and reasonable directions in respect to the handling, routing, and movement of traffic over other lines; paragraph 17 requires railroad companies to obey orders of the Commission concerning car service, and

provides a penalty for disobedience; and paragraph 21 vests in the Commission authority to reqire any railroad to provide itself with safe and adequate facilities for performing its car service, and fixes a penalty for refusal or neglect to comply with such an order; and section 26 authorizes the Commission to order a railroad to install automatic train-stop or train-control devices or other safety devices, and fixes a penalty for the refusal or neglect to comply with such an order. Section 1 of the Safety Appliance Act, as amended, provides that no railroad company shall use on its line any locomotive in moving interstate traffic not equipped with a power driving-wheel brake and appliances for operating the train-brake system, and that no train shall be run in such traffic that does not have a sufficient number of cars in it equipped with such power and train brakes that the engineer on the locomotive can control its speed without requiring brakemen to use the common hand brake for that purpose; and section 9 provides that whenever a train is operated with power or train brakes not less than fifty per cent of the cars shall have their brakes used and operated by the engineer, that all power-braked cars in the train which are associated together with such fifty per cent shall have their brakes so used and operated that the Interstate Commerce Commission may, from time to time, increase the minimum percentage of cars required to be operated with power or train brakes, and that failure to comply with any such requirement shall subject the company to a penalty.

"In respect to the regulatory power of the state and the occasions for its exercise, the general subject of commerce has been divided into three separate and distinct classes. They are those in which the power of the state is exclusive, those in which the state may act in the absence of legislation by Congress, and those in which the action of Congress is exclusive and therefore the state cannot act at all (citing cases). The reasonable limitation of the length of trains in the interest of public safety falls within the second class. As to that class, the exercise of the paramount power of Congress

is necessary to take from the state its subordinate power to legislate. Covington & Cincinnati Bridge Co. v. Kentucky, supra; Western Union Telegraph Co. v. James, supra. And mere congressional delegation of power to the Interstate Commerce Commission to act in respect to that class does not require the state to yield. It is only after action by the Commission that the state is shorn of its power (citing cases). But the intent of Congress to exert its superior authority and thus exclude or supersede state legislation concerning the same matter is not to be lightly inferred. It must be fairly manifested (citing cases). And, it is within the power of Congress to limit its regulation to only part of a given field, thus leaving the remainder open to action by the state (citing cases).

"The acts of Congress relied upon fail to make specific reference to the length of trains as an element of safety, and it is not contended that the Interstate Commerce Commission has acted or asserted its authority to act in respect of the matter under the powers which Congress has delegated to it. True, some if not all of the statutes concern themselves with various aspects of safety in the operation of trains. But, fairly construed, they do not contain any provision from which it can be reasonably implied that Congress intended to exert the paramount character of its authority in relation to the length of trains in such manner as to exclude or supersede state action. And until an intent to exercise such superior authority has been indicated, the state is free to legislate in the exertion of its police power . . . ."

It has come to our attention that the Interstate Commerce Commission in relation to the Transportation Act of 1940 has recently commented on that Act as follows:

"It is unnecessary to decide whether Congress has occupied the field of safety regulation with respect to the operation of trains or with respect to the length of trains. In any event, that is a question for the courts. The question before us is whether, in view of the

emergency found to exist, we were authorized by law to suspend the operation of State laws limiting the number of cars in a train."

The emergency referred to, of course, has reference to the suspension of the Train Limit Law for the duration of the war, and to which this state has unhesitatingly yielded. From the case of People vs. Letford, 79 Pac. (2d) 274, 102 Colo. 284, we quote the following:

"In approaching the question of the validity and constitutionality of the statute, it is well to keep in mind certain fundamental rules. When an act of the Legislature is attacked on the ground of unconstitutionality, the question presented is not whether it may be voided but whether it is possible to uphold it. Denver v. Knowles, 17 Colo. 204, 30 P. 1041, 17 L. R. A. 135. Every presumption will be indulged in favor of the legislation and only clear and demonstrable usurpation of power will authorize judicial interference with legislative action. Green v. Frazier, 253 U. S. 233, 40 S. Ct. 499, 64 L. Ed. 878. The rule was well stated by the Supreme Court of Massachusetts in Re Wellington et al., Petitioners, 16 Pick. 87, 26 Am. Dec. 631, and quoted with approval by us in Milheim v. Moffat Tunnel District 72 Colo. 268, 273, 211 P. 649, 651, as follows: 'When called upon to pronounce the invalidity of an act of legislation passed with all the forms and solemnities requisite to give it the force of law, courts will approach the question with great caution, examine it in every possible aspect and ponder upon it as long as deliberation and patient attention can throw any new light on the subject, and never declare a statute void, unless the nullity and invalidity of the act are placed, in their judgment, beyond reasonable doubt.'"

The trial court took from the 19th day of November to the first of the following May in the trial of this cause, excepting some recesses. There were 886 assignments of error and 39 propositions of law presented to us, and of the many scores of cases cited by both appellant and appellee, this court has read as many as possible to be consistent in

rendering justice to both sides. The matter has engrossed the attention of this court, as time would permit, since its presentation in April, 1943, until this time, but the opinion, condensed as it is in the foregoing pages, expresses our reason for holding that the findings and judgment of the trial court to the effect that the Train Limit Law is unconstitutional were in error.

We cannot impugn the motives of the legislature of our state, and in this particular case the purpose of the citizenry of our commonwealth by disturbing the enactment of this law made by them until we find that it is in violation of a law to which the state must yield.

The judgment is reversed.

R. C. STANFORD,
Judge.

Concurring:
A. G. MCALISTER,
Chief Justice.

ROSS, J.:

I dissent. My reasons will be given later. Illness prevents my doing so at this time.

I think the judgment of the lower court should be affirmed.

HENRY D. ROSS,
Judge.

APPENDIX D.

IN THE SUPREME COURT OF THE STATE OF ARIZONA.

To the Honorable the Superior Court of the State of Arizona in and for the County of Pima. (SEAL.)

GREETING:

Whereas, lately in the Superior Court of the State of Arizona in and for the County of Pima, before you in a cause between State of Arizona, ex rel. Joe Conway, Attorney General of the State of Arizona, Plaintiff, vs. Southern Pacific Company, a corporation, Defendant, No. 20087, the

said Superior Court made and entered its judgment on February 11, 1942, as follows:

"Now, Therefore, It Is Hereby Ordered, Adjudged And Decreed:

(a) That said Train-Limit Law is wholly void, invalid and unenforceable, as to said defendant, and each and all of its trains carrying any interstate commerce or traffic, or engaged in interstate transportation, upon each and all of the grounds hereinbefore set forth;

(b) That defendant is not liable to plaintiff by reason of any of the matters or circumstances alleged in the complaint herein, or otherwise, either for the sums demanded as penalties in said complaint, or for any other sum or amount whatever;

(c) That plaintiff take nothing by its action;

(d) That defendant do have and recover from plaintiff its costs of suit herein, in the sum of $_____.

Dated: This 11th day of February, 1942.

LEVI S. UDALL,
Judge of the Superior Court of the State of Arizona."

as by the inspection of the record of the said Superior Court, which was brought into the Supreme Court of the State of Arizona by virtue of an appeal by plaintiff agreeably to the law in such case made and provided fully and at large appears.

And Whereas, in April, in the year of our Lord one thousand nine hundred and forty-three, the said cause came on to be heard before the said Supreme Court and was submitted for decision after argument of counsel.

On Consideration Whereof, it was on the 23rd day of December in the year of our Lord one thousand nine hundred and forty-three, ordered by this Court that the judgment of the said Superior Court in this cause, entered February 11, 1942, be, and the same is hereby reversed. Costs in this court to said appellant State of Arizona of and from said appellee Southern Pacific Company on cost bill duly filed and allowed.

WHEREUPON, appellee filed its motion for rehearing, on consideration of which, with the reply and objections of appellant, it was, on January 13, 1944, Ordered that the motion for rehearing be denied.

You therefore are hereby commanded that such proceedings be had in said cause, as according to right and justice, and to law, ought to be had, the said appeal notwithstanding.

Witness, the Honorable A. G. McAlister, Chief Justice of the Supreme Court of the State of Arizona, the Fourteenth day of January, in the year of our Lord one thousand nine hundred and Forty-four.

Costs of No cost bill filed.

EUGENIA DAVIS,
Clerk of the Supreme Court
of the State of Arizona.

[Endorsed:] No. 4525. Supreme Court of the State of Arizona. State of Arizona ex Rel. Joe Conway, Attorney General of the State of Arizona, Appellant, vs. Southern Pacific Company, a Corporation, Appellee. Mandate. Issued January 14, 1944.

APPENDIX E.

Jan. 13, 1944.

IN THE SUPREME COURT OF THE STATE OF ARIZONA.

No. 4523.

STATE OF ARIZONA ex Rel. JOE CONWAY, Attorney General of the State of Arizona, *Appellant*,

vs.

SOUTHERN PACIFIC COMPANY, a Corporation, *Appellee*.

Appeal from the Superior Court of Pima County. Honorable Levi S. Udall, Judge. Judgment Reversed in Opinion of December 23, 1943.

Joe Conway, Attorney General; Earl Anderson, Assistant Attorney General; Charles L. Strouss, of Counsel, all of Phoenix, Arizona, Attorneys for Appellant.

Cleon T. Knapp, James P. Boyle, B. G. Thompson, all of Tucson, Arizona; Henley C. Booth, Burton Mason, both of San Francisco, California, Attorneys for Appellee.

Ross, J. (Dissenting):

When the opinion in this case was handed down on December 23, 1943, I was unable, because of illness, to give my reasons for dissenting. I now do so.

The validity of the Arizona Train Limit Law (section 69-119, Arizona Code 1939) as applied to interstate transportation of persons and property is the question for decision. Such law undertakes to penalize any railroad in the State of Arizona that runs over its lines, or any part thereof, any train consisting of more than 70 freight, or other cars, exclusive of caboose, or any passenger train of more than 14 cars.

The act is silent as to its purpose. If it was enacted to protect the safety, health and well-being of railroad employees, or the traveling public, it does not so recite, as in

the Williamson case (36 Fed. Supp. 607) cited in the majority opinion.

The law's observance until now by the interstate railroads operating in Arizona, as the evidence and findings conclusively show, has not only cost such utilities large sums of money, but, also, has delayed and interfered with their business of transportation of goods and persons, at both the east and west boundaries of the state, without any material benefit to the traveling public, in the way of safety or health, or of the employees unless it be that more of them thereby have secured employment, increasing the operating expenses of the roads.

One sure result of a compliance with the law has been to force interstate companies to operate many more trains in the conduct of their business than the safety and well-being of the employees would seem to require, greatly increasing their costs.

Under the law, a fruit or cattle train made up in California for the Kansas City or Chicago Markets, if it consists of more than 70 cars, must, when or before it reaches, Yuma, Arizona, be broken down to the limit of 70 cars before it proceeds through Arizona. When this same train has crossed Arizona it may be rebuilt to the California length and proceed on its course to the point of destination. The traffic from the east to California must also conform to this arbitrary rule at the state's boundary. In effect, the law limits length of trains from California and New Mexico to and through Arizona and practically outside of the state.

The regulation of the length of interstate trains, if permissible, is by reason of the state's right under the constitution to pass laws for the profection of its people's lives, safety, health and well-being and to do that the state may enter the field appropriated under the federal constitution to the federal government, when such field has not been wholly occupied by that government. Powers belonging under the constitution to the federal government but not exercised may in all proper cases be exercised by the state for its use and protection, and a state law to that end will be valid and enforceable.

The Train Limit Law, if an allowable state regulation originally, is no longer allowable for the following reasons:

1. The danger to life and health in the operation of long trains, because of the improvement in the operating services as shown by the evidence and findings, has been greatly minimized, if not wholly done away with.

2. That because of such improvement, if the Train Limit Law was ever a valid police regulation, it now, under the evidence, serves but one purpose, to wit, the employment of more employees and trains, with the expense and hazards incident thereto.

3. It invades the field of regulation occupied by the Congress in its legislation providing for safety appliances in railroad operations (Virginian Ry. Co. v. United States (1915), 223 Fed. 748) and the safety provisions of the Interstate Commerce Act.

3. In Ex Parte No. 156, November 8, 1943, the Interstate Commerce Commission refused to modify its Service Order No. 85, theretofore entered, suspending during the war the operation of state laws limiting the number of cars in trains, stating, among other things:

> "If state laws limiting the number of cars in trains are to be held valid (a question we do not decide), it would be possible for each state to set a different number of cars as the maximum to be hauled in a train. State might even limit the length of trains to one car, although such a law would be clearly arbitrary and unreasonable. Higher limits might be set by states and found reasonable, but lack of uniformity would place a serious burden on interstate commerce. * * *
>
> "The fact that freight trains in excess of 70 cars and passenger trains in excess of 14 cars are safely operated in states without train-limit laws 'is convincing evidence of its safety, except where unusual operating conditions exist.' * * *
>
> "We find that these state laws were and are in fact rules and regulations with respect to car service within

the meaning of section 1, paragraph (10) and (15); that Service Order No. 85 was and is in accord with the national transportation policy * * * and is fully authorized by section 1 * * * of the Interstate Commerce Act.''

The Interstate Commerce Commission refused to modify or change said Service Order No. 85 for the reasons (a) that it was a valid order made pursuant to act of Congress and (b) because as a matter of fact ''freight trains in excess of 70 cars and passenger trains in excess of 14 cars are safely operated in states without train-limit laws'', which '' 'is convincing evidence of its safety, except where unusual operating conditions exist.' '' This finding of fact by the Commerce Commission is fully and well supported by the evidence taken in this case and is in accord with the learned trial court's findings.

Four states, Arizona, Nevada, Louisiana and Oklahoma, have enacted train limit laws. The laws in the first three named states have been passed upon and declared to be invalid (Atchison, T. & S. F. Ry. Co. *v.* La Prade, 2 Fed. Supp. 855; Southern Pacific Co. *v.* Mashburn, 18 Fed. Supp. 393; Texas & New Orleans R. Co. *v.* Martin et al. (1936, unreported), No. 428 Equity), in Oklahoma it was sustained by a divided court (Missouri-Kansas-Texas R. Co. *v.* Williamson, 36 Fed. Supp. 607). The rulings of these courts is another very cogent reason why the Train Limit Law should not be sustained. These decisions were by three-judge federal courts and were unanimous in holding the law invalid, except in the state of Oklahoma. In other words, of the 12 judges presiding in these cases 10 joined in declaring the law invalid and two (in the Oklahoma case) sustained the law.

I think the judgment of the lower court should be affirmed.

HENRY D. ROSS,
Judge.

APPENDIX F.

IN THE SUPERIOR COURT OF THE STATE OF ARIZONA IN AND FOR THE COUNTY OF PIMA.

No. 20087.

STATE OF ARIZONA, ex rel. JOE CONWAY, Attorney General of the State of Arizona, *Plaintiff*,

vs.

SOUTHERN PACIFIC COMPANY, a corporation, *Defendant*.

Judgment On Mandate of Supreme Court.

The above entitled cause coming on regularly before the Court this 5th day of February, 1944, on the opinion and mandate of the Supreme Court of the State of Arizona,

It Is Now Ordered, Adjudged And Decreed:

1. That the Arizona Train Limit Law is constitutional and valid.

2. That plaintiff have and recover judgment against the defendant:

(a) on plaintiff's first cause of action, in the amount of $250.00;

(b) on plaintiff's second cause of action, in the amount of $250.00;

(c) for plaintiff's costs herein in the amount of $_____.

Dated this 5th day of February, 1944.

(S.) LEVI S. UDALL,
Judge.

12. The Permissible Number of Cars in an Interstate Train Is a Subject of National and Not Local Concern 50

IV. Specification of Errors 51

V. Summary of Argument 54

VI. Argument 69

Introductory Statement 69

1. The Train-Limit Law Invades an Exclusive National Field of Regulation (Assignment of Error No. 1) 81

2. The Train-Limit Law Regulates Interstate Commerce with Extraterritorial Effect (Assignment of Error No. 2) 156

3. The Train-Limit Law Directly, Materially, and Substantially Interferes with, Burdens, and Obstructs Interstate Commerce (Assignments of Error Nos. 3 and 4) 188

4. The Train-Limit Law Invades a Field of Regulation of Interstate Commerce Fully Occupied by Congress (Assignment of Error No. 5) 209

(a) The power brake provisions of the Safety Appliance Acts 213

(b) Section 25 of Part I of the Interstate Commerce Act 220

(c) In determining whether the Train-Limit Law is in conflict with Acts of Congress, the entire scheme of the Federal legislation; including not only what Congress did say, but what it did not say, with all other relevant facts and circumstances, must control 226

(d) Analysis of the evidence showing appellee's position respecting the dangers intended to be eliminated by the challenged law 233

Page

5. The Train-Limit Law Operates Arbitrarily and Unreasonably to Deprive Appellant of Its Property Without Due Process of Law (Assignment of Error No. 6) 255

(a) In considering whether the law is an unreasonable exercise of the police power, the cost or expense of compliance with its provisions is properly a factor to be taken into account, although not the sole factor 258

(b) There is a rebuttable presumption of reasonableness normally attending a state police-power statute, challenged under the Due-Process Clause; but 270

(c) In the instant case that presumption is of no avail because of the lapse of time and changes in conditions since the law was enacted 270

(d) Common belief, as exemplified by the almost total absence of similar State or Federal laws, and also by the recent action of the Interstate Commerce Commission (Service Order No. 85), may be relied upon to show, and does show, that the law is wholly unreasonable 296

(e) A purported safety measure which in fact bears no reasonable, nor any regulation whatever, to health or safety, but on the contrary increases certain hazards and creates others which would not otherwise exist, is unreasonable and without rational basis, and without regard to its claimed or actual effects upon interstate commerce, should be held invalid because in violation of the Due-Process Clause. The train-limit law comes within this principle, and is therefore invalid 305

Page

6. If the Decision of the Lower Court Be Construed as a Reversal of the Findings of Fact of the Trial Court, It Operates to Deny to Appellant Federal Rights to Which It Is Shown by the Evidence to Be Entitled (Assignments of Error Nos. 7 and 8) 314

Conclusion 330

SUPREME COURT OF THE UNITED STATES

OCTOBER TERM, 1944

No. 56

SOUTHERN PACIFIC COMPANY,
a corporation,
Appellant,

vs.

STATE OF ARIZONA ex rel. JOE CONWAY,
Attorney General of the State of Arizona,
Appellee.

BRIEF FOR APPELLANT

VOLUME I: THE LAW[1]

I.

OPINIONS BELOW

The opinion of the Supreme Court of Arizona (R. 4055-4068 is reported in 145 Pac.(2d) 530; the separate dissent-

[1] In a separately bound volume, styled "Volume II: The Facts," appellant presents a discussion of the evidence in this case in its relation to the findings of fact made by the trial court. (The State Supreme Court made no findings, nor did it revise the findings of the trial court.) For reasons more fully explained hereafter, Volume II need not be reviewed in the study of the case, unless the Court should conclude that, by reason of an expression in the opinion of the State Supreme Court, issues of fact are open upon this appeal.

ing opinion of Honorable Henry D. Ross, a judge of that court (R. 4068-4071), is reported in 145 Pac.(2d) 536. The official (Arizona State) report is not yet in print.

The Memorandum Opinion of the trial court (the Superior Court of Arizona, in and for the County of Pima) is reproduced in the printed record (R. 4042-4054), but is not officially reported.

II.

JURISDICTION

Issues under the Constitution and laws of the United States (viz., the Commerce Clause, and the Due-Process Clause of the 14th Amendment; and the Safety Appliance and Interstate Commerce Acts) were duly presented to the Superior Court of Arizona, in a suit brought in that court by the State of Arizona (the present appellee) for the recovery of penalties for alleged violations of the Arizona Train Limit Law, the statute hereinafter quoted in full. That court ruled in favor of appellant upon such issues, holding that the Train Limit Law is invalid because in violation of said constitutional provisions and statutes, and rendered its judgment for appellant accordingly, February 11, 1942 (R. 4039-4041).

Upon appeal by the State to the Supreme Court of Arizona (the highest court of that state), the judgment of the Superior Court was reversed, the State Supreme Court (one judge dissenting) holding, on December 23, 1943, that the challenged statute is valid under the Federal Constitu-

tion and laws. Final judgment upon the mandate (R. 4072-4073) of the State Supreme Court was thereupon entered February 5, 1944 (R. 4073-4074). The present appeal from said judgment was duly presented and allowed March 7, 1944 (R. 4081-4082). Jurisdiction of this Court is invoked under Section 237(a) of the Judicial Code (28 U.S.C. 344(a)).

The order of this Court noting probable jurisdiction herein was entered May 1, 1944 (R. 4088).

III.

STATEMENT OF THE CASE

(a) THE STATUTE INVOLVED.

The Arizona Train Limit Law,* the above mentioned statute the validity of which presents the essential question in the case, was enacted by the Arizona Legislature in 1912, and subsequently approved by the electors of that State at a referendum election on November 5, 1912. As enacted the statute had no preamble or statement of purpose, its full title and text having been as follows:

"An Act limiting the number of cars in a train.

"Section 1. It shall be unlawful for any person, firm, association, company or corporation, operating

---

*For convenience, throughout the record of this case the Arizona Train Limit Law has been generally referred to as either the "Train Limit Law," or simply and without other designation as "the law." The same practice is followed in this Brief.

any railroad in the State of Arizona, to run, or permit to be run, over his, their, or its line of road, or any portion thereof, any train consisting of more than seventy freight, or other cars, exclusive of caboose.

"Section 2. It shall be unlawful for any person, firm, association, company or corporation, operating any railroad in the State of Arizona, to run, or permit to be run, over his, their, or its line of road, or any portion thereof, any passenger train consisting of more than fourteen cars.

"Section 3. Any person, firm, association, company or corporation, operating any railroad in the State of Arizona, who shall willfully violate any of the provisions of this act, shall be liable to the State of Arizona for a penalty of not less than one hundred dollars, nor more than one thousand dollars, for each offense; and such penalty shall be recovered, and suits therefor brought by the attorney general, or under his direction, in the name of the State of Arizona, in any county through which such railroad may be run or operated, provided, however, that this act shall not apply in cases of engine failures between terminals.

"Section 4. All acts and parts of acts in conflict with the provisions of this act are hereby repealed."

The law continued in full force and effect from and after its enactment, and until September 15, 1942. On the latter date observance was suspended by reason of the issuance by the Interstate Commerce Commission of its Service Order No. 85, dated September 11, 1942, published in Volume 7, Federal Register, No. 181, page 7258.

The text of the Commission's Order is set forth in the accompanying footnote.*

Part 95—Car Service

LENGTH OF TRAINS

At a session of the Interstate Commerce Commission, Division 3, held at its office in Washington, D. C., on the 11th day of September, A. D. 1942.

The Commission having under consideration operating rules, regulations, and State laws limiting the length of railroad freight and passenger trains, the Commission is of the opinion that, due to the existing state of war, an emergency exists requiring immediate action within the meaning of section 1, paragraphs (10) to (17), inclusive, of the Interstate Commerce Act.

It appearing that certain rules, regulations, practices, and laws are now in effect and are being enforced in certain states limiting the length of railroad freight trains to not more than one-half mile and limiting the number of freight cars in a railroad freight train to 70 cars, and limiting the number of cars in a railroad passenger train to 14 or 16, and that compliance by railroads subject to the Interstate Commerce Act with such rules, regulations, practices, and laws, during the present emergency, may result in congestion of tracks and terminals, wasteful use of locomotives, and interference with the free flow of traffic necessary in the present emergency; and that railroad freight trains exceeding one-half mile in length, or exceeding 70 cars in length, and railroad passenger trains exceeding 14 or 16 cars in length may be operated in accordance with safety standards now applicable, during the present emergency, in and through such states, and that such operation will facilitate the free flow of traffic necessary during the present emergency;

Therefore, it is ordered, that:

Sec.
95.1 Length of trains.
95.2 Effective period; emergency character.

AUTHORITY: §§ 95.1 and 95.2, issued under 40 Stat. 101, 41 Stat. 476, 49 Stat. 543, 54 Stat. 901; 49 U.S.C. 1 (10)-(17).

§ 95.1. *Length of trains.* From and after September 15, 1942, carriers by railroad subject to the Interstate Commerce Act shall operate their trains, when necessary for the prompt movement of freight and the clearing or avoidance of congestion by either freight or passenger trains, without regard to any rules, regulations, practices or laws now in effect and being enforced in the

(b) THE PRESENT SUIT.

Appellant operates a large railroad system in the southwestern part of the United States, and is one of the two major railroad carriers whose lines traverse Arizona. In 1940, believing that the Train Limit Law is wholly invalid, appellant determined to operate its trains in Arizona without regard to the law, and during March and April of that year, it operated over its Arizona lines some 62 "long" passenger trains, and 302 "long" freight trains.* These operations led to the institution of the present suit on April 19, 1940.

This suit was commenced by filing a complaint (R. 1-4) in the Superior Court of Arizona, in and for Pima County, in which the State was named as plaintiff, and appellant

*Throughout this brief, as in the record of this case generally, trains of more than 70 cars exclusive of caboose, and passenger trains of more than 14 cars (the limits fixed by the law) are called "long" trains; trains conforming to these limits are called "short" trains.

---

various states limiting the length of freight trains to not more than one-half mile and limiting the number of cars in a railroad freight train to 70 cars or limiting the number of cars in a railroad passenger train to 14 or 16.

§95.2. *Effective period; emergency character.* This order shall remain in effect during the war in which the United States is now engaged, unless sooner terminated by subsequent order of the Commission; and that this order, being based upon conditions of war emergency, shall not constitute a precedent for peacetime operations.

It is further ordered, That this order shall be served upon each common carrier by railroad subject to the Interstate Commerce Act and upon each State railroad commission, and that notice of this order be given to the general public by depositing a copy thereof in the office of the Secretary of the Commission at Washington, D. C., and by filing it with the Director of the Division of the Federal Register, The National Archives.

By the Commission, division 3.

(Seal)

W. P. BARTEL,
Secretary.

as defendant. The complaint alleged the operation of a long passenger train, on March 2, 1940, and a long freight train on April 4, 1940, in violation of the law, and prayed judgment for the statutory penalties.

On May 9, 1940, appellant filed its answer (R. 5-32); in which, after admitting the operation of the two trains named in the complaint, it alleged that each of said trains consisted in large part of cars moving in interstate commerce and carrying interstate traffic, and denied that either of said operations was a willful violation of the law.

For a further separate and affirmative defense to the complaint, appellant alleged that the law was and is void, invalid and unconstitutional, because in violation of the Commerce Clause (Article I, Section 8, par. 3) of the Constitution of the United States, the Due-Process Clause of Section 1 of the 14th Amendment to the Constitution of the United States, and the corresponding Due-Process Clause set forth in Article II, Section 4, of the Constitution of Arizona, in that: (a) the law undertakes to regulate a subject-matter of national concern which, if required to be regulated at all, is subject to regulation only by Congress pursuant to the powers granted by the Commerce Clause; (b) the necessary effect of the law is to regulate appellant's train operations extra-territorially, that is to say, beyond the boundaries of Arizona; (c) the law directly and substantially interferes with, delays, and regulates appellant's interstate train operations in Arizona and the adjacent states; (d) the law imposes direct and substantial burdens upon the appellant's interstate train operations; (e) the law, to the extent that it has,

or is intended or claimed to have, the effect of limiting the number of cars in a train to that number which can be safely and effectively controlled or stopped by the use of air brakes and other appurtenances now in use on such trains, is in conflict with and an infringement upon existing Federal legislation having the same or similar purposes, enacted by Congress pursuant to its powers under the Commerce Clause; (f) the law deprives appellant of its property unreasonably and arbitrarily, in violation of the due-process clauses of the State and Federal Constitutions above referred to, for the reason, among others, that it bears no reasonable relation to health or safety, and does not eliminate or reduce any present hazard, but on the contrary creates certain hazards which would not otherwise exist, and increases other hazards of railroad operation in numerous respects.

The detailed facts supporting these basic allegations were set forth at length in the answer. See, in particular, paragraphs 1 to 6, inclusive, of Part III of the answer. (R. 7-23).

From the outset the suit was treated as a test case, in that the Attorney General, at the time the complaint was filed, obtained from the Superior Court an order as contemplated by the Arizona Code (Sec. 28-401, *Arizona Code Annotated*, 1939) staying all other prosecutions under the law, pending final determination of the present suit (R. 5).

(c) PROCEEDINGS IN THE TRIAL COURT.

The case was especially assigned for trial to Superior Judge Levi S. Udall, sitting without a jury. The trial com-

menced on November 19, 1940 and continued, with several intervening recesses, until and including May 1, 1941. Voluminous evidence was introduced, and since appellant undertook the burden of establishing its affirmative defense, its evidence in support was particularly complete. Appellant called 60 witnesses, who were on the stand on 37 out of the 46 days required for the trial; it offered in evidence 316 exhibits, of which 311 were received. The State called 13 witnesses, and offered in evidence 86 exhibits, of which 68 were received.

Following the trial and subsequent briefing of the case, and the submission to the trial court of proposed findings of fact by both parties, Judge Udall, on February 11, 1942, rendered his opinion and decision (R. 4042-4054), in which he stated his conclusion that the law is unconstitutional and void upon each of the grounds asserted in appellant's answer. At the same time, Judge Udall adopted, signed, and filed special findings of fact (R. 3887-4034), and separately stated his conclusions of law (R. 4035-4038); thereupon judgment was entered in favor of appellant.

The specific legal grounds for the decision, as set forth in said judgment (R. 4040) are as follows:

> "That that certain statute of the State of Arizona, known as the Arizona Train-Limit Law, being Section 69-119 of the Official Arizona Annotated Code, 1939, with statute is set forth in full in the complaint of the plaintiff herein, is unconstitutional and void, because:
>
> "*First:* Said statute invades the exclusive legislative field of Congress, as limited and defined by the Commerce Clause (par. 3, of Sec. 8, Art. 1) of the Constitution of the United States;

"*Second:* Said statute imposes direct, unreasonable and unlawful burdens upon, and interferes with, delays and obstructs interstate commerce, in violation of said Commerce Clause;

"*Third:* Said statute impairs the use and usefulness of the transportation facilities employed by defendant as a common carrier engaged in interstate commerce;

"*Fourth:* Said statute is in conflict with and infringes upon, and amounts to an unlawful attempt to supplement, the power-brake provisions of the Federal Safety Appliance Acts, and the safety-device provisions of Section 25 of the Interstate Commerce Act, which Federal statutes operate upon the same subject matter and are directed to the same objects as said Train-Limit Law and by which said statutes Congress has completely and exclusively occupied the field of regulation of train lengths;

"*Fifth:* Said statute operates unreasonably and arbitrarily to deprive defendant of its property, without due-process of law, in violation of both the Due-Process Clause of the Fourteenth Amendment to the Constitution of the United States, and the Due-Process Clause set forth in Section 4 of Article 2 of the Constitution of the State of Arizona."

(d) PROCEEDINGS ON APPEAL TO THE STATE SUPREME COURT.

On April 9, 1942, the State filed notice of appeal (R. 4054) to the Supreme Court of Arizona from the judgment of the Superior Court dated February 11, 1942. In connection with its appeal the State presented 886 separate assignments of error, asserting that the trial court had

erred: (1) in its rulings upon the admission and exclusion of evidence offered by the parties, thus preserving the objections and exceptions taken by its counsel during the trial (assignments Nos. 1 to 662, inclusive); (2) in making certain specified findings of fact, the findings thus challenged including the greater part of those adopted by the trial court (assignments Nos. 663 to 866, inclusive); (3) in making its conclusions of law (assignments Nos. 867 to 882, inclusive); and (4) in entering judgment (assignments Nos. 882 to 886, inclusive).

The appeal was submitted to the state court for decision, upon briefs and oral argument by the parties, on April 13, 1943. On December 23, 1943, the court announced its decision, concurred in by two judges (the third judge dissenting), reversing the trial court's judgment (R. 4055-4068). A motion for rehearing duly filed by appellant on January 7, 1944, was denied by the court on January 13, 1944; on the same date the dissenting opinion (R. 4068-4071) was filed. The court thereupon issued its mandate (R. 4072-4073) dated January 14, 1944, ordering the judgment to be reversed but not, it will be noted, directing that the findings of fact be vacated or modified. In obedience to said mandate, the trial court, on February 5, 1944, entered judgment (R. 4073-4074) declaring the law constitutional, and assessing against appellant a penalty of $250.00 for each of the two violations alleged in the complaint. The findings of fact were not referred to in said judgment, nor was any order entered modifying or disturbing them in any respect.

The state court's opinion is noteworthy in that it includes no discussion of the facts or the evidence, other

than mere passing mention of the two long-train operations described in the pleadings, a brief recital of the history of the enactment of the challenged law, and an indirect affirmation of the trial court's finding X-d (R. 3966-3969) that compliance with the law places upon appellant a continuing heavy burden of expense. No reference is made to the 662 alleged errors in the admission and exclusion of testimony, assigned by the State. The "findings of fact," though made the subject of 204 such assignments, are not even mentioned as such; indeed, the word "findings" appears but once in the opinion, near the end, in a sentence in which the court states that the "*opinion, condensed as it is in the foregoing pages, expresses our reason for holding that the findings and judgment of the trial court to the effect that the Train Limit Law is unconstitutional were in error.*"

This sentence cannot be construed as a pronouncement purporting to sustain the assignments of error addressed to the findings of fact, for two obvious reasons, among others: (1) there is no preceding discussion in the "foregoing opinion," relating to the findings of fact or assignments of error, or indicating any reason why the court might have considered any of the findings of fact to be erroneous; and (2) there were no findings *of fact* by the trial court "to the effect that the Train Limit Law is unconstitutional". All expressions of the trial court to that "effect" appear either as separate conclusions of law (R. 4035-4037), or in and as part of the judgment (R. 4040), or in the memorandum opinion (R. 4042). It is apparent that the state court had in mind, and intended specifically to reverse, the "findings" of unconstitutionality, which

appear *in the judgment*, for these are quoted at length in the opinion (R. 4056-4057), and are the only portions of any document signed and filed by the trial court which the state court thus mentions or quotes.

The decision of the state court rests principally upon the precedent afforded by the decision of the majority of the special three-judge Federal district court for the Western District of Oklahoma, in

Missouri-Kansas-Texas Ry. Co. v. Williamson (1941), 36 Fed. Supp. 607;

in which decision the Oklahoma Train Limit Law, imposing a limit of 70 freight or other cars, exclusive of caboose, was sustained as valid under the Constitution and laws of the United States.

It is quite apparent, from the text of the opinion, that the state court accepted the evidence as admitted (or excluded), by the trial court, and likewise accepted its findings of the facts developed by that evidence, and made no attempt to pass upon any of the alleged errors in either the rulings on the evidence, or the adoption of the findings. The court nevertheless considered that the *Oklahoma Train Limit case* afforded a satisfactory precedent, "fitting," as the court said, to be followed even though not binding upon it (R. 4062); and upon this basis reversed the judgment. To interpret the opinion as having any broader scope or purpose, or particularly as holding that the trial court erred in either its rulings or specific findings of fact, would be to read into it an intention and result not supported or suggested by any language therein,

and indeed specifically negatived by the fact that the mandate did not direct that the findings of fact be set aside or modified.

The question of the interpretation to be given to this sentence of the opinion is discussed at greater length, with the development of additional reasons for the views above expressed, in subdivision 6 of the argument in this brief (pp. 314-330). Furthermore, assuming that, because of the quoted sentence, this Court may feel that there is a possible basis for questioning whether the trial court's findings of fact properly conform to the issues and the record are fairly supported by the evidence, we present, in a separate volume, designated "Volume II: The Facts," a detailed discussion of those findings with reference to the supporting evidence. This discussion is presented under separate cover so that it may be readily omitted in the study of the case, as it should be unless the Court should consider that questions of fact are open upon this appeal.

(e) THE FACTS IN THE CASE, AS DEVELOPED IN THE SPECIAL FINDINGS OF FACT.

The Special Findings of Fact (R. 3887-4034) present a complete statement of all the relevant facts of the case as developed by the evidence. These findings are carefully and extensively annotated to the transcript and the exhibits, by the citation of the pages in the original reporter's transcript, and the exhibits by number, where is set forth the evidence relied upon to support each such finding. Such annotations form an integral part of the findings.

In order that this Court may have readily available a full statement of all the facts that are material to its

consideration of the questions presented in the case, we here set forth the following condensed summary of the findings of fact:

1. **Description of Appellant's Lines of Railroad.**

Appellant is an interstate common carrier by railroad, with lines in seven states: Arizona, Nevada, Utah, Texas, New Mexico, Oregon and California. As such, it is subject to the Interstate Commerce Act. Directly, and through its connections, it participates in the carriage of interstate commerce between all points of the United States and adjacent foreign countries. It has an extensive mileage (8648 miles of line), and a very large investment (approximately $729,000,000 in fixed property, not including rolling equipment). Its lines in Arizona consist of 1208 miles, and the investment in fixed property is approximately $69,000,000.

Appellant's lines in the affected territory extend across Southern California, Arizona, and New Mexico; there being a principal main line (via Gila and Lordsburg) over which the freight traffic is largely handled, and two alternate lines. The ruling grades and curvatures along the lines in Arizona are generally favorable, there being no very severe grades; the heaviest ruling grades are but 1.4%. The percentage of curved, to total of all track mileage, is comparatively small; on the principal main line in Arizona 84% of the total mileage is straight track; and only 1% consists of curves of more than 6°. All curves in grade territory are "compensated." The lines in Arizona are well constructed, and capable of sustaining the heaviest and most powerful locomotives and cars owned or operated by appellant.

The appellant's lines in Nevada and Utah are in territory very similar to that over which extend the lines in Arizona and New Mexico; the operating conditions are also very similar, and the lines themselves are well constructed and equipped, in accordance with the same standards as in Arizona.

(Finding of Fact No. III, R. 3890-3897.)

2. Character of Freight and Passenger Traffic Handled Upon Appellant's Lines in Arizona and Adjacent Territory: Comparison With Nevada Traffic.

The traffic, both freight and passenger, handled over the Arizona lines is predominantly (about 93%) interstate. The freight traffic consists in large part of perishable products, livestock and manufactured products requiring expeditious handling, and of empty cars returning after moving under load. The traffic across New Mexico is of the same character. The traffic handled on the main lines across Nevada and Utah is likewise similar to that handled in and across Arizona, consisting largely of interstate freight and passenger movements, and of empty cars used for the handling of such interstate movements.

(Finding of Fact No. IV, R. 3897-3901.)

3. Recent Improvements in Appellant's Transportation Plant, Both Generally, and in the Territory Affected by the Law.

Since 1912, and especially since 1923, the track, roadbed, and fixed structures of appellant's lines in Arizona and the adjacent affected territory have been greatly improved in practically every detail of construction, through the expenditures of large sums of money. Similar improvements have been made on the fixed plant and equip-

ment of appellant on other portions of its system. At the present time, however, the sidings and passing tracks on appellant's main lines in Arizona, though otherwise improved, are still of about the same lengths as in 1912, and are not generally of sufficient capacity to hold more than 70 cars, including engine and caboose.

Great improvements have also been made since 1912, and particularly since 1923, in the rolling equipment, locomotives, cars, etc., used on appellant's lines. Many stronger and heavier locomotives—the types in use in Arizona being much the same as in Nevada and Utah—were especially acquired for handling long freight and passenger trains, and have proved their ability so to do through their use in Nevada and Utah. Large sums have been expended in acquiring and improving such newer and better locomotives and cars. All freight cars now in service are built of steel, or with steel underframes; all passenger cars are entirely of steel. There have been numerous detailed improvements in the cars, notably in the wheels, running-gear, and air-brake mechanisms.

The purpose of these expenditures and improvements was to permit appellant to operate its railroad safely, economically, and efficiently. The locomotives, cars and fixed structures in Arizona are fully adequate for long-train operations; and there are no reasons, from this standpoint, why long trains could not be operated in Arizona. If the law's restrictions were removed, such operations would be initiated. The limited long-train operations of March and April, 1940, demonstrated the practicability of long-train operations in Arizona.

(Finding of Fact No. IV, R. 3902-3908.)

4. Appellant's Methods of Operation, Past and Present.

Appellant's system is subdivided into operating divisions and subdivisions; each has a terminal, where runs of trains begin and end, and trains are made up and broken up. Runs of crews and locomotives generally extend from terminal to terminal, with some exceptions. All operations are conducted according to standard codes of operating rules; the same rules, subject only to certain local deviations, are in effect in Arizona and elsewhere upon appellant's system. Systematic inspections of equipment are conducted in both the affected territory and elsewhere, to make certain that equipment is in good order; these inspections being in accordance with a general code applicable to all railroads, and for the purpose of insuring safety in train handling.

Operations in Nevada and Utah are subject to the same code of rules, and carried on in accordance with the same standards and methods, as in Arizona. The same system officials have jurisdiction over all of these operations. The same equipment is used interchangeably in both the affected territory and on the Nevada-Utah lines. The traffic conditions, operating conditions, and other factors affecting the operations are very similar, the only point of difference (other than the Arizona train-length restriction) being that colder weather prevails during the winter months in Nevada and Utah. The records maintained, and the statistical and other reports required in connection with operations in Arizona, Nevada, and Utah are of the same character, and kept or rendered pursuant to systems and methods of accounting and reporting equally applicable in both territories. The Train Limit

Law presents the only substantial difference in conditions as between the two territories, so that comprehensive comparisons between them afford a highly effective method of testing the results of the law.

In 1912 appellant operated very few long freight trains in Arizona; the longest train then operated contained only 75 cars. There were likewise very few long passenger trains operated. Up to 1922 freight train lengths in Arizona tended to increase, but since 1922 there has been no substantial increase in the average. In Nevada, on the other hand, the average train length has increased consistently since 1912, and notably since 1923. The average train length in Arizona, for the period 1936 to 1939, was 53.85 cars; in Nevada for the same period, 76.28 cars.

The practice of long-train operation is followed everywhere on appellant's system, except in Arizona, and has been followed since about the year 1925. In spite of the restraining effects of the Arizona law, the result has been to increase the average length of *all* freight trains over the entire system from 42.4 cars in 1922, to 53.6 cars in 1939.

The average length of *main line* freight trains on the system in 1939 was 60.1 cars; on the Tucson Division (which includes most of the lines in Arizona) 59.8 cars; on the Salt Lake Division, which includes most of the lines in Nevada and Utah, 85.4 cars. Since 1925 appellant has operated substantial and increasing numbers of long trains on its system, particularly in Nevada and Utah.

The effect of the law is to cause appellant to produce a far greater number of train-miles in Arizona than if it

were able to operate long trains as in Nevada and Utah. The excess train-miles thus produced over the 15-year period (1925-1939) amounted to 32.7%; for the year 1938, 37.7%. Long-train operation in Arizona to the same extent as in Nevada and Utah is entirely feasible, subject only to the extension of the passing tracks and the provision of larger locomotives.

Appellant handles through freight moving across Arizona and Nevada and Utah upon regular time-schedules. These schedules over both routes have been substantially reduced since 1921. However, the proportion of trains handled over the Arizona route, arriving on schedule, has been less than the corresponding proportion of those handled over the Nevada route.

The various important indices of efficiency and economy of operation, such as average train speeds, average gross-ton-miles per train hour, average fuel consumption, and average cost per thousand revenue ton-miles, show that the improvements in efficiency and economy in Arizona, and on the Tucson Division, have been considerably less than in the Nevada-Utah territory, or upon the system; that the long-train program in Nevada and Utah, and upon the system as a whole, has resulted in much greater improvement in efficiency and economy of operation than in Arizona and the affected territory. Appellant's inability to attain greater efficiency and economy of operation in Arizona, on the same scale as in Nevada, or upon its system as a whole, is largely and directly due to the Train Limit Law.

(Finding of Fact No. VII, R. 3909-3934.)

5. Comparison of Appellant's Methods of Operation With Those Followed on United States Railroads Generally.

The improvements in roadbed and equipment made by appellant were part of a general program of improvement agreed upon and carried out by United States railroads generally, commencing about the year 1923. In connection with this program the United States railroads built and purchased larger and heavier locomotives, larger and better freight and passenger cars, and retired the older, smaller and less efficient cars and locomotives. Improvements in the appliances upon the locomotives and cars were likewise made. All of this was for the purpose of improving service, and to permit safer, speedier, and more economical operation.

The railroads of the United States, acting through their Association, have a general code of rules covering the details in construction and equipment of cars, which all carriers are required to observe.

Improved methods of operation were undertaken contemporaneously with the 1923 program of improvement upon the railroads generally, and were made possible by reason of these improvements. These improved methods included the adoption and development of the standard long-train operating practice. The result has been that the average and actual lengths of freight trains in the United States have tended to increase continually. The long-train practice is now standard on practically every railroad in the United States, including all of the connections and competitors of the appellant. The handling of through freight on published and agreed schedules is likewise a general practice; and as methods of

operation have improved, and equipment and roadbed have likewise been improved, these schedules have been shortened and better on-time performance has been secured. Long-train operation constitutes an essential part of these improved operating methods.

Since 1923, and coincident with the substantial increase in train lengths during that period, there has been a marked improvement in the efficiency and economy of railroad operations in the United States. This improvement is comparable to that achieved upon appellant's lines, except those in Arizona, but including particularly the lines in Nevada and Utah. It is a direct result of the improvements in roadbed and equipment and operating methods, and particularly the long-train operating practice. It is shown by study of the various indices of efficiency before mentioned. It is likewise illustrated by the statistics of 16 individual systems, whose lines reach into every section of the country, and include about 54.25% of the mileage of the Class I railroads of the United States and handle about 60% of all the traffic handled by such railroads.

Each of these 16 systems follows the practice of long train operation, except to the extent that the law prevents the Santa Fe from doing so in Arizona and adjacent territory.

These improved methods of operation, and particularly the long-train practice, have resulted in substantial public benefits, through the carriers' ability to reduce the levels of their freight and passenger rates and charges, and to increase the average wages paid to their employees.

The operating rules upon United States railroads generally, and particularly the 16 individual systems referred to, are modeled upon the standard code, which also forms the basis for appellant's code of operating rules. Operating conditions upon these other railroads, traffic conditions, and other relevant circumstances are in general largely similar to those encountered upon appellant's lines in the affected territory.

(Finding of Fact No. VIII, R. 3934-3947.)

6. Recent Long-Train Operations of Appellant in Arizona: Intention to Undertake Future Long-Train Operations.

In March and April, 1940, appellant operated 62 long passenger trains, and in April, 1940, it operated 302 long freight trains, in Arizona. The average length of these long freight trains was 86.36 cars. The average length of all appellant's freight trains operated in Arizona during the month of April, 1940, was 57.85 cars. This long freight-train operation was upon a limited scale, principally because of limited siding capacities in Arizona.

If the restrictions of the law are removed, appellant will at once institute, and thereafter continue, long-train operations. In order to do so upon a substantial scale, comparable to operations in Nevada and Utah, it will be necessary to extend some 49 sidings in the affected territory; to provide additional repair and water-supply facilities; and to acquire, either by purchase or transfer from other portions of the system, some 30 or more larger locomotives. Such locomotives will replace approximately 50 smaller locomotives now in service, which will then be assigned to other parts of appellant's system.

(Finding of Fact No. IX, R. 3947-3950.)

7. Effect of the Train Limit Law Upon Appellant's Operations:

Appellant conducted redispatching studies for the purpose of determining the precise effects of the law upon its operations in the affected territory. These studies, conducted under the supervision of fully qualified officers, consisted of detailed analyses of traffic handled over the affected lines during a typical recent period, which traffic was then "redispatched" into longer trains, so as to conform the operations, for the purposes of the study, to conditions which would prevail if the law were wholly set aside. The actual redispatching was performed by chief train dispatchers who have immediate jurisdiction over operations in the affected territory.

The results of these studies present a precise and accurate determination of the effects of the law in requiring additional train service, creating or aggravating delays, and causing additional expenses.

The first of the redispatching studies related to the months of June and August, 1938. A second study related to the month of April, 1940, when long-train operations were undertaken; the operations being recast upon the basis of full observance of the law. In this way the amount of the saving actually achieved during the long-train period of April, 1940, was determined. This same period was also further redispatched, upon the basis of a completely unlimited long-train operation, to determine the amount of the potential saving if long-train operations on an unlimited scale had been possible during that period. The combination of these last two studies determines the differences between compliance with the law during April, 1940, and completely unlimited long-train operations dur-

ing that period, as to the features of additional train service, delays, and expenses.

The 1938 and 1940 studies, taken together, check and confirm each other's results.

A further study was undertaken with respect to passenger traffic during the entire year 1938, which determined the amount of the possible saving in expense and additional service if the passenger-train restriction were disregarded.

The redispatching studies demonstrate that the law imposes delays, due to necessary switching and reconsisting at terminals, both in Arizona and outside of the State, and at other points along the line outside of the State, and that in this respect it operates with substantial extra-territorial effect. Because of the substantially increased number of trains operated, the number of interferences due to the necessary meeting and passing of trains are greatly increased. The 1938 study shows that 4,304 additional unnecessary freight trains were run over the principal main line between Yuma and El Paso, via Gila and Lordsburg, which would not have been operated if it were not for the law; that such operations caused 16,512 additional meets and passes in that territory during that year. About 38.0% additional and unnecessary freight trains were thus run on said principal main line during 1938, which caused the meets and passes thereon to be increased about 63.0%.

The effect of the delays and interferences of the law was to cause scheduled freight trains to arrive later than if the law had not been observed, and to bring about

more schedule failures than would otherwise have taken place.

The law's restrictions also caused numerous delays to passenger trains and passenger-train equipment, and compelled, in 1938, the operation of 2,203 excess passenger-car miles. Many of these delays, and much of this excess car mileage, took place outside of Arizona.

By compelling the average and maximum lengths of freight trains to be reduced, the law correspondingly increases the number of trains operated and the number of train-miles and locomotive-miles produced. In 1938, if the law had not been in effect, the traffic actually moved by appellant between Yuma and El Paso, via Gila and Lordsburg, and between Tucson and El Paso, via Douglas, could have been handled (as stated) with 4,304 fewer freight trains, 638,569 fewer freight-train miles, and 798,424 fewer locomotive miles. Of the additional freight-train miles compelled by the law, 151,788 were produced in New Mexico and Texas, and were caused by and solely due to the law's extra-territorial effect. In 1940, as revealed by the 1940 redispatching studies, the traffic was heavier, and the additional and unnecessary trains, train-miles and locomotive-miles were substantially greater in number.

Similar effects follow from the passenger-train restriction, which has even wider extra-territorial effect than the freight-train restriction.

The increased annual expense of operation imposed upon appellant by the law amounts to $394,900 per year, based on 1938 operations. This figure includes the costs

due to wages of the crews on the additional trains, locomotive repairs, for the additional engines used, and fuel for the additional train operations, and certain other smaller items, but also takes into account, as an offsetting credit, all of the increased charges resulting from the increased investment in locomotives, and other facilities, in order to commence and continue unrestricted long-train operation. Of the total of the additional expense caused by the law, some $94,600 is associated with operations entirely outside of Arizona, and is made necessary by reason of the extra-territorial effect of the law.

(Finding of Fact No. X, R. 3950-3969.)

8. Slack and Slack-Action in Trains: Nature, Cause and Effects.

Freight and passenger cars are held together by means of couplers, which, in turn, are attached to the frames of the cars by draft gears. The latter provide a non-rigid connection between the units comprising the train. Most draft gears are of the friction type, but there are some few spring-type draft gears still in use. Friction-type draft gears permit a certain amount of motion, which is controlled by the friction members of the draft gears, and amounts to approximately 2¾ inches in either direction from the mean, or normal, position. In addition to this controlled movement, there is also a small amount of play—approximately 1 inch—at the coupler faces, between each pair of coupled cars.

The term "slack," as used in train operation, means the amount of movement between the coupled cars, and includes both the free motion at the coupler faces and the controlled resistance in the draft gears. The term "slack-

action" means the accumulated effect of such motion, as it comes into play as the result of train operations. Slack and slack-action exist in trains of all lengths.

Many factors affect the extent and severity of slack-action in a train at any particular time, including: the train speed; whether or not the slack is "bunched" or extended; the grade upon which the train is moving; whether it is accelerating or decelerating; the consist of the train, whether all loads or empties, and if partly loads and partly empties, the position of the loads and empties with respect to each other; and the action taken by the engineer in charge of the train. To a large degree the extent and amount of the slack-action in a freight train are within the control of the engineer, through the use of the air brakes and the engine power.

The amount and severity of slack-action in freight trains does not depend solely upon the number of cars in the train, but also upon the numerous other factors mentioned. The limitation of trains to 70 cars neither eliminates nor reduces the number or severity of the casualties attributable to slack-action. Such casualties take place on both long and short trains, and there are times when emergency stops of long trains take place without casualties, although similar stops of short trains produce severe casualties. The presence or absence of accidents and casualties due to slack-action is due to the presence or absence, in varying degree, of the factors which contribute to and control such slack-action.

In passenger-train operation, while slack and slack-action exist, it does not appear that the results of slack-action are any more severe or frequent on long than on

short trains. Nor does it appear that slack-action in passenger trains, whatever the train's length, is sufficient to cause serious injury or damage.

(Finding of Fact No. XI, R. 3969-3974.)

9. Safety of Operation as Affected by Train Lengths: Accident and Casualty Statistics.

Reports of railway accidents are made to the Interstate Commerce Commission, by each carrier, each month; those reports being summarized in annual accident bulletins published by the Commission, which classify the accidents in great detail by type and cause.

All the statistical showings of accidents and casualties received in this case were based upon statistics and reports of accidents to the Interstate Commerce Commission, or on records of accidents reportable to that Commission.

Accidents may be measured, as to their frequency, on the basis of locomotive-miles, train-miles or car-miles operated; casualties to individuals may also be measured against man-hours worked, or man-miles traveled. All these bases are in common use. The car-mile basis is the proper method to determine the frequency of casualties in relation to volume of traffic.

Side by side with the increase in train lengths on Class I railroads of the United States, during the period 1923-1939, there has been a continued downward trend in the frequency of casualties to all classes of employees. During the five-year period 1935-1939 such casualties, on a car-mile basis, were 70.33% less frequent than in the six-year period 1923-1928. On other bases of measurement, approximately the same improvement is shown.

Considering casualties sustained by road trainmen and enginemen only, there has been substantially the same improvement; the rate of frequency on the car-mile basis having improved 69.21%, comparing the five years 1935-1939 with the six years 1923-1928. As to casualties to road *freight* trainmen and enginemen *on duty*, the corresponding improvement, comparing the same two periods, was 69.32%. Considering only road freight conductors, brakemen and flagmen (not including enginemen), there was a similar downward trend, the improvement having been 66.21%, comparing the same two periods.

Confining the comparison to those casualties due to sudden start, stop, jerk or lurch of train or car, sustained by road freight conductors, brakemen and flagmen on duty (the so-called "slack-action" group), the reduction in the casualty rate, and the absolute number of casualties, has likewise been consistent over the period 1923-1939. Comparing the six years 1923-1928, with the five years 1935-1939, the improvement in the later period was 65.29%. In 1923 there were 1,957 of these casualties on all Class I railroads in the United States; in 1939, only 399 such casualties. In the five-year period 1935-1939, there were more than 37,000 casualties of all kinds to all classes of employees on duty in train and train-service accidents on Class I railroads; the unimportance of the so-called slack-action group of casualties is shown by the fact that there were but 2,473 such casualties during the same five-year period. There were only three fatal slack-action casualties in 1939; but the total of employee fatalities in all train and train-service accidents in that year was 353.

There has also been a consistent improvement in the rate of casualties to passengers on trains of Class I railroads; the improvement, on a passenger-mile basis, having been 17.66%, comparing the later five-year period 1935-1939 with the earlier six-year period 1923-1928.

The same downward trend is shown in the frequency of train accidents, i.e., that class of accidents, with or without casualties, which involve property damage in excess of $150.00. The nation-wide improvement in the accident rate of this class was 62%, comparing the later five-year period 1935-1939 with the earlier six-year period 1923-1928. Train accidents caused by defects in or failures of equipment have declined, over the 17 years 1923-1939, by 82.75%. Casualties in these classes of accidents are very infrequent, and have generally tended to decrease over the 17-year period referred to, the improvement in such frequency having been 74%.

A considerable part of the improvement in casualty rates on American railroads during the period in question is clearly shown to be directly attributable to the adoption and growth of the standard long-train method of operation, because a substantially less number of train units was operated than otherwise would have been required, and thus the opportunity for accidents and casualties was reduced.

Serious accidents are investigated by the Interstate Commerce Commission through its Bureau of Safety, which makes detailed reports. During the 12-year period 1928-1939, 1,002 serious accidents were investigated; 561 of these involved freight trains. 728 trains were involved,

of which 574 were of 70 cars or less, and 344 of 40 cars or less. Negligence of employees was assigned as the cause of 62.2% of the freight-train accidents. Defects in equipment were assigned as the cause in only 14.1% of such accidents. In none of the seriours accidents investigated was there any finding that train length had any bearing upon the accident, or that it might have been avoided if the train had been shorter. No recommendations were made by the Commission as to train length, although many other recommendations were made.

In the six year period, 1934-1939, out of 620 accidents investigated, 232 involved passenger trains; 267 passenger trains in all were involved. 261, or 97.8%, of these trains were of 14 cars or less, and 224, of 11 cars or less.

48.3% of these passenger-train accidents were caused by negligence of employees, according to the bureau's findings. Defects in equipment were charged with only 7 of these accidents, or 3% of the total. Collisions with vehicles at grade crossings were charged with 18% of these accidents; all but one of the trains involved in these grade-crossing collisions were short trains.

On appellant's Pacific Lines, the number and frequency of casualties to employees on duty, sustained in train and train-service accidents, has shown a general and substantially declining tendency. Over the 17-year period 1923-1939, the casualty rate for all classes of employees on duty has shown an improvement, comparing the five years 1935-1939, with the six years 1923-1928, of 26.86%.

The frequency of casualties to trainmen on duty on appellant's lines has likewise substantially declined since

1923. On the car-mile basis, comparing the earlier six-year period just mentioned with the recent five-year period 1935-1939, the improvement in the casualty rate was 38.16%.

The record contains exhaustive summaries of accidents occurring on appellant's lines in Arizona and Nevada, and comparisons of casualty frequency rates, as between the two states, together with exhibits and oral testimony relating to such accidents and casualties in detail. The lines in Arizona and Nevada are substantially similar, from practicaliy every standpoint; so that these comparisons afford a fair and reliable basis of contrasting operations as a whole, on the restricted basis permitted by the Arizona law, with operations conducted free of such restrictions, and show that the enforcement of the Arizona law has not been accompanied by any measurable decrease of casualties, including slack-action casualties, but has been accompanied by a greater proportion of casualties of all classes and from all causes. Since 1929, long-train operation in Nevada has greatly predominated; but prior to 1926, the operation of short trains predominated.

Comparing Arizona and Nevada, the rates of frequency of casualties to *all* classes of appellant's *employees, in all classes of service*, have generally been substantially higher in Arizona than in Nevada, and this is particularly true during the years since and including 1929. Generally speaking, the casualty rate in Arizona has been approximately twice as high, for these classes of casualties, as in Nevada. During the six years 1935-1940, there were more than three times as many injuries to employees in Arizona (266) as in Nevada (86), although in that period the

locomotive-miles in Nevada were 21,757,000, as compared with approximately 31,000,000 in Arizona.

Limiting the comparison to casualties to *all* classes of *employees on duty, in road freight-train operation*, the showing is more favorable in Nevada in every year, whether absolute number of casualties or casualty frequency rates be considered. This is particularly true of the years since 1929, when long-train operation has predominated in Nevada. Comparing frequency rates, the Arizona rates are much higher than those in Nevada, whether the train-mile or the car-mile basis is employed, the yearly frequency in Arizona being from one and one-half to two and one-half times as great as in Nevada. For the six years 1935-1940, the car-mile frequency in Arizona (16.54 per 100 million car-miles) was 2.5 times the Nevada rate (6.52). While there has been a downward trend in casualty rates in both states, the improvement in casualty rates in Nevada (61.5% on the train-mile basis, 71.1% on the car-mile basis) has been much greater than in Arizona (49.2% and 52.3%, respectively).

Confining comparisons to accidents to *road freight conductors, brakemen and flagmen on duty*, the same results are shown. Casualties have been larger in absolute number and much more frequent in their occurrence in Arizona than in Nevada, although the volume of the appellant's freight traffic handled in Nevada was about 5% greater than in Arizona. During the years of predominant long-train operation in Nevada (since and including 1929), the comparison favors Nevada still more strongly, the frequency rates of those casualties in Arizona (17.17 per 100 million c.m., 1929-34; 13.53 per 100 million c.m., 1935-40)

having been more than twice the corresponding Nevada rates (8.56, 1929-34; 6.05, 1935-40).

Considering only those accidents to trainmen *due to sudden start, stop, lurch or jerk of train or car*—the so-called "slack-action" casualties—it clearly appears that the enforcement of the 70-car limit in Arizona has not had the effect of preventing or minimizing such accidents and the incident casualties, either when the Arizona operations alone are considered, or when they are compared with the Nevada operations of the appellant. Considering absolute numbers of such casualties, there were 101 on short trains in Arizona during the 18 years 1923-1940 as compared to 94 on long trains in Nevada. Combining the two states, there were 125 such short-train casualties in both states, and 96 such long-train casualties in both states. During the 12 years 1929-1940, there were 61 such casualties on all trains in Nevada, and 62 in Arizona. As stated, the Nevada traffic was 5% greater than in Arizona.

This type of casualty is of comparatively infrequent occurrence. There were periods of several months in each state when no such casualties occurred. During the six years 1935-1940, the frequency rates were: Nevada, 3.14, and Arizona, 2.90 per 100 million car-miles, a difference of .24 casualty, or about one for each 416,666,667 c.m.: about one casualty for each 3¼ years of operation. The improvement in the frequency rate of these casualties in Nevada, which has accompanied the increase in actual and average train lengths in that state, has been much greater than in Arizona. On the car-mile basis, the improvement, comparing the six years 1935-1940 with the six years 1923-1928, has been 57.5%; in Arizona 47.7%

It clearly appears that the so-called "slack-action" accident is a minor factor in determining the reasonableness of the Train Limit Law.

Considering casualties in absolute number, and particularly from the standpoint of the additional hazard to road freight conductors, brakemen and flagmen caused by operating more train units than necessary, over the 18 years 1923-1940 there were 268 casualties to such employees in Nevada, and 449 in Arizona.

The law does not tend to minimize derailments caused by defects in or failure of equipment, as is shown by comparing Arizona and Nevada during the period 1923-1940. During that period there were 70 derailments of this class on appellant's lines in Nevada, and 106 in Arizona; and of the 70 Nevada derailments, 35 occurred on short trains; so that there were 141 out of a total of 176 derailments in both states on short trains, but only 35 on long trains. The rate of frequency of such derailments was also substantially greater in Arizona than in Nevada, throughout the 18-year period; on the car-mile basis, the rates were, respectively, 2.93 per hundred million car-miles for Nevada, and 4.64 per hundred million car-miles for Arizona.

Comparing the Nevada accidents and casualties by periods, and contrasting the earlier period when short-train operation predominated in that state, with the later period when long-train operation predominated, accidents and casualties in that state were greatly reduced in the latter period. In the three years 1923-1925, which were short-train years, there were 114 casualties to road freight-train employees on duty; in the three years

1937-1939, there were but 33 such casualties; although the volume of traffic during those three years was approximately 25% greater than in the earlier three-year period. Comparing frequency rates, on the locomotive-mile and train-mile basis, casualties during the earlier short-train period were 2.88 times as frequent as in the later long-train period; on the car-mile basis, they were more than four times as frequent.

Substantial improvements in appellant's roadbed, bridges, and equipment have been made in both Nevada and Arizona; the only fundamental difference between the two states being that created by the restrictions of the law. Therefore, while the improvements in casualty frequencies in both states are to some extent due to such improvements, the greater reduction in casualty frequencies in Nevada is largely, if not wholly, due to the absence of the train-length restriction and the consequent opportunity for long-train operation. It clearly appears that the standard long-train operation in Nevada, on appellant's lines, is much safer when all classes of employees subject to hazards in road freight-train operation are considered, than the restricted operation in Arizona.

The casualty showing for appellant's Los Angeles Division indicates that the proportion of the accidents and casualties occurring upon or in connection with the operation of long freight trains is slightly less in relation to all casualties occurring in freight-train operation, than the proportion of such long trains to the total of all trains run; and it particularly appears that there is no special or unusual hazard, produced by or associated with the operation of long freight trains on that division, that does

not also appertain to short-train operation, and that the elimination of long trains would not in any degree reduce or eliminate such hazards.

The evidence of casualties in appellant's freight-train operations in New Mexico, introduced by both appellant and appellee, shows that such casualties have been substantially less in both number and frequency than in Arizona, although somewhat more frequent than in Nevada. Average train lengths in New Mexico are somewhat greater than in Arizona, though not as great as in Nevada; and the percentage of long trains operated in New Mexico is much less than in Nevada. Considering the 11-year period 1930-1940, there were, in New Mexico, 129 casualties to *all employees associated with freight-train operation*, 98 of which were on short trains. During the five years 1936-1940, there were 61 such casualties, of which 49 were on short trains. During the same 11-year period (1930-1940) there were, in Arizona, 251 casualties to *all employees in freight-train operation*, and the casualty rates were substantially higher than in New Mexico. During the same 11-year period there were, in New Mexico, 92 casualties to *road freight conductors and brakemen on duty*, 67 of which were on short trains, whereas in Arizona there were 293 such casualties. The casualty rates for such casualties in Arizona were likewise substantially higher than in New Mexico. Considering only the so-called "slack-action" casualties, there were, during said 11-year period, only 29 such casualties in New Mexico; whereas there were 56 in Arizona; and the frequency of such casualties was again substantially higher in Arizona than in New Mexico.

Considering only train accidents in New Mexico and Arizona, the number and frequency rate of such accidents were much greater in Arizona over the 11 years 1930-1940, there having been 120 such accidents, 98 of which were on short trains, in New Mexico, and 232 such accidents, all on short trains, in Arizona.

So far as concerns passenger-train accidents in New Mexico, the evidence shows that train length has had nothing to do with any accident or casualty occurring on appellant's lines in that state during the 11-year period 1930-1940.

The Atchison, Topeka & Santa Fe Railway Company, which operates in California, Arizona and New Mexico, as well as in numerous other states, observes the Arizona law in its operations between Needles, California, and Gallup, New Mexico, a distance of 419.7 miles, but is free of such restriction, except for the extra-territorial effect of the law, in its operations in New Mexico east of Gallup. Casualty comparisons, covering accidents to road freight trainmen and enginemen on duty, and occurring while on or getting on or off road freight trains, show that in the short-train district between Needles and Gallup, the number and frequency of such casualties has been substantially greater over the 17 years 1923-1939 than in the 384-mile district between Gallup and Clovis, New Mexico. The nature and character of the traffic in the two districts compared is greatly similar, the only dissimilarity being in the length of trains. Thus, during the 17-year period, there were 119 casualties of the classes specified in the Clovis-Gallup long-train territory, but 219

in the short-train territory between Gallup and Needles; the frequency rate of such casualties on the car-mile basis was 8.75 per hundred million car-miles in the Clovis-Gallup territory, and 14.44 in the Gallup-Needles territory.

Statistics of operations on the Chesapeake and Ohio Railway, which is a Class I railroad, operating in Virginia, West Virginia, Kentucky, Ohio, Indiana, and Illinois, and which operates a very large percentage of its main-line freight trains in lengths of 70 cars or more, show pronounced reductions in the number and frequency of casualties to employees, and particularly to trainmen and enginemen in road freight-train operation. Operating conditions on the lines of this railroad are not substantially dissimilar to those in Arizona; some of the grades being more severe than on any of appellant's main lines in said state. Long-train operation greatly predominates on its main lines, it appearing that during a typical period in 1939, more than 88% of its main-line trains were long trains, and that 53.8% consisted of more than 140 cars. 150-car trains are commonly operated by this carrier. The improvement in its casualty rates, comparing the three years 1936-1938, with the four years 1924-1927, has been 62.21% for all employees, and 67.27% for trainmen and enginemen. There has been a corresponding improvement in the frequency of derailments due to defects in or failures of equipment.

There has been a continuous and marked decrease in the frequency and total number of reportable casualties in train and train-service accidents on appellant's lines in Nevada, during the 18-year period 1923-1940, but a substantially less decrease in such number and frequency

over the same period in Arizona. As before stated, train lengths have substantially increased over said 18-year period in Nevada, but have remained practically constant in Arizona. The improvement in the casualty rate per hundred million car-miles in Nevada, comparing the six years 1935-1940 with the six years 1923-1928, has been 71.1%; in Arizona, 52.3%.

Many casualties to employees occur while trains are standing; such casualties are closely related to and increase with an increase in the number of trains operated, but have no relation to the length of the train. During the 18 years 1923-1940 there were 546 reportable casualties in Arizona sustained by all classes of appellant's employees (as compared with 308 in Nevada) on duty in road freight-train operation. 177 of these Arizona casualties, or 32.4%, occurred while trains were standing, and all were on short trains. 73 of the 308 Nevada casualties, or 23.7%, occurred while the trains were standing, and 53 of the 73 were on short trains. There were likewise many casualties in connection with passenger-train operation, sustained while such trains were standing, in the 17-year period 1923-1939. There were, in Arizona, 77 such casualties, out of a total of 239 casualties of all classes, sustained in passenger-train accidents by all persons other than trespassers. In Nevada, during the same period, there were 18 such casualties out of a total of 109 similar casualties of all classes in passenger-train accidents.

There has been a substantial improvement in the frequency of passenger casualties on Class I railroads of the United States during the 17 years 1923-1939, the frequency rates of such casualties being, however, extremely small. In the period 1923-1928, the frequency of such casualties

per million passengers carried was 5.16. In the five years 1935-1939, such frequency was 5.0. On the passenger-mile basis, the improvement in the casualty rate, comparing these two periods, was 17.66%.

Comparing passenger casualties on appellant's lines in Nevada and Arizona, the operation in Nevada having been unrestricted, while in Arizona the 14-car limit has been observed through the years up to and including 1939, a satisfactory basis of comparison is afforded to determine the effectiveness of the Arizona limitation as a regulation in the purported interest of safety of passenger-train operation. The casualty rates and the total of casualties were substantially less in Nevada than in Arizona, during the 17-year period 1923-1939. There were 239 casualties to persons while on or getting on or off passenger trains in Arizona during that 17-year period, but only 109 in Nevada. The casualty rates in Arizona were approximately twice as great as in Nevada. The Nevada totals and rates are greatly inflated, by reason of 53 casualties resulting from the derailment at Harney, Nevada, on August 12, 1939, involving a 14-car train, which derailment was solely due to malicious tampering with the track, the appellant having had no responsibility for the accident or any means of avoiding it.

The Arizona 14-car limitation upon passenger trains bears no relation whatever to the safety of travelers or employees or others lawfully upon appellant's passenger trains in Arizona.

Casualties in grade-crossing accidents, considering the United States as a whole, bear a practically constant

relationship to the volume of train-service operated over such grade crossings, measured in train-miles. Over the 17 years 1923-1939, there were on the average 6.45 grade-crossing casualties, in accidents involving automobiles, per million train-miles operated; and in each year during that period the rate was very close to such average. Assuming the vehicular traffic over a grade-crossing to be constant, the hazard of grade-crossing accidents involving trains increases directly with the increased number of trains using the crossing. This hazard is therefore increased substantially if additional and unnecessary trains are operated over the crossing. Collisions occurring at such crossings are a source of casualties, not only to the occupants of vehicles, but also to the train crews and other persons on the trains or engines involved. The Train Limit Law, by requiring a greater number of trains to be run than otherwise necessary, increases the hazard of grade-crossing accidents in Arizona and the adjacent affected territory.

Considering freight-train derailments in Arizona, Nevada and New Mexico, the Train Limit Law not only does not bring about any reduction in the number and frequency of such accidents, but, by comparison with the results of operation in Nevada and New Mexico, results in an increased hazard over that resulting from the standard long-train method of operation.

There is no particular hazard of injury on long freight trains because of the emergency application of the air brakes by engineers. No reportable accident assigned to this cause has taken place in Nevada since 1936. In Arizona, during the 18-year period 1923-1940, there were nine

casualties assigned to emergency applications of brakes by the engineer, all of them on short trains. The application of the air brakes in emergency by an engineer on a freight train is a comparatively rare occurrence.

Casualties on freight trains due to undesired emergency applications of the air brakes, principally caused by light graduating springs in the triple-valve mechanism on the cars, have been practically eliminated, because of the compulsory use of heavier graduating springs, which largely prevent such undesired emergencies. Accidents on either long or short trains, due to undesired emergencies arising from this cause, are no longer a factor of material consequence.

During the period March 2 to April 30, 1940, when appellant operated 302 long freight trains and 62 long passenger trains in Arizona, there were seven accidents on passenger trains, all on trains operated in conformity with the law. There were no accidents or casualties on any of the 62 long passenger trains. There were seven accidents on or in connection with all of appellant's freight trains in Arizona, both long and short, in April, 1940. Four casualties were involved. All but one of these accidents involved short trains. The one accident involving a long train occurred while the train was standing.

Appellant's long-train operations in Arizona during March and April, 1940, were conducted without incurring any accident or casualty which could, or would, have been prevented or minimized if the law had been observed. None of the accidents during that period took place in circumstances where the length of the train had any bearing.

In 1939, there were some 2,693 employees on appellant's Tucson Division, whose safety while on duty is or might be affected in various aspects by the law. The law directly affects the opportunity for employment of train and engine-service employees on main-line freight and passenger trains only, because it compels a greater number of trains to be operated and thus increases the number of men required in such train service. Only 644, or 23.9%, of the 2,693 Tucson Division employees are train and engine-service employees in main and branch-line service.

In so far as concerns safety, all train-service employees, and all others whose duties require them to go or be upon the tracks, are affected by the law, because the increase in number of trains run increases the hazard of accidents to such employees. These hazards include: (a) the danger of being struck and run down while on the tracks; (b) head and rear-end collisions; (c) locomotive accidents; (d) grade-crossing accidents; (e) slipping or falling while getting on or off trains. There are some 1,652 employees, or about 61% of all those on the Tucson Division, whose safety is thus impaired by the law.

Appellee's contention respecting the safety features of the law refers principally, if not solely, to potential slack-action injuries to train-service employees (not including enginemen) upon main-line freight trains. There were only 331 such employees, out of the total of 2,693, on the Tucson Division. This total is to be contrasted with the 1,652 employees whose safety of employment is impaired by the law.

The frequency of train and train-service accidents is directly related to the number of train units operated;

when more trains are run than necessary to handle a given amount of traffic, the hazard in the handling of such traffic is correspondingly increased. The law required in 1938 about 31% more freight trains than actually were necessary on the Yuma-Gila-Lordsburg line alone, and compelled about 16,500 additional unnecessary meets and passes. It thus greatly increased the number of train orders, and the hazards due to misinterpretation or forgetfulness of such orders. It increased the number of employees required to move the same amount of traffic, and thus increased the hazards due to failure to observe rules or signals, and all the other classes of hazards related to the increased numbers of locomotives and train units operated, and tended to increase the hazard of accidents in yards, due to extra switching, and the hazards to maintenance employees who are required to be on tracks; and particularly the hazards of grade-crossing accidents and collisions.

Even if short-train operation might possibly result in any decrease in the number or severity of so-called "slack-action" casualties, that decrease is substantially more than offset by the increased number of accidents and casualties from other causes which follows the arbitrary limitation of trains and the consequent increase in the number required to handle the same volume of traffic. The law therefore not only bears no reasonable relation to safety, but on the contrary impairs and lessens substantially the safety of appellant's operations in Arizona and the adjacent affected territory.

(Finding of Fact No. XII, R. 3974-4022.)

10. Analysis of Certain Contentions Advanced by Appellee.

There is no evidence to support appellee's contention that trains would be delayed in long-train operation because of inadequate siding capacities at meeting and passing points. While siding capacities in the affected territory are not at present adequate in all cases to contain long trains, long-train operation in one direction or the other, but not in both directions at the same time, is perfectly feasible; moreover, if the restriction is removed, the sidings will be at once extended.

There is likewise no substance to appellee's contention that trains must be limited to 70 cars in order that members of the crew may see and interpret signals more readily. When a train is in motion, the only manual signal required is a stop signal; if such signal is given from the caboose and not seen by the engineer, the train may be stopped by the application of the conductor's emergency valve in the caboose. There can be no severe slack-action shock in the caboose in such cases. There is no evidence of any reportable casualty on appellant's lines from the use of the conductor's valve. When the train is at a standstill, if signals from the rear are not seen, no accident can result through such failure; the signal can either be repeated, or a member of the crew can go forward to pass the signal to the engineer.

No reportable *train-service* accident has occurred on appellant's lines in Arizona or Nevada over the last 18 years due to failure to observe or properly interpret signals. One reportable *train* accident assigned to that cause occurred in those two states, during said period; but it

did not involve any casualties, and related only to the movement of a helper engine with two cars and a caboose.

There is no substance to the contention that members of the crew in the cabooses of long trains are made less alert or efficient in performing their duties, because of claimed constant fear of injury. No evidence was offered to show that alertness or efficiency were thus impaired; in fact, the witnesses who testified respecting their alleged fear in cabooses of long trains have the right, by seniority choice, to work as conductors in the short-train territory between Yuma and Lordsburg; but for many years, *by choice*, they have worked in the long-train territory between Lordsburg and El Paso.

There is likewise no foundation for appellee's contention that long trains cannot be properly inspected and supervised while in operation, but that short trains can be, and that long-train operation is therefore more hazardous. Observation and inspection of trains in operation for the purpose of detecting defects or failures in the rolling equipment, can be and are as efficiently performed on long trains as on short trains. Reportable derailments due to defects in or failures of freight-car equipment are substantially less frequent in Nevada, in long-train operation, than in Arizona.

The purpose of inspection and observation of trains while en route is to detect such failures and take necessary action before an accident results. No witness who was called made or supported any claim that any accident had occurred upon a long train, as to which it was asserted or made to appear that the accident could

have been avoided, or its effects lessened, if the train had been short. No accident was referred to by any of appellee's witnesses, due to a defect in or failure of a car on a long train, as to which it was claimed that the accident could have been prevented, or its effects lessened through inspection or observation, if the train had been within the restriction of the law.

There is no basis for appellee's contention that the present type of air-brake equipment is inadequate to control the speed of and to stop long trains, but is more efficient and adequate upon short trains. The witnesses called by appellee included conductors and engineers working in both long-train and short-train territory; one of these engineers, who had handled many long trains, admitted that their control simply required more care. Another who handled certain long trains in Arizona during April, 1940, said that he had used greater care in their handling, but admitted that he had no difficulty. None of the conductors referred to any instance when the engineer was unable to control the speed of or to stop his train. A Santa Fe engineer, called by appellee, failed to refer to any instance within his knowledge when an engineer had been unable to control or stop a long freight train with the present type of air brakes. This engineer, though having sufficient seniority to work regularly in short-train territory in Arizona, has exercised his seniority to obtain and hold a preferred position in freight service in long-train territory in California.

Appellant's engineer witnesses, men of long experience, testified that the handling of long trains by engineers,

and particularly the control and stopping thereof, though requiring somewhat more care, involved no greater difficulties than in the case of short trains.

The 302 long trains operated by appellant in Arizona during April, 1940, were controlled and stopped, so far as the record shows, without difficulty. As to many of these trains, it affirmatively appears that the handling was without difficulty or incident.

(Finding of Fact No. XIII, R. 4022-4032.)

11. Extent of Penalties Imposed by the Law.

If appellant had operated its trains in 1938 without regard to the law, it would have run about 7,800 long freight trains, and about 360 long passenger trains in Arizona. Its liability for cumulative penalties would thus have ranged from about $816,000, to approximately $8,160,000.

(Finding of Fact No. XIV, R. 4032.)

12. The Permissible Number of Cars in an Inferstate Train Is a Subject of National and Not Local Concern.

The permissible number of cars in an interstate train is a subject of national and not local concern, and one which requires a general system or uniformity of regulation, if any be needed. It is a subject which therefore must, and should be, regulated by Congress, and not by the several states. It is wholly impracticable to construct and maintain railroad terminals exactly on state lines, or to split up or consolidate through trains except at terminals. Varying regulations of train lengths by the several

states, all of which would have extra-territorial effects similar to those of the Arizona law, would, if conflicting, result in serious interference, delay, and embarrassment to through interstate operations. Compliance with such varying standards of train length would likewise make useless the tremendous investment which has made long-train operation possible, and would cause the railroads to lose the efficiency and economies which have resulted therefrom.

(Finding of Fact No. XV, R. 4032-4033.)

IV.

SPECIFICATION OF ERRORS

1. The Supreme Court of Arizona erred in failing to hold that the Arizona Train Limit Law is invalid and unconstitutional, in violation of the Commerce Clause (Article I, Section 8, paragraph 3) of the Constitution of the United States, because said law undertakes to and does regulate a subject matter over which exclusive legislative jurisdiction is vested in Congress by said Commerce Clause, in that the length and consist of interstate railroad trains is a subject matter requiring a general or national system and uniformity of regulation, if such regulation should for any reason be required.

2. Said state court erred further in failing to hold said Train Limit Law invalid and unconstitutional, in violation of said Commerce Clause, because its necessary and inevitable effect is to regulate and control the lengths of the interstate trains operated over appellant's lines, not only

within Arizona, but also extra-territorially; that is to say, outside of Arizona, and in adjoining portions of California and New Mexico, and also in Texas.

3. Said state court erred further in failing to hold said Train Limit Law invalid and unconstitutional, in violation of said Commerce Clause, because its necessary and practical effect is directly, substantially and unreasonably to interfere with, delay, regulate and obstruct the operation of appellant's interstate trains, both within and without Arizona, and to impair the use and usefulness of appellant's facilities employed in interstate commerce.

4. Said state court erred further in failing to hold said law invalid and unconstitutional, in violation of said Commerce Clause, because its necessary and inevitable effect is to impose direct, substantial and unreasonable burdens upon interstate commerce as carried on by appellant, both within and without Arizona, and thus further to impair the use and usefulness of appellant's facilities employed in interstate commerce.

5. Said state court erred further in failing to hold and conclude that said Train Limit Law, to the extent that it has or may have, or is intended or claimed to have, the effect of limiting the number of cars in an interstate train to the maximum number which can be safely controlled or stopped in one train by the use of the types of air brakes now employed thereon, or any other type of train control or other safety device, is void and unenforceable against appellant, because it attempts to and does enter a legislative field already entered, and therefore occupied by Congress, and thereby conflicts with and infringes upon

existing legislation enacted by Congress, to wit, the Safety Appliance Act, as amended, and the Safety Section (Section 25) of Part I of the Interstate Commerce Act.

6. Said state court erred further in failing to hold said Train Limit Law unconstitutional and void, in violation of both the aforesaid Commerce Clause, and also the due-process clause of the Fourteenth Amendment to the Constitution of the United States, because said Train Limit Law operates arbitrarily and unreasonably to deprive appellant of its property without due process of law; in that said law (a) fixes maximum lengths of trains very much lower than those which obtain generally elsewhere throughout the United States under operating conditions substantially similar to those upon appellant's lines in Arizona; (b) makes no allowance for grade or other operating conditions, or for the construction, type, weight, or lengths of the cars composing the trains, or whether such cars are loaded or empty, or if loaded the weights of the loads; (c) imposes a great, substantial, and wholly unreasonable burden of expense upon, interference with, and delay to interstate commerce, and impairs the use and usefulness of appellant's transportation facilities; and (d) bears no reasonable relation to health or safety, and does not and will not either eliminate or to any substantial extent reduce any existing hazard, but on the contrary does and will create new and increase existing hazards and dangers of railroad operation.

7. Said state court erred further in holding and concluding that said Train Limit Law is valid and constitutional, and that the "findings and judgment of the trial

court to the effect that the Train Limit Law is unconstitutional were in error."

8. To the extent that the opinion and decision of said state court are or may be intended or construed to be a disapproval or reversal of the findings of fact of the trial court in this cause, or any part or portion of said findings of fact, said state court erred further in said opinion and decision, because the same, if and to the extent that they are or may be so construed or intended, operate to deny to appellant federal rights guaranteed by the Constitution and laws of the United States, to which it is shown by the evidence in this cause to be entitled.

V.

SUMMARY OF ARGUMENT

Introductory.

While the instant case is of first impression in this Court, there have been four prior cases in the Federal district courts involving state train-limit laws: *A. T. & S. F. Ry. Co. et al. v. LaPrade* (1933), 2 F.Supp. 855; *Southern Pacific Co. v. Mashburn* (1937), 18 F.Supp. 393; *Texas & New Orleans R. Co. v. Martin* (1936), U.S.D.C., E.D.La., No. 428 Equity (not officially reported); *M. K. & T. R. Co. v. Williamson* (1941), 36 F.Supp. 607.

In the *LaPrade case* the court declared invalid the same statute involved in the present case; but its conclusions were given no effect because this Court, in *Ex Parte LaPrade* (1933), 289 U.S. 444, held that the suit had abated by reason of the substitution as defendant of the incoming

attorney general. In the *Mashburn* and *Martin Cases* the Nevada and Louisiana laws were respectively held invalid; in the *Williamson Case*, the Oklahoma law was sustained by a divided court.

Compare, also, *Southern Pacific Co. v. Railroad Commission* (1935), 10 F.Supp. 918, in which a state regulation requiring cabooses to be placed midway in interstate trains on a particular district was held invalid; and *Ex Parte No. 156* (1943), 256 I.C.C. 523, in which the Interstate Commerce Commission declared that it had power, under the Car Service Clauses (pars. 10-17, of Section 1) of the Interstate Commerce Act, to suspend the state train-limit laws during the present war emergency.

1. The Train Limit Law Invades an Exclusive National Field of Regulation.

The principal objects of the Commerce Clause were and are to insure the national interest, as against conflicting and discriminatory state laws regulating interstate commerce, by providing for regulation of that commerce by a single authority as to all matters requiring a national and uniform system of regulation, and thereby guarding against obstructions to the free flow of such commerce. *Brown v. Maryland* (1827), 12 Wheat. 419; *Cooley v. Port Wardens* (1851), 12 How. 299; *Welton v. Missouri* (1875), 91 U.S. 275; *Mobile Co. v. Kimball* (1880), 102 U.S. 691; *Cook v. Marshall Co.* (1904), 196 U.S. 261; *Minnesota Rate Cases* (1912), 230 U.S. 352; *Port Richmond, etc. Ferry Co. v. Hudson Co.* (1914), 234 U.S. 317; *Parker v. Brown* (1943), 317 U.S. 341; *Union Brokerage Co. v. Jensen* (1944), 322 U.S. 202. Compare, also: *Wilmington Transp.*

Co. v. Railroad Commission (1915), 236 U.S. 151; *Oregon-Washington R. & N. Co. v. Washington* (1926), 270 U.S. 87; *Milk Control Board v. Eisenberg Farm Products* (1939), 306 U.S. 346; *United States v. South-Eastern Underwriters' Assn. et al.* (1944), 322 U.S. ....., 88 L.Ed. Adv. 1082.

The Congressional power to regulate commerce is exclusive whenever the subject matter is national in character, or admits of only one system or plan of regulation. *Robbins v. Shelby Co., etc.* (1887), 120 U.S. 489; *Atlantic & Pacific Telegraph Co. v. Philadelphia* (1903), 190 U.S. 160; *Kelly v. Washington* (1937), 302 U.S. 1. Inaction or silence by Congress is equivalent to a declaration that no regulation of the subject is necessary. *Hall v. DeCuir* (1877), 95 U.S. 485; *Welton v. Missouri* (1875), 91 U.S. 275; *Morrill v. Wisconsin* (1894), 156 U.S. 626; *Gloucester Ferry Co. v. Pennsylvania* (1885), 114 U.S. 196; *Covington & C. Bridge Co. v. Kentucky* (1894), 154 U.S. 204; *Leisy v. Hardin* (1890), 135 U.S. 100; *In re Rahrer* (1891), 140 U.S. 545; *Brennan v. Titusville* (1894), 153 U.S. 289; *Buck v. Kuykendall* (1925), 267 U.S. 307; *Bush v. Malloy* (1925), 267 U.S. 317.

While there is a permissible, so-called "joint" or "concurrent", field of regulation of interstate commerce, in which states may act through the exercise of their police power in the absence of action by Congress touching the same subject matter, the determination whether a particular regulation falls within that field, or on the other hand invades the exclusive national field, depends upon the nature of the subject matter regulated, and the effect of

the regulation upon interstate commerce; and does not depend on the claimed or stated purposes of the regulation or its relation to that purpose. *Minnesota Rate Cases* (1912), 230 U.S. 352; *South Covington Ry. Co. v. Covington* (1915), 235 U.S. 537; *Seaboard Airline R. Co. v. Blackwell* (1917), 244 U.S. 310; *Kansas City Southern Ry. Co. v. Kaw Valley Drainage Dist.* (1914), 233 U.S. 75; *Davis v. Farmers Coop. Co.* (1923), 262 U.S. 312; *Shafer v. Farmers' Grain Co.* (1925), 268 U.S. 189; *Parker v. Brown* (1942), 317 U.S. 341; *Union Brokerage Co. v. Jensen* (1944), 322 U.S. 202. A state cannot avoid the operation of the rule arising from the Commerce Clause, which forbids the regulation of matters of exclusive national concern, by the simple expedient of invoking "the convenient apologetics of the police power." *Kansas City Southern Ry. Co. v. Kaw Valley Drainage Dist.* (1914), 233 U.S. 75.

The undisputed facts of the instant case demonstrate that the subject matter of the length and consist of interstate freight and passenger trains moving from one state to another, or from one state across an intervening state to a third, is a matter of exclusive national concern. Intolerable obstructions to and interferences with interstate commerce would follow if each state could and should impose varying and inconsistent limitations. Such regulations, because of their inevitable extra-territorial effects, would create constant difficulty and embarrassment. Compare *Hall v. DeCuir* (1877), 95 U.S. 485; *South Covington Ry. Co. v. Covington* (1915), 235 U.S. 537; *Kelly v. Washington* (1937), 302 U.S. 1; and see also the *LaPrade, Mashburn,* and *California Midtrain Caboose Cases, supra.*

Service Order No. 85 of the Interstate Commerce Commission, suspending state train-limit laws during the present war emergency, constitutes a clear recognition of the exclusive national character of the subject matter.

The decisions in *A. C. L. R. Co. v. Georgia* (1914), 234 U.S. 280; *New York, etc. R. Co. v. New York* (1897), 165 U.S. 628; and *Smith v. Alabama* (1888), 124 U.S. 465, do not support any view that a state police-power regulation is valid if it directly and substantially interferes with and obstructs interstate commerce, or regulates a subject matter of such nature as to require a national and uniform system of regulation. These cases simply present examples of regulations in the concurrent field, having incidental and indirect effects upon commerce, which thus were valid in the absence of action by Congress. Compare: *I. C. R. Co. v. Illinois* (1896), 163 U.S. 142; *Minnesota Rate Cases* (1912), 230 U.S. 352; *M. K. & T. Ry. Co. v. Texas* (1918), 245 U.S. 484; *Southern Ry. Co. v. Indiana* (1915), 236 U.S. 439.

The *Arkansas Full Crew Cases* (*C. R. I. & P. Ry. Co. v. Arkansas* (1911), 219 U.S. 453; *St. Louis I. M. & S. Ry. Co. v. Arkansas* (1916), 240 U.S. 518; *Missouri-Pacific R. Co. v. Norwood* (1931), 283 U.S. 249), which involved the validity of the Arkansas Full-Crew Law, likewise have no bearing upon the national-field point. The *Barnwell Case* (*South Carolina Highway Dept. v. Barnwell Bros.* (1938), 303 U.S. 177), and other recent motor carrier decisions (*Morris v. Duby* (1927), 274 U.S. 135; *Sproles v. Binford* (1932), 286 U.S. 374; *Maurer v. Hamilton* (1940), 309 U.S. 598) are clearly distinguishable from the case at bar. In

the *Barnwell* and *Maurer* opinions this Court pointed out the difference in both principle and practice between state regulations covering the use of state highways, and the regulation of railroads (303 U.S., at pp. 186, 187; 309 U.S., at pp. 604, 605).

2. The Train Limit Law Regulates Interstate Commerce With Extra-Territorial Effect.

The extra-territorial effects of the law are inevitable and unchallenged. Compliance with its terms requires trains to be made up and broken up at points outside of Arizona, causes delays to trains and cars outside the state, and compels short-train operation for substantial distances in neighboring states. Additional train service outside the state, otherwise unnecessary, thus also results from the law.

A state police-power statute which unavoidably regulates the conduct of interstate commerce in other states is clearly invalid: *Hall v. DeCuir* (1877), 95 U.S. 485; *South Covington Ry. Co. v. Covington* (1915), 235 U.S. 537; *Bowman v. C. & N. W. Ry. Co.* (1888), 125 U.S. 465; and compare: *Pennoyer v. Neff* (1877), 95 U.S. 714; *Olmsted v. Olmsted* (1910), 216 U.S. 386; *Baldwin v. Seelig* (1935), 294 U.S. 511; *Connecticut, etc. Ins. Co. v. Johnson* (1938), 303 U.S. 77; *Magnolia Petroleum Co. v. Hunt* (1943), 320 U.S. 430; *McLeod v. Dilworth Co.* (1944), 322 U.S. 327.

The proper limitation of the state's police power to its own territorial jurisdiction has often been emphasized: *Minnesota Rate Cases* (1912), 230 U.S. 352; *Milk Control Board v. Eisenberg Farm Products* (1939), 306 U.S. 346; compare: *Sproles v. Binford* (1932), 286 U.S. 374, 390;

South Carolina Highway Dept. v. Barnwell Bros. (1938), 303 U.S. 177, 185. The recent decision in *Terminal R.R. Assn. v. Brotherhood* (1943), 318 U.S. 1, does not militate against our contention. The extra-territorial effects of the regulation there sustained were apparently inconsequential; i.e., at most merely "incidental and indirect". Here the extra-territorial burdens and obstructions imposed by the challenged law are inevitable, substantial, and direct.

3. The Train Limit Law Directly, Materially, and Substantially Interferes With, Burdens and Obstructs Interstate Commerce.

A state police-power regulation, even though assertedly addressed to a subject within the concurrent field, is invalid if it directly, materially, and substantially regulates, interferes with, burdens, and obstructs interstate commerce. *Illinois Central R. Co. v. Illinois* (1896), 163 U.S. 142; *Kansas City Southern R. Co. v. Kaw Valley Drainage Dist.* (1914), 233 U.S. 75; *South Covington R. Co. v. Covington* (1915), 235 U.S. 537; *St. L.-S. F. R. Co. v. Public Service Commission* (1921), 254 U.S. 535; *Adams Express Co. v. New York* (1913), 232 U.S. 14; *Seaboard Airline R. Co. v. Blackwell* (1917), 244 U.S. 310; *Davis v. Farmers Coop. Co.* (1923), 262 U.S. 312; *La Coste v. Dept. of Conservation* (1924), 263 U.S. 545; *Foster-Fountain Packing Co. v. Haydel* (1929), 278 U.S. 1; *California v. Thompson* (1941), 313 U.S. 109; *Parker v. Brown* (1942), 317 U.S. 341.

The commerce affected by the challenged statute is admittedly interstate in character. The fact that the statute is assertedly, or even actually, a safety regulation will not save it if the Court determines that in fact it infringes

the above principle. Compare *Kansas City Southern R. Co. v. Kaw Valley Drainage Dist.* (1914), 233 U.S. 75; *St. Louis & San Francisco Ry. Co. v. Public Service Commission* (1921), 254 U.S. 535; *Seaboard Airline R. Co. v. Blackwell* (1917), 244 U.S. 310; *Edwards v. California* (1941), 314 U.S. 160; *M. K. & T. R. Co. v. Texas* (1918), 245 U.S. 484; *St. Louis Southwestern Ry. Co. v. Arkansas* (1910), 217 U.S. 136; *Shafer v. Farmers Grain Co.* (1925), 268 U.S. 189. The Court has both the right and duty to make the necessary factual determination for itself. *Milk Control Board v. Eisenberg Farm Products* (1939), 306 U.S. 346; *La Coste v. Dept. of Conservation* (1924), 263 U.S. 545; *Foster-Fountain Packing Co. v. Haydel* (1929), 278 U.S. 1; *Parker v. Brown* (1942), 317 U.S. 341.

The actual obstructions, burdens, interferences or delays imposed by the challenged law are substantial, direct, continuous, and unavoidable. The heavy continuing financial burden, as found by the trial court (Finding X-d, R. 3966) is conceded by the state Supreme Court to be very large (R. 4063). The interference, delay and obstruction are equally serious (Findings X-b, X-c, R. 3953-3966; and compare the trial court's memorandum opinion, R. 4048-4049). The Interstate Commerce Commission has found that the law causes delay, congestion, and wasteful use of equipment, and interferes with the free flow of traffic: see Service Order No. 85, and the subsequent report of the Commission, 256 I.C.C. 523, 535.

The burdens and obstructions imposed upon commerce by the law wholly outweigh any possible safety benefits which may be claimed to result from its enforcement.

Such "benefits," whether consideration be given only to the so-called "slack action" hazard (a minor and relatively unimportant class of hazard), or to all hazards, are very slight at best, and indeed are actually *detriments;* the record being clear that in unrestricted operation there is much less hazard, and a much smaller casualty frequency, than under the compelled short-train operation.

4. The Train Limit Law Invades a Field of Regulation of Interstate Commerce Fully Occupied by Congress.

A state-police power regulation affecting interstate commerce, even though otherwise valid, is automatically ousted if it comes into conflict with any Federal statute or regulation covering the same subject matter. A state cannot validly enact legislation imposing additional or supplementary requirements or prohibitions. *Oregon-Washington R. & N. Co. v. Washington* (1926), 270 U.S. 87; *Southern Ry. Co. v. Reid* (1912), 222 U.S. 424; *Northern Pacific R. Co. v. Washington* (1912), 223 U.S. 370; *Erie R. Co. v. New York* (1914), 233 U.S. 671; *Missouri Pacific R. Co. v. Stroud* (1925), 267 U.S. 404; *C. R. I. & P. R. Co. v. Elevator Co.* (1913), 226 U.S. 426; *Napier v. Atlantic Coast Line R. Co.* (1926), 272 U.S. 605; *Pennsylvania R. Co. v. Public Service Commission* (1919), 250 U.S. 566. The field of safety of railroad operation as affected by train length has been occupied by Congress through the enactment of the power-brake provisions of the Safety Appliance Act (45 U.S. Code, Secs. 1, 9), and the safety section of the Interstate Commerce Act (49 U.S. Code, Sec. 25). The power-brake provisions forbid the oper-

ation of any train so long or heavy that it cannot be safely controlled, handled, and stopped in its ordinary operation by the use of the air brakes. *Virginian R. Co. v. United States* (1915), 223 Fed. 748. The Commission has investigated the matter of freight-train brakes (*Investigation of Power Brakes, etc.* (1924), 91 I.C.C. 481), and recently announced its intention to issue an order providing specifications for such brakes and requiring their application; such specifications, among other things, expressly contemplate trains of 150 cars.

There is no distinction in purpose or result between the challenged law and the two Federal statutes mentioned. Appellee's position is shown, by its own testimony and argument, to be that in the interest of safety long trains must be prohibited because with the present brakes the engineers cannot safely handle, control, and stop such trains. The decision in the *Virginian case*, 223 Fed. 748, shows that this is the purpose and result of the Safety Appliance Act. The Commission's action under Section 25 of the Interstate Commerce Act is likewise for the same purpose. The state law conflicts with the Federal acts by prohibiting the operation of trains which are lawful under the latter, because not unsafe or impossible to control: e.g., the 302 long freight trains and 62 long passenger trains actually operated in Arizona in March and April, 1940. In effect the state is attempting to substitute a fixed limit, applied regardless of attendant circumstances, for the judgment of a Federal court and jury based upon the particular facts developed in a prosecution under the Safety Appliance and Interstate Commerce Acts.

5. The Train Limit Law Operates Arbitrarily and Unreasonably to Deprive Appellant of Its Property Without Due Process of Law.

The heavy cost to appellant of compliance with the challenged law, though not controlling, may and should be considered, and contrasted with the completely negligible safety benefits flowing from such compliance. *Washington, etc. v. Fairchild* (1912), 224 U.S. 510; *Missouri Pacific R. Co. v. Norwood* (1931), 283 U.S. 249; *A. T. & S. F. Ry. Co. v. Railroad Commission* (1931), 283 U.S. 380; *Missouri-Pacific R. Co. v. Kansas* (1910), 216 U.S. 262; *Lehigh Valley R. Co. v. Commissioners* (1928), 278 U.S. 24. The only "benefit" seriously claimed is that slack-action casualties to freight trainmen are rendered less frequent and severe. Casualties of this type are relatively unimportant, constituting only about six percent of all the employee casualties occurring in freight-train operations. Even this claim has no factual basis; whereas it is clearly shown that all other classes of hazards to employees, as well as the grade-crossing hazard to non-employees, are greatly increased.

While there is a presumption of reasonableness normally favoring a police-power statute, it is not conclusive, but may be overcome by a proper showing. The courts are not precluded from examining the facts, by reason of any implied or expressed legislative declaration. *Nebbia v. New York* (1934), 291 U.S. 502; *Dobbins v. Los Angeles* (1904), 195 U.S. 223; *Lawton v. Steele* (1894), 152 U.S. 133; *Mugler v. Kansas* (1887), 123 U.S. 623; *Minnesota v. Barber* (1890), 136 U.S. 313. Compare: *N. C. & St. L. v. Walters* (1935), 294 U.S. 405; *Southern Ry. Co. v. Virginia* (1933), 290 U.S. 190; *Liggett Co. v. Baldridge* (1928), 278

U.S. 105; *St. Joseph Stockyards Co. v. United States* (1936), 298 U.S. 38; and see also, as showing that the presumption is merely *prima facie*: *Great Northern Ry. Co. v. Washington* (1937), 300 U.S. 154; *O'Gorman & Young v. Hartford Ins. Co.* (1931), 282 U.S. 251; *Pacific States, etc. Co. v. White* (1935), 296 U.S. 176; *United States v. Carolene Products Co.* (1938), 304 U.S. 144. Furthermore, a law valid when enacted may become invalid because of lapse of time and changed conditions, as in the case at bar: *N. C. & St. L. R. Co. v. Walters* (1935), 294 U.S. 405; *Albee State Bank v. Bryan* (1931), 282 U.S. 765; *Galveston Elec. Co. v. Galveston* (1922), 258 U.S. 388; and if actual changes in conditions are shown, the presumption is no longer available. *South Carolina Highway Dept. v. Barnwell Bros.* (1938), 303 U.S. 177; *Clark v. Paul Gray* (1939), 306 U.S. 583; *United States v. Carolene Products Co.* (1938), 304 U.S. 144. The state court erred in failing to recognize and apply these principles to the case at bar: compare *N. C. & St. L. R. Co. v. Walters* (1935), 294 U.S. 405, 414-415. The record here shows vast changes in the relevant conditions since the date when the law was enacted. The extent and character of these changes could not possibly have been foreseen by the Arizona legislature of 1912.

"Common belief" may be, and in many cases has been, given weight in considering the validity of challenged legislation. *Jacobson v. Massachusetts* (1905), 197 U.S. 11; *Muller v. Oregon* (1908), 208 U.S. 412; *Bunting v. Oregon* (1917), 243 U.S. 426; *West Coast Hotel Co. v. Parrish* (1937), 300 U.S. 379; *Parker v. Brown* (1943), 317 U.S. 341. In the case at bar, common belief is overwhelmingly opposed to the principle of the law. Such

statutes have been enacted in only four of the 48 states, and enforced in only two. Congress has, several times rejected proposed federal legislation fixing arbitrary maximum train-lengths. The long-train operating method has never been condemned by, but on the contrary has received at least inferential approval from the Interstate Commerce Commission, and is now standard all over the United States, except in Arizona and, recently, Oklahoma. The common opinion of the railroad industry thus clearly favors long-train operation. The only opposing opinion is that held by railroad employes in train and engine service, who constitute only a minority of those whose duties expose them to the hazards incident to train operation. The financial interest of this minority is favorably affected by train limit laws, because of increased employment opportunities. The remainder of the employes exposed to train operation, whose hazards of employment are needlessly increased by the increased number of trains run, certainly cannot be said to favor train limitation.

Service Order No. 85 reflects informed opinion respecting the adverse results of train-limit laws, and particularly their lack of merit from the safety standpoint. Compare *Ex Parte No. 156*, 256 I.C.C. 523, 536.

A purported safety measure which bears no reasonable relation to that purpose, but actually creates and increases hazards as does the Train-Limit Law—is unreasonable and invalid under the Due-Process Clause of the 14th Amendment: *Mugler v. Kansas* (1887), 123 U.S. 623; *Minnesota v. Barber* (1890), 136 U.S. 313; *Liggett Co. v. Baldridge* (1928), 278 U.S. 105; *Washington, etc. v. Roberge* (1928), 278 U.S. 116; *C. St. P. M. & O. Ry. v. Holmberg* (1930), 282 U.S. 162; *Nashville C. & St. L. R. Co. v.*

Walters (1935), 294 U.S. 405; *Treigle v. Acme Homestead Ass'n.* (1936), 297 U.S. 189. This principle has been recognized by the state court in its own earlier decisions, which, however, were wholly disregarded in the present case. *State v. Childs* (1927), 32 Ariz. 222; *Atchison, etc. Ry. Co. v. Arizona* (1928), 33 Ariz. 440; *State v. Borah* (1938), 51 Ariz. 318; *Buchman v. Bechtel* (1941), 57 Ariz. 653. The facts of record relative to safety as affected by the limitation (see Findings Nos. XI, XII, and XIII, R. 3969-4032) demonstrate that the Train-Limit Law does not reduce any hazard, even the limited and unimportant class associated with slack-action, but increases substantially—and as to some hazards actually multiplies the frequency—the hazards and casualties of railroad operation. The trial court declared (R. 4052): "as a matter of *cold fact*" the law makes "train operations more dangerous."

6. The Decision of the State Court, if Construed as a Reversal of the Trial Court's Findings of Fact, Operates to Deny to Appellant Federal Rights to Which It Is Shown by the Evidence to Be Entitled.

The lower court declared (R. 4067-4068) that its opinion expresses its reasons for holding that the trial court's findings "to the effect that the Train-Limit Law is unconstitutional were in error." This expression should not be construed as a reversal of the trial court's findings of fact, because: (1) the opinion contains no discussion of the facts in the case; (2) the state court itself, in many decisions, has stated and followed the rule that findings of fact by a trial court will not be reconsidered on appeal unless clearly erroneous, and did not here declare that it

was departing from that rule; (3) the mandate (R. 4072-4073) did not direct that the findings of fact be modified or vacated, and the judgment upon the mandate (R. 4073-4074) did not contain any expression vacating such findings; (4) there were no actual findings *of fact* "to the effect" that the law is unconstitutional.

If, nevertheless, the state court's expression is held to constitute a reversal of the trial court's findings of fact, the rule becomes applicable that where a claim of Federal rights has been made, and denied because of a factual holding by a state court, which is not properly supported by the evidence, this Court will examine the record for itself, and will not be concluded by the state court's determination. *Kansas City Southern R. Co. v. Albers Commission Co.* (1912), 223 U.S. 573; *Northern Pacific R. Co. v. North Dakota* (1915), 236 U.S. 585; *Norfolk & Western R. Co. v. Conley* (1915), 236 U.S. 605; *Aetna Life Ins. Co. v. Dunken* (1924), 266 U.S. 389; *Truax v. Corrigan* (1921), 257 U.S. 312; *Norris v. Alabama* (1935), 294 U.S. 587; *Great Northern Ry. Co. v. Washington* (1937), 300 U.S. 154; *United Gas Co. v. Texas* (1938), 303 U.S. 123; *Pierre v. Louisiana* (1939), 306 U.S. 354; *Smith v. Texas* (1940), 311 U.S. 128; *Milk Wagon Drivers' Union v. Meadowmoor Dairies* (1941), 312 U.S. 287.

In the instant case there is no real conflict of evidence: the showing is largely statistical, drawn from or based upon official sources and permanent railroad records, and thus of the same type approved by this Court in *Railroad Retirement Board v. Alton R. Co.* (1935), 295 U.S. 330. As shown in detail elsewhere (in Volume II hereof), the

trial court's findings accurately reflect and are fully supported by the record.

VI.

ARGUMENT

INTRODUCTORY STATEMENT

(Reviewing the various recent lower-court cases in which, with one exception, train-length regulations have been disapproved.)

The instant case is one of first impression in this Court, in that no previous case has been here presented in which there has been directly involved and decided the question of the validity of a state law limiting the length of interstate railroad trains. There have, however, been four such cases in the federal district courts, and also a fifth case involving a closely related question, likewise decided by a federal district court. The question was also considered by the Public Service Commission of Kansas and by the Supreme Court of that State. Quite recently, certain aspects of the general question have been considered by the Interstate Commerce Commission. As a preliminary to our argument, we shall discuss these several cases briefly.

The first of the series of cases in the federal courts, in point of time, and as well its relation to the present case, is the *First Arizona Train-Limit Case*, reported as:

A. T. & S. F. Ry. Co., et al. v. LaPrade (1933), 2 F.Supp. 855.

This decision is referred to in the opinion of the State court in the case at bar (R. 4061-4062), and also in the dissenting opinion (R. 4071).

In that case the plaintiff railroad companies directly assailed the same statute the validity of which is here challenged, and urged the same grounds of invalidity. The special three-judge court rendered a unanimous opinion, holding the statute void, on each and all of the following grounds (2 F.Supp., pp. 862-863):

> "first, it invades the exclusive legislative field of Congress, as limited by the Commerce Clause (paragraph 3, Sec. 8, art. 1) of the Constitution of the United States; second, it is in conflict with the train service clause of the car service provisions (paragraphs 10 to 17, inclusive, and paragraph 21 of section 1) of the Interstate Commerce Act; third, it is in conflict with and amounts to an unlawful attempt to supplement the Boiler Inspection Act, as amended, the power brake provisions of the Safety Appliance Acts, and section 26 of the Interstate Commerce Act, which operate upon the subject and are directed to the same object as the said Train-Limit Law, and by which Congress completely and exclusively occupied the train-length field; fourth, because it substantially and unreasonably impairs the usefulness of plaintiff's facilities; fifth, because it is an undue and unreasonable burden upon and direct interference with interstate commerce, in violation of said Commerce Clause; sixth, because it is so unreasonable as to deprive plaintiffs of their property without due process of law, in violation of the due-process clause of section 1 of the Fourteenth Amendment to the Constitution of the United States; seventh, that it is arbitrary and bears no reasonable relation to the safety of persons or property."

The conclusions expressed by that opinion were given no effect solely because of the holding of this Court in

Ex parte LaPrade (1933), 289 U.S. 444, 77 L.ed. 1311, which decided that the suit had abated because of the substitution of the incoming attorney general for the original defendant. This Court considered no other question.

In the instant case appellant alleged and urged, and the trial court held, that the law is invalid and unconstitutional for substantially the same reasons as in the *First Arizona Case*. Compare paragraphs 8 to 12, inclusive, of Part III of the answer (R. 24-27), and Conclusions of Law Nos. II to VII, inclusive, adopted by the trial court (R. 4035-4038).

The second of the train limit cases is the *Nevada Train-Limit Case:*

> *Southern Pacific Company v. Mashburn* (1937), 18 F.Supp. 393,

also cited in the two opinions rendered by the judges of the State Supreme Court (R. 4061, 4071).

In that case this appellant, as plaintiff, attacked the Nevada train-limit statute of 1935, which was apparently modeled after the Arizona law, having been very similar in both language and purport, except that (a) it contained a statement of its purpose ("safety"), and (b) it did not limit the lengths of passenger trains.

The special three-judge court held the law invalid and unconstitutional; and for exactly the same reasons which were urged before and sustained by the trial court in the instant case. The court said, in its unanimous opinion, among other things, that the challenged law bore "no reasonable relation to safety, but if enforced would impair

and lessen the safety of plaintiff's present method of freight-train operation in Nevada" (18 F.Supp. 394). No appeal was ever taken from the decision, and the Nevada law has never been complied with or enforced.

The third of the train-limit cases arose out of complaints severally filed by eight Louisiana railroads, attacking a statute of that state (enacted in 1936) limiting freight trains to 70 cars, exclusive of caboose, and passenger trains to 16 cars, and providing heavy cumulative penalties. The case was presented to a special three-judge court sitting in the Eastern District of Louisiana at New Orleans upon plaintiffs' motions for interlocutory injunctions. The evidence consisted entirely of the supporting and opposing affidavits. The case is unreported, but is identified upon the record of the court as:

Texas & New Orleans R. Co. v. Martin, et al. (1936), No. 428 Equity (and companion cases).

Following the submission, the court, with the concurrence of all the judges, ordered interlocutory injunctions to issue as prayed, which injunctions were later made permanent; the court announcing that, unless an appeal was taken, no formal findings or conclusions would be filed. No appeal was ever taken, and consequently no formal opinion has ever been rendered, nor any formal findings or conclusions filed; but the Louisiana law, like the Nevada law, stands adjudged to be invalid, and has never been observed or enforced. The reasons advanced by the plaintiffs in support of their attack on the law, and which the court apparently considered sound and well taken, were

substantially the same as in the prior train-limit cases, and in the present case.

The fourth of these cases is the *Oklahoma Train-Limit Case*:

M. K. & T. R. Co. v. Williamson (1941), 36 F.Supp. 607.

In that case one of the Oklahoma railroads challenged the Oklahoma Train-Limit Law enacted in 1937. The Oklahoma law is exactly like the Nevada law, except for the range of penalty; i.e., the law prohibits the operation of trains of more than 70 cars, exclusive of caboose, but does not mention passenger trains. This case, like the *Louisiana Case*, was heard on affidavits presented in support of and opposition to the motion for an interlocutory injunction; it being stipulated that the determination on the motion for interlocutory relief should also govern as to final relief. The majority of the special three-judge court rendered an opinion sustaining the law; the third judge dissented sharply from his associates, in an opinion (36 F.Supp. 616-617) in which he referred to the conclusions reached in the *First Arizona* and *Nevada Cases*, and declared his belief that the Oklahoma law was invalid for the reasons therein stated.

The opinion of the court of the *Oklahoma Case* is quoted at considerable length in the majority opinion of the state court in the instant case, having been apparently regarded by the judges as the controlling authority in the premises (R. 4062, 4063-4066).

The fifth case of this series, which involved the validity, not of a state train-limit law, but of a very similar at-

tempted restriction upon interstate trains and commerce, is:

Southern Pacific Co. v. Railroad Commission of California (1935), 10 F.Supp. 918.

That case (hereinafter referred to as the "*Mid-Train Caboose Case*") involved the following facts: The defendant Commission had ordered that each of the plaintiff company's trains of more than 50 cars, moving between Roseville and Calvada (the California-Nevada boundary) during the six winter months (October 1st to March 31st), be operated with an additional caboose, to be placed midway in the train. The purpose was to provide a comfortable place wherein brakemen could ride and observe the train operation, during cold or severe weather. The company's rules required brakemen to ride out upon their trains, while descending the steep grades between Roseville and Calvada, so as to observe the operation.

The Commission's order was held invalid and unconstitutional, and its enforcement permanently enjoined, for the following reasons:

(1) Entry into a field of regulation, vested in Congress by the Commerce Clause, the subject of the consist of interstate trains being one which, if regulated at all, should be regulated by the Federal Government; (2) regulation of, and interference with, the continuous movement of plaintiff's interstate freight trains in both Nevada and California; (3) imposition of burdens amounting to an interference, upon interstate trains; (4) extra-territorial regulation, in that the order, if enforced, would regulate interstate freight trains in Nevada, as far east as Sparks;

and (5) unreasonableness and arbitrary character of the order, particularly in that it would not eliminate hazards, but would tend instead substantially to increase the hazards of train operation in the affected territory; and thus violate the Commerce Clause, and the Due-Process Clause of the XIV Amendment.

In its opinion, the three-judge court referred with approval to the opinion in the *First Arizona Train-Limit Case*. No appeal was ever taken from the decision.

The Kansas proceedings in which the question of train-length regulation by the State was considered are covered by the reported opinion of the Supreme Court of that State in:

State, etc. v. A. T. & S. F. Ry. Co., et al, (1928), 125 Kan. 586; 264 Pac. 1056.

The opinion shows that two train-service brotherhoods in Kansas had initiated proceedings before the Public Service Commission, looking to the limitation of freight and passenger train lengths; that the Commission had undertaken an exhaustive investigation, as a result of which it rendered elaborate findings and conclusions. It appears, from the text of the opinion, that the contentions of the brotherhoods were substantially the same as those advanced by appellee here.

The Commission recognized the impracticability of the regulation by a state of the lengths of interstate trains. The following significant portion of its findings was quoted by the Kansas Supreme Court in its opinion:

> "'It is impracticable to direct that trains engaged in interstate commerce should, when arriving at the

Kansas state line, divide into two or more portions, each portion to be attached to an engine and caboose and manned with sufficient employes to conduct it as a train across the state. To do so would not be in the interest of economy. Locomotives, bridges, and tracks have been constructed and equipped for the purpose of hauling larger and heavier loads, thus decreasing materially the cost of operation. Economy in operation of trains, consistent with efficiency, is not only encouraged but demanded by state and national regulatory bodies. The employment of additional men in train service invites additional hazard to men, in that, as the number of employes is increased, the possibility of injury to a greater number is increased. The operation of a greater number of trains would perforce increase the hazard to the public at large at grade crossings, and accidents of this character constitute a large per cent of the serious railroad accidents of today. . . .

"'The evidence introduced herein does not by a preponderance thereof, show that accidents to employes, incurred by reason of operation of trains in Kansas, have unduly increased during the past few years solely because of the increase in length of trains. Neither has it been shown that accidents to passengers riding on such long trains have increased.'"

In each of the cited cases the statute or regulation proposed or under attack was attempted to be defended upon the ground that it was a necessary health and safety measure, undertaken and required in the interest of the health, and especially the safety, of persons, particularly train-service employees, upon freight and passenger trains. The appellee's attempt to justify the law in the instant case partakes of substantially the same character.

It may be noted that the four federal train-limit cases were heard before twelve different federal judges, five of whom were circuit judges and seven district judges. Three of the circuit judges and all of the district judges, or ten federal judges in all, agreed that state train-limit laws exactly or essentially similar to the challenged law are invalid, upon precisely the same constitutional grounds urged in the present case. Only two of these twelve judges have taken a contrary view.

Three of the ten federal judges mentioned also concurred in reaching the same result with respect to a state regulation not differing in principle from a train-limit law; although, of course, neither the volume of the traffic affected, the character and extent of the obstruction imposed, nor the financial burden was as severe and widespread as in the train-limit cases.

The expressions of the Interstate Commerce Commission to which we refer are contained in its report entitled:

Ex Parte No. 156: In the Matter of Service Order No. 85 (1943), 256 I.C.C. 523.

That report was rendered by the full commission, in denying a petition filed by the four major railroad train-service brotherhoods, seeking to have the Commission set aside its Service Order No. 85, dated September 11, 1942, (the full text of which is set forth on pages 5-6 hereof), in which the Commission had ordered railroad common carriers subject to the Interstate Commerce Act to separate their trains, when necessary, without regard to any state laws, rules, or regulations, limiting the number of

cars in railroad freight or passenger trains. Service Order No. 85 was issued by the Commission pursuant to the emergency powers created by the Car Service Clauses (pars. 10 to 17(a) of Section 1, of Part I of the Interstate Commerce Act), and had been attacked by the brotherhoods as in excess of the powers conferred by those provisions. In its report, the Commission, after referring to the several state train-limit laws, and to various decisions of this Court, said (256 I.C.C., pp. 530-531):

> "If State laws limiting the number of cars in trains are to be held valid (a question we do not decide), it would be possible for each State to set a different number of cars as the maximum to be hauled in a train. A State might even limit the length of trains to one car, although such a law would be clearly arbitrary and unreasonable. Higher limits might be set by States and found reasonable, *but lack of uniformity would place a serious burden on interstate commerce.*"

Again, after referring to this Court's opinion in *California v. Thompson* (1941), 313 U.S. 109, 85 L.ed. 1219, the Commission said (at page 534):

> "This language is significant because *train-limit laws are not matters of local concern* and the regulation of the number of cars which may be put in a train does infringe the national interest in maintaining the free flow of commerce under the present emergency war conditions." (Emphasis ours.)

We quote these expressions because of their direct bearing upon the first of the major legal propositions dis-

cussed in this argument: namely, that the field of regulation of the length and consist of interstate railroad trains is one which involves the national interest and therefore belongs exclusively to Congress, under the Commerce Clause, since it demands a national and uniform system of regulation, if any be required at all. It is significant that the Interstate Commerce Commission, with its expert knowledge of the intricate problems presented by the various phases of railroad regulation, should have expressed itself so forcefully upon this particular point.

Although obviously the several decisions cited above are closely in point in the instant case, we may assume that appellee will object vigorously to any consideration by this Court of any of them other than, of course, the *Oklahoma Case*. The cases were cited at length to both the trial court and the State Supreme Court, and in its briefs in those courts appellee sharply criticized such citations. Thus, referring particularly to our citation of the *First Arizona Train-Limit Case*, appellee reminded the state court that Mr. LaPrade, the Attorney-General in office at the time the oral argument was heard before the three-judge court, had vigorously objected to having been substituted for his predecessor in office against whom the suit had originally been brought and, when the district court overruled his objection, declined to participate further in the argument and withdrew from the court-room. Appellee argued that the decision was thus merely *ex parte* because rendered without the participation of the nominal

defendant. While it is true that Mr. LaPrade and his counsel did not take part in the oral argument, it is likewise true that elaborate briefs on the merits were filed with the court by his counsel, so that the court was fully apprised of their position and did not proceed to final judgment upon the sole basis of the showing and argument of the railroad-plaintiffs. The decision was in no sense ex parte, but on the contrary was rendered only after full consideration of the merits of the case and full opportunity to the defendant to participate. While the decision was given no effect solely because of this Court's conclusion that the substitution of the incoming Attorney-General was improper, the conclusions of the court on the merits are not for that reason to be regarded as a mere nullity. At least two other courts whose decisions were rendered subsequent to this Court's ruling in the matter have regarded as sound the views on the merits expressed in the opinion. It was cited with approval in both the *California Mid-Train Caboose Case*, 10 F. Supp. 918, 925, and the *Nevada Train-Limit Case*, 18 F. Supp. 393. None of the judges who heard and decided the *Nevada Case* had participated in the *First Arizona Case*.

In commenting upon the *Nevada Case*, appellee has suggested that that decision can hardly be regarded as persuasive in the instant case because, so it says, each of these cases must rest upon its special facts and be decided upon its own record. We may agree with appellee that each case stands on its own record; in fact, it was for that very reason that the Master who heard the *Nevada Case* and the three Federal judges before whom it was argued having decided, upon the basis of the record there

made, that the Nevada 70-car law was unconstitutional upon substantially all of the grounds urged as a matter of defense in the instant case, appellant undertook to present here a record as nearly as possible the counterpart of the Nevada record. In nearly all of its most important aspects the testimony presented by appellant in the present case is of the same character as in the *Nevada Case*, except that the statistical showings were brought down to date so as to include 1939, and 1940 where possible; whereas in the *Nevada Case* the latest year for which statistics were available was 1935. It may properly be said that in every feature the evidentiary showing made by appellant in the present case corresponds to the showing made by it as the plaintiff in the *Nevada Case*. Since there is no distinction in principle, it is beyond question that the *Nevada Case* affords a persuasive precedent in the instant case, and one which, we respectfully submit, should be given full weight by this Court.

1.

THE TRAIN-LIMIT LAW INVADES AN EXCLUSIVE NATIONAL FIELD OF REGULATION.

(Assignment of Error No. 1)

The first subdivision of this argument is addressed to the general proposition that the challenged law is invalid, as an infringement upon and violation of the Commerce Clause, because it constitutes a regulation by the State of a subject-matter which in its very nature is of national and not merely local concern, requiring a uniform system of regulation, if any be needed, and therefore exclusively subject to the regulatory powers granted to Congress by the Commerce Clause.

This proposition was expressed in Conclusion of Law No. II adopted by the trial court (R. 4035), the substance of which is as follows:

> The law constitutes an invalid exercise of the police power of the State, in the purported interest of safety, by regulating that which, if regulation be needed at all, is not subject to regulation by any of the states, but is solely of national concern, and subject only to the regulatory power of Congress under the Commerce Clause; that is to say, the number of cars that may lawfully be operated in a single train moving in interstate commerce, and operated by an interstate carrier in the continuous movement of such commerce from, to, or through Arizona. Such invalidity attaches, even though Congress may not have taken any action heretofore with respect to the specific subject, because the subject-matter—the length and consist of interstate trains—is one which requires a national or uniform system of regulation, if any be required.

We emphasize that, in considering this point, it is unnecessary for this Court to take into account whether the challenged law is really, or merely ostensibly, a safety statute; or whether it is unreasonable, arbitrary or otherwise in violation of the Due-Process Clause of the XIV Amendment. It is likewise unnecessary to consider whether the law imposes financial burdens upon, or interferes physically with, interstate commerce. The mere fact of entry into a forbidden field, reserved to the federal power, where national regulation is indispensable if any is to be attempted, is sufficient to invalidate the action

of the State, irrespective of the actual effects upon interstate commerce.

The regulation of the length and consist of interstate trains is clearly a subject upon which Congress *may* exercise its paramount authority, pursuant to the powers granted by the Commerce Clause. This premise has never been seriously disputed by appellee at any stage of this case, and was conceded in the state court, by reason of appellee's citation of, and the state court's reliance upon, the *Oklahoma Train-Limit Case*, in which the premise is practically taken for granted (36 F. Supp., at pages 615-616). Appellee has strongly contended, of course, and the lower court in effect has concluded, that Congress has taken no such action; whereas we show, in subdivision 4 of this argument, that Congress has acted in such fashion as to enter and thus to occupy the field, through the passage of the Safety Appliance Act (45 U. S. Code, Sections 1, 9), and Section 25 of Part I of the Interstate Commerce Act (49 U. S. Code, Part I, Section 25). Our immediate argument, however, goes to the point that, even if it were held that Congress has not acted, the subject-matter of train-length regulation is nevertheless exclusively national and not local in its nature, so that any character of state regulation is forbidden, whatever its apparent merit, or actual effect upon interstate commerce.

The principal objects of the Commerce Clause, as stated in numerous decisions of this Court, were to insure the national interest, as against conflicting and discriminatory state legislation regulating interstate commerce by providing for regulation of that commerce by a single authority in all fields and upon all subjects where national and

uniform regulation is required, and thereby to guard against obstructions to the free flow of such commerce.

Houston, E. & W. T. Ry. Co. v. United States (1914), 234 U.S. 342, 58 L.ed. 1341;

Port Richmond, etc., Ferry Co. v. Hudson Co. (1914), 234 U.S. 317, 58 L.ed. 1330;

National Labor Rel. Bd. v. Jones & Laughlin (1937), 301 U.S. 1 (36-38), 81 L.ed. 893 (911-912);

Parker v. Brown (1943), 317 U.S. 341 (363), 87 L.ed. 315 (332-333);

Union Brokerage Co. v. Jensen (1944), 322 U.S. 202, 88 L.ed., Adv., 868 (891).

In the *Welton Case*, this Court said (91 U.S., at page 280):

"The power to regulate it (commerce) embraces all the instruments by which such commerce may be conducted. . . . Where the subject to which the power applies is national in its character, or of such a nature

as to admit of uniformity of regulation, the power is exclusive of all State authority.

"It will not be denied that that portion of commerce . . . between the States which consists in the transportation and exchange of commodities is of national importance, and admits and requires uniformity of regulation. The very object of investing this power in the General Government was to insure this uniformity against discriminating State regulation."

In *Cook v. Marshall County*, supra, it was said (196 U.S., page 272):

"The power of Congress to regulate commerce among the States is perhaps the most benign gift of the Constitution. Indeed it may be said that without it the Constitution would not have been adopted. . . . The article was adopted . . . to relieve them (the States) from the embarrassing restrictions imposed upon the internal commerce of the country."

The opinion in the *Minnesota Rate Cases* contains a careful and exhaustive analysis of the respective powers of the states and Congress over interstate commerce. In the course of that discussion, this Court emphasized the supremacy of the federal power, and the exclusive authority of Congress over those subjects which are of such nature as to demand that, if regulated at all, their regulation should be by a single national authority. The Court said in part (230 U.S., at pages 399-400):

"There is no room in our scheme of government for the assertion of state power in hostility to the authorized exercise of Federal power. The authority of

Congress extends to every part of interstate commerce, and to every instrumentality or agency by which it is carried on; and the full control by Congress of the subjects committed to its regulation is not to be denied or thwarted by the commingling of interstate and intrastate operations. This is not to say that the Nation may deal with the internal concerns of the State, as such, but that the execution by Congress of its constitutional power to regulate interstate commerce is not limited by the fact that intrastate transactions may have become so interwoven therewith that the effective government of the former incidentally controls the latter. This conclusion necessarily results from the supremacy of the national power within its appointed sphere. (Citing cases.)

"The grant in the Constitution of its own force, that is, without action by Congress, established the essential immunity of interstate commercial intercourse from the direct control of the states with respect to those subjects embraced within the grant which are of such a nature as to demand that, if regulated at all, their regulation should be prescribed by a single authority. *It has repeatedly been declared by this court that as to those subjects which require a general system or uniformity of regulation, the power of Congress is exclusive.* In other matters, admitting of diversity of treatment according to the special requirements of local conditions, the States may act within their respective jurisdictions until Congress sees fit to act; and, when Congress does act, the exercise of its authority overrides all conflicting state legislation. (Citing cases.)

"The principle which determines this classification underlies the doctrine that the States cannot under any guise impose direct burdens upon interstate com-

merce. For this is but to hold that the States are not permitted directly to regulate or restrain that which from its nature should be under the control of the one authority and be free from restriction save as it is governed in the manner that the national legislature constitutionally ordains." (Emphasis supplied.)

In

Wilmington Transportation Co. v. Railroad Commission (1915), 236 U.S. 151, 59 L.ed. 508,

this Court said that the Commerce Clause

"denies authority to the states in all cases where the subject is of such a nature as to demand that, if regulated at all, its regulation should be through a general or national system, and that it should be free from restraint or direct burdens save as it is constitutionally governed by Congress."

In

Lemke v. Farmers Grain Co. (1922), 258 U.S. 50, 66 L.ed. 458,

this Court held the Grain Rating and Inspection Act of North Dakota to be void: not because it was unreasonable, but because it imposed direct burdens upon, and constituted an attempt to regulate, interstate commerce. In that case the defense raised by the state was that the statute was a proper police regulation; but the Court said (at page 58):

"It is contended that these regulations may stand upon the principles recognized in decisions of this court which permit the State to make local laws under its police power in the interest of the welfare of its people, which are valid although affecting inter-

state commerce, and may stand, at least until Congress takes possession of the field under its superior authority to regulate commerce among the States. *This principle has no application where the State passes beyond the exercise of its legitimate authority and undertakes to regulate interstate commerce by imposing burdens upon it.* This court stated the principle and its limitations in the discussion of the subject in the *Minnesota Rate Case.*" (Citing cases.) (Emphasis supplied.)

The decision in

Oregon-Washington R. & N. Co. v. Washington (1926), 270 U.S. 87, 70 L.ed. 482,

illustrates the essential distinction between the "exclusive national field" of regulation of interstate commerce, which the states may not enter at all, even in the absence of congressional action, and the "joint field" in which a state may exercise its police power, until and unless Congress has entered the field, and provided it does not *directly* and *substantially* regulate or obstruct interstate commerce; *incidental* or *indirect* effects only being permitted.

In that case, it appeared that Congress had conferred upon the Secretary of Agriculture the power to quarantine districts infected by dangerous plant diseases or insect infestations. He had failed to do so as to a certain injurious insect popularly called the alfalfa weevil; and the State of Washington itself proclaimed such quarantine, thereby shutting out importations of alfalfa hay and alfalfa meal from certain other states. This Court held that the congressional act could not be construed as leaving the states

at liberty to establish such quarantines, even in the absence of action by the Secretary of Agriculture, saying (at page 101):

> "In relation of the states to the regulation of interstate commerce by Congress there are two fields. *There is one in which the State cannot interfere at all, even in the silence of Congress.* In the other (and this is the one in which the legitimate exercise of the state's police power brings it into contact with interstate commerce so as to affect that commerce), the state may exercise its police power until Congress has by affirmative legislation occupied the field by regulating interstate commerce and so necessarily has excluded state action."

The Court in this connection stated further that the power of quarantine fell within the latter classification. In conclusion, the Court stated:

> "It follows that pending the existing legislation of Congress as to quarantine of diseased trees and plants in interstate commerce, the statute of Washington on the subject cannot be given application. *It is suggested that the states may act in the absence of any action by the Secretary of Agriculture; that it is left to him to allow the states to quarantine, and that if he does not act there is no invalidity in the state action. Such construction as that cannot be given to the Federal statute.* The obligation to act with respect to the states is put directly upon the Secretary of Agriculture whenever quarantine, in his judgment, is necessary. When he does not act, it must be presumed that it is not necessary. With the Federal law in force, state action is illegal and unwarranted." (Emphasis supplied.)

In the *Jones & Laughlin Case*, supra (301 U.S. 1) this Court discussed the nature and extent of the Congressional power under the Commerce Clause, referring with approval to the *Mobile County Case* and the *Houston E. & W. T. Ry. Co. Case*, both of which we cite herein, and said in part (301 U.S., at pages 36-38):

> "The fundamental principle is that the power to regulate commerce is the power to enact 'all appropriate legislation' for 'its protection and advancement' (*The Daniel Ball*, 10 Wall. 557, 564); to adopt measures 'to promote its growth and insure its safety' (*Mobile County v. Kimball*, 102 U.S. 691, 696, 697); 'to foster, protect, control and restrain.' *Second Employers' Liability Cases, supra*, page 47. See *Texas & N. O. R. Co. v. Railway Clerks, supra*. That power is plenary and may be exerted to protect interstate commerce 'no matter what the source of the dangers which threaten it.' *Second Employers' Liability Cases*, page 51; *Schechter Corp. v. United States, supra*. Although activities may be intrastate in character when separately considered, if they have such a close and substantial relation to interstate commerce that their control is essential or appropriate to protect that commerce from burdens and obstructions, Congress cannot be denied the power to exercise that control. . . .
>
> "That intrastate activities, by reason of close and intimate relation to interstate commerce, may fall within federal control is demonstrated in the case of carriers who are engaged in both interstate and intrastate transportation. There federal control has been found essential to secure the freedom of interstate traffic from interference or unjust discrimination and to promote the efficiency of the interstate service

(citing cases). . . . Other illustrations are found in the broad requirements of the Safety Appliance Act and the Hours of Service Act. *Southern Railway Co. v. United States*, 222 U.S. 20; *Baltimore & Ohio R. Co. v. Interstate Commerce Comm'n*, 221 U.S. 612. It is said that this exercise of federal power has relation to the maintenance of adequate instrumentalities of interstate commerce. But the agency is not superior to the commerce which uses it. The protective power extends to the former because it exists as to the latter."

In

Milk Control Board v. Eisenberg Farm Products (1939), 306 U.S. 346, 83 L.ed. 752,

this Court again referred with approval to the portions of the opinion in the *Minnesota Rate Cases* which we quote above, and said (at page 351):

"The grant of the power of regulation (of interstate commerce) to the Congress necessarily implies the subordination of the states to that power. This court has repeatedly declared that the grant established the immunity of interstate commerce from the control of the states respecting all those subjects embraced within the grant which are of such a nature as to demand that, if regulated at all, their regulation must be prescribed by a single authority."

To the same effect, see also:

Sunshine Anthracite Coal Co. v. Adkins (1940), 310 U.S. 381, 84 L.ed. 1263,

in which the Court (at page 394) referred to the congres-

sional power of regulation of interstate commerce as being "complete in itself," and paramount; and

Edwards v. California (1941), 314 U.S. 160 (174, 176), 86 L.ed. 119,

in which the Court quoted with approval the above excerpt from the *Milk Control Board* opinion.

The most recent pronouncement upon this topic is found in the opinion in:

United States v. South-Eastern Underwriters' Assn., et al. (1944), 322 U.S. ....., 88 L.ed., Adv. 1082,

in which this Court said (88 L.ed., Adv., pp. 1092-1094):

> "The precise boundary between national and state power over commerce has never yet been, and doubtless never can be, delineated by a single abstract definition. The most widely accepted general description of that part of commerce which is subject to the federal power is that given in 1824 by Chief Justice Marshall in Gibbons v. Ogden, 9 Wheat. 1, 189-190: 'Commerce, undoubtedly, is traffic, but it is something more: it is intercourse. It describes the commercial intercourse between nations, and parts of nations, in all its branches. . . .' Commerce is interstate, he said, when it 'concerns more States than one'. Id., 194. No decision of this Court has ever questioned this as too comprehensive a description of the subject matter of the Commerce Clause. To accept a description less comprehensive, the Court has recognized, would deprive the Congress of that full power necessary to enable it to discharge its Constitutional duty to govern commerce among the states."

"*The power confided to Congress by the Commerce Clause* is declared in The Federalist to be *for the purpose of securing the 'maintenance of harmony* and proper intercourse *among the States.'* But its purpose is not confined to empowering Congress with the negative authority to legislate against state regulations of commerce deemed inimical to the national interest. The power granted Congress is a 'positive power.' It is the power to legislate concerning transactions which, reaching across state boundaries, affect the people of more states than one;—to govern affairs which the individual states, with their limited territorial jurisdictions, are not fully capable of governing. This federal power to determine the rules of intercourse across state lines was essential to weld a loose confederacy into a single, indivisible Nation; its continued existence is equally essential to the welfare of that Nation.

"*Our basic responsibility in interpreting the Commerce Clause is to make certain that the power to govern intercourse among the states remains where the Constitution placed it.* That power, as held by this Court from the beginning, is vested in the Congress, available to be exercised for the national welfare as Congress shall deem necessary." (Emphasis supplied.)

So, in the case at bar, where this Court is confronted with a regulation imposed by a state, in a guise of a claimed exercise of the police power, the effect of which is to control and govern the conduct of commercial intercourse among the states and across state lines (i.e., not only within, but also far outside of the physical boundaries

of Arizona), it would seem to become this Court's "basic responsibility" to strike down that regulation, because it is an impairment and infringement upon the exclusive powers vested in Congress; for only by such action will this Court make certain that the power to regulate and govern the interstate commerce now subject to regulation by the Arizona statute shall remain where the Constitution placed it.

The power to regulate commerce is necessarily exclusive whenever the subjects of it *are national in their character, or admit only of one uniform system, or plan of regulation.*

Robbins v. Shelby County Taxing District (1887), 120 U.S. 489, 30 L.ed. 694;

In re Rahrer (1891), 140 U.S. 545, 35 L.ed. 572;

Brennan v. Titusville (1894), 153 U.S. 289, 38 L.ed. 719.

In

Buck v. Kuykendall (1925), 267 U.S. 307, 69 L.ed. 623,

it was held that a statute of Washington, under which truck operators on the highways of that state engaged exclusively in interstate commerce were prohibited from operating, without first applying for and obtaining from the State Department of Public Works a certificate of public convenience and necessity, was invalid, as a regulation of interstate commerce. This Court said (at page 316):

> "Thus, the provision of the Washington statute is a regulation, not of the use of its own highways, but of interstate commerce. Its effect upon such commerce is not merely to burden but to obstruct it. Such state action is forbidden by the Commerce Clause."

In

Bush v. Malloy (1925), 267 U.S. 317, 69 L.ed. 627,

in which the facts resembled closely those presented in the *Buck Case*, this Court said (at pages 324-325):

> "The state action in the Buck Case was held to be unconstitutional, not because the statute prescribed an arbitrary test for the granting of permits, or because the director of public works had exercised the power conferred arbitrarily or unreasonably, but because the statute, as construed and applied, invaded a field reserved by the Commerce Clause for Federal regulation."

It may be noted that, at the time these cases were decided, Congress had not undertaken to regulate the transportation of persons or property by motor carrier, over public highways, in interstate commerce; such regulation was not undertaken until the enactment on August 9, 1935, of the Motor Carrier Act, 1935 (49 U. S. Code, Chapter 8; Interstate Commerce Act, Part II, Sections 201-228). Nevertheless, this Court held that, despite congressional inaction, the states had invaded a field reserved by the Commerce Clause for federal regulation, and that their action was invalid.

Appellee has never seriously contended, at any stage of this case, that the "exclusive national field" of regulation does not exist nor does the state court in its opinion announce any such conclusion. In any event, the principle is thoroughly settled by the repeated decisions of this Court cited above; e.g., *Minnesota Rate Cases*, supra (230 U.S. 352, at pp. 399-400); *Milk Control Board v. Eisen-*

Berg Farm Products, supra (306 U.S. 346, at p. 351); *Kelly v. Washington*, supra (302 U.S. 1, at pp. 9, 14-15). Rather, the position taken by appellee in its argument presented to the courts below, and in effect though not expressly sustained by the state Supreme Court, has been somewhat as follows:

(a) Although there is an "exclusive national field" of regulation of interstate commerce, no invasion of that field takes place when a state undertakes to regulate in the interest of safety; because "safety is always in the joint field".

(b) In considering whether a challenged state regulation infringes the exclusive national field, the Court therefore needs to determine only whether the regulation was enacted for the purpose of promoting safety and bears a reasonable relation to that purpose; the Court need not concern itself with the nature of the subject-matter regulated, or the effects of the regulation apart from its relation to its claimed purpose.

(c) If the state regulation is for the purpose of safety, and bears a reasonable relation thereto, its other effects upon interstate commerce are, *in legal contemplation*, never more than "incidental" and "indirect", no matter how great the actual burdens, obstructions or interferences may be *in fact*.

(d) The Court cannot inquire or determine whether a challenged police-power measure imposes an unduly severe burden upon interstate commerce, the only remedy in that event lying with Congress.

(e) The Court likewise cannot undertake to determine from the evidence whether the challenged law is actually a safety measure; the law must be sustained unless, upon the entire record, the Court can say that there is no possible rational basis for the safety claim.

This argument depends initially upon the assumption that the Arizona Legislature enacted the train-limit law for the purpose of promoting safety. While the state Supreme Court has subscribed to this assumption, and has even declared in its opinion that no reason other than safety "could possibly be assigned" to this law (R. 4059), neither the assumption, nor the declaration of the court adopting it, are founded upon or supported by any facts of record. No such declaration of purpose was made by the Arizona Legislature of 1912, and no reference whatever to safety appears in the text of the statute. The companion statutes, adopted at the same session of the Arizona Legislature, to which the state court refers to support its conclusion, are wholly irrelevant; they were separately enacted, and it cannot be assumed, simply because of enactment at the same session, that the same purpose or motive was present. In point of fact, these other statutes, like the train-limit law, are wholly lacking in any preamble or specific statement of purpose, and contain no references whatever to safety.

In the light of the facts as they existed in 1912, it is highly doubtful whether the legislature had any safety purpose in mind. The law when enacted did not actually modify contemporaneous operating practices (R. 1107,

1108; Exhibits 149, 150, 182, 213); there had been no long-train operations in the state from which the legislature could have obtained any idea as to their safety compared to short-train operations. Therefore it is much more probable that the law was advocated and passed as a measure to continue existing conditions, and particularly to promote and preserve the employment of railroad trainmen by directly regulating interstate commerce. Certainly that has been, and is, its most obvious practical (but extra-legal) purpose and, as experience has shown, one of its principal results. The record before this Court demonstrates that the law bears no relation *in fact* to safety; the state wholly failed to prove the contrary, and, indeed, made no serious attempt to do so. We therefore submit that appellee's argument fails at the outset, because it depends upon the assumption that a particular purpose may be ascribed to the challenged law although the statement of that purpose does not appear of record and, in fact, was conspicuously omitted by the enacting legislature.

Apart from this basic defect, however, the state's position as above outlined is not supported by the controlling decisions of this Court. Those decisions, when read together, definitely lead to and sustain the following principles having immediate bearing upon the "national-field" phase of this case:

(a) There is a field of regulation of interstate commerce reserved exclusively to the national government, embracing all of those subjects which are of national and not merely local concern, as to which uniformity of regulation is essential if any be required. In this field state

action is wholly forbidden, whether or not Congress has acted.

Minnesota Rate Cases, supra, 230 U.S. at p. 399;
South Covington Ry. Co. v. Covington (1915), 235 U.S. 537, 59 L.ed. 350;
Kelly v. Washington, supra, 302 U.S. at pp. 9, 14;
Milk Control Board v. Eisenberg, supra, 306 U.S. at p. 351;
Edwards v. California, supra, 314 U.S. at p. 176.

(b) There is a second, so-called "joint" or "concurrent" field of regulation, embracing those matters of local nature and local concern, where in the absence of action by Congress, state regulation is permissible, even though interstate commerce is thereby affected to some degree; provided that the national interest is not impaired nor the free flow of interstate commerce obstructed.

Oregon-Washington R. & N. Co. v. Washington, supra, 270 U.S., at p. 101;
Minnesota Rate Cases, supra, 230 U.S., at p. 400;
Milk Control Board v. Eisenberg, supra, 306 U.S., at p. 351;
California v. Thompson, supra, 313 U.S., at p. 116;
Parker v. Brown, supra, 317 U.S., at pp. 362-363.

(c) In determining whether a challenged state regulation falls within the prohibited federal field or the permissible joint field, it is immaterial that the regulation may be for the purpose of safety or reasonably related to that purpose. The determination turns upon the nature

of the subject-matter regulated, and the incidence of the regulation upon interstate commerce, and not upon the claimed or stated purpose.

Minnesota Rate Cases, supra, 230 U.S., at p. 400;
South Covington Ry. Co. v. Covington, supra (235 U.S. 537);
Seaboard Airline R. Co. v. Blackwell (1917), 244 U.S. 310, 315-316, 61 L.ed. 1160;
Kansas City Southern Ry. Co. v. Kaw Valley Drainage District (1914), 233 U.S. 75, 78-79, 58 L.ed. 857;
Davis v. Farmers Coop. Co. (1923), 262 U.S. 312, 315, 67 L.ed. 996;
Shafer v. Farmers Grain Co. (1925), 268 U.S. 189, 69 L.ed. 909;
Parker v. Brown, supra, 317 U.S., at p. 363;
Union Brokerage Co. v. Jensen, supra, 322 U.S., at p. 210.

Appellee has heretofore particularly relied upon certain language found at page 402 of the opinion in the *Minnesota Rate Cases*, supra, to support its argument that the question whether a state law infringes the exclusive national field must be determined by reference solely to its purpose and its relation to that purpose, and not by consideration of the nature of the subject-matter regulated; the particular passage thus relied upon being as follows:

> "But within these limitations there necessarily remains to the States, until Congress acts, a wide range for the permissible exercise of power appropriate to their territorial jurisdiction although interstate com-

merce may be affected. It extends to those matters of a local nature as to which it is impossible to derive from the constitutional grant an intention that they should go uncontrolled pending Federal intervention. *Thus, there are certain subjects having the most obvious and direct relation to interstate commerce, which, nevertheless, with the acquiescence of Congress, have been controlled by state legislation* from the foundation of the Government because of the necessity that they should not remain unregulated and *that their regulation should be adapted to varying local exigencies;* hence the absence of regulation by Congress in such matters has not imported that there should be no restriction but rather that the States should continue to supply the needed rules until Congress should decide to supersede them. Further, it is competent for a State to govern its internal commerce, to provide local improvements, to create and regulate local facilities, *to adopt protective measures of a reasonable character in the interest of the health, safety, morals and welfare of its people, although interstate commerce may incidentally or indirectly be involved.* Our system of government is a practical adjustment by which the National authority as conferred by the Constitution is maintained in its full scope without unnecessary loss of local efficiency. Where the subject is peculiarly one of local concern, and from its nature belongs to the class with which the State appropriately deals in making reasonable provision for local needs, it cannot be regarded as left to the unrestrained will of individuals because Congress has not acted, although it may have such a relation to interstate commerce as to be within the reach of the Federal power. *In such case, Congress must be the judge of the necessity of Federal action.*

> Its paramount authority always enables it to intervene at its discretion * * *." (Emphasis as in appellee's closing brief to the State Supreme Court.)

It will be apparent at once, we believe, that the quoted language does not sustain appellee's views. This Court was careful to point out that the power permitted to the states extends to "matters of a *local* nature"; and again this Court said that, "where the subject-matter is peculiarly one of *local concern*, and from its nature belongs to the class with which the state appropriately deals, etc.," it is subject to reasonable state action in the absence of action by Congress. This emphasis on "local concern" is heightened by the repeated use of the word "local," not less than eight times in this same paragraph (pp. 402-403 of the opinion).

The same concept has been treated as controlling throughout the later decisions of this Court, and finds its most recent expressions in *California v. Thompson*, and *Parker v. Brown*, supra. In the *Thompson Case* this Court referred (313 U.S., at p. 116) to the authority of the state, in the exercise of its police power, to regulate negotiations for interstate transportation "where they affect *matters of local concern* and do not infringe the national interest in maintaining the free flow of commerce and in preserving uniformity in the regulation of commerce in matters of national concern." In *Parker v. Brown*, supra, this Court said (317 U.S., at p. 362):

> "When Congress has not exerted its power under the Commerce Clause and state regulation of *matters*

of local concern is so related to interstate commerce that it also operates as a regulation of that commerce, the reconciliation of the power thus granted with that reserved to the state is to be attained by the accommodation of the competing demands of the state and national interests involved." (Citing cases.) (Emphasis supplied.)

These authorities thus show that the state's power to regulate, no matter what the *purpose* of the regulation, extends only to *matters of local concern;* those matters which are of national concern are wholly beyond the scope of the state power. As was said in the *Milk Control Board Case* (306 U.S., at p. 351) and again in the *Edwards Case* (314 U.S., p. 176), quoting the substance of the earlier pronouncement in the *Minnesota Rate Cases*, (230 U.S., p. 399):

> "This Court has repeatedly declared that the grant (the Commerce Clause) established the immunity of interstate commerce from the control of the states respecting all those subjects embraced within the grant which are of such a nature as to demand, that if regulated at all, their regulation must be prescribed by a single authority."

There are not less than three cases, all decided since the *Minnesota Rate Cases*, and one of very recent date, in which this Court has held that state police-power laws or regulations, obviously in the interest of public safety and welfare, and apparently bearing some relation to that purpose, were invalid because in violation of the Commerce Clause: specifically, because either they invaded the exclusive national field, or in the guise of regulating a

local matter they directly interfered with and obstructed interstate commerce. In

Kansas City Southern Ry. Co. v. Kaw Valley Drainage Dist., supra (233 U.S. 75),

the railroad company had challenged the validity of certain orders requiring it to remove bridges which were part of its interstate railroad system. There had recently been disastrous floods in the streams crossed by these bridges, and a comprehensive flood and drainage program had been authorized by the state. The removal or substantial change in the location of these bridges would have greatly facilitated completion of the project. It was not seriously disputed that these orders were thus reasonably related to public health and safety. But this Court, without undertaking to review that issue, held the orders invalid because they were a direct invasion of an exclusive national field, in that they undertook to regulate a subject-matter which by its very nature was subject only to federal control. This Court said (233 U.S., pp. 78-79):

> "They are out and out orders to remove bridges that are a necessary part of lines of commerce by rail among the States. But *that subject-matter is under the exclusive control of Congress, and is not one that is left to the States until there shall be further action on its part.* The freedom from interference on the part of the States is not confined to a simple prohibition of laws impairing it, but extends to interference by any ultimate organ.
>
> . . . . . .
>
> *The decisions also show that a State cannot avoid the operation of this rule by simply invoking the con-*

venient apologetics of the police power. It repeatedly has been said or implied that a direct interference with commerce among the States could not be justified in this way. *The State can do nothing which will directly burden or impede the interstate traffic of the company, or impair the usefulness of its facilities for such traffic.* (Citing cases.)" (Emphasis ours.)

In

Seaboard Airline R. Co. v. Blackwell, supra (244 U.S. 310),

this Court held invalid a Georgia statute which required the engineer of every railroad train to sound the whistle at least 400 yards before arriving at each highway grade crossing, and at the same time to check and keep checking the speed of his train so as to be able to stop in time if the crossing were occupied by highway traffic. It was shown that interstate trains, if required to conform to this law, would be delayed several hours beyond their normal schedules. Although there was not, and could not be, any question but that the state regulation bore a reasonable relation to public health and safety, the Court did not consider that point; it found the regulation to be invalid because of the direct and intolerable burden imposed upon interstate commerce.

In

Edwards v. California, supra (314 U.S. 160),

this Court reviewed a California statute which prohibited the bringing or assisting into the state of any indigent non-resident, and held it invalid, in violation of the Com-

merce Clause, because it directly regulated a subject matter which, if regulated at all, must be regulated only by Congress itself.

It might be argued, with considerable force, that a statute prohibiting the influx of indigent persons is directly and reasonably related to the public health and welfare, because if operates to relieve local communities of the burden of care sometimes imposed by the presence of large numbers of persons without adequate means of support. Indeed, an argument somewhat to that effect was presented in support of the law before this Court. But the Court did not attempt to decide whether the regulation was reasonable or bore a reasonable relation to its claimed purpose. After citing *California v. Thompson*, supra (313 U.S. 109), and referring to the principle that the states may regulate, under the police power, in *matters of local concern* even though interstate commerce is affected, the Court said (at pp. 173-174, 176):

> "But this does not mean that there are no boundaries to the permissible area of State legislative activity. There are. *And none is more certain than the prohibition against attempts on the part of any single State to isolate itself from difficulties common to all of them by restraining the transportation of persons and property across its borders.* It is frequently the case that a State might gain a momentary respite from the pressure of events by the simple expedient of shutting its gates to the outside world. But, in the words of Mr. Justice Cardozo: 'The Constitution was framed under the dominion of a political philosophy less parochial in range. It was framed upon the theory that the people of the several States

must sink or swim together, and that in the long run prosperity and salvation are in union and not division.' *Baldwin v. Seelig*, 294 U.S. 511, 523.

"It is difficult to conceive of a statute more squarely in conflict with this theory than the Section challenged here. Its express purpose and inevitable effect is to prohibit the transportation of indigent persons across the California border. The burden upon interstate commerce is intended and immediate; it is the plain and sole function of the statute. . . . We think this statute must fail under any known test of the validity of State interference with interstate commerce."

After further discussion, the Court continued with the quotation from the opinion in *Milk Control Board v. Eisenberg Farm Products*, supra, to which reference has already been made, as follows:

"'This Court has repeatedly declared that the grant [the commerce clause] established the immunity of interstate commerce from the control of the States respecting all those subjects embraced within the grant which are of such a nature as to demand that, if regulated at all, their regulation must be prescribed by a single authority.' *Milk Control Board v. Eisenberg Farm Products*, 306 U.S. 346, 351. We are of the opinion that the transportation of indigent persons from State to State clearly falls within this class of subjects." (Emphasis supplied.)

The application of this decision to the facts in the case at bar is plain and obvious. The train-limit law, like the California statute in the cited case, is plainly an attempt to regulate interstate commerce in the interest of some

local or, as the Court says, "parochial" purpose, and without regard to the results of the restraint upon the general conduct and movement of interstate commerce. The inevitable effect of the law is to regulate and obstruct the transportation of interstate commerce across the Arizona boundaries, and across the territory of both the state itself and the adjoining states. The burden upon interstate commerce is intended and immediate; it is the plain and obvious function and result of the statute. If the transportation of only *one* class of person (indigents) from state to state is a subject as to which national regulation alone may be had, then certainly it cannot be argued that the transportation of *all kinds* of persons and property in interstate commerce from state to state, and across several states, is not equally a subject for national regulation alone.

The essential question is therefore whether, upon the facts, and in the light of the controlling pronouncements, the challenged law is, on the one hand, a regulation of a subject matter of national concern, embraced within the exclusive national field; or is, on the other, a regulation of a matter of purely local concern, which may be appropriately regulated by the several states as long as they do not impair the national interest in preserving uniformity on national matters or obstruct the free flow of commerce, and thus permissible provided other conditions of validity are satisfied; that is, provided: (1) the burdens or interferences imposed upon commerce are not more than incidental or indirect; (2) the state has acted within its own proper territorial jurisdiction; (3) Congress itself has not acted in such fashion as to occupy the field; and (4) other

constitutional restrictions, e.g., the Due-Process Clause, are not disregarded.

It requires only brief consideration of the nature of the regulation accomplished by the Arizona law, and of the inevitable effects of the statute, to demonstrate that it constitutes a regulation of a subject matter which, if regulated at all, must be regulated by Congress. The following situation, which might arise if the doctrine were generally sustained that the several states may regulate the length of interstate trains, will serve to illustrate the point. If Arizona may properly limit the length of interstate trains to 70 cars, equally New Mexico may limit their length to 65 cars, and California to 75 cars. Texas might enact a 60-car law. Oklahoma now has a 70-car law. If we assume that the general subject is properly within the power of the several states, then the number of cars which might be permitted certainly would vary in the different states, as the result of the varying judgments of the several state legislatures, or the effectiveness with which the advocates of train-limit legislation were able to press their views upon the legislators. With these varying limitations in effect, over the route of which appellant's lines across Arizona form an essential part, let us suppose that a California shipper of fresh fruits desires to ship 90 cars from a point in Southern California, over the lines of appellant and its connection the Rock Island Railroad, to some point in Kansas or beyond. With the 75-car limit in California, 15 cars of the total must be left behind, either to be handled in a following train, or deteriorate from the delay. The 75-car train can then proceed to a point west of the

Arizona boundary, such as Indio; or, if the present policy of the State of Arizona is continued, it may be moved into Yuma, even though thereby it actually crosses into Arizona with more than 70 cars. Because of the Arizona law, it must then be broken up, and five cars left behind to follow on some later train. At some point in Arizona near to but west of the New Mexico boundary line, five more cars would have to be left behind, with consequent delay. As the remaining cars approached the New Mexico-Texas boundary near El Paso, the process would have to be repeated. After re-entering New Mexico, the train could again be built up to 65 cars, and upon entering Oklahoma, to 70 cars, although not, in either case, with the cars that had been left behind; and if we suppose further that no train-limit law had been enacted in Kansas, the train, upon approaching that state, could either continue with the 70 cars, or could be held just inside of the Kansas boundary, until the cars which had previously been detached were brought forwa d and consolidated.

A similar situation could, of course, exist on any other through route passing through several states: for example, the route of the Pennsylvania Railroad from Washington to New York City. This line extends for about 226 miles, through or across five different states and the District of Columbia. Assuming as in the first example that different train-length restrictions were imposed in each of these states, and that Congress had not acted in the field, through trains moving from one of these cities to the other would have to be made up and broken up not less than four times, or on the average once every 57 miles. The

only practical alternative would be to make up each train, at point of origin, in conformity with the shortest prescribed train length in any one of the five states. In either event, speedy and efficient movement of interstate railroad traffic over the through route would become virtually impossible.

These illustrations are not in the least fanciful or overdrawn; on the contrary, they are well within the bounds of possibility.

A second consideration, which shows that the subject-matter of the Arizona law is one which must be regulated by the federal authority alone, is found in the admitted and inevitable extra-territorial effect of the limitation. The Arizona law, as a regulation of the length of interstate trains, is not restricted in effect to operations in Arizona alone. The testimony in this case establishes, with a finality which appellee never attempted to challenge, that it is wholly impracticable to locate, outside of but precisely at the Arizona boundaries, the terminals required for the making up and breaking up of trains, in order to conform their lengths to the law's restrictions. Such trains have to be operated from and to the nearest terminals outside of Arizona, in units not exceeding 70 freight cars or 14 passenger cars (in which case the extra-territorial effects of the law extend as far as Indio, California, and Lordsburg, New Mexico, and in many cases as far east as El Paso, more than 170 miles outside of the state); or, such trains have to be stopped at some convenient points outside of Arizona, when approaching the state boundary, and there remade so as to conform to the law when enter-

ing the state, and again must be stopped when leaving the state, either at those points or at points further distant, in order to be made up in the longer units which the laws in the adjoining states permit. In practice, the extra-territorial effect is to some extent avoided at the westerly boundary, by operating trains across the boundary and into the yard at Yuma, on the Arizona side, where the operation of making up and breaking up the trains is performed. There is still, however, substantial extra-territorial effect in California in the case of passenger trains, because it is not always practicable to reconstitute such trains at Yuma and they must therefore be run from or to their originating or destination terminal, at Los Angeles (a distance of 250 miles outside of Arizona), in sizes to fit the Arizona law. At the easterly boundary, there is no terminal adjacent to the state line, and none can be there constructed, except at great expense; nor would it then be practicable for use. The result is that trains are operated in conformity with the law's restrictions as far east as Lordsburg, 23 miles from the state line, and in many cases as far east as El Paso, Texas, 171 miles. This extra-territorial effect is continuous and inevitable under the law, and, as we show elsewhere, is not only not challenged, but in effect conceded by appellee (R. 1918).

In recognition of these possibilities, the Interstate Commerce Commission, in the opinion relative to *Service Order No. 85* (256 I.C.C. 523, supra) voiced the expressions already quoted and here repeated for emphasis (256 I.C.C., pp. 530-531, 534):

"If State laws limiting the number of cars in trains are to be held valid (a question we do not decide), it would be possible for each State to set a different number of cars as the maximum to be hauled in a train. A State might even limit the length of trains to one car, although such a law would be clearly arbitrary and unreasonable. Higher limits might be set by States and found reasonable, but lack of uniformity would place a serious burden on interstate commerce.

. . . . . .

"This language* is significant because train-limit laws are not matters of local concern and the regulation of the number of cars which may be put in a train does infringe the national interest in maintaining the free flow of commerce under the present emergency war conditions."

We anticipate that appellee may argue that the failure of Congress to enact legislation relative to train lengths should be taken as expressing the congressional view that the subject matter is appropriate for state regulation, and so not exclusively national in character; and in this connection it may also contend that any relief from the state restrictions must be sought from Congress and not by court action. This argument is completely disposed of by those decisions of this Court, already cited, which establish that when the subject matter is of such nature as to demand uniformity of regulation by a single authority, silence or inaction by Congress is equivalent to

*The "language" referred to appears in the next to the concluding paragraph on page 116 of this Court's opinion in *California v. Thompson*, supra (313 U.S. 109), which paragraph was quoted in full by the Commission.

a declaration that interstate commerce shall be free and untrammeled. Compare:

Welton v. Missouri, supra, 91 U.S. 275, 282;
Missouri v. Kansas Natural Gas Co. (1924), 265 U.S. 298, 310, 68 L.ed. 1027.

As this Court indicated in the *Minnesota Rate Cases*, supra (230 U.S., at pp. 402-403), it is only when the "subject is peculiarly one of *local* concern" that inaction by Congress leaves the field open to the state to make reasonable provision for local needs.

Furthermore, the argument that relief against regulation of a subject matter of national concern must be sought from Congress alone loses sight of realities. If the subject matter is of national concern but not heretofore regulated by Congress, and there has been no disposition on the part of Congress to enact such regulation, then, it may be asked, just how would one interested in setting aside a state regulation present the matter to Congress? Could he ask for the passage of a resolution affirmatively declaring that no regulation is necessary? Or should he ask Congress to adopt some affirmative regulation (though believing that none is needed) simply to make certain that the state regulation is set aside?

Although congressional regulation has extended to a great many phases of the construction and operation of interstate railroads, there has never been, so far as we can discover, any federal law or regulation prescribing the width (gauge) of the tracks. The present standard, which by common acceptance prevails throughout the nation and in adjacent foreign countries, is four feet eight and

one-half inches. Suppose that a state should now pass a law, expressly stated to be in the interest of greater safety, prohibiting the operation of any railroad within its boundaries not having a gauge of at least six feet. It can be argued, with at least as much plausibility as in the case of a train-limit law, that a regulation imposing this wider gauge is in the interest of safety, and bears a reasonable relation to that purpose. If the theory of the "national field" heretofore advanced by appellee and impliedly sustained by the state court is correct, the regulation would fall within the "joint field", and (assuming apparent reasonableness) this Court could not interfere; the only remedy would be by petition to Congress. Of course, the interruption and obstruction to interstate commerce resulting from such a law would be so immediate, obvious, and complete as to leave no judicial doubt of the necessity of uniform regulation; if any were required; and we cannot believe that any court would hesitate to hold the law wholly invalid under the Commerce Clause.

A regulation of the width of the track and thus of the trains is no different in principle, and not greatly different in its effects upon interstate commerce, from a law which limits the length of trains. For each of these two regulations a specious claim of greater safety can probably be made. Each unquestionably would, and in the case of the train-limit law demonstrably does, interfere with the proper conduct of interstate commerce, imposing direct and substantial obstructions to its free movement. A regulation of gauge would of course actually prevent the through movement of cars, and compel physical

transfer of freight and passengers at or before reaching the state boundaries; the regulation of train length, however, delays and at times prevents the movement of cars, because it requires them to be detached from trains in which they are being handled and could continue to be handled, and held at points adjacent to or outside of state boundaries until trains can be made up in lengths conforming to the restriction, so that the cars can proceed. In the case of passenger traffic, the restriction of train length may, and upon occasion does, require the actual transfer of passengers from one car to another, and thus is practically equivalent, from the standpoint of delay and inconvenience, to a compulsory change of gauge.

The precise question whether the subject matter of the length and consist of interstate railroad trains falls within the exclusive national field of regulation has never been presented to this Court in such form as to result in a direct ruling. There are, however, not less than three decisions of this Court which, although not relating directly to the subject of train lengths, do relate to subjects so closely similar that no distinction in principle can be observed, and thus hold, at least indirectly, that the subject matter is one requiring a national or uniform system of regulation, and hence within the exclusive national field; viz.:

Hall v. DeCuir, supra (95 U.S. 485);
South Covington Ry. Co. v. Covington, supra (235 U.S. 537);
Kelly v. Washington, supra (302 U. S. 1).

The *DeCuir Case* arose out of a Louisiana law requiring equal rights and privileges without discrimination as to

race and color. Mrs. DeCuir, a negress, sought accommodations on a boat plying between Louisiana and Mississippi and demanded them in the cabin specially set apart for white persons. Her demand was refused. She sued for damages under the state act, and the defense was that the statute was void because an attempt to regulate commerce among the states. This Court, in denying her claim, said (95 U.S., at pp. 488-490):

> "But we think it may safely be said that state legislation which seeks to impose a direct burden upon interstate commerce or to interfere directly with its freedom, does encroach upon the exclusive power of Congress. The statute now under consideration, in our opinion, occupies that position. It does not act upon the business through the local instruments to be employed after coming within the state, but directly upon the business as it comes into the state from without or goes out from within. While it purports only to control the carrier when engaged within the state, it must necessarily influence his conduct to some extent in the management of the business throughout his entire voyage.
>
> "It was to meet just such a case that the commercial clause in the Constitution was adopted. The river Mississippi passes through or along the borders of ten different states, and its tributaries reach many more. The commerce upon these waters is immense, and its regulation clearly a matter of national concern. *If each state was at liberty to regulate the conduct of carriers while within its jurisdiction, the confusion likely to follow could not but be productive of great inconvenience and unnecessary hardship.* Each state could provide for its own passengers and

regulate the transportation of its own freight, regardless of the interests of others. Nay more; it could prescribe rules by which the carrier must be governed within the state in respect to passengers and property brought from without. On one side of the river or its tributaries he might be required to observe one set of rules, and on the other another. *Commerce cannot flourish in the midst of such embarrassments.*"

"As was said by Mr. Justice Field, speaking for the court in Welton v. The State of Missouri, 91 U.S. 282, 'inaction (by Congress) . . . is equivalent to a declaration that interstate commerce shall remain free and untrammeled'. Applying that principle to the circumstances of this case, congressional inaction left Benson at liberty to adopt such reasonable rules and regulations for the disposition of passengers upon his boat, while pursuing her voyage within Louisiana or without, as seemed to him most for the interest of all concerned. The statute under which this suit is brought, as construed by the state court, seeks to take away from him that power so long as he is within Louisiana; and while recognizing to the fullest extent the principle which sustains a statute, unless its unconstitutionality is clearly established, we think this statute, to the extent that it requires those engaged in the transportation of passengers among the states to carry colored passengers in Louisiana in the same cabin with whites, is unconstitutional and void. If the public good requires such legislation, it must come from Congress and not from the States." (Emphasis ours.)

Although the *DeCuir Case* was decided in 1877, it has frequently been cited and followed by this Court, and is

unquestionably still regarded as a correct statement of principle. Thus, it was one of the leading cases referred to in the opinion in the *Minnesota Rate Cases*, supra (230 U.S., at p. 401), and was likewise cited in *South Carolina Highway Dept. v. Barnwell Bros.* (1938), 303 U.S. 177, 185, 82 L. ed. 734.

In *South Covington R. Co. v. Covington*, supra (235 U.S. 537), it was held that the City of Covington, Kentucky, could not regulate the interstate business of a street railway company transporting passengers from that city to Cincinnati, Ohio, by restricting the number of passengers which the company might admit to its cars, and requiring it to operate sufficient cars to accommodate the public within such restriction. The Court said (235 U.S., at pages 547-548):

> "To comply with these regulations, the testimony shows, would require about one-half more than the present number of cars operated by the Company, and more cars than can be operated in Cincinnati within the present franchise rights and privileges, held by the Company, or controlled by it, in that City. Whether, in view of this situation, this regulation would be so unreasonable as to be void, we need not now inquire. These facts, together with the other details of operation of the cars of this Company, are to be taken into view in determining the nature of the regulations here attempted, and whether it so directly burdens interstate commerce as to be beyond the power of the State. We think the necessary effect of these regulations is not only to determine the manner of carrying passengers in Covington and the number of cars that are to be run in connection with

the business there, but necessarily directs the number of cars to be run in Cincinnati, and the manner of loading them when there, where the traffic is much impeded and other lines of street railway and many hindrances have to be taken into consideration in regulating the traffic. If Covington can regulate these matters, certainly Cincinnati can, and interstate business might be impeded by conflicting and varying regulations in this respect, with which it might be impossible to comply. *On one side of the river one set of regulations might be enforced, and on the other side quite a different set, and both seeking to control a practically continuous movement of cars.* As was said in Hall v. DeCuir, 95 U.S. 485, 489, 'commerce cannot flourish in the midst of such embarrassments.'

"We need not stop to consider whether Congress has undertaken to regulate such interstate transportation as this, for it is clearly within its power to do so, and absence of Federal regulation does not give the power to the State to make rules which so necessarily control the conduct of interstate commerce as do those just considered." (Emphasis supplied.)

Like *Hall v. DeCuir*, supra, the *South Covington Case* has also been cited frequently by this Court. Moreover, it has not been overruled in the so-called *Second South Covington Case (South Covington etc. R. Co. v. Kentucky* (1920), 252 U.S. 399, 64 L.ed. 631), as appellee has at times suggested. Reference to the majority opinion in the latter case (252 U.S., at pp. 403, 404) will reveal that the Court drew a very substantial distinction between the Kentucky statute, which it sustained in the *Second South Covington Case*, and the city ordinance which it invalidated in the *First Case*. In the *Second Case*,

the Court held that there was a distinct operation in Kentucky, authorized and required by the charter of the companies, and that the state act in question regulated that operation and not more, and therefore was not a regulation of interstate commerce. It also said, after citing the *First Case*, that the state act affected interstate business *incidentaly*, and did not subject it to unreasonable demands.

Referring further to the *First Case*, the Court said (p. 404):

> "The cited case expresses the principle of decision and marks the limitation upon the power of a state, and when its legislation is or is not an interference with interstate commerce."

In any event the *First South Covington Case* has apparently not been regarded by this Court as without authoritative force. It has been cited with approval in other decisions both before and since the *Second Case*. Prior thereto it was cited in:

Western Oil Refining Co. v. Lipscomb (1917), 244 U.S. 346 (349), 61 L.ed. 1181 (1184);

M. K. & T. Ry. Co. v. Texas (1918), 245 U.S. 484 (489), 62 L.ed. 419 (422); and

Denver & Rio Grande R. R. Co. v. Denver (1919), 250 U.S. 241 (246), 63 L.ed. 958 (962).

In the *Denver Case* it was referred to in support of the proposition that a city ordinance requiring the removal of a spur track from a street intersection was not invalid, in violation of the Commerce Clause, for the following reason as stated by the Court (p. 246):

"The ordinance makes no discrimination against interstate commerce, will not impede its movement in regular course, and will affect it only *incidentally and indirectly.*" (Emphasis ours.)

Subsequent to the *Second Case*, the *First Case* was cited with approval in the unanimous opinion of the Court in

Hartford Accident, etc., Co. v. Illinois (1936), 298 U.S. 155 (158), 80 L.ed. 1099 (1102),

where it was coupled with the *Minnesota Rate Cases.*

The most recent citation of the *First South Covington Case* is at the conclusion of this Court's opinion in *Terminal Railroad Assn. v. Brotherhood* (1943), 318 U.S. 1, 9, 87 L.ed. 571, where the results of the *South Covington* decision were briefly summarized, and it was pointed out that the challenged ordinance was struck down "because of the likelihood that serious burdens would be imposed upon interstate commerce by virtue of the impossibility of compliance with probable conflicting regulations."

The *Kelly Case* (*Kelly v. Washington*, 302 U.S. 1) arose out of an attempt by the State of Washington to enforce a code of regulations applying to motor-driven tugs; it appearing that Congress, though it had enacted a rather complete code of regulation for steam vessels, as well as for motor-driven vessels of certain sizes, had restricted the scope of the regulations applying to the latter so as to exclude all but a very few of the tugs involved in this case. An initial question in the case was therefore whether Congress, by means of the federal acts, had occupied the field of regulation in such fashion as to exclude the state;

there was also the further question whether the state law must fall in its entirety, on the theory that the subject matter was one as to which uniformity of regulation was required, so that no state action whatever could be undertaken.

As to the argument that Congress had occupied the field, the Court said (302 U.S., at page 9):

> ". . . The argument is also unnecessary and inapposite if the subject is one demanding uniformity of regulation so that state action is altogether inadmissible in the absence of federal action. *In that class of cases the Constitution itself occupies the field even if there is no federal legislation.*" (Emphasis supplied.)

The Court said further (at pages 14-15):

> "The remaining question is whether the state law must fall in its entirety, not because of inconsistency with federal action, but because the subject is one as to which uniformity of regulation is required and hence, whether or not Congress has acted, the State is without authority. *Cooley v. Board of Wardens*, 12 How. 299, 319; *Minnesota Rate Cases*, 230 U.S. 352, 399, 400.
>
> "The state law is a comprehensive code. While it excepts vessels which are subject to inspection under the laws of the United States, it has provisions which may be deemed to fall within the class of regulations which Congress alone can provide. For example, *Congress may establish standards and designs for the structure and equipment of vessels, and may prescribe rules for their operation, which could not properly be left to the diverse action of the States. The State of*

Washington might prescribe standards, designs, equipment and rules of one sort, Oregon another, California another, and so on." (Emphasis supplied.)

The Court then concluded that the state might, for the protection of its people, provide for the inspection of vessels which were actually unsafe and unseaworthy, and that such inspection, for the purpose of insuring those objects, constituted a subject matter as to which uniformity of regulation in all aspects was not required; but the Court continued (at page 15):

> ". . . . If, however, the State goes farther and attempts to impose particular *standards* as to structure, design, equipment *and operation which* in the judgment of its authorities may be desirable but *pass beyond what is plainly essential to safety and seaworthiness*, the State will encounter the principle that such requirements, if imposed at all, must be through the action of Congress which can establish a uniform rule." (Emphasis supplied.)

The quoted language applies with peculiar force to the instant case. Clearly the train-limit law is no mere provision for the inspection of trains or cars, to insure the detection of those which are defective, and thus unsafe to be handled. On the contrary, it is a positive and inelastic state-made "*rule and standard*" for the operation of appellant's interstate trains; indeed, it is hard to conceive of any rule which a state might prescribe more directly controlling and regulating such operations. It is just such a rule as might (to borrow the Court's illustration) be of "one sort" in Arizona, another in California, still another in New Mexico, "and so on". It

therefore falls squarely within the condemnation expressed in the portion of the opinion last quoted: i.e., it passes "beyond what is plainly essential to safety", and "encounters the principle that such requirements, if imposed at all, must be through the action of Congress which can establish a uniform rule" if one be required.

The question whether the regulation of train lengths falls within the exclusive national field was *directly* presented in each of the series of train-limit cases in the United States District Courts, to which we have already referred. In both the *First Arizona* and the *Nevada Cases* the courts held that the subject matter is such as to demand uniform regulation, and thus within the exclusive national field. In the *Oklahoma Case*, on the other hand, the majority held that the subject matter lies within the so-called "joint" field; and is properly subject to regulation by the state, unless and until the National Government acts, and always provided, of course, that the burden imposed upon interstate commerce is no more than *incidental* or *indirect*.

The three-judge court which rendered the opinion in the *First Arizona Train-Limit Case* appears to have regarded the *DeCuir* and *First South Covington Cases* as practically determinative, for the cases were cited and relied upon in that part of its opinion relating to the point now under discussion. Specifically, it was said, in the *Arizona Case* (2 F.Supp., at page 859):

> "Clearly, the Constitution has conferred upon Congress full and exclusive power to regulate commerce between the states, and any attempted enforcement of the statute of a state, passed under the guise of the police power, which directly affects interstate com-

merce to such an extent as to amount to a regulation thereof, is void and will be enjoined. (Hall v. DeCuir, 95 U.S. 485, and other cases.)

"If it should be determined that the various states have power to regulate interstate train lengths, then each state might prescribe a different limitation. A transcontinental shipment originating in California and destined for the Atlantic seaboard would require the carrier to break up and rearrange its trains before it could enter the boundaries of each state to comply with these varying limitations. This would involve an unreasonable delay in the handling of interstate traffic and impose an unreasonable burden on the same. The evidence shows that attempts have been made in the states of Indiana, Illinois, Wisconsin, California, Colorado and others to pass statutes, the effect of which are to limit the number of cars in trains. Indiana proposed a 70-car limit; Illinois a half-mile limit; Wisconsin a 3,300 ft. limit; California various limits based on grades—of a half mile or more, and different limits on different grades; Colorado a 65-car limit on certain grades and on grades of not less than one per cent, a 55-car limit.

"The present practice of the plaintiffs in its observance of the Arizona Law is illustrative of the extent of interference and the burden that would be imposed upon commerce if different regulations should be prescribed in different states. At the present time east-bound freight trains leave points in California consisting of from eighty to one hundred cars or more. These trains are hauled to division points west of the boundary of Arizona. They are there broken up into shorter trains of seventy cars or less to comply with the Arizona law. Additional train and en-

gine crews are provided, the short trains are then hauled through the state to a division point east of the state boundary, where they are again coupled up into long trains which continue on their transcontinental journeys. The same practice prevails as to west-bound transcontinental traffic."

The court then quoted a portion of the language from the opinions in the *DeCuir* and *Covington Cases*, and continued:

> *"We are convinced that the subject of the length of trains engaged in interstate traffic is national in its character, requiring uniformity of regulation, and that the power to so regulate is exclusively conferred upon Congress by the Commerce Clause of the Constitution."* (Emphasis supplied.)

The Mid-Train Caboose Case:

(Southern Pac. Co. v. Railroad Commission (1935), 10 F.Supp. 918).

We have heretofore called attention to the close resemblance, particularly in legal aspect, between the instant case and the *California Mid-Train Caboose Case*. In that case the court cited and relied upon many of the authorities referred to in this brief; and this was particularly true of its review of the point, there presented by this appellant (as plaintiff) in substantially the same manner as in the instant case, that the order challenged as invalid constituted an invasion by the State, under the "convenient apologetics of the police power," of a field of regulation where Congress possesses exclusive power and the State may not enter even in the absence of Congressional

action. The court said, in part (10 F. Supp., at page 920):

> "That the Commerce Clause of the Constitution has conferred upon Congress full power to regulate interstate commerce is all but elementary, and any attempt by a state to interfere with such exclusive regulation has been held unconstitutional and void."

The court then cited certain of the decisions referred to herein; and quoted from the opinions in the *Minnesota Rate Cases* and the *K. C. S. Ry. Co. Case*; also citing *Hall v. DeCuir*, supra, to the point (page 922):

> "It is equally well settled that a state may not under the guise of the police power directly interfere with interstate commerce."

The court also said (at page 922):

> "If the order bears a reasonable relationship to public health and safety, and does not transgress the constitutional protection of interstate commerce, the power of the state to make it cannot be questioned."

We emphasize the twofold condition which, the court declared, must be satisfied if a purported police-power order is not to be set aside. The sentence last quoted might, with equal propriety and fidelity to controlling principles announced by this Court, have been phrased as follows:

> "Even if the order bears a reasonable relationship to health and safety, but also transgresses the constitutional protection of interstate commerce, the power of the state to make it cannot be sustained."

Such was indeed precisely the holding of the court in the case. After a lengthy discussion (pages 923-924) of the evidence bearing upon the reasonableness of the order as a health and safety measure, the court said (page 924):

> "*The issue relative to the order as an attempted regulation in the interests of health and safety is not free from doubt*, but we think that what was said by the Supreme Court in Hall v. DeCuir, 95 U.S. 485, 24 L.ed. 547, is applicable to the issue." (Emphasis supplied.)

The court then quoted at length from the opinion in *Hall v. DeCuir*, including particularly in its quotation the following language from that opinion (95 U.S., at page 488):

> "We think it may safely be said that State legislation which seeks to impose a direct burden upon interstate commerce or to interfere directly with its freedom, does encroach upon the exclusive power of Congress. The statute now under consideration, in our opinion, occupies that position. It does not act upon the business through the local instruments to be employed after coming within the State, but directly upon the business as it comes into the State from without or goes out from within. While it purports only to control the carrier when engaged within the State, it must necessarily influence his conduct to some extent in the management of his business throughout his entire voyage. Uniformity in the regulations by which he is to be governed from one end to the other of his route is a necessity in his business, and to secure it Congress, which is untrammeled by State lines, has been invested with the exclusive legislative power of determining what such regulations shall be."

To support its view, the court cited also the *First South Covington Case*, supra, among others.

We emphasize again that the question whether the statute under attack was reasonable *as a police-power regulation* was not the essential point decided in *Hall v. DeCuir*: the essence of that decision was that a state regulation, *even though it might be reasonable*, could not stand if in purpose and effect it directly regulated a subject matter within the exclusive national field. Such was precisely the position taken by the court in the *Mid-Train Caboose Case*: it recognized that *Hall v. DeCuir* was and is controlling, even though the reasonableness of the order, as a police power regulation, was "not free from doubt."

Interstate Commerce Commission Service Order No. 85.

In earlier passages of this brief, we have called attention to Service Order No. 85, issued by the Interstate Commerce Commission effective September 15, 1942, which order requires all interstate rail carriers subject to the Interstate Commerce Act to operate their trains during the present emergency without regard to state train-limit laws, when necessary to avoid congestion or move traffic promptly; the order being predicated upon recitals of fact by the Commission that such train-limit laws may result in congestion, wasteful use of locomotives, and interference with the free flow of traffic, and that "long" trains may be operated in accordance with existing safety standards.

Considered superficially, it might seem that the greater significance of this order in the instant case is in relation to either the "safety" or the "interference" issues. While

undoubtedly the order is of great pertinency in those respects, we think it also has direct bearing upon the point now under discussion: the "exclusive national field" issue.

The order is addressed to an emergency, presently declared to exist, and by its terms will continue effective only for the duration of that emergency; but it is not based upon an emergency statute. The provisions found in paragraphs 10 to 17 of Section 1 of the Interstate Commerce Act, under authority of which the order by its terms was issued, were enacted in 1917, and expanded in 1920 (41 Stat. L. 476) and have been continued in effect, with amendments not material to this discussion, up to the present time. Congress thus recognized many years ago that the power exists, under the Commerce Clause, to prevent interferences with and delays to the free flow of interstate commerce moving in the cars and trains of railroad carriers; recognized, further, the necessity for efficient and economical use of motive power and other equipment; and thereupon delegated to its own agency, the Interstate Commerce Commission, the exercise of that power; just as, for other purposes, it has delegated to the Commission its constitutional power to regulate the rates and charges, and various other aspects of the operations and activities of such carriers. To be sure, the power is now exercised because of the necessities arising from the emergency. But the emergency does not create the power; it has simply called for its exercise, because the Commission has recognized that the interferences, burdens and delays imposed by the Train-Limit Law, though serious in time of peace, have in time of war become much more acute, and therefore an intolerable impediment and hazard, not merely to

the free flow of the commerce of the nation, but to the national welfare, and, indeed, the national existence. The emergency has simply accentuated and brought into sharper relief that the power to abate these interferences exists, and must and should be exercised. But the power itself, by virtue of which the carriers are required to disregard the state restrictions, rests today, as it did in 1917 when the statutory provisions were passed, and as it has, indeed, ever since 1789, when the Federal Government under our Constitution first commenced to function, upon the grant of power expressed in the Commerce Clause, and the essential immunity from state regulation thereby conferred upon those aspects of interstate commerce as to which a uniform national system of regulation must prevail if any be required.

The order is therefore, beyond any question, an exercise of power by Congress through its delegated agency which, even if the field of train-limit regulation were joint or concurrent, would oust completely the conflicting state enactment. But the order is much more: it is a definite expression of the exclusive federal power; a recognition, by mandatory direction, of the paramount federal interest in the employment by the railroads constituting the national transportation system of those operating methods which, are notoriously known and, by this record, convincingly shown to result in the speediest, safest, and most efficient transportation, and in the elimination of the artificial, state-imposed handicaps which create and augment waste, delay, and hazard.

It may be suggested, on behalf of appellee, that as a result of this order the instant case has become moot, or

that the penalties demanded by the complaint have been suspended. Such is not the fact. The alleged violations occurred in March and April, 1940, long before the issuance of the order. If the statute is valid, appellant is liable for those penalties; but if it is invalid, there is no liability. As already emphasized, the instant case is a prosecution of the character contemplated by Section 28-401 of the Arizona Annotated Code, 1939 (Laws of 1931, Chapter 84), and was brought for the express purpose of enabling the validity of the challenged statute to be tested.

Furthermore, since the order by its terms suspends the train-limit restrictions for the period of the emergency only, it does not afford the same permanent character of relief which would follow from a final decision holding the law invalid. Because of the temporary character of the order and the uncertainty as to when it will expire by its terms, appellant cannot undertake the permanent investments in siding extensions, roundhouse and shop facilities and other improvements which, as the record shows, will be necessary to enable it to conduct a standard long-train operation in Arizona in the same manner and to the same extent as elsewhere upon its system. These investments would be warranted only if appellant were reasonably assured that the restrictions are permanently removed. The temporary relief granted by the order of course enables appellant to achieve much greater economy, efficiency, and safety in its Arizona operations, and to avoid the wasteful congestion, interference and delay inherent in restricted operations; but the long-train operations are still limited, just as they were during the month of April, 1940, by the fact that the fixed plant and

equipment in Arizona is not at present adapted to long-train operation. For example, just as in 1940, and because the passing tracks and sidings in Arizona do not generally accommodate trains of more than 70 freight cars, it is not presently practicable to operate long trains in both directions at the same time.

Irrespective of the order, therefore, it is essential that the instant case be fully and finally decided by this Court, so that the present uncertainty may be ended, and appellant may know whether it will be warranted in undertaking the extensive improvements required to enable its Arizona properties to be operated efficiently, safely and economically, and in accordance with the standard practice prevailing elsewhere in the United States.

The Court will note that in the preamble to its order the Commission has declared that long trains may be operated "in accordance with safety standards now applicable." The present safety standards are the same as those existing in 1940 and 1941, when the instant case was tried; there have been no amendments to existing state or federal safety statutes applicable to the operation of railroad trains in Arizona, nor any new enactments. The order should, therefore, be given great weight, as an expression of view by an expert tribunal "created by law and informed by experience" (*Illinois Central R. Co. v. Commission* (1907), 206 U.S. 441, 454; 51 L.ed. 1128), on the question whether long-train operation is safe, practicable, and efficient in those states (Arizona and Oklahoma), where train-limit laws now exist. However, the order is more than a mere expression of such views; it is an outright

recognition of the correctness of the trial court's finding and conclusion that the permissible number of cars in an interstate train is a subject of exclusive national concern, as to which the states have no power of regulation, even in those cases where Congress has not seen fit to act, either directly or by its delegated agency.

Review of Certain Cases Heretofore Relied Upon by Appellee.

In its discussions of the "national field" issue in the lower courts, appellee has largely relied upon certain decisions of this Court which we shall here review in some detail.

The Georgia Electric Headlight, New York Car Heating, and Alabama Engineer Cases:

(*Atlantic Coast Line R. Co. v. Georgia* (1914), 234 U.S. 280, 58 L.ed. 1312;
(*New York, N. H. & H. Ry. Co. v. New York* (1897), 165 U.S. 628, 41 L.ed. 853;
(*Smith v. Alabama* (1888), 124 U.S. 465, 31 L.ed. 508.)

The *Georgia Headlight Case* involved the validity of a statute of Georgia requiring the use of electric headlights on locomotives using main lines. After a trial the railroad company was convicted of violating the law; and the judgment of the Supreme Court of the state was reviewed by writ of error.

Speaking through Mr. Justice Hughes, this Court held that the argument that other contiguous states might prescribe an oil or acetylene headlight and that "if state requirements conflict, it will be necessary to carry addi-

tional apparatus and make various adjustments at state lines, which would delay and inconvenience interstate traffic", was disposed of by the *New York Car-Heating Case*, supra; and that the suggestion was only one of "possible inconvenience": a far different situation than the picture here presented of direct, daily and substantial interference with, and obstruction to, the free movement of trains and cars engaged in a large and continuous movement in interstate commerce.

This Court held that the case was one in which, "in the absence of legislation by Congress," the states might secure "needed local protection" until Congress acted, provided that the "legislation *must not be arbitrary*, or pass beyond the limits of a *fair judgment* as to what the *exigency* demands."

In the *New York Car-Heating Case*, it was said (165 U.S., page 632):

> "The statute in question is not directed against interstate commerce. Nor it is within the meaning of the Constitution, a *regulation* of commerce, although it controls, *in some degree*, the conduct of those engaged in such commerce."

In answer to the carrier's argument that conflict between the state regulations in respect to heating of passenger cars used in interstate commerce might require passengers to leave cars at state lines, and get into other cars heated in a different mode required by the law of the state they were about to enter, the Court said that "these *possible inconveniences*" could not affect the state's police power, and also again characterized the possible

effect of the act as merely an "inconvenience." That statute was of quite a different sort from the Train-Limit Law; it did not require cars concededly fit for the transportation of passengers or freight, moving therein in a continuous movement in interstate commerce, to be detached at the state line, to remain there or be sent forward on another train. The Arizona statute does so. Nor did it, as does the Arizona law, require, outside as well as inside the borders of the state, expensive and unnecessary operations by limiting the length of trains engaged in continuous movement in interstate commerce.

Smith v. Alabama, supra (124 U.S. 465, 31 L.ed. 508), was also cited in the *Georgia Headlight Case* (234 U.S., p. 291) to the point that state rules prescribed for railroad construction and for their management and operation, designed to protect persons and property otherwise endangered by their use, are strictly within the limits of the local law. *They are not per se regulations of commerce; it is only when they operate as such in the circumstances of their application, and conflict with the expressed or presumed will of Congress* exerted on the same subject that they can be required to give way to the supreme authority of the Constitution." That case upheld an Alabama statute requiring locomotive engineers in that state to be examined and licensed. Upholding the statute, and following a long discussion which does not at all bear on the question of entry into a national field, it was concluded by the Court (124 U.S. at page 482, italics ours):

"In conclusion, we find, therefore, first, that the statute of Alabama, the validity of which is under

consideration, *is not, considered in its own nature, a regulation of interstate commerce,* even when applied as in the case under consideration; secondly, that it is properly an act of legislation within the scope of the admitted power reserved to the State to regulate the relative rights and duties of persons being and acting within its territorial jurisdiction, intended to operate so as to secure for the public, safety of person and property; and, thirdly, that *so far as it affects transactions of commerce among the States, it does so only indirectly, incidentally, and remotely, and not so as to burden or impede them, and, in the particulars in which it touches those transactions at all, it is not in conflict with any express enactment of Congress on the subject, nor contrary to any intention of Congress to be presumed from its silence.*" (A clear recognition of the "exclusive field" principle.)

Applying that quotation to the case at bar, we find that the Arizona statute "considered in its own nature" is "a regulation of interstate commerce" and that "so far as it affects transactions of commerce among the states" it does so directly and not, as in the *Alabama Case*, merely "indirectly, incidentally and remotely"; also, in the instant case, the Arizona law burdens and *impedes* interstate commerce, and is "contrary to any (the) intention of Congress to be presumed from its silence" in a matter which, if regulated at all, should be regulated by Congress.

N. C. & St. L. Ry. Co. v. Alabama (1888), 128 U.S. 96, 32 L.ed. 352, is a companion to *Smith v. Alabama*, supra, in that it follows much the same line of reasoning, and in fact quotes extensively from the

opinion. So far as the present case is concerned, it is sufficient to note that the Court pointedly remarked that the state regulation under attack, which required all operating employees on railroads to be examined and certified as being free of color blindness, was of the same character as the statute requiring engineers to be examined and certified; the Court saying further (128 U.S., at p. 101; 32 L.ed., at p. 354):

> "Such legislation is not directed against commerce, and only affects it *incidentally*, and therefore cannot be called, within the meaning of the Constitution, a regulation of commerce."

The *Alabama Cases* must also be read with the qualification expressed by the Court at the end of the opinion in *Illinois Central Railroad Co. v. Illinois* (1896), 163 U.S. 142, 41 L.ed. 107, that (page 154):

> "The State may make reasonable regulations to secure the safety of passengers, even on interstate trains, while within its borders. But the State can do nothing which will *directly burden* or *impede* the interstate traffic of the company, or *impair the usefulness of its facilities for such traffic*. Railroad Co. v. Richmond, 19 Wall. 584, 589; Stone v. Farmers' Loan & Trust Co., 116 U.S. 307, 334; Smith v. Alabama, 124 U.S. 465."

The *Illinois Central Case* was relied on in the opinion in the *First Arizona Case*. It was also cited with approval in *Cleveland etc. Ry. Co. v. Illinois* (1900), 177 U.S. 514, 44 L.ed. 869. The *Cleveland Case* refers at the beginning of the opinion to a number of cases, including *Smith v.*

Alabama, supra, and *New York etc. R. R. v. New York*, supra, and characterizes them as "local laws," saying (at p. 517)—and the disjunctive "or" is significant:

> "In none of these cases was it thought that the regulations were unreasonable *or* operated in any just sense as a *restriction upon interstate commerce.*" (Emphasis supplied.)

But what to us is the most persuasive argument that, by his opinion in the *Georgia Headlight Case*, Mr. Justice Hughes did not depart from the "national field" doctrine, is the list of cases he cited following his quotation from the *Alabama Case*. He included the *Minnesota Rate Cases*, supra—in which he wrote the opinion—and referred to page 402 of that opinion.

In the portion of the opinion immediately preceding that page, and as shown by our prior quotation therefrom, it was held "that the states cannot, under any guise, impose *direct* burdens upon interstate commerce * * * that the states are not permitted *directly* to regulate or restrain that which, from its nature, should be under the control of the one authority, and be free from restriction save as it is governed in the manner that the national legislature constitutionally ordains." Thereafter, with the citation of many authorities, the opinion enumerated certain types of regulation which were forbidden to the states, and continued with the following language, already quoted (230 U.S., at p. 402):

> "But within these limitations there necessarily remains to the States, until Congress acts, a wide range for the permissible exercise of power *appro-*

priate to their territorial jurisdiction although interstate commerce may be affected. *It extends to those matters of a local nature as to which it is impossible to derive from the constitutional grant an intention that they should go uncontrolled pending Federal intervention. . .*

. . . Further, it is competent for a state to govern its internal commerce, to provide local improvements, to create and regulate local facilities, to adopt protective measures of a reasonable character in the interest of the health, safety, morals and welfare of its people, although interstate commerce may be *incidentally* or *indirectly* involved." (Emphasis supplied.)

The *Georgia Headlight Case* was decided June 4, 1914. When the Court came to decide the *First South Covington Case* (235 U.S. 537) on January 5, 1915, evidently the *Georgia Case* was not an obstacle.

We think it apparent that, in speaking for the Court in the *Georgia Headlight Case*, Mr. Justice Hughes did not intend to depart from the principle, upon which we insist, that a state may legislate in the absence of congressional regulation only as to matters of local concern as described in the *Minnesota* opinion.

The essential difference between the *Georgia Headlight Case* and the case at bar is that the matter of locomotive headlights lies in the *concurrent* field, in which a state may prescribe safety regulations for cars and trains, even though they are engaged in interstate commerce, and such regulations, if not unreasonable or arbitrary, or directly affecting commerce, will be valid until and unless Congress acts on the subject; while the regulation of the

number of cars in a train employed in interstate commerce, especially in the circumstances and with the results shown in the case at bar, lies within the field exclusively reserved for congressional action.

In the *Georgia Headlight Case*, as well as in the *New York Car-Heating* and *Alabama Cases* just referred to, there was no direct and material interference with interstate commerce, or substantial delay and obstruction thereto, as in Arizona under the challenged law. The interference and delay were regarded as speculative and negligible. It was pointed out by Mr. Justice Hughes, in the *Georgia Case* (234 U.S., p. 292), that if the plaintiff's fears became "realities," the remedy was with Congress. There is no such speculation here. The actual interference is real and substantial, resulting directly from enforced compliance with the law. Long trains are standard practice on the through main line that crosses Arizona, California, and New Mexico, except between Yuma and Lordsburg; and by thrusting the law's limitations between California and New Mexico, Arizona in effect chokes and directly interferes with the continuous stream of interstate transportation that passes across the Arizona "bridge."

Requiring a safety device on a locomotive, or a safer method of heating cars, are in a different category, and have effects quite different, from the actual interference with and obstruction to the free flow of interstate commerce within and without the state, that result from limiting the length of interstate trains. This Court has not hesitated to interpose the protection of the Commerce Clause when train operation is actually interfered with. By the *Covington*

Case (235 U.S. 537), and the *Train-Schedule Case* (*M. K. & T. Ry. Co. v. Texas* (1918), 245 U.S. 484, 62 L.ed. 419), the Court has denied the interpretation appellee's counsel have sought to place upon the decision in the *Georgia Case*; that is, that by that case this Court intended to give implied approval to a state train-limit law. In the *Covington Case* both the *Headlight* and *Car-Heating Cases* were characterized as "*only incidentally affecting interstate business, and not subjecting the same to unreasonable demands.*" In

Southern Ry. Co. v. R. R. Com. of Indiana (1915), 236 U.S. 439, 59 L.ed. 665,

this Court (at page 446) clarified its intention in the *Georgia Headlight Case* by saying, just before citing that case, with respect "to the appliances with which certain instrumentalities of interstate commerce may be furnished, in order to secure the safety of employees, until Congress entered that field, the states could *legislate as to equipment in such manner as to incidentally affect, without burdening* interstate commerce."

Again, after citing the *Georgia Case* and other cases, the Court said (at page 447):

> "Without, therefore, discussing the many cases sustaining the right of the States to legislate on subjects which, while *not burdening, may yet incidentally affect interstate commerce*, it is sufficient here to say that Congress has so far occupied the field of legislation relating to the equipment of freight cars with safety appliances as to supersede existing and prevent further legislation on that subject." (Emphasis ours.)

The *Georgia Headlight, New York Car-Heating* and *Alabama Cases*, which, necessarily, were discussed together,

are not therefore out of harmony with either the later or the earlier cases upon which we rely. They are leading cases, in a distinct group of cases, that hold that there is a concurrent field of regulation in which the state may legislate as to matters of *local concern* even though interstate commerce is affected, until Congress exercises its authority; that thereupon state legislation in that particular field is precluded and existing state legislation is suspended, even though it only supplements the congressional action; that the congressional action may be only to delegate to an administrative tribunal the power to regulate in the particular field, but will nevertheless be sufficient if the delegated power is duly exercised; further (and this is important) that even in the absence of congressional action in this concurrent field, the state law must not be unreasonable or arbitrary, and must not infringe the national interest in the regulation of commerce or materially obstruct the free flow thereof.

The Arkansas Full Crew Cases:

C. R. I. & P. Ry. Co. v. Arkansas (1911), 219 U.S. 453, 55 L.ed. 290;

St. Louis, I. M. & S. Ry. Co. v. Arkansas (1916), 240 U.S. 518, 60 L.ed. 776;

Missouri Pacific R. Co. v. Norwood (1931), 283 U.S. 249, 75 L.ed. 1010 (modified in 283 U.S. 809).

These three cases involved the validity of the Arkansas Full Crew Law; the first case having considered those provisions of the Act which prescribe the minimum number of employees to be used in the operation of freight trains; the second having construed those provisions which

specify the number of men on switching crews within the city limits; while the third related to the validity of the law generally. None of these cases has any bearing upon the "national field" phase of the instant case. There is a marked distinction between a state, in the absence of Congressional legislation on the subject, prescribing the number of employees who must man a train or work together as a switch crew within the state, and the same state limiting the length of trains in interstate commerce, as they enter, pass through, or leave the state. Full crew legislation relates only to the manning of trains; train limit legislation dictates how trains shall be made up, and greatly increases the number of trains, not only between points within the state, but when entering and leaving the state, and while in adjoining states. It is obvious that while a "full-crew" law enacted by a state may add expense to the operation of interstate trains, by requiring the employment of more men in train operation than the management might otherwise employ, it does not result in any delay to interstate traffic while crossing a state, or in any interference with interstate traffic as it enters or leaves the state.

A further important distinction between the *Arkansas Full-Crew Cases* and the instant case is, that in those cases no claim was made that the Arkansas Full-Crew statutes had extra-territorial effect. While that point may have been incidentally involved, the opinions do not indicate that it was relied upon by the railroad companies as a ground of complaint, or that it was passed upon by either the state or the federal courts, in considering the validity of the statutes. That distinction between those cases and

the case at bar is very important, for the evidence here shows (and appellee perforce concedes) that the challenged law operates directly to control the lengths of appellant's interstate trains, not only within Arizona, but also for substantial distances in California, New Mexico, and Texas.

It would be only in occasional and inconsequential instances that a state full-crew law would have extra-territorial effect, in its practical operation. Train and enginemen are paid on the basis of hours served or miles run (whichever results in the greatest pay for a tour on duty) and, universally, eight hours *or less* on duty, or 100 miles *or less* run, constitute a day's work and entitle the train or engineman to a day's pay. Running an extra man across the state line, as a train leaves the state and to the nearest division terminal where crews are changed, or putting him on the crew at that nearest terminal as the train is about to enter the state, would in the vast majority of cases not increase his pay above that which he would be paid if he boarded or left the train exactly at the state line. Moreover, putting the extra man on, or taking him off, does not delay the train, or require it to be broken up before it enters the state, as does a train-limit law. In any event, that point does not appear to have been urged in the *Arkansas Cases*.

The Barnwell Case and Other Motor Carrier Cases:

In earlier discussions of the "national field" issue appellee has also frequently cited this Court's recent decision in the *Barnwell Case* (*South Carolina Highway De-*

partment v. Barnwell Bros. (1938), 303 U.S. 177, 82 L.ed. 734) and certain other decisions relative to state regulations of motor carriers on state highways, particularly:

Morris v. Duby (1927), 274 U.S. 135, 71 L.ed. 967;

Sproles v. Binford (1932) 286 U.S. 374, 74 L.ed. 1167;

Maurer v. Hamilton (1940), 309 U.S. 598, 84 L.ed. 969.

In the *Barnwell Case*, this Court was directly concerned with a challenge addressed to regulations imposed by the Highway Department of South Carolina upon the weight and widths of motor vehicles, including those engaged in interstate commerce, operating upon its public highways. The evidence before the lower court was apparently conflicting upon the propriety and reasonableness of the limitations in question; and the court had undertaken to resolve that conflict, and had thereby reached the conclusion that the limitations were unreasonable and imposed unlawful burdens upon interstate commerce. That judgment was reversed on appeal, this Court holding that where a rational basis for the regulation was shown, and the means of regulation chosen were reasonably adapted to the end sought, the regulation would be sustained even though interstate commerce was *incidentally* affected.

There are a number of important features of the opinion which in our view deserve particular mention:

First, the case related to the regulation by a state of the use of its own public highways. The Court in this, as in many other cases, has recognized that the problem of regulation of vehicles on highways is peculiarly local

in character, and here observed a clear distinction between the regulation of vehicles on state-owned public highways, on the one hand, and privately-owned transportation agencies operating upon their own rights of way (i.e., railroads), on the other, saying (303 U.S., at pages 186-187):

> ". . . *The commerce clause has also been thought to set its own limitation upon state control of interstate rail carriers so as to preclude the subordination of the efficiency and convenience of interstate traffic to local service requirements.*

"But the present case affords no occasion for saying that the bare possession of power by Congress to regulate the interstate traffic forces the states to conform to standards which Congress might, but has not adopted, or curtails their power to take measures to insure the safety and conservation of their highways which may be applied to like traffic moving intrastate. Few subjects of state regulation are so peculiarly *of local concern as is the use of state highways.* There are few, local regulation of which is so inseparable from a substantial effect on interstate commerce. *Unlike the railroads, local highways are built, owned and maintained by the state or its municipal subdivisions.* The state has a primary and immediate concern in their safe and economical administration. The present regulations, or any others of like purpose, if they are to accomplish their end, must be applied alike to interstate and intrastate traffic both moving in large volume over the highways. The fact that they affect alike shippers in interstate and intrastate commerce in large number within as well as without the state is a safeguard against their abuse." (Emphasis supplied.)

Second, this Court, although stating that in matters of local concern, and where the field of regulation is joint, the state may act as to many subjects unless and until Congress acts and thereby occupies the field, also reaffirmed the principle for which we contend; namely, that the Commerce Clause of its own force forbids state regulation upon those subjects which by their very nature are of national concern. The Court said (at pages 185-186):

> "The commerce clause, by its own force, prohibits discrimination against interstate commerce, whatever its form or method, and the decisions of this Court have recognized that there is scope for its like operation when state legislation nominally of local concern is in point of fact aimed at interstate commerce, or by its necessary operation is a means of gaining a local benefit by throwing the attendant burdens on those without the state. (Citing cases.)
>
> It was to end these practises that the commerce clause was adopted."

That expression is particularly applicable here. For the challenged law, whether or not originally intended as a regulation of interstate commerce, is "in point of fact aimed at" that commerce, the traffic affected by it being approximately 94% interstate in character. The heavy burden cast upon appellant's operations thus creates obvious discriminations against such commerce. The cost of compliance cannot be recouped except by either increasing the appellant's rates and fares and thus its total revenues, or by reducing its expenditures for other purposes, and thus in some degree its ability to render adequate service. In either event, the burden is borne by inter-

state commerce, and principally by appellant's patrons shipping and traveling from and to points outside of Arizona. In a word, interstate commerce bears the added burden so that limited benefits, principally by way of increased employment opportunities, may be afforded to a comparatively few residents of Arizona.

Third, the Court did not say, as appellee has heretofore attempted to infer, that a purported police-power statute must be upheld merely because supported by expressions of partisan opinion given by interested witnesses. The Court's opinion makes it clear that a challenged state regulation must bear a *reasonable* relation to its supposed object; and must be founded on some rational basis. The presumption that a legislative enactment is supported by facts known to the legislature will not save the regulation if, upon an examination of the record, it is clear that the law does not rest upon a rational foundation. And how could the Arizona Legislature of 1912 have known what the railroad operation of 1941 would be?

Appellee's principal emphasis, in its citation of the *Barnwell Case* upon the "national-field" point, has been directed, however, to the proposition that it is not the Court's function to determine whether the burdens imposed upon interstate commerce by state regulation, *otherwise permissible*, are too great. That argument entirely misses the point now under discussion. The excerpts from the opinion upon which appellee has relied clearly show that before any need arises for the determination whether too great a burden is imposed, the challenged regulation must be shown to be "otherwise permissible". A regulation which attempts to deal with a matter falling

within the *exclusive* national field is not "otherwise", or in any degree, "permissible": the Constitutional grant, of its own force, has precluded the states from attempting *any* such regulation, no matter whether it bears heavily or lightly upon interstate commerce.

Minnesota Rate Cases, supra (230 U.S. 352, 399-400);

Milk Control Board v. Eisenberg Farm Products, supra (306 U.S. 346, 351);

Edwards v. California, supra (314 U.S. 160, 174, 176).

It is impossible to draw, from the *Barnwell Case*, any support for the argument that the exclusive national field does not exist, or that the Train-Limit Law does not invade that field. On the contrary, this Court in both the *Barnwell opinion* itself, and as well in later opinions, particularly the *Milk Control Board Case*, *California v. Thompson*, and *Parker v. Brown*, has recognized and reaffirmed the existence of the exclusive national field, where all manner of state regulation is prohibited, even in the absence of congressional action.

It is noteworthy that the *Barnwell Case* is cited in the opinions in both the *Thompson* and *Parker Cases* (309 U.S., p. 116; 317 U.S., p. 362), in direct connection with the passages in those two opinions in which emphasis is laid upon the *national* interest in preserving uniformity of regulation in matters of national concern, and maintaining the free and unobstructed flow of commerce.

The *Morris*, *Sprales* and *Maurer Cases* resemble the *Barnwell Case*, in that they involved simply the validity of state regulations of motor carriers operating upon

state highways, with particular reference to weights, lengths, and sizes. In fact, these decisions are largely along the same lines as the *Barnwell* decision. Obviously, and as was fully recognized, particularly in the *Barnwell Case* (compare the excerpts quoted in the preceding discussion), the regulation of truck weights and lengths for the purpose of preserving state highways is quite a different thing from the regulation of lengths of freight and passenger trains entering the state upon, and using in the state, in continuous journeys in interstate commerce, a line of railroad in private ownership.

In the *Maurer Case*, this Court recognized and commented at length upon the essentially different problems involved in the national regulation, on the one hand, of rail carriers "operating over roads and with privately owned and controlled equipment, with standards of roadbed, operation and equipment substantially uniform throughout the country"; and on the other, the regulation of vehicular traffic over the highways of the several states. As to the latter, it said that the problem bore little resemblance to the regulation of other systems of transportation, because it involved a far more varied and complex undertaking; the differences between highway characteristics and usage in the various states being substantial, while state regulation, developed over a period of years, had been directed to the safe and convenient use of highways and their conservation with reference to varying local needs and conditions (309 U.S., at pp. 604-605).

In none of these cases was any claim made or sustained that the state regulations had other than *incidental*

effects upon interstate operations; nor do these decisions warrant any argument that this Court should sustain a state enactment, such as the Train-Limit Law, which *directly, substantially* and *immediately* controls and regulates interstate commerce. On the contrary, it may be particularly noted that in the *Sproles Case*, Mr. Chief Justice Hughes, who rendered the opinion, referred to his own prior opinion in the *Minnesota Rate Cases*, supra, and particularly to pages 399 and 400 of that opinion, and declared that the regulations adopted by the State fell within that class where states may take action in matters admitting of diversity of treatment, according to special requirements of local conditions; but not, as specifically stated on page 400 of the *Minnesota* opinion, in any manner so as to impose direct burdens upon interstate commerce, or to regulate directly, or restrain, that which from its nature should be under the control of the one authority and free of restriction, save as it is governed in the manner that the national legislature constitutionally ordains.

We conclude our argument upon the "national field" issue by quoting that portion of the memorandum opinion of the trial court in which the point is discussed (R. 404):

> "There is a field of regulation of interstate activities which, under the Commerce Clause, is exclusively reserved to the National Government, and I am firmly convinced that the subject of the length of trains engaged in interstate traffic falls within that class. This for the reason that the subject matter is national in its character, requiring uniformity of regulation by

a single authority. If each state was at liberty to regulate the conduct of carriers while within its jurisdiction, the confusion likely to follow could not but be productive of great inconvenience and unnecessary hardship. The very purpose of the Commerce Clause was to insure uniformity of regulation of interstate commerce against conflicting and discriminating state legislation, such as the law in question. The absence of any act of Congress on the subject of train lengths is equal to its declaration that commerce in that matter shall be free. In other words, the inertia of government should be on the side of freedom of commerce, rather than on the side of restraint of commerce. The determination of this entire case might well be decided upon this exclusive Federal field doctrine, which is in effect saying that Arizona never had the right to pass this legislation in the first instance."

This expression unquestionably sets forth the principles correctly applicable to the case at bar, as declared in the controlling decisions of this Court. It follows that the state supreme court, which neither noticed nor discussed the "national field" issue, and particularly failed (unless possibly by indirection) to state any conclusion thereon, erred as a matter of law in such omission.

We respectfully submit that this Court should correct that error by holding and declaring:

(1) The subject matter of the length and consist of interstate trains is clearly shown to be of such nature that, if regulated at all, the regulation should be prescribed by a single nation-wide authority.

(2) Said subject matter therefore falls within the exclusive national field, and state regulation is not permissible, even in the absence of affirmative action by Congress.

(3) Because the subject matter is thus exclusively national in character, it is unnecessary, in determining whether the state regulation is invalid as an invasion of the national field, to consider whether it is a proper police-power measure, either in the interest of safety or otherwise; and it is equally unnecessary to undertake to consider whether any actual financial burden is imposed upon interstate commerce, or any physical interference or obstruction created. The mere fact of entry into a field of regulation which is a subject of national concern, where national regulation is indispensable if any be required, is sufficient to invalidate the law regardless of its tangible effects upon interstate commerce, or its real or claimed relation to public health and safety. Since the subject matter falls within the national field, where "a general system or uniformity of regulation is required," the power of the national government is exclusive; the state cannot regulate under any pretext; and any reasons, whether of safety or otherwise, ascribed or claimed for attempted action by the state in the field become wholly immaterial.

2.

THE TRAIN-LIMIT LAW REGULATES INTERSTATE COMMERCE WITH EXTRATERRITORIAL EFFECT.

(Assignment of Error No. 2)

In its Conclusion of Law No. III (R. 4035-4036) the trial court held that the challenged law is unconstitutional, in violation of the Commerce Clause, because its neces-

sary and inevitable effect is to regulate the lengths of appellant's interstate trains in the adjacent states of California, New Mexico, and Texas, as well as in Arizona; in other words, because it operates with extraterritorial effect.

The opinion of the state court contains no mention whatever of this point—not even the implied disapproval of the lower court's reasoning upon the other major issues which may be said to follow from the lengthy quotation (R. 4063-4066) from the opinion in the *Oklahoma Train-Limit Case*. For while each of these other points was discussed at some length in that opinion, the question of the possible extraterritorial effect of the Oklahoma law is not referred to, and apparently was not presented to that court. The issue is nevertheless important in the present case and, in view of the decisions of this Court, should be regarded as controlling, irrespective of the conclusions reached upon the other issues.

The extraterritorial effects of the law are widespread, substantial, and completely unavoidable. The unchallenged testimony shows that, in order to comply strictly with the law's restrictions, appellant must reconsist (i.e., reduce or build up) its trains at points outside Arizona; that it is, in a practical sense, impossible to locate the terminals required for these operations exactly at the state lines. At the eastern boundary of the state the reconsisting operations are and for years have been performed at points outside of Arizona: on the principal main freight line, at Lordsburg, New Mexico, or points farther east. At the westerly boundary, reconsisting operations have been performed at Yuma, which is physically

within Arizona, and extraterritorial effects are thus largely avoided; but although this practice has prevailed for many years, there can be no question (and appellee's counsel have in effect conceded) that absolute compliance with the law would require appellant to perform the reconsisting operations at some point in California (R. 1918).

In any event it is not disputed that the inevitable effect of the law is to control (i.e., to "regulate") the lengths of all trains for at least 23 miles in New Mexico (the distance from Lordsburg to the boundary), and as to a substantial proportion (approximately 75 per cent of the freight trains) this control extends as far east as El Paso, more than 170 miles beyond the boundary, and into the State of Texas. In the case of passenger trains, the reconsisting operations compelled by the law are frequently performed at El Paso, and occasionally at points in California; so that as to passenger-train operation the extraterritorial control extends for 171 miles beyond the easterly boundary of Arizona, and as far west as Los Angeles, California, 250 miles from the Arizona boundary. These extraterritorial effects of the law are, we repeat, wholly unchallenged by appellee.

The reconsisting operations themselves are necessary, solely because of the law's requirements. Since they are largely performed at points outside of Arizona, they constitute an additional extraterritorial effect of the law upon appellant's operation of its interstate trains. This further extraterritorial effect of the law is likewise wholly unchallenged.

The enforced extraterritorial operation of shorter trains, as far as the reconsisting points, and as far as Los Angeles

and El Paso at certain times, necessarily causes and requires appellant to operate additional train service in the extraterritorial districts where such shorter trains are compelled to be run, and to incur additional expense of that service. That this additional extraterritorial train service is compelled by the law is likewise virtually conceded by appellee; and while certain items of the expense thereof may be questioned, it cannot be disputed that some expense, of material amount, is incurred.

The evidence establishes that the reconsisting operations result in delays to all "long" trains, and the cars therein, incident to the operations themselves; further, that the cars required to be set out at the reconsisting points to await movement by following trains are delayed for varying periods. Many of these delays, which are wholly due to the law, and would be avoided if it were set aside, occur at points outside of the state. The law thus contributes still another extraterritorial effect, by way of obstructions to and interferences with the continuous movement of interstate commerce, imposed at points outside Arizona.

Appellee has never challenged our convincing showing that the law thus inevitably operates with extraterritorial effect. It is difficult to see how any such challenge could be attempted. Appellant's evidence on the point is clear and convincing; moreover, appellee failed to introduce any evidence of its own, and did not even attempt to indicate how the extraterritorial effects of the law, outside of Arizona, could be avoided or minimized, if the law were fully complied with within the state. As we have said, its counsel even admitted that the law can be com-

pletely observed *within* Arizona, only if its restrictions are also made effective in those portions of the adjoining states immediately beyond the boundary lines, and extending "* * *to the next terminal" (R. 1918).

In a number of cases this Court has reviewed state laws or regulations the necessary effects of which were directly to regulate commerce beyond their own boundaries. The consistent trend of these decisions supports the principle that a state may not, consistently with the power delegated to the Federal Government by the Constitution, regulate transactions in interstate commerce occurring in part, or entirely, outside of the state; and that when a state law or regulation, whatever its merits or desirability, of necessity and by inevitable and inescapable effect regulates and controls interstate commerce outside of the state boundaries, as does the Train-Limit Law, it thereby conflicts with the Commerce Clause and must be set aside.

In

Hall v. DeCuir, supra (95 U.S. 485),

the point is very definitely presented. We call attention to the following language from the opinion (95 U.S. at page 488):

> "The statute now under consideration . . . does not act upon the business through the local instruments to be employed after coming within the state, but directly upon the business as it comes into the state from without or goes out from within. *While it purports only to control the carrier when engaged within the state, it must necessarily influence his conduct to some extent in the management of his business*

throughout his entire voyage. His disposition of passengers taken up and put down within the state, or taken up within to be carried without, *cannot but affect in greater or less degree* those taken up without and brought within, and sometimes *those taken up and put down without.*" (Emphasis supplied.)

The decision in the *First South Covington Case* is equally in point. As this Court said, to comply with the regulations imposed by Covington would have required about one-half more than the number of cars being presently operated by the railway, and more cars than could be operated in Cincinnati within its franchise rights. That the Court regarded the regulations as extraterritorial in operation, and therefore void, clearly appears from the following portion of the opinion (235 U.S., at pages 547-548):

> "We think *the necessary effect of these regulations is not only to determine the manner of carrying passengers in Covington and the number of cars* that are to be run in connection with the business there, *but necessarily directs the numbers of cars to be run in Cincinnati, and the manner of loading them when there, where the traffic is much impeded and other lines of street railway and many hindrances have to be taken into consideration* in regulating the traffic. If Covington can regulate these matters, certainly Cincinnati can, and interstate business might be impeded by conflicting and varying regulations in this respect, with which it might be impossible to comply. On one side of the river one set of regulations might be enforced, and on the other side quite a different set, and both seeking to control a practically continuous movement of cars." (Emphasis supplied.)

The decision in

Bowman v. C. & N. W. Ry. Co. (1888), 125 U.S. 465, 31 L.ed. 700,

is likewise directly in point. The case involved the validity of a statute of Iowa which forbade a common carrier knowingly to transport into the state any intoxicating liquor. A shipment had been tendered to the carrier at a station in Illinois; and having been refused for transportation, this suit had been brought in the federal court for Illinois. The carrier pleaded its inability to receive and transport the shipment, relying upon the prohibition of the Iowa statute.* This Court held that this plea could not be sustained, declaring the Iowa law to be void because it was a regulation of interstate commerce, and particularly because it operated with extra territorial effect upon interstate transportation, which would be commenced outside of Iowa. The Court referred to prior cases, including certain of the decisions cited in the preceding subdivision of this argument, in which it had been declared that there are certain classes of subjects, as to which the power of regulation by the Federal Government under the Commerce Clause is exclusive, because there can of necessity be only one system or plan of regulation; that inaction by Congress in such cases is a declaration of purpose that the commerce shall be free. It then said (at page 486):

> "The principle thus announced has a more obvious application to the circumstances of such a case as the

*There was at that time no Federal statute similar to the Webb-Kenyon Act which was passed later to remove the protection of the Commerce Clause from shipments of intoxicating liquor into a "dry" state.

present, when it is considered that the *law of the State of Iowa under consideration*, while it professes to regulate the conduct of carriers engaged in transportation within the limits of that state, nevertheless *materially affects, if allowed to operate, the conduct of such carriers, both as respects their rights and obligations, in every other state into or through which they pass* in the prosecution of their business of interstate transportation. In the present case, the defendant is sued as a common carrier in the State of Illinois, and the breach of duty alleged against it is a violation of the law of that state in refusing to receive and transport goods which, as a common carrier, by that law, it was bound to accept and carry. It interposes as a defence a law of the State of Iowa, which forbids the delivery of such goods within that state. *Has the law of Iowa any extra-territorial force which does not belong to the law of the State of Illinois?* If the law of Iowa forbids the delivery, and the law of Illinois requires the transportation, which of the two shall prevail? How can the former make void the latter? *In view of this necessary operation of the law of Iowa, if it be valid, the language of this court in the case of* Hall v. DeCuir, 95 U.S. 485, 488, *is exactly in point.*" (Emphasis supplied.)

The Court then referred at length to the opinion in *Hall v. DeCuir*, supra; and after enumerating the various matters properly subject to state legislation and the police power, and quoting at length from *Robbins v. Shelby Taxing District*, supra (120 U.S., at page 493) continued:

"The section of the statute of Iowa, the validity of which is drawn in question in this case, does not fall within this enumeration of legitimate exertions of the police power. *It is not an exercise of the jurisdiction*

of the state over persons and property within its limits. On the contrary, it is an attempt to assert that jurisdiction over persons and property within the limits of other states. It seeks to prohibit and stop their passage and importation into its own limits, and *is designed as a regulation for the conduct of commerce before the merchandise is brought to its border.* It is not one of those local regulations designed to aid and facilitate commerce . . . It is, on the other hand, a regulation directly affecting interstate commerce in an essential and vital point. *If authorized, in the present instance, upon the grounds and motives of the policy which have dictated it, the same reason would justify any and every other state regulation of interstate commerce upon any grounds and reasons which might prompt in particular cases their adoption.* It is, therefore, a regulation of that character which constitutes an unauthorized interference with the power given to Congress over the subject. If not in contravention of any positive legislation by Congress, it is nevertheless a breach and interruption of that liberty of trade which Congress ordains as the national policy, by willing that it shall be free from restrictive regulations."

In answer to the contention that the statute in question was designed only to prohibit sales within Iowa, the Court said that that argument could not be sustained because the right to prohibit sales arises only after the transportation has been determined, and the sales which the state may forbid are those *within its jurisdiction.* The Court said further (at page 499):

"Its (the state's) power over them does not begin to operate until they are brought within the terri-

torial limits which circumscribe it. It might be very convenient and useful in the execution of the policy of prohibition within the state to extend the powers of the state beyond its territorial limits. *But such extra-territorial powers cannot be assumed upon such an implication. On the contrary, the nature of the case contradicts their existence.* For if they belong to one state, they belong to all, and cannot be exercised severally and independently. The attempt would necessarily produce that conflict and confusion which it was the very purpose of the Constitution by its delegations of national power to prevent."

The general principle that state statutes cannot validly operate beyond the boundaries of the state by which they are made is, of course, of long standing.

In

Pennoyer v. Neff (1877), 95 U.S. 714, 24 L.ed. 565,

this Court, after stating that each state has exclusive jurisdiction within its territory, subject to the paramount provisions of the Federal Constitution, said further (at page 722):

"The other principle of public law referred to follows from the one mentioned; that is, that no state can exercise direct jurisdiction and authority over persons or property without its territory."

In

Olmsted v. Olmsted (1910), 216 U.S. 386, 54 L.ed. 530,

it was said (at page 395):

"The legislature of Michigan had no power to pass an act which would affect the transmission of title to lands located in the State of New York."

In

Baldwin v. Seelig (1935), 294 U.S. 511, 79 L.ed. 1032,

this Court held invalid an attempt by the State of New York to project a police power statute, directly affecting interstate commerce, beyond its own boundaries and into the territorial limits of another state. The statute undertook to prescribe the minimum prices to be paid by distributors, for milk brought from any source, either within or without the state, into New York City and there sold for public consumption. The Court said (294 U.S., at page 521):

> "New York has no power to project its legislation into Vermont by regulating the price to be paid in that state for milk acquired there. So much is not disputed."

In

Connecticut General Life Insurance Co. v. Johnson (1938), 303 U.S. 77, 82 L.ed. 673,

this Court, in its decision relating to the power of the state to impose taxes upon a foreign corporation with respect to transactions taking place in another state, said (at pp. 80-81):

> ". . . A state which controls the property and activities within its boundaries of a foreign corporation admitted to do business there may tax them. But the due process clause denies to the state the power to tax or regulate the corporation's property and activities elsewhere." (Citing cases)

In

Magnolia Petroleum Co. v. Hunt (1943), 320 U.S. 430, 88 L.ed. Adv. 161,

this Court, in the course of a discussion of the effect to be given, in the courts of Louisiana, to a final judgment obtained in the courts of Texas, said (pp. 439, 440):

> "The full faith and credit clause like the commerce clause thus became a nationally unifying force. . . . But whether the Texas award purported also to adjudicate the rights and duties of the parties under the Louisiana law or to control persons and Courts in Louisiana is irrelevant to our present inquiry. For Texas is without power to give extraterritorial effect to its laws." (Citing cases.)

In

McLeod v. Dilworth Co. (1944), 322 U.S. 327, 88 L.ed. Adv., 910,

this Court affirmed a decision of the Supreme Court of Arkansas, holding that the Commerce Clause prohibited the application of an Arkansas sales-tax statute to sales carried on and completed in Tennessee, even though the goods after purchase were shipped to a destination in Arkansas for subsequent use; saying (at pp. 330-331):

> ". . . . For Arkansas to impose a tax on such transaction [a sale made in Tennessee] would be to project its powers beyond its boundaries and to tax an interstate transaction.
>
> ". . . . A tax on an interstate sale like the one before us and unlike the tax on the enjoyment of the goods sold, involves an assumption of power by a State which the Commerce Clause was meant to end. The very purpose of the Commerce Clause was

to create an area of free trade among the several States. That clause vested the power of taxing a transaction forming an unbroken process of interstate commerce in the Congress, not in the States."

In its arguments addressed to the courts below, relating to this issue, appellee has relied largely upon the *New York Car Heating, Georgia Electric Headlight, Arkansas Full Crew*, and *Barnwell Cases*, each of which has already been reviewed in our discussion of the "exclusive national field" phase of the case. Appellee has contended particularly that the statutes or orders which in those cases were sustained would nevertheless substantially affect interstate commerce, beyond the state boundaries, because they would require either a complete change of equipment at the state line, or an adjustment of the entire interstate operation to the most restrictive requirement encountered along the route.

None of these cases affords any real support for appellee's argument; on the contrary, they all recognize the fundamental principle, stated in the *Minnesota Rate Cases*, and again in *Milk Control Board v. Eisenberg Farm Products*, that even when acting in the "joint field," for the purpose of making regulations to meet the "special requirements of local conditions," the states' freedom of action is limited to "their respective jurisdictions." Thus, in the *Minnesota Rate Cases*, this Court said (230 U.S., pp. 399-400, 402):

> "In other matters, admitting of diversity of treatment according to the special requirements of local conditions the States may act *within their respective jurisdictions* until Congress sees fit to act. . . .

"But within these limitations (of subject matter) there necessarily remains to the States, until Congress acts, a wide range for the permissible exercise of power *appropriate to their territorial jurisdictions* although interstate commerce may be affected." (Emphasis supplied.)

The *New York Car-Heating* and *Georgia Headlight Cases* contain nothing to indicate approval by this Court of any state police-power regulation having the far-reaching extra-territorial effects shown to result from the Arizona law. In the *Car-Heating Case*, the Court was careful to specify that the power of the state in the premises was "to regulate the relative rights and duties of those *within its limits*"; that "the state's plenary authority existed *within its territorial limits*" (165 U.S., at p. 632; 41 L.ed., at p. 854). (We have previously shown that the exercise of this "plenary authority" cannot, in the light of later decisions, involve any obstruction to the free flow of commerce, or impairment of the national interest in uniformity of regulation of matters requiring such regulation.)

In the *Georgia Headlight Case*, this Court said that the state's power to regulate, even though interstate commerce might incidentally be "inconvenienced," was for the purpose of protecting "life and property *within its borders*" (234 U.S., at p. 292).

The *Barnwell Case* plainly affords no support for appellee, for no question of extra-territorial effect was involved. In point of fact, this Court, in a footnote to its opinion (303 U.S., p. 185), remarked:

"State regulations affecting interstate commerce, whose purpose or effect is to gain for those within the state an advantage at the expense of those without, or *to burden those out of the state without any corresponding advantage to those within*, have been thought to impinge on the constitutional prohibition even though Congress has not acted." (Emphasis supplied.)

Hall v. DeCuir, *Bowman v. C. & N. W. Ry. Co.*, and *Baldwin v. Seelig*, supra, among other cases, were cited to support this statement, and with apparent approval.

In the *First Arkansas Full Crew Case* (219 U.S. 433), this Court likewise indicated that the state's power must be confined within its own territorial limits: the protection claimed to be afforded by the law being, as the Court said, extended to interstate travelers as well as to local citizens, *while within Arkansas* (219 U.S., at p. 465); and it was further said (at p. 466) that this regulation related "to the rights and duties of all *within the jurisdiction*."

In *Sproles v. Binford*, supra (286 U.S. 374), also one of the cases upon which appellee has heretofore greatly relied, this Court again followed the doctrine declared in the *Minnesota Rate Cases*; for the Court referred (286 U.S., at p. 390) to the portions of that opinion already cited in this discussion, and to

"the established principle that in matters admitting of diversity of treatment, according to the special requirements of local conditions, the states may act *within their respective jurisdictions* until Congress sees fit to act." (Emphasis supplied.)

The *Sprolès* opinion also directly supports our contention that local regulation by a state within its borders may not, by necessary effect, extend beyond those borders, for the Court said, immediately following the excerpt last quoted:

> "As this principle maintains essential local authority to meet local needs *it follows that one state cannot establish standards which would derogate from the equal power of other states to make regulations of their own.*" (Emphasis supplied.)

Paraphrasing this language: it is obvious that Arizona cannot establish maximum standards for the lengths of trains, which by necessary effect also prevail in California and New Mexico (as admittedly the train-limit restrictions do), and derogate from the equal power of those states to make corresponding regulations of their own. The very fact, however, as we earnestly contend, that a state regulation of the lengths of interstate trains operating in continuous movement over a through route cannot be confined to the state of its making, but must, if fully enforced within those boundaries, also directly regulate and control operations in adjoining states, demonstrates that the entire subject matter falls within the exclusive national field.

We anticipate that appellee will also rely largely, as it did in oral argument to the state court, upon

Terminal Railroad Association v. Brotherhood, supra (318 U.S. 1, 87 L.ed. 571).

That case involved the validity of an order of the Illinois Commerce Commission requiring cabooses to be attached

to guts of cars, for certain inter-yard movements at and adjacent to East St. Louis, Illinois, including movements across the Mississippi River bridges, and thus from and to locations in the adjacent State of Missouri. This Court remarked that on its face the order required only that cabooses be used within Illinois, and did not require their use in Missouri, but assumed that as a practical consequence of the order cabooses used in Illinois on the interstate runs must also be used at least as far as the nearest switching point in Missouri. The Court said (318 U.S., at pp. 8, 9):

> "If lack of facilities at the State lines requires as a practical matter that in order to provide cabooses in Illinois appellant must also provide them for some distance in Missouri, that fact does not preclude Illinois from regulating the operation to the limits of its territory." (Citing *Missouri P. R. Co. v. Kansas*, 216 U.S. 262, 54 L.ed. 472; *South Covington & C. R. Co. v. Covington*, supra, 235 U.S. 537, 59 L.ed. 350.)

The *Terminal Case* is readily distinguishable on its facts from the case at bar. The opinion shows that any extra-territorial effects resulting from the Illinois Commission's order could properly be described as merely incidental and indirect; in fact, of no material consequence at all. There was certainly no real and substantial burden and interference, as in the instant case, whereby trains and cars moving in a continuous course in interstate commerce are subjected to a regulation which directly and completely controls their movement, for long distances before they reach and after they have left the state; an

extra-territorial regulation which admittedly cannot be avoided if the law is literally complied with inside the state. While the measure of the financial burden incurred because of the extra-territorial effect considered in the *Terminal Case*, is not stated in the opinion, it must have been very slight; the movement of a caboose, attached to a cut of cars, for a few hundred yards beyond the state line, could hardly involve more than a mere nominal expense over and above the cost otherwise. But the burden imposed by the Arizona law, solely because of the compelled extra-territorial operations, and excluding any burden associated with the effects of the law within the state, is nearly $100,000 per year, based upon 1938 operations.

The Court's reference in the *Terminal Case* (318 U.S., at p. 8) to the "governing principles" of *Parker v. Brown*, supra (317 U.S. 341, 361-363), emphasizes the distinction. For the governing principle stated in that case is that "state regulations of matters of local concern" which also regulate interstate commerce are to be sustained, provided they relate to a matter of *local* character, which may be appropriately regulated *locally*, and because of its nature may never be adequately dealt with by Congress, and provided also that the national interest in the regulation of commerce by a single authority is not impaired, nor the free flow of commerce materially obstructed.

The Train-Limit Law does not come within the classification thus stated. It regulates a matter clearly of national and not local concern, for which possibly varying local regulations are wholly inappropriate; indeed, its very

nature shows that it can be dealt with adequately only by Congress, if any regulation is needed. The law likewise directly and substantially impairs the national interest in uniformity of regulation, and seriously obstructs the free flow of commerce. Since it is thus wholly distinct, in both character and subject matter regulated, from the order involved in the *Terminal Case*, clearly the principle of the *Parker Case* cannot be invoked to sustain the law; and it follows equally that in considering the extra-territorial point the *Terminal Case* has no application.

Apart from these considerations, it is clear that the Court did not intend, in the *Terminal Case*, to announce or approve any general principle that an admitted extra-territorial regulation of interstate commerce shall be disregarded as immaterial, in considering the validity of a state police-power regulation. This is made clear by the citation, at the close of the opinion, of the *First South Covington Case*. In that case, as the Court points out (318 U.S., at p. 9, Note 16) the local ordinance under attack was held invalid for the reason, among others, that there was a likelihood that serious burdens would be imposed upon interstate commerce because of the impossibility of compliance with probable conflicting regulations; or, as stated in the *Covington* opinion itself, because the ordinance not only determined the manner of carrying passengers in Covington and the number of cars to be run there, but also necessarily "directs the number of cars to be run in Cincinnati and the manner of loading them when there. . . . On one side of the river one set of regulations might be enforced, and on the other

quite a different set, and both seeking to control a practically continuous movement of cars" (235 U.S. 537, 548). These same factors have been shown to exist in the present case. Compare our prior discussion of the "national field" point, and particularly the quoted excerpts from the recent opinion of the Interstate Commerce Commission sustaining as lawful its Service Order No. 85 (256 I.C.C. 523).

The discussion of extraterritorial effect of the law, in the opinion rendered by the trial court, is brief and to the point and merits the attention of this Court. It reads as follows (R. 4049):

> "What is even more serious from the standpoint of those who seek to uphold the Act is it extraterritorial effect. The challenged law lays hands upon interstate commerce moving over defendant's lines long before it reaches the physical boundaries of Arizona, and continues directly to affect and regulate that commerce long after it has left Arizona. As a practical matter, it nearly controls the length of passenger trains from Los Angeles to El Paso, and of freight trains from Yuma to Lordsburg, the latter point being twenty-three miles east of the state line, and frequently on to El Paso, 171 miles beyond Arizona's boundary. Under the decided cases it is fatal for any police-power statute to operate with extra territorial effect, and under the guise of police power no state may thus directly interfere with interstate commerce."

In its disposition of this same issue, the court in the *First Arizona Case* held that the Train-Limit Law operated directly to interfere with interstate commerce and

imposed undue and unreasonable burdens thereon (as indicated by the excerpt quoted in the preceding subdivision of this brief); and emphasized the extraterritorial effect of that law, by pointing to the fact that eastbound trains of greater length than permitted by the law were required to be broken up into Arizona-size trains at terminals west of the Arizona boundary, which short trains were then handled across the state to terminals east of the Arizona line, where they were again consolidated into trains of larger size, and normal operating methods resumed.

The question of extraterritorial effect was also involved in the *Mid-Train Caboose Case*, in which it was said (10 F. Supp. at page 921):

> "Plaintiff challenges the order upon the ground of its extraterritorial effect. While the order designates only intrastate lines, it has a direct bearing on interstate commerce. Defendant commission, appreciating that in practical operation the order would have extraterritorial effect, said in its decision:
>
> > "'Legally, of course, any order made by this Commission must be limited to intrastate train operations. Since the company does not now have trackage facilities at Calvada adequate to permit of the addition or withdrawal of a caboose from trains at this point, it would be compelled, if the work is to be done there, to construct such facilities. The estimated cost of construction is $6,700.00. The delay occasioned there by the necessary switching would be approximately thirty minutes. Practically, however, no such costs or delays would be occasioned, for obviously, if the company is re-

quired to comply with the trainmen's demand, it will actually perform such switching at Sparks, Nevada, its regular division point, seventeen miles east of the state line.'

"Plaintiff pleads that, in the interest of economy and expeditious handling of interstate commerce, it would, if forced to a choice, take the course which the commission stated was obvious."

As before stated, the court followed the principles declared in *Hall v. DeCuir* and the *First South Covington Case*, supra, and held the challenged order invalid.

In the *Nevada Train-Limit Case* the court, after making specific findings of fact setting forth the extraterritorial delays, interferences, and other burdens upon interstate commerce which the Nevada statute, if enforced, would inevitably create and impose in the adjoining states of California and Utah, adopted a conclusion of law reading as follows:

"IV. Said Train-Limit Law is further unconstitutional and void, and in violation of said Commerce Clause, because its necessary, practical, and inevitable effect is, and would and will be, to regulate the length of the interstate railroad trains operated over plaintiff's lines, not only within Nevada, but also in adjoining portions of the states of California and Utah."

We call attention to the close resemblance between the trial court's Conclusion of Law No. III (R. 4035-4036) dealing with the point now under discussion, and that adopted in the case last cited. That similarity is not in the least

fortuitous. The challenged law in the *Nevada Case* was virtually identical with the Arizona law, and its extra-territorial effects were necessarily substantially the same.

It is clear, we think, from the foregoing authorities that even when a state undertakes to regulate a subject even of local concern, and in so doing enacts a statute which, by necessary and inevitable result, directly and substantially regulates the conduct and flow of interstate commerce beyond the state's territorial boundaries and within the borders of other states, such regulation cannot be sustained; if it operates extraterritorially, it is invalid because in violation of the Commerce Clause. The challenged statute offends against this principle, because it admittedly and inevitably regulates and controls interstate commerce in the adjoining states.

3.

THE TRAIN-LIMIT LAW DIRECTLY, MATERIALLY, AND SUBSTANTIALLY INTERFERES WITH, BURDENS, AND OBSTRUCTS INTERSTATE COMMERCE.

(Assignments of Error Nos. 3 and 4)

In its Conclusions of Law Nos. IV and V (R. 4036), the trial court held the train-limit law invalid, under the Commerce Clause, because its necessary and inevitable effects are directly, substantially and unreasonably to interfere with, regulate, and delay the operation of appellant's interstate trains in Arizona and adjacent states, and to impose direct, substantial and unreasonable financial burdens upon the interstate commerce there conducted by appellant; and thus to impair the use and usefulness of its transportation facilities employed in interstate com-

merce. The substance of these two conclusions is also recited in paragraphs second and third of the trial court's judgment of February 11, 1942, reading as follows (R. 4040):

> "*Second:* Said statute imposes direct, unreasonable and unlawful burdens upon, and interferes with, delays and obstructs interstate commerce, in violation of said Commerce Clause;
>
> "*Third:* Said statute impairs the use and usefulness of the transportation facilities employed by defendant as a common carrier engaged in interstate commerce;"

Although these conclusions were appropriately challenged by the state upon its appeal from the judgment, no specific discussion of the issue appears in the opinion of the state Supreme Court. However, the court, in quoting from the majority opinion in the *Oklahoma Train Load Case* (R. 4063), included the passage (36 F.Supp., at p. 942) which expresses the view that a state police power regulation may be sustained, if reasonable, even though it necessarily "affects interstate commerce in an *incidental* or *indirect* manner, but not otherwise." (Emphasis ours.) This reference, coupled with the reversal of the trial court's judgment, may be taken as expressing the court's conclusion that the law affects interstate commerce only "incidentally or indirectly," and "not otherwise."

The state court thus appeared to recognize the basic principle of law upon which the trial court's conclusions are founded: namely, that a state statute, though claimed

to be an exercise of the police power in the so-called joint or concurrent field (i.e., a regulation of matters of local concern), and even though assertedly or actually enacted in the interest of public health or safety, will be set aside as an infringement of the Commerce Clause if it directly, substantially, and materially regulates, burdens, and interferes with interstate commerce. The court's reversal of the judgment can be assigned therefore to its failure or refusal either to recognize the facts, or, recognizing them, to view the interferences, obstructions, and burdens imposed by the law as direct, material and substantial."

The principle just stated, the correctness of which was plainly conceded in the *Oklahoma Case*, and thus inferentially by the state court in the case at bar, has been announced and followed in repeated decisions by this Court, many of which have been cited in conjunction with our preceding discussion addressed to the "exclusive national field" issue. We call particular attention to:

Illinois Central R. Co. v. Illinois, supra (163 U.S. 142, 41 L.ed. 107);

K. C. S. R. Co. v. Kaw Valley Drainage Dist., supra (233 U.S. 75, 58 L.ed. 857);

---

*The state court declared in its opinion (R. 4063) immediately preceding its lengthy quotation from the *Oklahoma* decision, that, "in that case, *like the one at bar*, the railroad company was compelled . . . to expend *great sums of money* in order to comply with the restrictions . . . "; but apparently thought that the "*great sum*" ($400,000 per year, as found by the trial court) was not a sufficiently *direct* and *substantial* burden to justify the invocation of the commerce clause.

South Covington R. Co. v. Covington, supra (235 U.S. 537, 59 L.ed. 350);

St. L.-S. F. R. Co. v. Public Service Comm., (1921), 254 U.S. 535, 65 L.ed. 389;

Minnesota Rate Cases, supra (230 U.S., at pp. 400-401);

Savage v. Jones (1912), 225 U.S. 501, 56 L.ed. 1182;

Adams Express Co. v. New York (1913), 232 U.S. 14, 58 L.ed. 490;

Seaboard Airline R. Co. v. Blackwell, supra (244 U.S. 310, 61 L.ed. 1176);

M. K. & T. Ry. Co. v. Texas, supra (245 U.S. 484, 62 L.ed. 419);

Milk Control Board v. Eisenberg Farm Products Co., supra (306 U.S., at pp. 351, 352);

Davis v. Farmers Co-Op. Co., supra (262 U.S. 312, 67 L.ed. 996);

La Coste v. Dept. of Conservation (1924), 263 U.S. 545, 68 L.ed. 437;

Foster-Fountain Packing Co. v. Haydel (1929), 278 U.S. 1, 73 L.ed. 147;

Brennan v. Titusville, supra (153 U.S. 289, 38 L.ed. 719);

California v. Thompson, supra (313 U.S. 109, 85 L.ed. 1219);

Parker v. Brown, supra (317 U.S. 341, 87 L.ed 315).

There is no question, and none has ever been raised by appellee, that the commerce affected and regulated by the challenged law is interstate in character, and thus

within the protection of the above principle. The fact is that substantially every train which moves on appellant's lines in Arizona and is thus controlled as to its length by the law, and certainly every train on the main lines, consists in large part (and in many cases entirely) of interstate traffic; that is to say, these trains are composed largely, if not altogether, of cars carrying freight and passengers moving in interstate commerce from and to points beyond Arizona, or between points in other states and points in Arizona; or of empty cars returning from points outside Arizona to points within or beyond that state. By comparison with the total traffic handled upon appellant's lines in Arizona, the volume of the local, i.e., intrastate, traffic is inconsiderable. It is apparent that substantially every train operated by appellant which is compelled to observe the limitations of the law is a train moving in and handling interstate commerce, and that the effect of the law, apart from its effects upon operations in adjacent states, has been, is, and will be to lay hands upon, interfere with, and regulate, interstate commerce upon appellant's line within Arizona.

For the immediate purpose of this discussion the essential question is therefore not so much whether the commerce regulated is interstate in character, nor whether the law was enacted for the purpose of safety and is reasonably related to that purpose. Rather, the question is whether, even assuming (which we deny) that the law is a reasonable regulation of a matter of local concern, and so within the joint or concurrent field, on the one hand it actually regulates, interferes with, and burdens interstate commerce directly and substantially, and imposes

substantial and material obstructions to the free flow of such commerce, or whether, on the other, it affects interstate commerce only indirectly and incidentally, and without impairing the national interest.

As noted in subdivision 1 of this argument (the "national field"), appellee has contended before that (1) a state safety law or regulation, if reasonably related to that purpose, can never *in legal contemplation* impose more than indirect or incidental burdens or interferences upon interstate commerce; (2) therefore, the court cannot inquire into the actual effects of such a law upon interstate commerce, until and unless it has determined that the law has no possible rational basis; (3) the courts cannot give relief in any event, for if the burden or obstruction imposed upon interstate commerce is too great, resort must be had to Congress, which alone can provide the remedy. Addressing itself to the factual questions of the burdens and interferences occasioned by the law, appellee has also contended that (4) there is here no competent or otherwise adequate showing of actual burden, obstruction or interference, the extensive findings of the trial court to that effect being unsupported by sufficient lawful probative evidence.

The first of these expected contentions has already been reviewed in the preceding discussion, and there shown to be opposed to the principle and result of those decisions of this Court, in which state police power statutes or orders, in the interest of public health, safety or convenience and apparently bearing some reasonable relationship to that object, have been set aside because of direct, material and substantial burdens and obstructions

imposed upon interstate commerce. These decisions are clear to the effect that such interferences and obstructions cannot be excused or justified by resort to the "convenient apologetics of the police power." Thus, in *Kansas City Southern R. Co. v. Kaw Valley Drainage District*, supra, this Court said, in language already quoted in earlier references to this case (233 U.S., p. 79):

> "The decisions also show that a state cannot avoid the operation of this rule by simply invoking the convenient apologetics of the police power. It repeatedly has been said or implied that *a direct interference with commerce among the states could not be justified* in this way. *The state can do nothing which will directly burden or impede the interstate traffic of the company* or impair the usefulness of its facilities for such traffic." (Citing cases.) (Emphasis supplied.)

We call particular attention to the expressions used by the Court in the *South Covington* and *Illinois Central Cases*, in the quotations from those opinions which appear in the portion of this brief devoted to the "national field" phase.

In the *Illinois Central Case*, this Court also said (163 U.S., at page 153):

> "The effect of the statute of Illinois, as construed and applied by the Supreme Court of the state, is to require a fast mail train, carrying interstate passengers and the United States mail, from Chicago, in the State of Illinois to places south of the Ohio River, over an interstate highway established by authority of Congress, *to delay the transportation* of such pas-

sengers and mails, by turning aside from the direct interstate route, and running to a station three miles and a half away from a point on that route, and back again to the same point, and thus traveling seven miles which form no part of its course, before proceeding on its way; and to do this for the purpose of discharging and receiving passengers at that station, for the interstate travel to and from which, as is admitted in this case, the railroad company furnishes other and ample accommodation.

"This court is unanimously of opinion that this requirement is an *unconstitutional hindrance and obstruction of interstate commerce*, and of the passage of the mails of the United States." (Emphasis supplied.)

In the *St. Louis and San Francisco Ry. Case*, supra, the question was as to the validity of an order of the State Commission, which required the detouring of certain through passenger trains which were interstate in character, the detour being to serve a city of some 4,000 inhabitants which was already adequately served by other trains. This order, of course, could only have been justified under the police power; and in holding it invalid because it unduly burdened interstate commerce, the Court said (254 U.S., at p. 537):

"Considering the facts disclosed, we think it plain that the fourteen local passenger trains meet the reasonable requirements of Caruthersville, and that the Commission's order unduly burdens interstate commerce. *Compliance with it would require the railway to maintain 16 more miles of track at the high standard essential for the through trains, and to move the*

latter 16 miles further, with consequent delay and inconveniences all along the line. The burden certainly would not be less serious than those which were condemned in some, if not all, of the cases above referred to." (Emphasis supplied.)

In other words, the state might require adequate local service but could not lay its regulating hand on through interstate trains *as such*. Practically all of appellant's main-line trains in Arizona are of that character.

In the *La Coste Case*, supra, it was said (263 U.S. at page 550):

> "The commerce clause (art. 1, Sec. 8, clause 3) confers on Congress power to regulate interstate and foreign commerce, and therefore such power is impliedly forbidden to the states. 'Even their power to lay and collect taxes, comprehensive and necessary as that power is, cannot be exerted in a way which involves a discrimination against such commerce.' . . . A state may not enforce any law, the necessary effect of which is to prevent, obstruct, or burden interstate commerce. . . .
>
> "This court will determine for itself what is the necessary operation and effect of a state law challenged on the ground that it interferes with or burdens interstate commerce. The name, description, or characterization given it by the legislature or the courts of the state will not necessarily control. Regard must be had to the substance of the measure rather than its form."

In *Seaboard Airline R. Co. v. Blackwell*, supra (244 U.S. 310), this Court, as already noted, invalidated the so

called Georgia "blow-post" law, which would have required the slowing down of trains at grade crossings, to such an extent as to delay them several hours beyond their normal schedules. The sole ground of the decision was that the regulation imposed a direct and intolerable burden and obstruction upon the free flow of interstate commerce, and the obvious and apparently unquestioned relation of the statute to the public health and safety did not avail to save it.

In *Shafer v. Farmers Brain Company* (1925), 268 U.S. 189, 69 L.ed. 909, this Court held invalid, under the Commerce Clause, a state statute which undertook to control the purchase and shipment of grain produced in and moving out of the state. The law was defended as an alleged necessary exercise of police power in the interest of the local producers. But the Court said (at p. 199):

> "The decisions of this court respecting the validity of state laws challenged under the commerce clause have established many rules covering various situations. Two of these rules are specially invoked here, one, that a state statute enacted for admissible state purposes, and which affects interstate commerce only incidentally and remotely, is not a prohibited state regulation in the sense of that clause; and the other [illegible] at *a state statute which, by its necessary operation, directly interferes with or burdens such commerce, is a prohibited regulation and invalid, regardless of the purpose with which it was enacted.*" (Emphasis supplied.)

In *Edwards v. California*, supra (314 U.S. 160), this Court set aside the California statute forbidding the

bringing of indigent persons into the state; again, despite the apparent relation between the law and the public welfare, and solely because of the direct obstruction thus imposed upon the freedom of movement of persons in interstate commerce.

In

Missouri, Kansas & Texas R. Co. v. Texas, supra (245 U.S. 484, 62 L.ed. 419),

this Court reversed a judgment rendered in a suit for penalties brought by the State of Texas, which penalties had been assessed for the violation of an order of the State Railroad Commission requiring

> "passenger trains in Texas to start from their point of origin and from stations on the line in accordance with advertised schedule, allowing them not to exceed thirty minutes at origin or points of junction with other lines to make connection with trains on such other lines, and not exceeding ten minutes more if at the end of thirty minutes the connecting trains were in sight."

The Court said (245 U.S., at page 488):

> "Again the question is not what the State Commission might require of a road deriving its powers from the State, with regard to local business (Missouri Pacific Ry. Co. v. Kansas, 216 U.S. 262, 283) but whether the order if applied to this case would not unlawfully interfere with commerce among the States.
>
> "On its face the order as applied was an interference with such commerce. It undertook to fix the time allowed the stops in the course of interstate transit.

It was a serious interference, for it made the defendant liable for an interstate train not starting on schedule time, when the train did not come into the defendant's hands, from another company in another state, until too late. This, as we understand the facts, was the train to which the advertised schedule applied, and if so, the mere statement of the result is enough to show that the burden imposed not only was serious but was unwarranted as well as unjust. The suggestion that compliance with the order could have been secured by having an extra train ready to run if the regular one was not on time hardly is practical, and is not an adequate answer, even in form. For the defendant advertised, or at least had the right to advertise, the interstate train, and, if it did so, would not free itself from liability for a delay on the part of that train by offering another. We think it plain that this order was applied in a way that was beyond the power of the Commission and courts of the State. Seaboard Air Line Ry. v. Blackwell, 244 U.S. 310. Chicago, Burlington & Quincy R. R. Co. v. Railroad Commission of Wisconsin, 237 U.S. 220, 226. South Covington & Cincinnati Street Ry. Co. v. Covington, 235 U.S. 537, 548."

In

St. Louis S. W. Ry. Co. v. Arkansas (1910), 217 U.S. 136, 54 L.ed. 698,

this Court reversed a judgment of the Supreme Court of Arkansas imposing penalties on the railroad for an alleged failure to furnish cars for loading by a shipper. The state court had held that the railroad was not excused, even though the failure was due solely to its inability to regain its own cars which had been sent from its own line, over

other railroads as required to reach the billed destinations. This Court said (at p. 149):

> "Coming to the merits, we think it needs but statement to demonstrate that the ruling of the court below involved necessarily the assertion of power in the State to absolutely forbid the efficacious carrying on of interstate commerce, or, what is equivalent thereto, to cause the right to efficiently conduct such commerce to depend upon the willingness of the company to be subjected to enormous pecuniary penalties as a condition of the exercise of the right."

It will be noted that Conclusion of Law No. IV declares the law to be invalid because of the physical interference, obstruction and delay imposed upon appellant's interstate trains; whereas Conclusion of Law No. V refers to the financial burden imposed upon appellant's operations in Arizona by reason of enforced compliance with the law. Both the physical interference and obstruction, and the financial burden, fall within the prohibition of the principle above set forth; in fact, many of the decisions make no distinction in terms as between a purely physical interference *with* or obstruction to interstate commerce and the financial burden upon it—both the words "burden" and "interference" having been used either interchangeably or as synonymous. But as the authorities show, whether the burden and interference be due to financial imposition or direct interference and obstruction, they are equally prohibited under the Commerce Clause. To be strictly and technically correct, it is quite conceivable that a state might impose a forbidden burden upon interstate commerce—for example, by a license fee or a tax on gross receipts from interstate

transactions—without interfering with it in the sense of physically hindering or preventing its being carried on between the state and adjoining states, or through the state, provided that the tax or license fee is paid. Compare: *Fisher's Bend Station v. Tax Commission* (1936), 297 U.S. 650 (655), 80 L.ed. 956. It is likewise conceivable that, as illustrated by the situations in *K. C. S. Ry. Co. v. Kaw Valley Drainage Dist.*, supra (233 U.S. 75), and *Seaboard etc. R. Co. v. Blackwell*, supra (244 U.S. 310), a direct physical interference or obstruction may take place, though no immediate financial burden is imposed. These considerations may have persuaded the trial court to adopt the conclusions of law in their present form, so as to differentiate between the interference and the burden, treating the one as purely physical and the other as largely financial in character, though there are many cases in which either may be construed as equivalent to the other. The distinction is perhaps unimportant, because both are forbidden—the attempted exercise of the state police power to the contrary notwithstanding.

We think that it may be taken as settled law, therefore, as laid down in the numerous decisions above cited, and in a host of others, including many largely relied upon by appellee at earlier stages of the case (for example, the *Alabama Engineers' Case*, the *Minnesota Rate Cases*, the *Milk Control Board Case*, and the *Oklahoma Train Limit Case*), that a state regulation of a matter of even local concern, enacted in the exercise of the police power, even though reasonably claimed to be in the interest of safety, will be set aside as a violation of the Commerce Clause if it materially and substantially regulates, burdens, in-

terferes with, or obstructs interstate commerce; *incidental, remote* or *indirect* effects or burdens being all that are permitted.

The decisions likewise show that the courts have not only the right, but also the duty, in any case in which the validity of a state police power regulation is called into question because of allegedly imposing unlawful burdens, interferences, or obstructions upon interstate commerce, of considering the facts as they are developed in the record, to determine whether the claimed burden or interference is merely incidental, indirect and nominal, and without substantial effect upon interstate commerce, or is, on the other hand, direct, material and substantial, so as to impose practical obstructions, interferences and burdens upon the free flow of commerce and thus to impair the national interests. Necessarily the court must undertake this function; for otherwise the protection now afforded to interstate commerce against widespread local interferences and burdens would be effectively nullified by a perfunctory affirmative declaration adopted, perhaps, by a majority of a local city council or board of supervisors, or even set forth in the mere fiat of an individual state or county official, to whom power had been delegated by local statute or ordinance. Naturally this Court has recognized the right to determine *independently*, notwithstanding the legislative declaration, as to the extent and character of the alleged burden or interference. Thus, in the recent *Milk Control Board Case*, upon which appellee has frequently relied, the Court, after stating (306 U.S., at pp. 351-352) the general principles controlling the exercise of the power to regulate interstate commerce by both the

Federal Government and the states, turned to a review of the particular statute the validity of which was in issue. It said (at pp. 352-353):

> "The purpose of the statute under review obviously is to reach a domestic situation in the interest of the welfare of the producers and consumers of milk in Pennsylvania . . . the question is whether the prescription of prices to be paid producers in the effort to accomplish these ends constitutes a prohibited burden on interstate commerce or an incidental burden which is permissible until superseded by Congressional enactment. *That question can be answered only by weighing the nature of the respondent's activities, and the propriety of local regulation of them as disclosed by the record.*"

The Court then reviewed the facts of record and concluded:

> "These considerations, we think, justify the conclusions that the effect of the law on interstate commerce is *incidental* and not forbidden by the constitution, in the absence of regulation by Congress." (Emphasis supplied.)

In

La Coste v. Dept. of Conservation, supra,

this Court said, in language already quoted (263 U.S., at p. 550):

> "This court will determine *for itself* what is the necessary operation and effect of a state law challenged on the ground that it interferes with or burdens interstate commerce. The name, description or characterization given it by the legislature or the

courts of the state will not necessarily control. Regard must be had to the substance of the measure rather than its form."

In

Foster-Fountain Packing Co. v. Haydel, supra,

the Court said (278 U.S., at p. 10):

> "*One challenging the validity of a state enactment on the ground that it is repugnant to the commerce clause is not necessarily bound by the legislative declarations of purpose.* It is open to him to show that in their *practical operation* its provisions directly *burden* or destroy interstate commerce. *Minnesota v. Barber*, 136 U.S. 313, 319, 34 L.ed. 455, 457; *Brimmer v. Rebman*, 138 U.S. 78, 81, 34 L.ed. 862, 863. In determining what is interstate commerce, courts look to *practical considerations* and the established course of business. *Swift & Co. v. United States*, 196 U.S. 375, 398, 49 L.ed. 518, 525; *Lemke v. Farmers Grain Co.*, 258 U.S. 50, 59, 66 L.ed. 458, 464; *Binderup v. Pathe Exch.*, 263 U.S. 291, 309, 68 L.ed. 308; *Shafer v. Farmers Grain Co.*, 268 U.S. 189, 198, 200, 69 L.ed. 909, 914, 915. *Interstate commerce includes more than transportation; it embraces all the component parts of commercial intercourse among states. And a state statute that operates directly to burden any of its essential elements is invalid.*" (Emphasis supplied.)

The *Foster-Fountain Packing Co. Case* was cited with apparent approval, in two different footnotes to the opinion in the *Barnwell Case* (303 U.S., pp. 185-188).

In the *Blackwell Case*, supra, 244 U.S. 310 (also, as noted, cited with apparent approval in the *Barnwell Case*)

this Court reviewed at length the factual situation revealed by the record, and concluded that the statute involved (which was purely a police-power measure, in the purported interest of safety) had been shown invalid because of the *burden* imposed upon interstate commerce; as the Court said, in the later *Burnwell* opinion (303 U.S., at p. 187), it was "an unnecessarily harsh restriction."

In the *M. K. T. Ry. Case*, supra, the Court likewise reviewed the facts before arriving at its conclusions (245 U.S., at p. 488) that the challenged regulation constituted an undue and improper interference with and burden upon interstate commerce.

In *Parker v. Brown*, supra (317 U.S. 341) this Court said (pp. 362-363):

> "But they (state regulations of "matters of local concern") are to be upheld *because upon a consideration of all the relevant facts and circumstances* it appears that the matter is one which may appropriately be regulated in the interest of safety, health and well being of local communities, and which, because of its local character and the practical difficulties involved, may never be adequately dealt with by Congress." (Emphasis supplied.)

We cite these cases merely as illustrative; many others to the same effect might be added. It is clear that this Court is not prevented from examining the facts of record, as they have been determined and summarized in the findings adopted by the trial court, in order to determine whether actual, immediate and direct burdens, interferences, and obstructions are imposed.

Heretofore appellee has attempted to support its position respecting the function of the Court in this connection, by referring to a portion of the opinion in the *Barnwell Case* reading as follows (303 U.S., pp. 189-190):

> "Congress, in the exercise of its plenary power to regulate interstate commerce, may determine whether the burdens imposed on it by state regulation, otherwise permissible, are too great, and may, by legislation designed to secure uniformity or in other respects to protect the national interest in the commerce, curtail to some extent the state's regulatory power. But that is a legislative, not a judicial function, to be performed in the light of the Congressional judgment of what is appropriate regulation of interstate commerce, and the extent to which, in that field, state power and local interests should be required to yield to the national authority and interest."

In prior discussion in this brief we have called attention to the qualifying phrase "otherwise permissible," used by the Court in referring to those state regulations with respect to which Congress may provide relief when the burden becomes too great. The decisions of this Court, both before and since the *Barnwell Case*, show that a state regulation of even a "matter of local concern," if it materially and substantially obstructs and interferes with interstate commerce, is not "otherwise permissible," any more than if it were an attempted regulation of a matter of exclusive national concern. In either event, it is wholly forbidden by the Commerce Clause itself, without any necessity for the exercise of the plenary powers of Congress;

it is automatically removed and set aside when the Commerce Clause is duly invoked and applied. The quoted passage therefore means that even when a state regulation is particularly addressed to a matter of local concern, and because affecting interstate commerce only incidentally and indirectly is "otherwise permissible," Congress may still act in the joint field, if convinced that uniformity is desirable or that the national interest will in other respects be promoted, and thereby curtail still further even the limited powers available to the state.

There is nothing in the opinion to indicate that a court may not inquire and determine whether an alleged interference with interstate commerce by a state exceeds in degree what is "otherwise permissible"; on the contrary, the entire opinion shows that there was no intent on the part of this Court to alter, in any way, the well-recognized and uniformly sustained principles of decision which have been announced both before and since the *Barnwell Case*, and find particular expression in the later decisions in *Milk Control Board v. Eisenberg*, and *Parker v. Brown*, supra.

While appellee has at times attempted to question whether there is any direct, substantial and material interference, burden or obstruction, the facts, as revealed by the record and found by the trial court, are wholly against its contention.

The physical interferences and obstructions created by the law, and the direct regulatory effects of the law are covered by several specific findings of the trial court. Finding X(b) (R. 3953-3962) specifies the interferences with and

delays to appellant's interstate trains and traffic, which occur both within and without Arizona and consist of (1) interference with and delays to cars and trains at terminals; (2) delays to individual cars, as distinguished from delays to entire trains; and (3) interferences with and delays to trains while on line between terminals; Finding X(c) (R. 3962-3966) sets forth the regulatory effects of the law upon appellant's train operations, showing how the law operates to reduce the average and actual lengths of the trains operated in Arizona and the adjacent affected territory below the actual and average lengths which would prevail if the law were not in effect, and therefore increases the number of trains, train miles, and locomotive miles necessarily operated to handle the same volume of traffic. Thus in 1938, a year of relatively light traffic, the law compelled the operation of 4,304 more freight trains, producing 638,569 more freight train miles, and 798,424 more locomotive miles than would otherwise have been necessary. Expressed in percentages, 30.8% more freight trains, 33.1% more freight-train miles, and 35.9% more locomotive miles were produced than otherwise would have been required; and of the additional train miles, 151,789, or 23.8% were produced in New Mexico and Texas, and were solely due to the extra-territorial effects of the law. It is, of course, unquestioned that these delays, interferences and regulatory effects are imposed entirely upon interstate commerce; for, as Finding IV(a) shows, about 93% of all of the revenue freight-ton-miles made in Arizona, and over 95% of all revenue passenger-miles, over the five-year period 1935-1939, were interstate in character; and it is clear that practically every train

affected by the law, including each of the additional trains which the law compels to be operated, is an interstate train.

The financial burdens, expressed both in terms of the expense incurred directly because of appellant's enforced compliance, and as the impairment of usefulness arising because of appellant's inability to use its transportation facilities in Arizona and the adjacent territory as efficiently and economically as would be possible if the law's restrictions were removed, are likewise covered by specific findings.

Finding X(d) (R. 3966-3969) directly sets forth the actual additional expense imposed upon appellant, and which it would save if it did not comply with the law, amounting to $394,900 per year, based upon the year 1938. All of this expense could be avoided if the law were not complied with. Nearly $95,000 out of this total is compelled to be incurred outside of Arizona, because of the extra-territorial effect of the law. As already noted, the State Supreme Court concurred, at least inferentially, in the finding that a heavy financial burden of compliance is imposed.

Finding VII, and particularly paragraph (d)(3) of that Finding (R. 3929-3934), shows the extent to which appellant has been unable, because of the restriction, to make efficient and economical use of its Arizona facilities; particularly, it demonstrates the degree to which such efficiency and economy in Arizona, and upon the Arizona lines, have lagged behind, by contrast with the efficiency and economy obtained on other parts of the system—notably in Nevada and Utah, where long-train operations

under conditions generally quite similar to those in Arizona (apart from the train-limit restriction) have been normally developed and carried on. This Finding thus sets forth both the fact and the extent of the impairment in the use and usefulness of appellant's property and facilities employed in interstate commerce, which is directly caused by, and attributable to, the restrictions of the law.

It seems clear, beyond any possibility of dispute, that these direct, immediate, material and substantial interferences, obstructions and regulations, accompanied by these substantial and continuing burdens, affecting, as they do, every train operated by appellant in Arizona, as well as in the adjacent territory, must be considered as "direct," "immediate," "material," and "substantial," within the meaning of the controlling decisions; they cannot, under any theory, be classed as "indirect," "incidental," or "remote." Clearly, there is a *direct, substantial,* and *immediate regulation* of, *interference* with, and *obstruction* to interstate commerce when, in a year of comparatively light traffic, the law compels the operation of approximately one-third more freight trains, train miles and locomotive miles than otherwise would be required, and imposes upon that operation the necessity of reconsisting interstate freight and passenger trains at points outside of Arizona, as well as at Yuma, with delay to both the trains themselves; and the cars which must be left behind or held for consolidation; when it imposes further upon the operation some 16,612 additional meets and passes, or about 63% more than otherwise would have been required, each of which meets and passes involves

a delay to at least one train, and possibly to others. Equally, there is clearly a substantial, direct and immediate burden when, in such a year of light traffic, compliance with the law results in the additional and unnecessary expenditure of approximately $400,000, over and above the expenses which would be incurred if the law were not complied with.

The discussion of this point in the memorandum opinion of the trial court is particularly illuminating. That court said (R. 4048-4049):

> "The heavy direct burden cast by the law upon interstate commerce can not be seriously questioned and the impairment of the efficient use of defendant's property is of itself an unlawful taking of that property without due process of law, which is a violation of both the state and Federal constitutions. . . .
>
> "The record here also amply discloses that the law causes real interference with, and delay to, interstate commerce, practically to the extent that Arizona operations create a bottle-neck. Actually ninety-three per cent of the freight traffic and ninety-five of the passenger business of the defendant in Arizona is interstate commerce. Furthermore, the law certainly imposes a great, substantial and wholly unreasonable burden of expense upon this interstate traffic. To hold in this case that interstate commerce was only incidentally or indirectly involved would be less than realistic, for the interference and regulation is *substantial, continuous, direct and unavoidable*, as is pointed out in detail in the findings of fact." (Emphasis as in the original.)

If there were any possible doubt that the burden, interference and obstruction is substantial, direct, imme-

diate and unavoidable, that doubt is finally set at rest by the findings of the Interstate Commerce Commission in the recitals preceding the ordering paragraphs of its *Service Order No. 85*, and affirmed by it in its opinion in which it sustained its power to make that order: *Ex parte 156*, supra, 256 I.C.C. 523, 535. In those recitals the Commission said that:

> "compliance by railroads subject to the Interstate Commerce Act with such rules, regulations, practices and laws (referring to state train-limit laws) during the present emergency, may result in congestion of tracks and terminals, wasteful use of locomotives and interference with the free flow of traffic necessary in the present emergency . . . and that such operation (without compliance with train limits) will facilitate the free flow of traffic necessary during the present emergency."

The Commission accordingly ordered carriers subject to the Interstate Commerce Act to operate their trains without regard to such train-limit laws "when necessary for the prompt movement of freight and the clearing or avoidance of congestion."

The suggestion is sometimes made that in a case involving a state regulation in the concurrent field, the court may and should analyze and evaluate the factual showing as to the burdens and obstructions imposed and the benefits claimed, so as to determine, by balancing the one against the other, whether the challenged regulation infringes the reasonable protection of the Commerce Clause. If that course is thought desirable in the present case, the only conclusion that can possibly follow is that the

safety benefits claimed and shown to result from the Train-Limit Law are at best so exceedingly slight as to merit no consideration by contrast with the admittedly heavy, substantial, continuous, and unavoidable burdens and obstructions imposed.

The extensive factual showing of the law's results, from the safety standpoint, presents no actual conflict, being primarily based upon official reports and statistics. It is carefully summarized in the trial court's findings Nos. XI, XII, and XIII (R. 3969-4032), the substance of which is restated, for convenience, in our preceding statement of facts. Without here undertaking to review that evidence at length,* there are certain salient features of the safety phase which we emphasize:

(1) The essential question is not, as appellee has contended at earlier stages of this case, whether a given number of long trains can be operated more or less safely than an equal number of short trains; but whether the *entire* operation (i.e., the movement of *all* the traffic which appellant, as a common carrier, must handle into, within and across Arizona) can be accomplished with fewer casualties if appellant is permitted to run trains of all lengths necessary to the handling of that traffic, and thus to meet the transportation requirements effectively, but with as few train units as practicable, rather than being compelled to observe fixed restrictions, and thus to operate many more train units than are needed.

(2) Again, the essential question is not whether a compelled short-train operation results in more or fewer

---

*A discussion of the safety evidence in its relation to the trial court's safety findings is included in Volume II of this brief.

casualties of the particular type heretofore emphasized by appellee (the so-called "slack action" type, which comprises only about 6% of all of the employee casualties which occur in train operation; see Exhibits 262, 266; R. 3300, 3304), as compared to the unrestricted operation; but whether *all* classes of accidents and casualties incident to railroad operation are reduced or increased by the enforcement of the law's restrictions.

(3) The answers to these two questions need not be sought in hypothesis, speculation or opinion; they are to be found in *actual experience* with both long (unrestricted) and short (restricted) train operations, as reflected in accident and casualty reports and statistics, covering each and all of the 18 years immediately preceding the date of the trial, and covering not only the Arizona lines, but also other parts of appellant's own system, as well as the other railroads of the United States.

That experience convincingly shows beyond any possible debate that, from the casualty standpoint, the unrestricted operation carried on with as few train units as practicable results in far less hazard, and a much smaller casualty frequency, whether all classes of accidents and casualties or only restricted groups of casualties be considered, than does the restricted (short train) operation. Even considering the narrow issue of the number and frequency of the slack-action type of casualties, the record of accidents and casualties in Arizona and elsewhere shows that the law has not eliminated this class of accident, or even measurably affected its frequency.

(4) There is no evidence of record which shows, or tends to show, nor even any claim by any of appellee's

witnesses, that any accident or casualty has occurred upon or in connection with a long freight or passenger train as to which it could be reasonably said that the same accident would not have occurred if the train had been within the limits prescribed by the law, or, if occurring, would have been less severe.

(5). The results, from the casualty standpoint, of appellant's long-train operations in Arizona during March and April, 1940, though not claimed to be conclusive, strongly indicate that long-train operation is *less* hazardous (and certainly not *more* hazardous) than short-train operation. There were *no* accidents or casualties on *any* of the 62 passenger trains which, during that period, were operated without regard to the law. There was but *one* casualty occurring on *one* of the 302 *long* freight trains operated during that period, *which took place when a brakeman fell while dismounting from the caboose of a 91-car train, the caboose being detached at the time* and handled alone by the engine. There were, during the period of long passenger train operation, 7 accidents with 7 casualties, all occurring upon trains operated in conformity with the law. There were, during the period of long freight train operations, 6 accidents, with 4 casualties, occurring upon *short* freight trains.

It follows that the law can not be upheld under the Commerce Clause, because upon consideration of all the relevant facts and circumstances—the nature of the subject matter regulated, the substantial interferences and obstructions to and heavy burdens upon interstate commerce, as against the very dubious safety benefits, and the certainty that many if not all of the hazards incident

to train operation are materially increased—it plainly appears that the matter here regulated is not local in character; that there are no practical difficulties preventing adequate treatment by Congress; and—of great importance—that even assuming that the subject matter may be considered "local", there is no scope for this particular regulation, because it substantially impairs the national interest in the uniform regulation of interstate commerce and materially obstructs the free flow of that commerce. The competing demands of the state and national interests, asssuming that there is a demand by the state, can be accommodated here only by holding the state law invalid.

This conclusion is strongly supported by the reasoning followed and the results reached by this Court, in *Terminal Railroad Association v. Brotherhood*, supra (318 U.S. 1). The Court there stated (at page 8):

> "It (the challenged state regulation) finds its origin in the local climatic conditions and in the hazards created by particular local physical structures, and it has rather obvious relation to the health and safety of local workmen. The record in the case does not afford a sure basis for calculating the costs to commerce resulting from the order against the costs to the safety and health of the workmen which it was intended to minimize, and there is evidence in the case that nearby railroads have seen fit in the absence of legal compulsion to provide cabooses in circumstances substantially similar to those upon which appellant relies to establish absence of state power."

The Train-Limit Law, by contrast, was not apparently inspired by any peculiar local climatic or other condition, and certainly is not seriously claimed or shown to be necessary as a safety measure on this account. The hazard (of slack action), to which it is alleged to be particularly addressed, plainly is not local to Arizona, nor is there any unusual condition in that state which is claimed to increase that hazard. The relation of the law to local health and safety is not only not "obvious"; to the contrary, it is clearly shown, and specially found, that the law is a source of increased hazard and multiplied casualties: "As a matter of cold fact, it makes these short-train operations more dangerous" (Opinion of trial court, R. 4053). The record here affords a sure and (even to the state court) "satisfactory" basis for computing the cost to commerce resulting from the law, in terms of financial burden; and an equally sure and satisfactory basis of measuring the added cost in terms of the obstructions imposed, and especially the additional and unnecessary hazards created. There are no "costs to health and safety of workmen" incident to the unrestricted operation which the challenged law measurably reduces, not even the "slack-action" hazard: so that there is nothing by way of tangible benefit against which the added cost to commerce can be placed. The delay, burden, and obstruction are imposed by the law upon commerce as a purchase price of claimed "benefits" which become, upon analysis of the record, actual and positive detriments.

Finally, and as contrasted with the evidence in the *Terminal Case*, showing a general voluntary adoption by other

nearby railroads of the practice required by the challenged order, there is in the case at bar a complete and uncontradicted showing that long-train operation is the common, standard, and regular practice upon the major railroads throughout the nation, and has been for many years; that the compelled short-train practice has prevailed, during the last fifteen to twenty years, only in Arizona (and for a brief period, since the record closed, in Oklahoma); that the circumstances under which such long-train operations are carried on are not essentially different, and certainly no more favorable generally to the practice, than in Arizona; and—as we again emphasize—that there have taken place, side by side with the development and extension of this long-train operating practice, very substantial improvements in the efficiency, speed, economy, and above all, the *safety*, of railroad operations throughout the nation.

In the light of the trial court's findings, the summary thereof in the trial court's opinion, and the confirmatory conclusions of the Interstate Commerce Commission, we think there can be no doubt as to the applicability in the present case of those principles or decision set forth in this Court's opinions cited above; that is to say, the law must be held invalid as an infringement upon, and a violation of, the Commerce Clause, because even though considered as a possible exercise of the state's police power in the concurrent field, it imposes burdens, obstructions, and interferences which far exceed the mere incidental, indirect, or remote effects permitted to the state, and are instead inevitable, material, direct, substantial, and con-

tinuous, and far outweigh any possible "benefits" which, from even the most partisan standpoint, can be claimed on this record to flow from the law.

4.

THE TRAIN LIMIT LAW INVADES A FIELD OF REGULATION OF INTERSTATE COMMERCE FULLY OCCUPIED BY CONGRESS.

(Assignment of Error No. 5).

We turn now to a discussion of the "occupancy-of-the-field" issue; i.e., the proposition that the challenged law is invalid because it infringes upon, conflicts with, and attempts to supplement federal legislation having the same or similar purposes, whereby Congress, acting both directly and through its delegated agency, the Interstate Commerce Commission, has fully occupied the field of regulation of the length and consist of interstate railroad trains.

This proposition is set forth at length in Conclusion of Law No. VI of the trial court, the substance of which is as follows (R. 4036-4037):

> "To the extent that the Train Limit Law has, or is claimed to have, the effect of limiting the length of a train to the maximum number of cars which can be safely controlled or stopped by the use of the air brakes and appurtenances now employed thereon, or by any other form of train control or other safety device, said law is void because it enters a legislative field already entered and therefore occupied by Congress, and conflicts with and infringes upon Federal legislation enacted under the Commerce clause: namely, the power-brake provisions of the Safety

Appliance Act (Secs. 1 and 9), and the provisions of Section 25 of Part I of the Interstate Commerce Act, whereby full power was delegated to the Interstate Commerce Commission to investigate and determine the adequacy of air brakes and other forms of train-control and safety devices used on interstate railroad trains, and by order to prescribe the form and type of such airbrakes and other devices; which power and authority the Commission has duly exercised."

Although this conclusion was challenged by the state upon its appeal to the state Supreme Court, the point was not separately discussed by the latter in its opinion, except to the extent that it may have done so by its quotation (R. 4064-4066) from the majority opinion in the *Oklahoma Case*, where the same issue is reviewed at length (36 F. Supp., pp. 614-616). In his dissenting opinion in the court below, however, Judge Ross made clear his view that the law invades the federally occupied field, saying (R. 4070):

> "The Train Limit Law, if an allowable state regulation originally, is no longer allowable for the following reasons: . . .
>
> "3. It invades the field of regulation occupied by the Congress in its legislation providing for safety appliances in railroad operations (*Virginian Ry. Co. v. United States* (1915), 223 Fed. 748) and the safety provisions of the Interstate Commerce Act."

[4] The general principle applicable to this branch of the case may be stated as follows: A state police-power statute which, in the absence of federal legislation touching the subject matter, might possibly be sustained as a law-

ful regulation in the "concurrent field", because addressed to a matter of local concern, and not imposing any material burden upon, or obstruction to, the free flow of interstate commerce, or otherwise impairing the national interest, is immediately set aside when Congress, exercising its delegated power under the Commerce Clause, enacts any legislation which, by direct statement or necessary effect, clearly manifests the congressional intent to cover the subject matter; for the field is thereby occupied, and any existing or future state legislation upon the subject is precluded.

Among the cases which support this principle are:

Oregon-Washington R. & N. Co. v. Washington, supra (270 U.S. 87, 70 L.ed. 482);

Southern Railway Co. v. Reid (1912), 222 U.S. 424 (436), 56 L.ed. 257;

Northern Pacific Railway Co. v. Washington (1912), 222 U.S. 370 (378), 56 L.ed. 237;

Erie R. Co. v. New York (1914), 233 U.S. 671, 58 L.ed. 1149;

Missouri Pacific R. Co. v. Stroud (1925), 267 U.S. 404 (407-408), 69 L.ed. 683;

C. R. I. & P. R. Co. v. Elevator Co. (1913), 226 U.S. 426 (435), 57 L.ed. 284;

Napier v. Atlantic Coast Line R. Co. (1926), 272 U.S. 605 (612-613), 71 L.ed. 432;

Pennsylvania R. Co. v. Public Service Commission (1919), 250 U.S. 566 (569), 63 L.ed. 1142.

The *Napier* and *Pennsylvania Cases* are of particular interest, because they hold that when there is a delegation

of power to the Commission with respect to a particular subject matter (the character of the appliances to be used upon railroad locomotives and equipment in interstate commerce), and even though the Commission may not have exercised the delegated power to the full extent conferred, any state legislation is nevertheless precluded: for "the states can no more supplement the federal requirements than they can annul them."

Our argument upon the "occupancy-of-the-field" point is addressed to and predicated upon a contention advanced by appellee and sustained by the state court: a contention which, moreover, appellee is virtually compelled to make by the very nature of the case and the issues as they arise from the affirmative defense presented by appellant as the original defendant. In its answer appellant attacked the law as having no justification as a purported safety measure, and at the trial it presented voluminous evidence to support that challenge. It was therefore essential to appellee's attempt to sustain the law's validity that it should undertake in the trial court to show, and upon its appeal to the state court to convince that tribunal, that the restrictions upon train operations imposed by the law are necessary in the interest of safety; for it is apparently conceded that if the law cannot be sustained as a safety measure, it cannot be sustained at all.

By far the greater part of the testimony of appellee's rebuttal witnesses, as well as practically all of its discussion and criticism of appellant's safety evidence, therefore is and has been addressed to its claim and theory that the law is necessary as a safety statute, and particularly to the specific contention that long trains cannot be

operated (i.e., handled, controlled and stopped) in Arizona with as few hazards as short trains.

Two federal statutes are referred to in appellant's answer (par. 12(b) of Part III; R. 26-27), and also in the text of the trial court's Conclusion No. VI, as having constituted the means whereby Congress has entered, and thereby occupied, the field of regulation in which the Train Limit Law attempts to operate: viz., the power-brake provisions (Sections 1 and 9) of the Safety Appliance Act (45 U.S. Code 1, 9), and the Safety Section (Sec. 25) of Part I of the Interstate Commerce Act (49 U.S.C., I, 25).

(a) The power brake provisions of the Safety Appliance Acts:

Section 1 of the Safety Appliance Act, enacted March 7, 1893 (27 Stat. 531; Section 1, Title 45, U.S.C.) now reads:

> "It shall be unlawful for any common carrier engaged in interstate commerce by railroad to use on its line any locomotive engine in moving interstate traffic not equipped with a power driving-wheel brake and appliances for operating the train-brake system, or to run any train in such traffic after said date that has not a sufficient number of cars in it so equipped with power or train brakes that the engineer on the locomotive drawing such train can control its speed without requiring brakemen to use the common hand brake for that purpose."

Section 9, enacted March 2, 1903 (32 Stat. 943; Sec. 9, Tit. 45, U.S.C.) now reads:

> "Whenever, as provided in sections 1-7 of this title, any train is operated with power or train brakes

not less than 50 per centum of the cars in such train shall have their brakes used and operated by the engineer of the locomotive drawing such train; and all power-braked cars in such train which are associated together with said 50 per centum shall have their brakes so used and operated; and, to more fully carry into effect the objects of said sections, the Interstate Commerce Commission may, from time to time, after full hearing, increase the minimum percentage of cars in any train required to be operated with power or train brakes which must have their brakes used and operated as aforesaid; and failure to comply with any such requirement of the said Interstate Commerce Commission shall be subject to the like penalty as failure to comply with any requirement of this section."

While Section 9 thus required at least 50 per cent of the cars in each train to be equipped with power brakes operated by the engineer, it also authorized the Commission, after due hearing, to increase that percentage. Pursuant to that delegation, the Commission has from time to time issued successive orders until the requirement now stands at 85 per cent* (cf. *New York Central R. Co. v. U. S.* (1924), 265 U.S. 41, 68 L.ed. 892; *U. S. v. Panhandle & Santa Fe R. Co.* (1938), 21 F. Supp. 919).

*Order of Interstate Commerce Commission of June 6, 1910.

It Is Ordered, That on and after September 1, 1910, on all railroads used in interstate commerce, whenever as required by the safety appliance act as amended March 2, 1903, any train is operated with power or train brakes, not less than 85 per cent of the cars of such train shall have their brakes used and operated by the engineer of the locomotive drawing such train, and all power-brake cars in every such train which are associated together with the 85 per cent shall have their brakes so used and operated.

Section 6 of the Safety Appliance Act makes it "the duty of the Interstate Commerce Commission to lodge with the proper district attorneys information of any such violations as may come to its knowledge."

Congress also annually makes appropriations to enable the Commission to "keep informed regarding and to enforce compliance with" the Safety Appliance Act.*

It will be noted that Section 1 of the Act does not provide *in terms* that air brakes shall be used for the purpose of controlling trains but only that such and so much equipment shall be placed on trains that the engineer can control them; but certainly this is the necessary implication, and the federal courts, in construing the Act, have therefore held that Congress intended not only that trains should be equipped with air brakes, but that they should be controlled in a reasonably safe manner by air brakes, and to that end must be made short enough so that they can be so controlled.

The leading Circuit Court of Appeals decision in which this doctrine was announced was:

Virginian Ry. Co. v. United States (1915), 223 Fed. 748.

*For instance, in 1929 Congress appropriated upwards of $500,000 "To enable the Interstate Commerce Commission to keep informed regarding and to enforce compliance with Acts to promote the safety of employees and travelers upon railroads; the Act requiring common carriers to make reports of accidents and authorizing investigations thereof; and to enable the Interstate Commerce Commission to investigate and test appliances intended to promote the safety of railway operation, as authorized by the joint resolution approved June 30, 1906 (U. S. C., page 1441, section 35), and the provision of the Sundry Civil Act approved May 27, 1908 (U. S. C., page 1441, sections 36, 37), to investigate, test experimentally, and report on the use and need of any appliances or systems intended to promote the safety of railway operation, inspectors, and for traveling expenses." (45 Stat. 1239.)

The facts in the case were these:

In 1912 it was the common practice of the Virginian Railway to operate coal trains of 100 cars, each carrying approximately 54 tons; those trains exceeded in tonnage, if not in number of cars, the trains in ordinary use on any of the other railroads.

Over a certain section of the track, because of its condition, trains were limited by order to speeds of five miles an hour at one point and ten miles an hour at other points. With respect to operation at that rate of speed with air brakes alone, the court said:

> "It was found, however, that these very long trains could not be operated safely, at the slow rate of speed required on this grade, when air brakes only were used for their control. This was because air brakes could not be applied with needed effect, if at all, without exerting a pressure which would stop the train, or, if released before the train came to a standstill, would cause such a jerking and surging of the train as to break the cars apart, and accidents of this kind were of frequent occurrence."

Under those circumstances the company in May, 1912, promulgated an order as to when hand brakes only should be used except that:

> "The automatic air brakes will be used if it is seen that the hand brakes are not holding properly to make a quick stop on account of being flagged, or in other cases of emergency."

The following stipulation was introduced in evidence:

> "The engines on each of said trains were equipped with a power driving wheel brake, and appliances

for operating the train brake system, and all of the cars in each of said trains were equipped with power or train brakes, so that the engineer on each of said engines could control the speed of the trains without requiring brakemen to use a common hand brake for the purpose. All of said cars in each of said trains were also equipped with hand brakes."

The court summed up the facts and stated the question at issue as follows:

"It appears to be conceded by defendant, and the fact is clearly established by the testimony, that *trains of a smaller number of cars could be safely operated on this section of road, even at the slow rate of speed stated, by using only the air brakes and the locomotive power brake.* Just how many cars could be handled without the use of hand brakes is not altogether certain, but apparently there was no difficulty with trains of 50 cars, or even more than that number. In short, *the alleged necessity for requiring hand brakes to be used resulted wholly from the extreme length of the trains,* coupled with the low rate of speed at which they were moved. Shorter trains could be operated with entire safety, as respects control of speed and otherwise, without the aid of hand brakes.

The situation, then, was this: All the appliances contemplated by the statute were fully provided, were of proper construction, and in good working order. *Trains of say 50 cars, probably more, could be safely operated without the aid of hand brakes; but for trains of greater length, certainly for those of 80 to 100 cars, it was necessary,* in order to avoid the risk of accident, *to make use of hand brakes* as provided in the quoted order. *Was the use of hand brakes un-*

der such circumstances a violation of the Federal statute?" (Emphasis ours.)

The court then held that the Safety Appliance Acts, when properly construed, required not only that trains be so equipped that they could be controlled by power brakes, but that, except in emergencies, they must be so controlled, and, in order to effectuate such purpose, *that only trains short enough to be controlled by air brakes with safety could be operated.* This is precisely the field of regulation which, as appellee has asserted, has not been occupied by federal legislation, and the precise purpose for which, as it has plainly contended, the challenged law was enacted.

The essence of the decision is this: that Congress by enacting the Safety Appliance Act has imposed the requirement, not only that air brakes shall be applied upon a definite minimum proportion (now 85 percent) of the cars in a train, but also that they shall so function that the train may be controlled by the engineer; *that the operation of a train longer than can be so controlled is forbidden, under penalty;* and that in determining the question of ability to control, the *length of the train*, its loading, the character of the territory where it is operated, and all other relevant circumstances are to be taken into account.

The *Virginian Case* has been cited with approval in several later cases:

New York C. R. Co. v. U. S., supra (265 U.S. 1) (46), 68 L.ed. 892);

U. S. v. Great Northern Ry. Co. (1916), 229 U.S. 927;

Pennsylvania Co. v. U. S. (1917), 241 Fed. 824 (830);

U. S. v. G. R. & I. R. Co. (1916), 244 Fed. 609 (613) (affirmed, 249 Fed. 650).

In this connection we call attention also to the Interstate Commerce Commission's interlocutory report in:

Investigation of Power Brakes and Appliances (1924), 91 I.C.C. 481,

in which the Commission, after lengthy investigation, including hearings at which testimony was offered by representatives of both the carriers and the train service employees, made certain findings respecting the development, present methods of use and efficiency of existing types of air-brake equipment. This report was introduced in evidence by appellee as Exhibit 385 (R. 2706).

In that proceeding the Commission referred to the first type of power brake developed, the so-called straight air-brake, similar to the present street car air brake, in which the brake was applied when the train line pressure was increased, and released when the train line pressure was reduced; but the brake was wholly inoperative when a train broke in two.

Next came the plain automatic brake, which, according to the Commission, was "placed in service when trains of 25 or 30 cars were common"; and then the third, or H type, was developed "as train lengths increased to 50 cars." The evidence shows that neither of those types is presently used by appellant; but it is obvious that neither could be used on a train containing even seventy

loaded cars, particularly in heavy grade mountain territory, without violating the Safety Appliance Act, because, although such a train undoubtedly could be stopped, it would be impossible for the engineer to *control* it in a reasonably safe and proper manner. While the K-type of brake, developed and made standard in 1919, "as train lengths were still further increased to 100 or more cars," undoubtedly can lawfully be used on trains of 100 cars or substantially more, yet there is a limit to the length of the train which can be controlled properly and with a reasonable degree of safety when equipped with that type of brake. Just what that limit would be in any particular case is a question for the federal courts to determine in a prosecution under the act and in the light of the facts developed in such case. Neither state courts nor state legislatures are authorized to pass upon that question.

(b) Section 25 of Part I of the Interstate Commerce Act:

The power brake provisions of the Safety Appliance Acts were the only federal train-control regulations in effect until 1920; they were then supplemented by the addition to the Interstate Commerce Act of Section 26. In 1920 that section provided that the Commission might order any railroad carrier subject to the Interstate Commerce Act to install automatic train-stop or train-control devices or other safety devices, in compliance with specifications and requirements prescribed by the Commission. In 1937 the section was amended and greatly amplified. In September, 1940, it was renumbered as Section 25 of Part I of the Interstate Commerce Act (by the passage of the Transportation Act, 1940) but was not otherwise

changed. As amended in 1937, and at present, Section 25 provides in part:

> ". . . The Commission may, after investigation, if found necessary in the public interest, order any carrier within a time specified in the order, to install the block signal system, interlocking, *automatic train stop, train control, and/or* cab-signal *devices, and/or other similar appliances, methods, and systems intended to promote the safety of railroad operation,* which comply with specifications and requirements prescribed by the Commission, upon the whole or any part of its railroad, such order to be issued and published a reasonable time (as determined by the Commission) in advance of the date for its fulfillment:" (Emphasis supplied.)

This section in terms thus authorizes the Commission to prescribe and require automatic train-stop or train-control devices, or other similar appliances, methods and systems intended to promote the safety of railroad operations. Under settled rules of statutory construction the words "other similar appliances, methods, and systems" refer to devices of the same general nature, and performing the same functions as "train-stop" or "train-control" devices. The air brakes themselves are "train-stop" or "train control devices," and it is only by their application that trains can be controlled and stopped.

In the interlocutory report in the *Power Brake Investigation Case*, the Commission's opinion begins with the following statement:

> "This is a proceeding instituted by us on our own motion under Section 26* of the Interstate Commerce

*Now renumbered as Section 25.

Act, which authorizes us, after investigation, to order the installation of automatic train-stop or train-control devices, or other safety devices, which comply with specifications and requirements prescribed by us, upon the whole or any part of the railroad of any carrier by railroad subject to the act."

The Commission followed this statement by reference to the power brake provisions of the Safety Appliance Act, and to the minimum percentage of cars and trains required to be equipped with power brakes, and then said (91 I.C.C., at page 483):

> "As a result of its investigations our Bureau of Safety has reported to us that many serious train accidents, in which have occurred numerous deaths and injuries to persons as well as great damage to property, have been caused by faulty or inadequate power-brake equipment. The reports of our inspectors have indicated a lack of improvement in power-brake conditions commensurate with the requirements of safe and efficient operation. . . .
>
> The situation on the whole demanded a broad general inquiry by us into the subject of the use and operation of power brakes, and, following the receipt of a petition on behalf of the Automatic Straight Air Brake Company for an investigation under Section 26 of the Interstate Commerce Act, we entered our order in this proceeding on February 20, 1922."

In the report the Commission found that improvements in methods of operation and maintenance of power brakes should be made, and that also the air-brake apparatus should be changed so as to provide for certain additional functions not performed by the apparatus then in use.

The Commission also suggested certain tentative general specifications and requirements for changes in air brakes, but held the case open for the purpose of giving the matter further consideration before prescribing final and complete specifications.

Subsequently investigations and tests were conducted by the American Railway Association; and in 1933 the carriers adopted the specifications of the new type ("AB") brake, meeting the Commission's suggestions (Exhibit 396; R. 3572-3577).

The most recent action dealing with the matter of air brakes, taken by the Commission pursuant to Section 25, occurred on July 29, 1944, and October 19, 1944, when the Commission issued its further general orders in the *Power Brake Investigation Case*, requiring all interstate railroad carriers to show cause why an order should not be made, prescribing the specifications for the power brakes to be applied to cars used in freight service, and setting a definite time limit within which all cars so used must have the specified air brakes applied.

Pertinent portions of the order of July 29, 1944, are quoted in the accompanying footnote,* and the entire order is re-

*"*It appearing*, That on July 18, 1924, the Commission made and filed a report in this proceeding in which there were enumerated certain general requirements which should be met by power brakes for passenger and freight trains, in the interest of increased safety in train operation; . . .

It further appearing, That respondents . . . after extended investigation and tests, adopted, on August 16, 1933, specifications and requirements for power brakes, and appliances for their operation, in freight service . . .

It is ordered, That all common carriers by railroad subject to section 25 of the Interstate Commerce Act be, . . . cited to show cause, . . . why . . .

(1) Specifications and requirements as set forth in the appen-

produced as Appendix "A" to this volume.* It will be noted that the specifications of air brakes thus proposed to be adopted by the Commission are substantially identical with the "Specifications for Freight Brakes" adopted as above stated by the American Railway Association in 1933; except that the Commission's specifications contain in addition the express statement (which appears *twice*) that both the service and emergency requirements are based upon brake-pipe pressure of 70 lbs., *and train length of 150 cars*. This particular phrase does not appear in the Association's specifications (Exhibit 396).

Thus the Commission's latest order not only recognizes the obvious and immediate relationship between air brake requirements and the number of cars in the train, but also definitely contemplates the operation of trains consisting of *more than twice* as many cars as the Arizona law permits. The record shows that such trains are often operated (Exhibits 44, 81, 100, 117, 118; R. 404, 874-878).

In the meantime, the Commission's order of 1924 with respect to improvement in the methods of operation and in maintenance of air brakes has been complied with; by the installation of heavier graduating springs in triple valves, undesired emergency applications of the brakes

*The specifications were slightly modified by the order of October 19, 1944. The appendix sets forth the modified specifications.

dix to this order should not be prescribed by the Commission for power brakes and appliances for operating power brake systems, to be applied to cars used in freight service; and

(2) If specifications and requirements in substantial conformity with those set forth in the appendix to this order are prescribed by the Commission, an order should not be issued requiring that all cars used in freight service be equipped with power brakes and appliances for operating power brake systems, conforming to such specifications and requirements, on or before January 1, 1946.

(i.e., those not due to action of the engineer or the conductor) were eliminated almost completely. That improved methods of maintenance and operation of air brakes have been placed in effect and observed was recognized and admitted by appellee's principal witnesses (*Cooper*, R. 2304, 2349-2350; *Durnil*, R. 2406; *Kennedy*, R. 2428; *Shaw*, R. 2653).

The point of our citation of the Commission's opinion and recent order in the *Power Brake Case* is not that the Commission's findings of fact and observations themselves prove or disprove any claim respecting the operations or other characteristics of air brakes; but the report and order absolutely and conclusively show that the Commission has exercised and is actually exercising its powers under the Safety Appliance Acts, and Section 25 of the Interstate Commerce Act, *as to railroad air brake equipment;* which necessarily includes, as the Commission has expressly recognized, the lengths of trains controllable by such equipment. Common fairness as well as the requirements of due process have dictated that no order should be entered without a hearing and thorough investigation. *But the power to order has been delegated to the Commission by Congress and is being constitutionally exercised. Because of interchange of cars between railroads an order of national effect is indispensable.*

It is our position therefore that Congress has directly entered and occupied the *entire* field—not merely the air brake and safety appliance features—of train-length regulation by enacting the Safety Appliance Act and delegating to the Commission the powers conferred by Section 25.

It is obvious that there must be some limit to the effectiveness of any air brake; much testimony was offered by appellee supporting that view. For illustration, probably no one would contend that the modern air brake, although shown to be fully adequate to control trains of substantially more than 70 cars and indeed of more than double that number, would operate effectively on the 500th car of a 500-car train, under all conditions. What that effective limit is no witness in this case attempted to say, except that certain of appellee's witnesses made rather casual references to 100 cars as constituting a long train requiring greater care in handling. The Commission's recent order shows that the effective limit is believed to be not less than 150 cars.

(c) In determining whether the Train-Limit Law is in conflict with acts of Congress, the entire scheme of the Federal legislation, including not only what Congress did say, but what it did not say, with all other relevant facts and circumstances, must control.

In

Savage v. Jones, supra (225 U.S. 501, 56 L.ed. 1182), this Court, speaking through Mr. Justice Hughes, said (225 U.S., at p. 533):

> "When the question is whether a Federal act overrides a state law, *the entire scheme of the statute must of course be considered* and that which needs must be implied is of no less force than that which is expressed. If the purpose of the act cannot otherwise be accomplished—if its operation within its chosen field else must be frustrated and its provisions be

refused their natural effect—the state law must yield to the regulation of Congress within the sphere of its delegated power." (Emphasis supplied.)

While the rule of statutory construction laid down in that case is peculiarly applicable here, there is not here presented the question whether the Arizona law has been overridden by Congress. Arizona has never had the power to determine the number of trains to be run across the state boundary lines, or in New Mexico and California. Insofar as train control is concerned, the original Safety Appliance Act was passed in 1893, and amended in 1903 and 1910, the latest amendment thus preceding the enactment of the challenged law by two years. The addition of Section 26 (now Section 25) to the Interstate Commerce Act, in 1920, and its substantial amendment in 1937, supplemented the pre-existing federal train-control legislation, and reinforced the prior legislation by which Congress had (as the *Virginian Case*, supra, 223 Fed. 748, makes clear) provided that trains should be limited to safely controllable lengths.

By the original Safety Appliance Act, and Section 3 of the amendatory act of 1910, the Commission, acting either by itself or in cooperation with the railroads, was authorized to prescribe certain construction details of safety appliances other than power brakes; but Congress did not at that time either itself prescribe, or authorize the Commission to prescribe, the details of construction of power brakes. Such power has, however, apparently been conferred upon the Commission by Section 25 of the Interstate Commerce Act; for that statute now states that the

Commission may require railroad carriers to install automatic train-stop or train-control devices, or *other safety devices* which comply with specifications and requirements prescribed by the Commission. The Commission, in the *Power Brake Investigation*, supra, has held that by the section as first enacted it was vested with such power; and now, by its order of July 29, 1944, it has taken direct steps to exercise that power.

But, insofar as the present case is concerned, it is immaterial whether that specific power was conferred upon the Commission; nor is it material that Congress did not go further, and, in addition to providing in the Safety Appliance Act and in Section 25 for the safe control of trains by air brakes, provide also, for train-control purposes, that trains in excess of specified lengths should not be run; that omission does not leave room for the Arizona law to operate in the train-control field.

The situation arising out of the passage of the Train Limit Law, after the enactment by Congress of the Safety Appliance Acts, was similar to that which obtained when Congress by the passage of the Employers' Liability Act merely made railroads liable to their employees for personal injuries caused by negligence, and failed to mention injuries not caused by carriers' negligence. The State of New York, by its Workmen's Compensation law, attempted to remedy the apparent oversight of Congress. In

N. Y. C. R. R. Co. v. Winfield (1917), 244 U.S. 147; 61 L.ed. 1045,

which involved the New York statute, this Court stated the contentions of the respective parties and its views as follows (p. 149):

"By one side it is said that the act, although regulating the liability or obligation of the carrier and the right of the employee where the injury results in whole or in part from negligence attributable to the carrier, does not cover injuries occurring without such negligence, and therefore leaves that class of injuries to be dealt with by state laws; and by the other side it is said that the act covers both classes of injuries and is exclusive as to both. * * *

In our opinion the latter view is right and the other wrong. Whether and in what circumstances railroad companies engaging in interstate commerce shall be required to compensate their employees in such commerce for injuries sustained therein are matters in which the Nation as a whole is interested and *there are weighty considerations why the controlling law should be uniform and not change at every state line.*" (Emphasis supplied)

Not only did the Federal Employers' Liability Act fail to provide compensation for injuries occurring without negligence, but it also failed to define negligence. In

C. & O. R. R. Co. v. Stapleton (1929), 279 U.S. 587, 73 L.ed. 861,

it was contended that by reason of this omission of Congress state legislatures had the right to determine that certain acts or omissions amounted to negligence; but this Court held that Congress, though it had failed to prescribe the acts or omissions constituting negligence, did not intend thereby to permit the states so to do. In so deciding, the Court said (p. 592):

"The exclusive operation of the Federal Employers' Liability Act within the field of rights and duties as

between an interstate commerce common carrier and its employees has been illustrated in opinions of this Court applying that Act by quotations of the words of Mr. Justice Story in Prigg v. Pennsylvania, 16 Pet. 539, 617, used in another association:

'If this be so, then it would seem upon just principles of construction, that the legislation of Congress, if constitutional, must supersede all state legislation upon the same subject; and by necessary implication prohibit it. For, if Congress have a constitutional power to regulate in a particular subject, and they do actually regulate it in a given manner, and in a certain form, *it cannot be that the state legislatures have a right to interfere, and, as it were, by way of complement to the legislation of Congress, to prescribe additional regulations, and what they may deem auxiliary provisions for the same purpose.* In such a case, the legislation of Congress, in what it does prescribe, manifestly indicates, that it does not intend that there shall be any further legislation to act upon the subject matter. Its silence as to what it does not do is as expressive of what its intention is as the direct provisions made by it.'" (Emphasis supplied.)

In this connection, note should also be taken of *Pennsylvania R. Co. v. Public Service Commission*, supra (250 U.S. 566), in which an order of the Pennsylvania commission relating to the safety appliances to be used upon end cars of trains was held to be invalid, because it was an attempt to supplement orders made by the Commission pursuant to Section 3 of the Safety Appliance Act of 1910.

There, as here, the Safety Appliance Act was relied on. Insofar as it was applicable to the *Pennsylvania Case*, it

provided that certain appliances should be attached to cars to enable employees to get on and off trains with safety; the State of Pennsylvania concluded that another appliance was necessary for the same general purpose, and the real question was whether Congress by the legislation it had enacted and its failure to supplement it intended that it should be exclusive. If it did, then the Pennsylvania law would be void because, as was said by Mr. Justice Holmes, when Congress exercises "its exclusive powers over interstate commerce so far as to take possession of the field the states no more can supplement its requirements than they can annul them."

There would seem to be no room for argument that inasmuch as the two federal statutes referred to were clearly passed for the purpose of regulating interstate train operations in the interest of safety, the Train Limit Law, if claimed to be sustainable upon the ground that it is likewise a regulation of train operation in the interest of safety, must be held invalid because of this clear conflict in purpose and effect; for of course it is incompetent, as the cited cases plainly hold, for a state to attempt either to supplement federal statutes having a similar purpose and effect, or to attempt to annul or override them. In the lower courts appellee attempted to avoid this conflict, by arguing that the Train Limit Law regulates a different phase of train operation than the federal acts, and with somewhat different motives or considerations in mind. That is to say, appellee sought to place the state and federal acts in separate compartments in the same field of regulation, by (1) denying that the federal acts have anything to do with train limits, or amount to anything except require-

ments respecting the appliances to be placed in and used upon trains; (2) attempting to draw a distinction between the regulation of train lengths for the sake of the control of train speed (asserted by appellee to be the purpose of the Safety Appliance Act), and similar regulation for the sake of control of the slack action (the asserted purpose of the Train Limit Law); and (3) contending that in practical experience over the past thirty years, the Train Limit Law and the Safety Appliance Act have operated wholly without any conflict.

In order to understand precisely what is meant by the terms "slack" and "slack action," as used in this discussion, reference may be had to the trial court's findings. We call particular attention to paragraphs (a), (b), (c) and (d) of Finding XI (R. 3969-3973). Paragraphs (a) and (b) describe the manner in which cars in trains are coupled together, referring to the couplers and draft gears which connect the cars and the amount of play or free motion, as well as controlled motion, or "controlled resistance," which is built into draft gears and couplers, and is necessary for purposes of train operation. "Slack" and "slack action" are then defined in paragraph (c): "Slack" as:

> "The amount of the movement, including both the free motion at the coupler faces and the controlled resistance in the draft gears, which may take place between the coupled cars of a moving train;"

and "slack action" as:

> "The accumulated effect of such motion, as it may be created or brought into play as the result of train operations."

It is also stated, in the finding, that slack and slack action exist and occur in trains of all lengths.

No exception was taken by appellee, in the lower court, nor any error assigned, in connection with paragraphs (a), (b) or (c) of Finding XI; and a large portion of paragraph (d) was likewise not challenged.

(d) Analysis of the evidence showing appellee's position respecting the dangers intended to be eliminated by the challenged law:

In the course of appellee's case on rebuttal, it called as witnesses three locomotive engineers in appellant's employ, and one employed by the Santa Fe: Witnesses Kennedy, Cheek, Stevenson and Cooper.

These witnesses gave lengthy testimony, in answer to questions by appellee's counsel, with regard to the details of the air brakes and their appliances in use on freight and passenger trains; *and particularly testified as to the ability of engineers to control their trains while in operation, and to stop them, with the use of the air brakes.* Counsel notably and repeatedly asked these witnesses whether the engineer's ability to control and stop his train was affected by the train's length; in each case receiving an affirmative answer.

Thus, Mr. Cooper, after giving detailed testimony as to the air brake system and air brake appliances (R. 2292-2310), said (R. 2314) that ability to control the slack in the train was dependent solely upon the ability to apply and release the brakes throughout the train; and that his ability to start and stop a train was affected by the length, particularly comparing a 70-car train with the train of 109 cars (R. 2338-2339).

The witness was then asked by counsel (R. 2341):

"Mr. Strouss: As the length of the train increases, what, if any, effect does it have upon your ability to safely control the slack in the train?

A. You increase the length of the train and you increase the slack of the train, because every car added adds just that much more to it, and quite naturally, if you have a long train you have more slack than you have in a shorter train, and it is more difficult to control because there is more of it."

The testimony of Messrs. Kennedy and Stevenson, though much briefer, was along similar lines; both witnesses replying, when asked as to the effect of train length upon their ability to control and stop their trains, that the longer the train, the slower the brakes apply, and the less they apply on the rear, so that controlling and stopping a long train of 100 cars takes a longer time and a greater distance (R. 2423, 2425, 2456, 2461).

This same subject matter is dealt with in Finding XIII (e) of the trial court (R. 4030-4032), in which the testimony of these witnesses is briefly analyzed; we ask the Court to refer to that finding. We may emphasize, in passing, that neither Messrs. Cooper, Kennedy, nor Stevenson, nor any other witness called by appellee, was willing to admit that he was not able to control adequately and without accident any and every train which he had been or might be called upon to handle; that the engineers employed by appellant (called by appellee) also agreed that the controlling of long trains required only greater care, but did not involve any greater *difficulty*; their testimony

in this respect being strongly confirmed by appellant's engineer witnesses.

Appellee is thus committed, by the careful phrasing of its counsel's repeated questions, and the testimony of its witnesses, to the proposition that trains exceeding the lengths fixed by the law cannot be safely operated and controlled with the present types of air brakes; that the essential safety purpose of the law is to limit trains to lengths which with the present types of air brakes can be properly handled and safely controlled.

In the concluding portion of its argument to the court below upon this phase of the case, appellee attempted to ascribe to the law the narrow purpose of limiting the amount of the slack in the train to that maximum quantity beyond which the care required for control of such slack, and the hazards from the slack action, are too great to be permitted. This argument not only does not accord adequate recognition to appellee's evidentiary showing; it is also at variance with the arguments advanced in its opening brief to that court (pp. 408-409, 415, 418-419), under the topic *Air Brakes and Their Operation;* where it discussed certain portions of the testimony. Thus, in that brief appellee asserted (at p. 408):

> "*The safety of train operations depends upon the engineer's ability to control his train* and to control the slack in that train, which in turn depends upon the efficiency of the braking system. . . . *Maximum control of the train*, and of the slack therein, *is obtained only when the brakes* on each car *fully and promptly apply or release* in response to the engineer's valve on the engine. . . . *The result of long*

train operation is, by increasing with each car the length of the brake pipe . . . *to increase the delay in the application or release of the brakes* on the rear end and the probability that some brakes on the rear will be partially or wholly inoperative." (Emphasis and omissions supplied by *appellant.*)

Appellee also quoted in that brief (p. 415) from the *Southern Pacific Air Brake Manual*, introduced by appellee as its Exhibit 319, as follows:

> "Smooth train handling depends upon the ability to control the slack and how to prevent it from running in or out harshly. . . . . The heavier the engine and the longer the train *the greater is the care required.*" (Emphasis and omissions as in *appellee's* quotation.)

Appellee further contended in the same brief (p. 418):

> "In mountain or grade operations typical of the Southern Pacific operation in Arizona, where frequent applications of the brakes are required to control the train as the length of the train increases, it becomes more difficult to release and to apply the brakes, especially where loads are handled."

At page 419 of the same brief, and as if to show that the Train Limit Law is necessary to supplement the safety purposes and results of compliance with the provisions of the Safety Appliance Act, appellee said:

> "A greater distance will be required to stop a long train than a short train, although the brake system complies with all the requirements of the Safety Appliance Act. The longer the train the greater the time required for the reduction wave to reach the rear cars

and the longer the *delay* in the application of the brakes on the rear cars. In other words, the longer the train *the longer the delay in the full application of the braking power of the train.* The result will be an increase in the time and distance required to stop the train." (Emphasis as in the original.)

In concluding the discussion in that brief of air brakes and their operations, appellee added this illuminating revelation of its true position (p. 420):

> "In this aspect of its safety purpose the Train Limit Law recognizes that all *the foregoing is true, regardless of the type of brake in use.*" (Emphasis as in the original.)

It is noteworthy that appellee did not, either in this discussion or elsewhere specifically deny that its essential contention was and has been precisely as we have stated it: that the law undertakes, in the purported interest of safety, to limit trains to the lengths which, with the present types of air brakes and their appurtenances, can be properly and safely handled and controlled.

(e) There is no distinction in purpose or result between the federal statutes and the challenged state law.

The attempted distinction in purpose and result, as between the federal statutes and the Train Limit Law, is wholly imaginary and non-existent. In the first place, the federal statutes not only require that safety appliances be placed on the cars and locomotives, but also that they be serviceable; that they control not only the speed of trains, but also that they *control their operation safely.* The essence of the *Virginian Ry. Co.* decision was that

with the appliances then (1912) available, and in the circumstances prevailing upon that railroad, the *longer* (80 to 100 cars) and heavier trains could not be *safely operated and controlled*, with the use of air brakes only; hence operation of these longer trains was a violation of the Safety Appliance Act, and subject to penalty. The act was definitely construed to require that trains must be short enough to be safely controlled by the engineer by means of the air brakes.

Control of the *train* carries with it control of the *slack* and the potential *slack action* in the train. Slack is admittedly present in the train at all times, and is essential to train operation (R. 1673, 2446). Proper control of the slack is necessary for safety, according to appellee and its witnesses although (so appellee has asserted) frequently unobtainable because of the inadequacy of the present types of air brakes (R. 2314, 2423). Safe control of the train operation therefore imports safe and adequate control of the slack action; and the Safety Appliance Act, as interpreted in the *Virginian Case*, since it requires such safe control and forbids the operation of trains which are so long as to prevent such control, thereby equally requires trains to be so limited that the slack action may also be adequately controlled.

There is no such difference between control of *speed* and control of *slack action* as appellee has endeavored to present. Slack action is created by the motion of the train, and occurs only as a result of sudden changes of speed (Ex. 319, p. 8; R. 2429, 2796); its strength and severity, and particularly the consequences when it occurs, are

largely dependent upon the speed at the time of the occurrence (R. 2415, 2429). An engineer of ordinary experience, by proper use of the throttle and the brakes, is able to and does control the speed and thus the slack and slack action in the train (R. 2434-2435, 2787-2799, 2815-2817). We do not say that speed and slack action are identical, for of course they are not. But control of speed and control of slack action involve substantially the same factors; because slack action is so closely related to train speed, and so largely determined by the speed, both as to occurrence and result, that proper and safe control of the train speed necessarily results in large measure in a similar degree of control of the slack action.

The Safety Appliance Act as construed in the *Virginian Case*, supra, is a true, practical, and logical train-limit law, because it permits the operation of as many cars in the train as can be safely controlled, having in mind the loading of the cars, the physical characteristics of the territory over which the train operates, and the functioning of the brakes, and only forbids the operation of a greater number. Its effectiveness as an actual regulation of appellant's train operations in Arizona is greatly diminished by the Train Limit Law because the latter names a fixed limit which cannot be exceeded, no matter what may be the conditions affecting the safe control of the train.

It follows that the two laws have not operated, and do not operate, without conflict. The state law imposes a fixed limit which has been demonstrated, not only by experience in all of the other states of the United States, but also by appellant's own long-train operations in March

and April, 1940, to be substantially less than would be and is imposed, under the conditions prevailing in Arizona, by the federal statute. Specifically, and as stated in Finding No. IX(a) of the trial court (R. 3947), appellant operated 302 long freight trains and 62 long passenger trains over its Arizona lines during March and April, 1940. There was not only *no* testimony that any of these long freight trains was not properly controlled at all times; there was in fact *positive* testimony, from at least two of the engineers who handled some of these trains, that no particular difficulty of control was experienced (R. 2435, 2815). There was no reportable accident or casualty occurring upon any of these long trains, which could be ascribed to a lack of control, or to ineffectiveness of the air brakes, or to any other condition alleged by appellee to be associated with long-train operation.

All these trains were therefore lawful under the federal act, but forbidden by the state statute. We repeat that the conflict between the two statutes is obvious and inevitable.

Appellant's witnesses Fifield and Menzies, who are locomotive engineers of long experience in both train handling and the observation and supervision of other engineers, showed by their testimony that appellant's engineers, in both Arizona (in the 1940 long-train operations) and elsewhere on the system, and notably in Nevada, have no difficulties in handling freight and passenger trains of all lengths, including those much longer than 70 or 14 cars, and in controlling and stopping them, by the use of the present types of air brakes (R. 2787, 2797, 2801, 2806, 2816-2817).

The conclusions to be drawn from this testimony are fully confirmed by the findings of the Interstate Commerce Commission in connection with Service Order No. 85. In the recitals accompanying that order the Commission declared that "railroad freight trains exceeding . . . 70 cars in length, and railroad passenger cars exceeding 14 or 16 cars in length, may be operated in accordance with safety standards now applicable, during the present emergency, in and through such (train limit) states"; and in its opinion, in which it sustained the validity of Service Order No. 85 (*In re Service Order 85*, supra, 256 I.C.C. 523) the Commission again said (at p. 536):

> "The fact that freight trains in excess of 70 cars and passenger trains in excess of 14 cars are safely operated in other states is convincing evidence of its safety, except where unusual operating conditions exist."

There is no showing that unusual operating conditions exist on appellant's lines in Arizona; on the contrary, the conditions are demonstrated by the record to be more favorable than in many other states where long-train operation is the common standard practice.

But this discussion is not, in our view, all that is to be said upon this branch of the case. The fact is that appellee attempted to lay the foundation for a claim that one of the objects of the law is to confine trains to the lengths which can be efficiently handled by a type of air brake that has been and is being successfully used in the actual handling of long trains. Thus the state is undertaking

to accomplish by indirection what it cannot do by direct legislation; that is, to limit the lengths of trains to 70 or 14 cars, on the theory that the modern air brake will not safely control trains of greater lengths.

To illustrate: Under the Safety Appliance Acts, the Interstate Commerce Commission has required certain types of end and side ladders on box cars; two end ladders and two side ladders to each car. The state can no more supplement that regulation than it can annul it: if the state passed a law requiring four end ladders and four side ladders, even of the same type as that prescribed by the Interstate Commerce Commission, the law would unquestionably be invalid under the Commerce Clause and the Federal Safety Appliance Acts. But it could be attacked by a railroad affected by it on two grounds: *first*, under the Fourteenth Amendment, on the ground of unreasonableness; and, *second*, under the Commerce Clause, on the ground of attempted entry into a completely occupied field. If the state in such a suit proved, by clear and cogent evidence, that the additional side ladders were necessary and, therefore, that the statute was reasonable, that proof would have no bearing whatever on the ground of attack based on the Commerce Clause; even if the court should find that the additional ladders were reasonable, the law, nevertheless, would be void under the Commerce Clause point. On the other hand, if in such a case the court should find, under the Fourteenth Amendment point, that the requirement of additional ladders was unreasonable and arbitrary, that would

not deprive the complaining railroad of the right to have a finding in its favor on the Commerce Clause point.

That situation is exactly comparable with the situation here. On the issue of reasonableness, based on the Due Process Clause, appellee has tried to show that the statute is reasonably necessary, because it limits the length of trains to a length that can be properly and successfully handled with the modern air brakes. The inefficiency of the air brake is claimed to be the controlling reason for the law; the gravamen of the state's indictment of long-train operation. That claim and the consequent conflict with federal statutes are not evident on the face of the challenged law; therefore, appellant was not bound to anticipate the claim in its case in chief; but it was completely overcome in rebuttal. But the absence of proof of the claim does not deprive appellant of the right to have a final decision on the Commerce Clause point, that the said statute is in conflict with and amounts to an unlawful attempt to supplement the power-brake provision of the Federal Safety Appliance and Interstate Commerce Acts, by which statutes Congress has completely and exclusively occupied the field of regulation of train lengths.

To illustrate further: The evidence warrants the conclusion that the modern air brake would not be sufficient to control a train of a consist of say 500 cars. If such a train were made up in a terminal yard, and ran on a trip along the road, undoubtedly a federal prosecution would lie under the Safety Appliance Act, for operation of a train not equipped with adequate brakes; and it would be no defense

to assert that no brakes had yet been or, from present knowledge, are likely to be invented which will effectively control a train of 500 cars. The offense would consist in running a train that could not be safely and properly controlled by the air brakes. Such was precisely the basis of the prosecution and final decision in the *Virginian Case*, supra, 223 Fed. 748. What Arizona has plainly tried to do, by the Train Limit Law, is to substitute its judgment for that of a federal court or a federal jury, under proper instructions, in a prosecution for violation of the Safety Appliance Act, as to the length of a train that may be properly controlled by the modern air brake; and that attempted substitution is nothing less than a direct entry into a field of federal regulation which has already been entered and occupied by Congress, to the extent that the state cannot even supplement the regulation.

Moreover, if appellee should claim that it has proven that a long train cannot be safely controlled by the modern air brake and that the statute is a proper police regulation to limit trains to lengths that can be safely controlled by that means, then the law is brought even more completely within the "occupied field" doctrine, because it will have been not only alleged but clearly shown—according to appellee's assumed claim—that the state has stepped in and legislated, for the specific purpose of supplementing or adding to the congressional acts, and the regulations made pursuant thereto.

Appellee is thus brought to a completely untenable position. It must either claim that the law is necessary as a safety measure, or admit that it is not a safety regulation.

If it takes the latter course, it necessarily admits that the law is unreasonable and arbitrary; for as previously stated if the law cannot be sustained as a safety measure, it cannot be sustained at all. Necessarily, therefore, appellee claims that the law is a justified and necessary safety measure, which achieves that object by forbidding the dangerous operation inherent in running long trains; the prohibited long-train operation being assertedly more dangerous than the permitted short-train operation because the long train contains so much more slack that when in motion the slack action cannot be safely controlled. This result is said to be due to the fact that the brakes, although of the same type as on a short train, do not function as well on the long train, so that the control is incomplete and insufficient. The argument thus reduces to the contention that the law promotes safety by limiting trains to the lengths which can be safely controlled, handled, and stopped with the types of air brakes in use, and for that purpose forbids the operation of the longer, allegedly unsafe, trains. This contention, when fairly analyzed, thus brings the law into the occupied field, and squarely into conflict with the federal statutes and the regulations made by the Commission thereunder, because the latter have precisely the same purposes and are addressed to the same subject matter.

Whichever position appellee may choose, that choice is equivalent to a confession of the law's invalidity: either because it is not a safety measure, and has no relation to that purpose; or because, as a regulation of interstate commerce, it conflicts with and infringes upon federal

statutes having identical purposes and operating in the same field.

In prior argument upon this issue appellee has relied particularly upon:

Kelly v. *Washington*, supra (302 U.S. 1, 82 L.ed. 3).

As pointed out in our earlier discussion of this case, this Court held that there was no inconsistency between the federal acts regulating shipping on navigable waters and the state law under attack (so far as it applied to the craft involved in the case), because Congress had been careful to delimit its exercise of jurisdiction, and though regulating steam vessels, and seagoing motor-driven vessels of 300 tons or more; had not regulated but had exempted the smaller motor-driven craft. The state law therefore touched that which the federal laws and regulations had clearly and with apparent intention left untouched.

But the decision presents no analogy to the instant case. Here the Congress, and the Commission as its agency, have regulated the air brakes (the only means of controlling trains) as well as other safety appliances, for all rolling equipment (cars and locomotives) used by steam railroads, and for all trains in which they are run: not merely of a certain size or length, or used in a particular service, but of all sizes, lengths and classes, and in all kinds of service. It is inconceivable that there should now be any remnant of authority left in the state which would permit it to regulate, even indirectly, in the field of train handling and control by means of the air brakes. Safety appliances do not [illegible]

of a dual or concurrent jurisdiction (*Napier v. Atlantic Coast Line R. Co.*, supra, 272 U.S. 605); and in safety appliance matters the state "can no more supplement" the federal provisions "than it can annul them" (*Pennsylvania R. Co. v. Public Service Commission*, supra, 250 U.S. 566).

The exclusive character of federal safety appliance acts is shown by the holding in:

Gilcary v. Cuyahoga Valley R. Co. (1934), 292 U.S. 57 (60), 78 L.ed. 1123:

"The Safety Appliance Acts govern common carriers by railroad engaged in interstate commerce. The Act of 1893 applied only to vehicles used by them in moving interstate traffic. 45 U. S. C. Sec. 2. Its requirements were by the Act of 1903 extended to all their vehicles. Id., Sec. 8. Southern Ry. Co. v. United States, 222 U.S. 20, 26. Moore v. Chesapeake & Ohio Ry. Co., 291 U.S. 205, 213. So far as the safety equipment of such vehicles is concerned, these Acts operate to exclude state regulation whether consistent, *complementary, additional* or otherwise. Prigg v. Pennsylvania, 16 Pet. 539, 617. Southern Ry. Co. v. Railroad Comm'n, 236 U.S. 439, 446. Internat. Shoe Co. v. Pinkus, 278 U.S. 261, 265. The imposition of penalties (id., Sec. 6) and abrogation of assumption of risk (id., Sec. 7) are measures for enforcement." (Emphasis ours.)

The *Georgia Electric Headlight Case*, supra (234 U.S. 280), previously cited by appellee in this same connection, is likewise of little assistance to its argument. In that case this Court, after referring to the Safety Appliance Acts,

the Boiler Inspection Act, the Accident Reports Act, and certain related statutes, said (234 U.S., at p. 293):

> "But it is manifest that none of these acts provides regulations for locomotive headlights. .... It does not appear, however, either that Congress has acted or that the Commission under the authority of Congress has established any regulation so far as headlights are concerned. As to these, the situation has not been altered by any assertion of Federal power and the case stands as it has always stood without regulation unless it be supplied by local authority."

Clearly that language does not apply to the situation presented in the present case. Here it is manifest that Congress has provided, both directly and through the agency of the Commission, regulations for air brakes to be used on cars and trains of interstate carriers, requiring them to be of such character, number and effectiveness that trains may be adequately controlled and stopped by their use; and, as specifically held in the *Virginian Case*, supra, has forbidden under penalty the operation of a train longer than can be safely controlled and stopped with the air brakes. The very essence of appellee's evidentiary showing is, however, an attempt to prove that the present air brakes do not adequately control long trains, and thereby to support the claim that a rational basis for the law is afforded. It is plain that the law, if construed as or claimed to be necessary for that reason, is nothing but an attempt by the state to supplement or replace the federal regulations. The situation is such that the federal power has been directly exerted to compel the provision and use of adequate brakes and other safety

devices on appellant's cars and trains, and no need or place exists for regulation by local authority. This legislation, by which Arizona attempts to shorten the lengths of trains so that the type of air brakes approved by the Interstate Commerce Commission under its broad powers may effectively operate is certainly, and in the instant case is obviously claimed to be "complementary" or "additional" to the Safety Appliance Acts, Section 25 of the Interstate Commerce Act, and the Commission's regulations thereunder; and such was the explicit holding in the *First Arizona* and *Nevada Cases*, where the same claims were made as are indicated here.

The Supreme Court's latest decision in the *Arkansas Full-Crew Cases:*

> *Missouri Pacific R. Co. v. Norwood* (1933), 290 U.S. 600, 78 L.ed. 527,

offers no comfort to appellee. The railroad in that case did not rely upon the Safety Appliance Act, as supplemented by Section 25 of the Interstate Commerce Act. Such statutes could not have had any possible relevancy in that case. The decision therefore did not pass upon our specific point that the Commission was directly given power to regulate air brakes, regardless of state laws to the contrary. The decision upon the issue of conflict between the state law and federal statutes is summed up in the concluding expression by the Court in the earlier decision of the same case (283 U.S. 249, 258):

> "We think it very clear that Congress has not prescribed or empowered the Commission to fix the number of men to be employed in train or switching crews."

Appellee has also referred, in prior argument upon this issue, to:

Missouri, Kansas & Texas Ry. Co. v. Haber (1898), 169 U.S. 613, 42 L.ed. 878;

Welch Co. v. New Hampshire (1939), 306 U.S. 79, 83 L.ed. 500;

Maurer v. Hamilton, supra (309 U.S. 598, 84 L.ed. 969).

The *Haber Case* was cited by appellee, jointly with the *Kelly Case*, supra, to the point that a state police-power statute is not to be regarded as set aside by an act of Congress, unless the repugnance or conflict between the two statutes is so direct and positive that they cannot be reconciled or consistently stand together. It is apparent that that principle cannot be invoked in the present case to save the challenged law. As we have shown, there is a direct and positive conflict between the Safety Appliance Act and Section 23 of the Interstate Commerce Act, on the one hand, and the Train Limit Law on the other; for the Train Limit Law undertakes to forbid, in Arizona, an operation which the other laws, addressed to the same subject matter, permit. That is to say, the Safety Appliance Act, though forbidding the operation of any train which is so long or so heavy that it cannot be safely controlled, handled and stopped, imposes no fixed limit, but permits all of the relevant conditions, such as grade, weight and loading of cars, and the like to be taken into consideration; whereas the Train Limit Law imposes fixed and arbitrary limits, regardless of these conditions and regardless of the fact that experience has demonstrated

that longer trains can be and are safely and effectively operated, handled, controlled, and stopped.

The *Welch* and *Maurer Cases* were referred to apparently because of the expressions in those opinions to the effect that the congressional intention to *displace* local laws relating to health or safety is not in general to be inferred, unless clearly indicated. Obviously, this principle has no application here, because the Safety Appliance Act was passed initially more than nineteen years before the enactment of the Train Limit Law; even the 1910 amendment preceded the Law by two years. Thus, instead of the federal act having superseded or displaced the state law, the latter has invaded a field already occupied by Congress.

The "occupied-field issue" was also presented in the *First Arizona Case,* and was discussed in the following language in that opinion (2 F. Supp., pp. 860-861):

> "The defense of these suits is based on the contention that Congress has passed no Act dealing with the subject of train lengths; that the Boiler Inspection Act, the Power Brake Provision of the Safety Appliance Act and Section 26 of the Interstate Commerce Act, do not cover certain dangers and hazards of train operations and, until Congress deals specifically with those subjects the states are free to adopt such reasonable regulations—in the exercise of its police power.
>
> We cannot agree to this proposition: . . .
>
> "Sections 22 and 34, inclusive, Title 45 USCA, are what are known as the Boiler Inspection Act. This Act requires that every locomotive, its boiler, tender,

and all parts and appurtenances thereof must be inspected, as provided in the Act. Section 1 of the same Title makes it unlawful for any common carrier engaged in interstate commerce by railroad to use on its line any locomotive engine not equipped with power driving-wheel brakes and appliances for operating the train-brake system. Section 2 provides that it shall be unlawful for a common carrier by railroad to haul or permit to be hauled or used on its line any car not equipped with automatic couplers which can be uncoupled without the necessity of men going between the ends of cars. Section 4 requires each car to be equipped with secure grab irons or handholds in the ends and sides of each car for greater security to men in coupling and uncoupling cars. Section 5 prohibits the use of freight cars which do not comply with the prescribed standard as to height of drawbars. Section 11 makes it unlawful for a common carrier to permit to be hauled or used on its line any car not equipped with secure sill steps and efficient hand brakes, ladders and running boards. Section 12 provides that all these appliances shall remain as standard equipment to be used on all cars unless changed by order of the Interstate Commerce Commission. Section 17 makes it unlawful for the carrier to operate a locomotive not equipped with an ash pan which can be dumped without the necessity of any employee going under the locomotive. Section 26 of Title 49 provides that the Commission may order a carrier by railroad to install automatic train-stop or train-control devices, *or other safety devices, which comply with specifications and requirements prescribed by the Commission*, upon the whole or any part of its railroad. All of these acts deal with the subject of safety in the operation of railroad trains in interstate commerce.

It will seem from this that Congress has dealt quite extensively with the subject of safety of interstate train operation. The fact that it has not dealt specifically with each element or factor is immaterial, as the Commission, under power conferred by Congress, is fully authorized to prescribe rules and regulations affecting the subject of train operation."

The court then cited this Court's decision in

Napier v. Atlantic Coast Line R. Co., supra (272 U.S. 605),

and continued:

"From the foregoing, *we conclude that Congress has occupied the field of legislation involved, and has granted to the Interstate Commerce Commission full power and authority to deal with the subject, and that legislation by the states is thereby superseded.*" (Emphasis supplied)

The following discussion of the issue, in the Memorandum Opinion of the trial court in this case, likewise merits the attention of this Court (R. 4047-4048):

"There is a second so-called 'joint' field of regulation, relating to those matters which require diversity of treatment according to local conditions, where the states may act within their respective jurisdictions, unless and until Congress sees fit to exercise its paramount authority. But even if the law in question were found not to fall in the 'exclusive Federal field,' but rather in the 'joint field' of regulation, still the law must be stricken down for the reason that in my opinion Congress has, by the enactment of the Safety Appliance Act, Boiler Inspection Act, etc., coupled with the broad powers delegated to the Inter-

state Commerce Commission, fully 'occupied' this joint field of regulation. This would automatically oust the State of any power to supplement or expand such regulations any more than it could annul or amend them. *Clearly if the law is necessary as a safety measure because 'long trains' cannot be properly controlled and stopped with the present types of air brakes, then it gets over into a field already occupied by the Congress* through the passage of the safety acts above referred to. Engineer Thrace Cooper of the Santa Fe System called by the State testified: 'Your ability to control slack in a train rests solely on your ability to apply and release the brakes throughout the train." (Emphasis supplied.)

We submit that this Court should hold and conclude that Congress, acting both directly, and through the medium of orders issued by the Interstate Commerce Commission as the congressional agency, has undertaken to regulate train lengths in the interest of safety, by limiting interstate trains to the maximum number of cars capable of being safely handled, controlled and stopped with the use of the air brakes and other safety devices required by such federal statutes and orders, and has thus completely occupied the field in which the challenged state law operates; so that the latter, which regulates the same subject matter, and by its requirements conflicts with and attempts to modify or supplement the federal regulations, is wholly invalid.

5.

THE TRAIN LIMIT LAW OPERATES ARBITRARILY AND UNREASONABLY TO DEPRIVE APPELLANT OF ITS PROPERTY WITHOUT DUE PROCESS OF LAW.

(Assignment of Error No. 6)

The fifth major issue of this case, as presented by appellant's affirmative defense (Answer, Part III, pars. 5 and 11, in particular; R. 19-22, 25) and the evidence of both parties, is whether the challenged law is a reasonable exercise of the state's police power in the interest of safety. Appellant contends that the law not only fails to promote safety but actually and substantially increases hazards, so that, taking into consideration the concededly heavy burden of compliance and the arbitrary nature of the regulation itself, it is unreasonable and without rational basis, and thus in violation of the due-process guarantee of the XIV Amendment, as well as the Commerce Clause.

This point was covered at length and in detail in appellant's evidence. There was both an ample and wholly uncontradicted showing of the heavy burden and direct obstruction and interference cast upon appellant by the law, and also an exhaustive treatment of the safety issue. The state likewise dealt with the safety issue, devoting practically all of its comparatively limited counter-showing to that point. Since the statistical portion of the state's evidence was predicated upon reports made by or to the Interstate Commerce Commission, or the Arizona Corporation Commission, to that extent it duplicated certain portions of appellant's testimony, and thus served to confirm the conclusions to be drawn therefrom. There is practically no factual conflict in the testimony of the parties on the safety

point; they differ principally in the conclusions they seek to draw.

The "due-process" issue was very fully covered in the Findings, Conclusions, and Memorandum Opinion of the trial court. There were the detailed findings on the points of financial burden (Finding X(d), R. 3966-3969); interference, delay and obstruction (Findings X(b) and (c), R. 3953-3966) and impairment of efficient and economical use of appellant's property (Finding VII(b)(2), R. 3917-3921; VII(d)(3), R. 3929-3934; XVIII, R. 4034); and there were also specific findings addressed to all phases of the safety question, and all of the claims advanced by appellee and its witnesses in attempted justification of the law (Findings XI, XII, XIII, R. 3969-4032). In line with these findings the trial court adopted its Conclusion of Law No. VII (R. 4037-4038), the substance of which is as follows:

> The law is invalid and in violation of the Commerce Clause and both the Federal and State Due-Process Clauses, because it operates arbitrarily and unreasonably to deprive appellant of its property without due process of law; in that (a) it fixes maximum train lengths very much lower than generally obtain elsewhere throughout the United States under similar operating conditions; (b) it makes no allowance for grade or other revelant conditions, including the consist of the trains themselves; (c) it imposes substantial and wholly unreasonable burdens, interferences and delays, and impairs the use and usefulness of appellant's transportation facilities; and (d) it bears no reasonable relation to safety, and neither eliminates nor reduces any existing hazard, but on the contrary creates hazards not otherwise existing,

and increases other hazards and dangers of railroad operation.

Five principal questions, involving both law and fact, represented by the five propositions stated below, are in our view controlling upon the "due-process" point in this case:

(a) In considering whether the law is an unreasonable exercise of the police power, the cost or expense of compliance is properly a factor to be taken into account, though not the sole factor.

(b) In considering whether the law is unreasonable and thus in violation of the due-process clause, the Court is entitled to exercise its independent judgment upon the facts as developed in the record and found by the trial court, and in this respect is not bound or hampered by any legislative declaration of purpose, either actual or presumed. The legislative choice is at best supported by merely a rebuttable presumption of reasonableness; but this presumption may be overcome by adequate proof, or may not even arise in a particular case because of other circumstances therein.

(c) A law which, when enacted, may have been reasonable and valid under the due-process provision, may by lapse of time and change in conditions become unreasonable, and therefore invalid. If relevant conditions have in fact changed substantially since enactment of the law, the presumption of reasonableness above referred to is no longer available.

(d) Common belief, as exemplified by the almost total absence of similar state or Federal laws, and also by the recent action of the Interstate Commerce Commission (Service Order No. 85), may be relied upon to show, and does show, that the law is wholly unreasonable.

(e) A purported safety measure which in fact bears no reasonable or any relation whatever to health or safety, but on the contrary increases certain hazards and creates others which would not otherwise exist, is unreasonable and without rational basis and therefore, and without regard to its claimed or actual effects upon interstate commerce, should be held invalid because in violation of the due-process clause. The challenged law is shown by the evidence and the findings of the trial court to fall within this principle.

(a) In Considering Whether the Law Is an Unreasonable Exercise of the Police Power, the Cost or Expense of Compliance With Its Provisions Is Properly a Factor to Be Taken Into Account, Although Not the Sole Factor.

Finding No. XVI of the trial court (R. 4033-4034) states, in substance, that the added expense caused by appellant's compliance with the law is a factor (but not the sole or controlling factor) which may and should properly be, and has been, taken into consideration in passing upon the reasonableness of the law as a purported safety measure, and in finding that the law is unreasonable and arbitrary, and without any reasonable relation to its claimed, or purported, purpose; and that wholly apart from any question of the burden imposed upon interstate commerce by such compliance, the added cost which appellant is compelled to incur by reason of obedience to the law is wholly out of proportion to, and far exceeds, any safety to any persons which has been, or can or will be promoted by the law.

The principle which is followed in this finding, namely, that expense of compliance is properly a factor to be taken into consideration in determining the reasonableness of a

police-power regulation challenged under the due-process guarantee, is of long standing and has been frequently stated by this Court.

In

Washington ex rel. O. W. R. and N. Co. v. Fairchild (1912), 224 U.S. 510, 56 L. ed. 863,

the Court said (at p. 529):

> "The question in each case must be determined in the light of all the facts, and with a just regard to the advantage to be derived by the public and the expense to be incurred by the carrier."

In

Missouri Pacific R. Co. v. Norwood, supra (283 U.S. 249, 75 L. ed. 1010),

the Court said (at p. 255):

> "The cost of complying with state laws enacted to promote safety is an element properly to be taken into account in determining whether such laws are arbitrary and repugnant to the Due-Process Clause of the Fourteenth Amendment."

In

A. T. & S. F. Ry. Co. v. Railroad Commission (1931), 283 U.S. 380, 75 L. ed. 1129,

in a case involving an attack upon a state order requiring the building of a new station for the convenience and comfort of the people of the City of Los Angeles (a clear exercise of the police power), the Court said (at pp. 395-396):

> ". . . But the power to regulate is not unlimited. 'It may not unnecessarily or arbitrarily trammel or interfere with the operation and conduct of railroad

properties and business.' *Norfolk & Western Ry. Co. v. Public Service Comm.*, 265 U.S. 70, 74; *Mississippi Railroad Comm. v. Mobile & Ohio R. Co.*, *supra*. The question in each case is whether, in the light of the facts disclosed, the regulation is essentially an unreasonable one. *Wisconsin, Minnesota & Pacific R. Co. v. Jacobson*, *supra*, *Norfolk & Western Ry. Co. v. Public Service Comm.*, *supra*. And 'the matter of expense is an important criterion to be taken into view in determining the reasonableness of the order.' *Oregon R. & Nav. Co. v. Fairchild*, 224 U.S. 510, 529."

As the Court said, in

Wisconsin etc. R. R. v. Jacobson (1900), 179 U.S. 287 (301), 45 L. ed. 194,

with reference to a police power order:

"A statute, or a regulation provided for therein is frequently valid, or the reverse, according as the fact may be, whether it is a reasonable or an unreasonable exercise of legislative power over the subject matter involved. *And in many cases questions of degree are the controlling ones by which to determine the validity, or the reverse, of legislative action.*"

In

Missouri Pacific R. Co. v. Kansas (1910), 216 U.S. 262, 54 L.ed. 272,

which involved the validity of a state commission's order requiring the carrier to maintain passenger-train service, this Court said (at p. 278):

"Of course, the fact that the furnishing of necessary facilities ordered may occasion an incidental pecuniary loss is an important criterion to be taken into

view in determining the reasonableness of the order, but it is not the only one."

In

Lehigh Valley R. Co. v. Commissioners (1928), 278 U.S. 24, 73 L.ed. 161,

involving the validity of an order for the elimination of a highway grade crossing, this Court said (at p. 33):

> "The board has the discretion to fix the cost. The function of the court is to determine whether the outlay involved in the order of the board is extravagant in the light of all the circumstances, in view of the importance of the crossing," . . .
>
> "An increase from $200,000 to $300,000 for a railroad crossing might well, under different circumstances from those here, be regarded as so unreasonable as to make the order a violation of the company's constitutional rights, and to be in the nature of confiscation. The protection of the 14th Amendment in such cases is real and is not to be lightly regarded."

With particular reference to the earlier decision in

Erie R. Co. v. Commissioners (1921), 254 U.S. 394, 65 L. ed. 322,

the Court said, further, in the *Lehigh Valley case*, that the rule of the *Erie case* that the police power is effective, even though it may lead to bankruptcy in individual cases . . .

> "is not to be construed as meaning that danger to the public will justify grade expenditures unreasonably burdening the railroad when less expenditure can reasonably accomplish the object of improvements and avoid the danger. If the danger is clear,

reasonable care must be taken to eliminate it, and the police power may be exerted to that end. But it becomes the duty of the court, where the cost is questioned, to determine whether it is within reasonable limits. This follows from principles clearly established by this court." (Citations.) "We emphasize this, not because there is doubt about it, but because *we deprecate the impression apparently entertained by some that in the safeguarding of railroad crossings by order of state or local authority the exercise of police power escapes the ordinary constitutional limitations of reasonableness of cost.*" (Emphasis supplied.)

The State Supreme Court notably failed to include, in its quotation from the *Oklahoma case*, any portion of that opinion dealing with the "due-process" issues, as presented to the Oklahoma court (although the "due-process" issue was discussed therein at considerable length: 36 F. Sup. 612-614), except that portion dealing with the consideration to be given to the cost of compliance (36 F. Sup. p. 614). The Oklahoma court said, in this connection, in language reproduced in the opinion of the state court (R. 4063-4064):

"Plaintiff relies upon the Due-Process Clause of the 14th Amendment. It is obvious that to comply with the statute plaintiff will be required to expend additional sums in the operation of its business. The cost of compliance with a statute of this kind is an element for appropriate consideration in determining whether the statute is arbitrary, capricious or repugnant to due process, but, standing alone, it is not always enough to warrant judicial determination of invalidity." (Citing: *Missouri Pacific R. Co. v. Kansas*, supra; *Lehigh Valley R. Co. v. Commis-*

sioners, supra; *Missouri Pacific R. Co. v. Norwood*, supra.).

The State Court thus apparently accepted the views of the trial court as expressed in its Finding No. XVI and repeated in the proposition which serves as the sub-caption for this discussion; but declined to apply that principle to the case before it, in spite of its inferential agreement with the trial court that compliance with the statute compels appellant "to expend great sums of money".*

We do not and cannot claim that this very heavy continuous and recurring expense, fully proven as it is, would alone justify annullment under the due-process clause.

But unquestionably the Court may set up that expense against any benefits it thinks may be conferred by the law, and determine whether upon a fair consideration of the evidence the supposed benefits are not outweighed by the large cost. There is no evidence that a reduction in damage to equipment and lading is accomplished by the arbitrary limitation or the operation compelled thereby and the record shows that the long-train method of operation is more economical in that respect.

Decrease in the hazard of casualties to all classes of employes arising from road freight or passenger train operation, or even in hazards to trainmen from all causes, has not been claimed by appellee as either the real object of the

*As already noted, the state court said, immediately preceding its quotation from the opinion in the *Oklahoma Case* (R. 4062-4063):

> "In that (Oklahoma) case, *like the one at bar*, the railroad company was compelled . . . to expend great sums of money in order to comply with the restriction . . ." (Emphasis supplied.)

law or the result of its enforcement. In the face of the evidence such a claim would be futile; indeed the trial court found that the hazards just mentioned, with their consequent casualties, are greatly increased. We assert that the evidence shows that clearly, convincingly and beyond any fair debate.

Appellee must stake its all on slack-action accidents. We submit, on the analysis of the evidence made in Finding No. XII of the trial court, that the most that can be said is that compliance with the law does not measurably change the ratio of those accidents to freight-train miles run, and actually increases them on the true basis of arriving at the relative safety of the short-train and long-train methods of operation—the car-mile basis. By appellee's silence on the subject of short-train casualties, and casualties to others than men on the train or in the caboose, it failed even to create a conflict with appellant's showing that by far the safest way to handle the traffic is to use as few train-units as are practicable, even though thereby the standard long-train method of operation is followed. That question, upon the basis of all the evidence, is not even debatable.

In earlier argument appellee has cited *Nashville C. & St. L. Ry. Co. v. White* (1929), 278 U.S. 456, 73 L.ed. 452, in connection with its discussion of the "cost of compliance," and particularly has emphasized a sentence of the opinion reading:

> "There is a marginal chance that occasionally a life may be saved."

We believe that that quotation is peculiarly unfortunate for appellee, in the light of the experience gained with the Train-Limit Law.

Casualties of all classes occur in both long-train and short-train operation: the most that appellee may claim for the law is that it prevents or minimizes certain of these hazards, and it stresses particularly the so-called slack-action hazard. The test of experience may be applied to this claim in a number of ways. The readiest example is found in those exhibits showing the results of appellan t's operations in Nevada and Arizona. During the past several years, and particularly since and including 1929, long-train operation has prevailed in Nevada, while the law has been fully observed in Arizona, except for a brief period in March and April, 1940; but all other conditions pertaining to train operations have been identical in both states, or very nearly so. If the law is truly a safety measure, then the accidents and casualties in Arizona should have been much less frequent, for the law should have prevented the occurrence in Arizona of many accidents of the kind attributable (if appellee is correct) to the Nevada long-train operation. This record shows that the law has not only failed in this asserted purpose, but indeed has had exactly opposite effects.

Thus, in the 12 years 1929-1940, there were, *in Nevada*, 134 casualties to all classes of employees on duty, incident to road freight train operation; in the same period, *in Arizona*, there were 290 such casualties (Exhibit 277, R. 3372). In terms of frequency, there were 10.08, or about 100% *more* (i.e., *double*) such casualties per 100,000,000 car miles in Arizona during the six years 1929-1934, and 10.02, or about 170% *more* (i.e., nearly *treble*) during the six years 1935-1940. Otherwise stated, if the 70-car limit had been observed in freight-train operation in Ne-

vada during those 12 years, and the same dubious "benefits" had been realized as were actually experienced in Arizona, there would have been at least ten more of these casualties in Nevada for every 100,000,000 car miles produced, or a total of 162 more such casualties, over the 12 years, than actually occurred in the long-train operation. The increase would have been about 125%, or *more than double.*

Even taking slack-action casualties, experience has shown that the limitation does not measurably reduce either their number or their frequency. Thus, during the ten-year period 1929-1938, there were in Arizona 48 such accidents, with 57 casualties; 47 of which, with 55 casualties, were on short trains. In the same ten-year period there were 41 such accidents in Nevada, with 54 casualties. Thus there were more accidents and casualties of this type on *short* trains in Arizona than on all trains in Nevada during those ten years. The volume of the Arizona traffic, measured in car miles, was about five percent less than in Nevada during that period.

Taking again the same 12-year period (1929-1940) above referred to: there were in Nevada during those years, 61 slack-action casualties to trainmen, associated with the operation of 1,619,000,000 freight car miles; there were in Arizona 62 such casualties, associated with the operation of 1,544,550,000 car miles. The casualty rate per hundred million car miles was 3.77 in Nevada; 4.01 in Arizona (Exhibit 280, R. 3375).

Thus, the 70-car limitation has not only failed to reduce the slack-action casualty frequency in Arizona to the level

experienced in Nevada under long-train operation—and this is all that appellee could have claimed for the law, from the most optimistic view-point—there have actually been, under the compelled Arizona operation, .24 more casualties for each 100,000,000 car miles produced during the 12-year period.

Another example of the effect of the law as an accident maker rather than preventer is afforded by the grade crossing hazard. There is no question that the law requires about one-third more train miles to be operated than would otherwise be necessary; its underlying purpose is to compel the affected railroads to operate more trains. In the year 1938, the additional train-miles thus operated by appellant totaled about 680,000 in Arizona and the adjacent territory (Finding X(c), R. 3964, 3965).* The history of grade-crossing accidents and casualties in the United States shows that their frequency bears a practically constant relationship to the number of train-miles operated; in any year, and regardless of other circumstances which may vary from year to year, experience shows that there are almost certain to be about 13 persons killed or seriously injured, at railroad highway grade crossings, for every two million train-miles operated (Ex. 269, R. 3307). Thus, the law in 1938, by compelling about two-thirds of a million additional and unnecessary train-miles to be run, produced a virtual certainty of at least 4 additional deaths or serious injuries at grade crossings on appellant's lines alone; this entirely apart from its effects in increasing other classes of hazards and resulting casualties.

*In 1940, the excess of train miles compelled by the law was about 730,000; R. 3964.

The reasons for these inevitable results are simple and obvious. The law, by increasing the number of trains operated approximately one-third, also requires approximately one-third more train and enginemen to be employed than would otherwise be needed, and exposes these additional men to every hazard that may occur in connection with train operations, whether the train is moving or standing. By placing one-third more trains on the tracks, it creates additional hazards for those employes whose duties require them to be on the tracks, and who are or may be struck or run down by passing trains. By causing more train units to be operated, it requires more signals to be given, more meetings and passings of trains to be made, more train orders to be issued, and thus involves more opportunities for oversight, negligence, forgetfulness, or disobedience of orders. All of these factors combined produce the results which are plain and inescapable upon the face of the unchallenged record. There is no doubt that the law, far from affording even a "marginal chance" of occasionally saving a life or avoiding an accident, practically insures an increased number of deaths and serious injuries from almost every class of hazard associated with railroad operations.

It is particularly clear that in this case there can be no genuine attempt by appellee to array "*human* flesh and blood" against mere money. Its primary safety claim relates to slack-action casualties and not to any other type of accident or hazard. Giving to this contention all the weight possible in the light of the facts, observance of the

law in Arizona has apparently resulted in about one *more* slack-accident casualty, for each 417,000,000 car miles produced during the 12-year period 1929-1940, than would have occurred with long-train operation (Exhibit 280, R. 3375). This "benefit" falls so far short of justifying the claim as to compel the conclusion that the law's supporters, i.e., the major train and engine-service brotherhoods, have no real concern with safety. Their true motives are quite different: they have never denied that they support this and other similar restrictions, because the affected railroads are thereby compelled to operate more trains and thus increase the employment opportunities of their members. The practical financial aspect of train limitation constitutes their real interest.

Appellant, and those others who join with it in opposing arbitrary train limits, although in part motivated by financial considerations, are entitled to support their cause by pointing also to the public benefits realized from long train operation, in the way of both a better railroad transportation performance and a greater degree of railroad safety. It is established, and indeed not seriously disputed, that when the restriction is not observed, appellant and other railroads are much better able to provide speedy and efficient transportation service at reduced cost to their patrons, and thus to discharge their public obligation. The facts of record, recited in part above, show equally beyond any question that long-train operation without regard to fixed limitations has also resulted in greater safety for the public, and for all classes of railroad employees, including all of those who by reason of their duties face any of the hazards of train operation; that even as to the limited

class of casualties with which appellee and its supporters are nominally concerned, the law results in no real benefit, and has in fact demonstrated its inability to reduce even this limited and unimportant class of hazards.

The Train Limit Law has been and is a costly experience, whether the price be measured in *money*, or in *interference*, *delay* and *obstruction* to essential transportation, or in *human life* and *limb*.

(b) There Is a Rebuttable Presumption of Reasonableness Normally Attending a State Police-Power Statute, Challenged Under the Due-Process Clause; but

(c) In the Instant Case That Presumption Is of No Avail Because of the Lapse of Time and Changes in Conditions Since the Law Was Enacted

It has been pointed out that in its opinion the state court failed to give any independent consideration (i.e., other than as indicated by its quotation from and reliance upon those portions of the *Oklahoma* opinion in which similar issues were treated) to any of the legal issues of this case except the "due-process" issue. Even the court's consideration of that issue was far from comprehensive; for it consisted essentially of: (a) the statement, as a premise, that the law was enacted "for the purpose of the safety and protection of employees and people being transported by railroad," because "no other reason (than safety) could possibly be assigned" (R. 4059); (b) the citation of but *one* decision of this court (*Barbier v. Connolly*, (1885), 113 U.S. 27, 28 L.ed. 923), and four state decisions, and a quotation from the text of *Corpus Juris Secundum*; (c) the quotation of the part of the *Oklahoma*

opinion, 36 F.Sup. 611 (614) already mentioned, which deals with the consideration properly to be given to the expense of compliance; (d) the indirect statement, also already noted, that enforced compliance with the challenged law imposes great additional expense; and (e) the conclusion which, although not expressly stated may be fairly inferred from the context, that as a safety measure the law is supported against appellant's challenge under the due-process clause by an overwhelming and virtually conclusive presumption of validity.

That the court was convinced of and accepted as correct this theory of "overwhelming presumption" is shown by the quotations included in the opinion; and even more persuasively by its failure to review or discuss any of the evidence of the parties or findings of the trial court, addressed to the safety issue and thus to the ultimate question of reasonableness under the due-process clause. This omission is consistent only with acceptance of the supposed presumption: otherwise, in view of appellant's extensive showing, and the careful and detailed findings of the trial court, at least some review of the evidence would have been essential to support reversal of the trial court's judgment.

In this same vein, it should also be noted that in its quotation from the *Oklahoma* opinion the court omitted the greater part of the discussion of the due-process point, and particularly omitted the portion dealing with the safety showing in that case: compare that opinion, 36 F. Supp. at pages 612-614. Naturally, to have included this discussion would have reflected unfavorably upon the complete omission of all reference to the apparently much more

complete safety showing in the instant case, and also upon the acceptance of the overwhelming presumption. For the Oklahoma court, *as a trial court,* held only that the safety evidence before it tending to support the challenged law had "greater strength" than the opposing showing, and hence, in view of all the facts, that it could not be said that the Oklahoma statute bore no reasonable or substantial relation to safety, or was unreasonable or arbitrary. The state court's professed acceptance of the *Oklahoma case* as the guiding authority was thus far from complete.

Apart from this inconsistency, the state court erred in failing to conclude, in accordance with the controlling decisions of this Court, that a state police-power statute attacked under the due process clause is supported by merely a *rebuttable* presumption of reasonableness, which may even disappear if the fact situation warrants. This Court has repeatedly held that in a case of this character the court has not only the power, but the duty, to review the facts, to reach an independent determination thereon, and to hold the challenged statute invalid if it clearly appears, even though the evidence be conflicting, that the regulation is unreasonable and arbitrary, and without reasonable relation to its declared or ostensible purpose. Thus the Court said, in

Nebbia v. New York (1934), 291 U.S. 502 (525), 78 L. ed. 940:

"The Fifth Amendment, in the field of Federal activity (*Addyston Pipe & Steel Co. v. U. S.*, 175 U.S. 211, 228, 229) and the Fourteenth, as respects state action (*Barbier v. Connelly*, 113 U.S. 27, 31; *C., B. & Q. R. Co. v. Illinois* (200 U.S. 561, 562) do not prohibit

governmental regulation for *the public welfare*. They merely condition the exertion of the admitted power, by securing that the end shall be accomplished by methods consistent with due process. And the guaranty of due process, as has often been held, demands only that the law *shall not be unreasonable, or capricious, and that the means selected shall have a real and substantial relation to the object sought to be attained.* It results that a regulation valid for one sort of business, or in given circumstances, may be invalid for another sort, or for the same business under other circumstances, *because the reasonableness of each regulation depends upon the relevant facts.*" (Emphasis supplied.)

Not always have the state courts borne in mind that the *power* to substitute the judicial judgment for that of the legislative exists, and with the power the *duty* to do so in proper cases; undoubtedly misled by the reiteration of the rule of caution against its exercise. Thus in *Dobbins v. Los Angeles* (1903), 139 Cal. 179 (183), 72 Pac. 970, it was held that if the subject matter of the legislation is within the legislative power, the legislature is the exclusive judge of the propriety of the particular exercise, and that a court *would not* substitute its judgment. On writ of error to this Court (*Dobbins v. Los Angeles* (1904), 195 U.S. 223, 49 L. ed. 169) the judgment was reversed. The Court referred to the lower court's basis of decision as being "the proposition . . . that the act of the municipality in question *cannot* be reviewed, because so to do would be a substitution of the judgment of the court for that of the council upon a matter left within the exclusive control of the legislative body." Admitting that "every intendment" was to be in-

dulged in favor of the legislation, and that it was not the province of the courts to invalidate it "except in clear cases," it was nevertheless held to be "thoroughly well settled" that legislation under the police power was "subject to investigation in the courts"; that the legislature's "determination as to what is a proper exercise of its police powers is not final or conclusive, but is subject to the supervision of the courts"; citing *Lawton v. Steele* (1894), 152 U.S. 133, 38 L. ed. 385.

In the *Lawton Case*, this Court had said (152 U.S., at pp. 136-137):

> "To justify the state in thus interposing its authority in behalf of the public, it must appear, first, *that the interests of the public generally, as distinguished from those of a particular class*, require such interference; and, second, that the means are reasonably necessary for the accomplishment of the purpose, and not unduly oppressive upon individuals. The legislature may not, under the guise of protecting the public interests, arbitrarily interfere with private business, or impose unusual and unnecessary restrictions upon lawful occupations. *In other words, its determination as to what is a proper exercise of its police powers is not final or conclusive, but is subject to the supervision of the courts.*" (Emphasis supplied.)

It is particularly true that in no case has it ever been declared by this Court that there is any preferred class of purposes among those for which the state's police power may be exercised. Thus, a purported safety law or order has no higher standing than a law or order which merely

promotes public comfort or convenience by requiring a new railroad station to be built or added train service to be afforded, or one which in order to safeguard public health or morals declares certain practices or things to be public nuisances and abatable as such. It has no greater sanctity or presumption of necessity or propriety than a state law or order fixing public utility rates which is sustainable only under the police power and the most common ground for attack on which is that it violates the Fourteenth Amendment. In all cases where a statute or regulation is attacked upon the ground that it violates the due-process clause, a court will always disregard the ostensible purpose and inquire into the substance and effect in order that it may *for itself* determine whether the law has any real or substantial relation to public health, safety, etc.; and will not be bound by legislative declarations of purpose.

In

Mugler v. Kansas (1887), 123 U.S. 623, 31 L. ed. 205, this Court said (at p. 661):

> "The courts are not bound by mere forms, nor are they to be misled by mere pretences. They are at liberty—indeed, under a solemn duty—to look at the substance of things, whenever they enter upon the inquiry whether the legislature has transcended the limits of its authority. *If, therefore, a statute purporting to have been enacted to protect the public health, the public morals, or the public safety, has no real or substantial relation to those objects, or is a palpable invasion of rights secured by the fundamental law, it is the duty of the courts to so adjudge, and thereby give effect to the constitution.*" (Emphasis supplied.)

In

Minnesota v. Barber (1890), 136 U.S. 313, 34 L. ed. 455,

the Court said (at p. 319):

> "The presumption that this statute was enacted, in good faith, for the purpose expressed in the title, namely, to protect the health of the people of Minnesota, cannot control the final determination of the question whether it is not repugnant to the Constitution of the United States. There may be no purpose upon the part of a legislature to violate the provisions of that instrument, and yet a statute enacted by it, under the forms of law, may, by its necessary operation, be destructive of rights granted or secured by the Constitution." (Citing *Henderson etc. v. New York etc.*, 92 U.S. 259, 268, 23 L. ed. 543.)

After referring to the *Mugler Case*, supra, the Court also said:

> "Upon the authority of those cases, and others that could be cited, it is our duty to inquire, in respect to the statute before us, not only whether there is a real and substantial relation between its avowed objects and the means devised for attaining those objects, but whether by its necessary or natural operation it impairs or destroys rights secured by the Constitution of the United States."

In

Adams v. Tanner (1917), 244 U. S. 590, 61 L. ed. 1336,

this Court rejected the theory that mere reference to the police power can create any unassailable presumption, saying (at p. 595):

"Happily for all, the fundamental guaranties of the Constitution cannot be freely submerged if and whenever some ostensible justification is advanced and the police power invoked."

In

Meyer v. Nebraska (1923), 262 U.S. 390, 67 L. ed. 1042,

this Court, after citing numerous earlier cases, declared the rule to be as follows (pp. 399-400):

"The problem for *our determination* is whether the statute, *as construed and applied*, unreasonably infringes the liberty guaranteed to the plaintiff in error by the 14th Amendment." (Emphasis supplied.)

In *Lehigh Valley R. Co. v. Commissioners*, supra, (278 U.S. 24, 73 L. ed. 161) already cited in the discussion upon the "Cost of Compliance," this Court said (at p. 33):

" . . . The function of the court is to determine whether the outlay involved in the order of the board is extravagant in the light of all the circumstances . . . it becomes the duty of the court, where the cost is questioned, to determine whether it is within reasonable limits."

In

N. C. & St. L. R. Co. v. Walters (1935), 294 U.S. 405, 79 L. ed. 458,

the railroad company had protested against being compelled to pay one-half of the cost of the construction of an underpass whereby a main trunkline highway was to be carried beneath one of its main lines. The company, conceding that the state may ordinarily, under its police power,

impose upon a railroad the entire cost, or any part of the cost, of eliminating a grade crossing, claimed that under the special circumstances there shown the statute which imposed the cost upon it, as well as the order of the state authority made pursuant thereto, were arbitrary and unreasonable, in violation of the due-process clause of the Fourteenth Amendment. Upon the facts, this Court held that the state court had erred in refusing to consider the special facts relied upon by the railroad company, and reversed that court's dismissal of the suit. The Court said, in part:

> "*A statute valid as to one set of facts may be invalid as to another. A statute valid when enacted may become invalid by change in the conditions to which it is applied.* The police power is subject to the constitutional limitation that it may not be exerted arbitrarily or unreasonably . . . The promotion of public convenience will not justify the requiring of a railroad, any more than of others, the expenditure of money, unless it can be shown that a duty to provide the particular convenience rests upon it."

This Court thus made it plain that even when a matter so clearly involving safety as a grade-crossing elimination is before it, it will nevertheless protect a railroad by examining closely into the reasonableness of the challenged statute or order, as related to the facts presented.

In another case involving a state statute under which a railroad was required to build an overhead crossing:

Southern Ry. Co. v. Virginia (1933), 290 U.S. 190, 78 L. ed. 260,

the Court said (at p. 196):

"The claim that the questioned statute was enacted under the police power of the State and, therefore, is not subject to the standards applicable to legislation under other powers, conflicts with the firmly established rule that every State power is limited by the inhibitions of the Fourteenth Amendment." (Citing cases.)

In

Fairmont Creamery Co. v. Minnesota (1927), 274 U.S. 1, 71 L. ed. 893,

this Court commented (at p. 11), upon the "duty of the Court *to inquire into the real effect* of any statute duly challenged because of interference with freedom of contract guaranteed by the 14th Amendment, and to declare it invalid when without substantial relation to some evil within the power of the State to suppress and a clear infringement of private rights."

In

Liggett Co. v. Baldridge (1928), 278 U.S. 105, 73 L.ed. 204,

this Court held invalid a police-power statute of Pennsylvania which prohibited the ownership of a drug store by other than a registered pharmacist. The Court said (at p. 111):

"Unless justified as a valid exercise of the police power the act assailed must be declared unconstitutional because the enforcement thereof will deprive appellant of its property without due process of law. * * *"

"The act is sought to be sustained specifically upon the ground that it is reasonably calculated to promote

the public health; and the determination we are called upon to make is whether the act has a real and substantial relation to that end or is a clear and arbitrary invasion of appellant's property rights guaranteed by the Constitution . . . A statute cannot 'under the guise of protecting the public arbitrarily interfere with private business or prohibit lawful occupations or impose unreasonable and unnecessary restrictions upon them.' (Citing cases.) In the light of various requirements of the Pennsylvania statutes, it is made clear, if it were otherwise doubtful, that mere stock ownership in a corporation owning and operating a drug store, can have no real or substantial relation to the public health; and that the act in question creates an unreasonable and unnecessary restriction upon private business. No facts are presented by the record, and, so far as appears, none were presented to the legislature which enacted the statute that properly could give rise to a different conclusion."

In

St. Joseph Stockyards Co. v. United States (1936), 298 U.S. 38, 80 L. ed. 233,

which involved the reasonableness of certain rates fixed by a Federal legislative agency (and assailed under the due-process clause of the Fifth Amendment), this Court announced its views in language which is directly pertinent here. After saying (298 U.S., at p. 50) that "the fixing of rates is a legislative act" and that the legislature may delegate this authority, the Court further said that where the legislative agency is required to accord a fair hearing, and act upon evidence so as to satisfy the requirements of due process, the judicial inquiry goes no further than to

ascertain whether there is evidence to support the findings, and the question of the weight of the evidence in determining issues of fact lies with the legislative agency. The Court then said (at pp. 51-52):

> "But the Constitution fixes limits to the rate-making power by prohibiting the deprivation of property without due process of law or the taking of private property for public use without just compensation. *When the legislature acts directly, its action is subject to judicial scrutiny and determination in order to prevent the transgression of these limits of power. The legislature cannot preclude that scrutiny or determination by any declaration or legislative finding.* Legislative declaration or finding is necessarily subject to independent judicial review upon the facts and the law by courts of competent jurisdiction to the end that the Constitution as the supreme law of the land may be maintained."

Even if the Train Limit Law were a recent enactment, instead of having been passed in 1912, at a time when practically all of the circumstances material to its enactment were far different than at the present time, no state legislature, either as a body or by committee, could possibly have given to a police-power statute, passed with the declared intent to promote safety, so thorough an examination of the facts as is presented by the record, and summarized by the findings in the present case. Practically, such an examination would be impossible. To say that either the trial court, or this Court upon appeal, must blindly and unquestionably accept the legislative conclusions, express or implied, is to foreclose a citizen from judicial review; unless, on its face, the statute is so plainly unreasonable or arbi-

trary that within itself exist the seeds of its judicial dissolution.

Many cases might be cited—each of which must be viewed in the light of its facts—declaring the reluctance of a court to set aside a police power statute or order on the sole ground of unreasonableness; but this Court has not hesitated to give relief in a proper case and has never applied the "scintilla" rule in favor of the state or the rule of "moral certainty and beyond a reasonable doubt" against the citizen, as has the state court in the case at bar.

In

Pacific States Box & Basket Co. v. White (1935), 296 U.S. 176, 80 L. ed. 138,

which was a case involving a disputed police-power regulation of the State of Oregon, the Court (at p. 185) referred to "this rebuttable presumption of the existence of a state of facts sufficient to justify the exertion of the police power."

In

Great Northern Ry. Co. v. Washington (1937), 300 U.S. 154, 81 L. ed. 573,

in which this Court considered the question of the validity of a state statute imposing fees upon public utilities operating in the state, which the state court had held to be in the nature of regulatory or inspection fees, it was said (at pp. 160-161):

> "A law exhibiting the intent to impose a compensatory fee for such a legitimate purpose is *prima facie* reasonable. If the exaction be so unreasonable and disproportionate to the service as to impugn the good

faith of the law it cannot stand either under the Commerce Clause or the 14th Amendment . . . Such a statute may, in spite of *the presumption of validity*, show on its face that some part of the exaction is to be used for a purpose other than the legitimate one of supervision or regulation, and may, for that reason, be void. *And a statute fair on its face may be shown to be void and unenforceable on account of its actual operation.*" (Emphasis supplied.)

In

O'Gorman & Young v. Hartford Ins. Co. (1931), 282 U.S. 251, 75 L. ed. 324,

this Court clearly indicated that while there is a presumption favoring the constitutionality of a challenged police-power statute, that presumption may be overcome by adequate proof. The Court said (pp. 257-258):

"The statute here questioned deals with a subject clearly within the scope of the police power. We are asked to declare it void on the ground that the specific method of regulation prescribed is unreasonable and hence deprives the plaintiff of due process of law. As underlying questions of fact may condition the constitutionality of legislation of this character, *the presumption of constitutionality must prevail in the absence of some factual foundation of record for overthrowing the statute.*" (Emphasis supplied.)

Compare, also, the statement in the opinion in the *Minnesota Rate Cases*, supra (230 U.S. 352, 452-453, 57 L. ed. 1511):

"It is fundamental that the judicial power to declare legislative action invalid upon constitutional grounds is to be exercised only in clear cases. The constitu-

tional invalidity must be manifest, and if it rests upon disputed questions of fact, the invalidating facts must be proved."

In

United States v. Carolene Products Co. (1938), 304 U.S. 144, 82 L.ed. 1234,

this Court said (at p. 153):

"Where the existence of a rational basis for legislation whose constitutionality is attacked depends upon facts beyond the sphere of judicial notice, such facts may properly be made the subject of judicial inquiry, *Borden's Farm Products Co. v. Baldwin*, 293 U.S. 194, and the constitutionality of a statute predicated upon the existence of a particular state of facts may be challenged by showing to the court that those facts have ceased to exist."

The erroneous views of the state court as to the presumption are revealed, not only by its failure to recognize controlling decisions of this Court, but also by the nature of the authorities upon which it actually relied. Thus, it cited a portion of Section 100 of the article in *Corpus Juris Secundum* dealing with the subject of Constitutional Law (See 16 C.J. (2) 277, 278; R. 4059), and apparently treated this quotation as a correct statement supporting the view that no inquiry into the facts could be undertaken by the court. The excerpt, when analyzed, does not support the state court's conclusion; at most, it establishes only that it is to be presumed that the legislature, when it enacted the challenged law, was possessed of full knowledge of the facts and circumstances intended to be reached by the legislation, and acted in good faith and in the light of its knowledge. This presumption, such as it may be, would

in this case extend only to the action of the legislature *in 1912*; it would not avail to support the challenged law, under the greatly changed conditions prevailing *in 1940*. Furthermore the same section of the text, in a portion not cited by the court, declares that the presumption supporting the legislative determination is not conclusive, but merely rebuttable:

16 *C. J.* (2) 281-282:

> "So, when a statutory classification is called into question, if any state of facts reasonably can be conceived that would sustain it, the existence of that state of facts at the time the law was enacted must be assumed. However, *this presumption of the existence of factual conditions, or of the correctness of legislative findings, supporting legislation, is a rebuttable presumption of fact and not a rule of law which makes legislative action invulnerable to constitutional attack.* The party attacking the statute has the burden of establishing the invalidating facts on which his claim is based, if the court cannot take judicial notice of such facts."

The opinion in *Salem Lodge, etc. v. Swails* (1935), 209 Ind. 347, 197 N.E. 837, cited by the state court (R. 4059), contains no statement such as attributed to it by the court. No question was presented under the federal due-process clause, or any other provision of the Federal Constitution. The decision simply has no relation at all to the case at bar.

In

State ex rel. Blaine v. Wisconsin Telephone Co. (1919), 169 U.S. 198, 172 N.W. 255,

also cited in the state court's opinion (R. 4059), the question was as to the power of the state to continue to reg-

ulate the rates of telephone companies, after possession and control of their facilities had been assumed by the President, on July 31, 1918, pursuant to authority of Congress, as an incident to the war effort. The decision obviously has no bearing, unless to support the principle of Federal supremacy in matters of joint concern.

State ex rel. McBride v. Superior Court (1918), 103 Wash. 409, 174 Pac. 973 (cited at R. 4059-4060), involved the question of the legality of the detention of a diseased individual, who was held pursuant to an administrative order of a local health commissioner, acting under a local city ordinance. In its opinion the Washington court made certain pronouncements respecting the scope of the inquiry where the police power is involved, which, however, must be read in relation to the facts before the court, and also in the light of the controlling decisions of this Court. On its facts, the case bears no resemblance to the instant case, and certainly does not support any view that when the validity of an alleged safety statute is duly questioned, and the facts supporting invalidity are carefully developed, the court cannot consider them in arriving at its determination.

The decision in *People ex rel. Rogers v. Letford* (1938), 102 Colo. 284, 79 Pac.(2d) 274, (R. 4067) is likewise without particular bearing in the present case. The case involved generally the validity of the Water Conservancy Act of Colorado; and the pronouncement quoted in the opinion herein was merely a sort of general preamble to the discussion of the particular issues. The statement of the Colorado Court to the effect that invalidity must be established

"beyond a reasonable doubt" is not supported by the pronouncements of this Court. As shown by the numerous decisions already cited, the requirement is no more than that the invalidating facts be *clearly* established.

The state court's approach to the issues in the instant case thus resembles that of the Supreme Court of Tennessee in its decision in *Nashville, C. & St. L. Ry. v. Baker* (1934), 167 Tenn. 470, 71 S.W.(2d) 678, which, as noted above, was reversed upon appeal to this Court: *Nashville, C. & St. L. Ry. v. Walters*, supra (294 U.S. 405, 79 L.ed. 458). In summarizing the state court's decision this Court said (294 U.S., at pp. 414-415):

> "The Supreme Court (of Tennessee) declined to consider the special facts relied upon as showing that the order, and the statute as applied, were arbitrary and unreasonable; and did not pass upon the question whether the evidence sustained those findings. It held that the statute was, upon its face, constitutional; that when it was passed the State had, in the exercise of its police power, authority to impose upon railroads one-half of the cost of eliminating existing or future grade crossings; and that the Court could not 'any more' consider 'whether the provisions of the act in question have been rendered burdensome or unreasonable by changed economic and transportation conditions,' than it 'could consider changed mental attitudes to determine the constitutionality and enforceability of a statute'."

So, here, the state court apparently declined to consider the facts specially found, and relied upon as showing that the Train-Limit Law is arbitrary and unreasonable; or even to pass upon any question whether the evidence sus-

tains those findings. It has held that the challenged statute is upon its face constitutional as an exercise of the police power, and supported by a presumption of reasonableness so strong as to render consideration of the facts unnecessary as well as improper. It has wholly failed to consider whether the statute, even if it could be assumed to have been valid when enacted in 1912, has become invalid because of the vast changes in conditions during the intervening years. In the light of the *Walters case* and the other decisions cited, the state court's consideration of the case was incomplete and partial, and its conclusions were wholly erroneous.

Whatever may be the correct rule generally as to the nature of the presumption in favor of the validity of a police-power statute, and, correspondingly, the extent of the consideration of the facts which must be undertaken by the court before which such a statute is challenged, no such presumption is available in the instant case to assist the appellee in its attempt to sustain the law, nor to justify or support the state court's failure to make a proper determination of the law's merits as an asserted safety measure, upon full consideration of all the facts. Such determination was properly made by the trial court in the first instance, and may and should now be made by this Court on this appeal.

A series of recent decisions of this Court, some of which have been greatly relied upon by appellee in the courts below, make it very clear that the presumption favoring the reasonableness of a state law arises, because the legislative determination "is presumed to be supported by facts known

to" the legislature, which is "assumed to have acted upon information available to the courts"; but that such presumption does not arise if "facts judicially known or proved preclude the possibility" of the legislature having so acted. Compare:

South Carolina Highway Dept. v. Barnwell Bros., supra (303 U.S., at p. 191);
Clark v. Paul Gray (1939), 306 U.S. 583 (at p. 594); 83 L. ed. 1001;

and see, also:

Chastleton Corporation v. Sinclair (1924), 264 U.S. 543 (547), 68 L. ed. 841;
United States v. Carolene Products Co., supra, (304 U.S. 144, 153, 82 L. ed. 1234).

In the instant case, we have precisely the situation contemplated by the Court's qualifying phrase: in that facts both judicially known, and amply established by competent proof, demonstrate that the law cannot *today* be supported by the facts assumed to have been known to the legislature which passed it in 1912.

Conceivably, the prima facie presumption of validity illustrated by the decisions might assist to support the law, if reliance could be placed upon conditions as they existed in 1912, and the knowledge of those conditions, presumably available to and acted upon by the 1912 legislature; in other words, if this were a prosecution for a violation committed in 1912 or shortly thereafter, and while the conditions were fairly similar to those prevailing at the time of the enactment.

However, it is here shown, so clearly that extended argument is unnecessary, that the present conditions are vastly and fundamentally different from those existing when the law was passed. It is equally true, of course, that the 1912 legislature could not possibly have had any knowledge or appreciation, or even any prevision, of present conditions. Appellant's railroad plant in Arizona, as of the months of March and April, 1940 (the precise period of the long-train operations which are the subject of the present case) is entirely different from that which existed in 1912. Both the rolling equipment and the fixed plant have been completely changed, through the medium of extensive improvement and reconstruction. The volume and characteristics of the traffic are quite different from that which was carried in 1912. The evidence upon this point, which is wholly unchallenged, is summarized in the trial court's Findings of Fact Nos. IV(a) (R. 3897-3898), VI(a) and (b) (R. 3902-3907) and VII(b) and (c) (R. 3915-3924). Finding IV(a) in its entirety, and as well Findings VI(a) and (b) in large part, were not questioned nor assigned as error by appellee upon its appeal to the state court. Furthermore, throughout the entire course of the case, appellee has never made any contention that these sweeping changes have not occurred; nor referred to any evidence which would challenge or contradict the showing of the fact and extent of the changes. On the contrary, the changes were treated as established facts (appellee's opening brief in the state court, pp. 240, 274-275).

It follows that in the instant case there is no presumption such as mentioned in the cited cases, grounded upon sup-

posed legislative knowledge, and now requiring consideration in connection with a judicial examination of the facts as they have been found to exist, and the determination, upon the basis of existing facts, whether the law is a proper and reasonable exercise of the police power. A presumption, based upon supposed legislative knowledge of 1912 conditions, would have no value to sustain a claim that the law is valid as applied to the wholly different conditions of 1940. On the other hand, the legislative determination cannot be presumed to be supported by the facts of 1940, upon which the case must now rest, because this Court knows judicially, and the evidence of the record proves beyond challenge, that those facts are wholly different from the facts which were presumably known to the 1912 legislature; and further knows that, in the very nature of things, that legislature could not have known the 1940 facts, nor accurately foreseen them.

What we have said above is perhaps another phrasing of the principle expressed in those decisions of this Court which hold that a statute, which may possibly be valid as against a challenge of unreasonableness at the time of its enactment, may, through lapse of time, and resulting change in conditions, become unreasonable and therefore invalid. Typical of these cases is *Nashville, C. & St. L. R. Co. v. Walters*, supra, in which, as previously noted, the Court said (294 U.S., at p. 415):

> "A statute valid as to one set of facts may be invalid as to another. *A statute valid when enacted may become invalid by change in the conditions to which it is applied.*" (Emphasis supplied.)

In *Albee State Bank v. Bryan* (1931), 282 U.S. 765, 75 L. ed. 699, which was a suit to enjoin enforcement of a Nebraska state law upon the ground of violation of the due-process clause, the Court said (p. 775):

> "The principle that a police regulation, valid when adopted, may become invalid because in its operation it has proved to be confiscatory, carries with it the recognition of the fact that earlier compliance with the regulation does not forfeit the right of protest when the regulation becomes intolerable."

So, in the present case, the possible suggestion that the Train-Limit Law was enacted in 1912, but its validity never contested until 1929, when the *First Arizona Train-Limit Case* was filed, obviously affords no reason for criticizing appellant's present endeavor to have the law declared invalid.

In *Galveston Electric Co. v. Galveston* (1922), 258 U.S. 388, 66 L. ed. 678, this Court stated its views in practically the same language used in the *Nashville case*, supra, saying (at p. 400):

> "A rate ordinance invalid when adopted may later become valid, just as *an ordinance valid when made may become invalid by change in conditions* (citing cases)." (Emphasis supplied.)

Equally this argument may be said to follow somewhat the same line of reasoning as in

Southern Ry. Co. v. Virginia, supra (290 U.S. 190),

in which the Court held invalid an asserted police power statute which provided that a state administrative officer might make a mandatory order for the elimination of a

grade crossing, without prior notice or investigation; the Court declaring that such an officer could not be empowered to make an order of that type, having final and binding effect, merely upon the basis of his view and opinion. Dealing with the argument that the legislature might itself have passed a specific statute ordering the elimination of the crossing, without giving to the railroad company notice or opportunity to be heard, the Court said (at p. 197):

> "There is an obvious difference between legislative determination and the finding of an administrative official not supported by evidence. In theory, at least, the legislature acts upon adequate knowledge, after full consideration and through members who represent the entire public."

If, however, it should appear, as in the present case, that the legislative action as applied to present-day conditions is not and cannot be based upon adequate, *or any*, knowledge of those conditions, or any consideration of them, and that the conditions which the enacting legislature knew or might have known have wholly changed, then the "obvious difference" noted by the Court disappears; and unreasonable legislative action having no present factual basis is no less a denial of due process than similar arbitrary action of an administrative official.

We close this discussion with the citation of the decision of the United States District Court for Arkansas, in

Missouri Pacific R. Co. v. Norwood (1933), 13 Fed. Supp. 23.

In this decision, later affirmed by this Court on December 11, 1933 (290 U.S. 600, 78 L. ed. 527), in a brief memor-

andum opinion, the District Court expressly recognized that even though the statute there involved (the Full-Crew Law of Arkansas) might have been sustained in earlier decisions, a re-examination of the facts currently existing should be made so as to determine whether conditions had so changed as to render the statute arbitrary and unreasonable, in the light of those changes. The court said (at p. 26):

> "Concisely, the issue is whether conditions in operation affecting these freight train and switching activities and/or expense of compliance with the laws have so changed since these statutes became law as to render application of them now clearly unreasonable and arbitrary, although such was not so under conditions existing when they were enacted. The 'conditions' and the changes therein are to be considered as to their effect upon the safety of employees and of the public. The 'expense' is to be considered as 'an element properly to be taken into account in determining whether such laws are arbitrary.' Missouri Pac. R. Co. v. Norwood, 283 U.S. 249, 255, 51 S. Ct. 458, 461, 75 L. ed. 1010.
>
> "We are dealing with operating conditions of freight trains (both on the road and in the yard) and the changes on the road which have come about therein within the 25 years since the brakeman law was enacted in 1907, and changes in the city yards during the 19 years since the switchman law was enacted in 1913. To give a picture of these changes, counsel have properly found it necessary to introduce much evidence and upon many different details."

The distinction between the *Norwood Case* and the instant case, insofar as concerns the present discussion, is

that in that case there were two earlier decisions in which the challenged law had been sustained upon the basis of the conditions as they then existed; whereas in the instant case, no earlier decision exists sustaining the challenged law. The only prior judicial expression rendered involving this law (the final opinion of the three-judge court in the *First Arizona Case*, 2 F. Supp. 855) condemns it as invalid upon substantially all of the grounds announced in the opinion, conclusions, and judgment of the trial court herein. It is difficult to see how any greater presumption can exist to favor appellee, or support the law, than was recognized in the *Norwood Case;* and certainly no greater affirmative burden here rested upon appellant, in presenting its affirmative defense, than was faced by the moving party in that case. In fact, in the present case, the presumption is not available for the reasons shown; and the burden upon appellant in sustaining its due-process point should not be regarded as any greater than to show, by a fair preponderance of the evidence, that in the light of present-day conditions (upon which, alone, appellee must rely to sustain its position) the challenged law bears no reasonable relation to its alleged object of safety, and, instead of promoting that object, actually increases many hazards and creates many others which would not exist if the law were not enforced. Even if it could be held, however, that the presumption still remains and must be overcome, the evidentiary showing here was ample, as the trial court indicated, to establish the facts which demonstrate that the law is unreasonable, and thus to overcome the presumption completely.

(d) Common Belief, as Exemplified by the Almost Total Absence of Similar State or Federal Laws, and Also by the Recent Action of the Interstate Commerce Commission (Service Order No. 85), May Be Relied Upon to Show, and Does Show, That the Law Is Wholly Unreasonable.

This Court has frequently given consideration in its decisions to what it has termed "common belief" or "common knowledge", in determining the propriety and validity of challenged police-power regulations. Examples of such cases are:

Jacobson v. Massachusetts (1905), 197 U.S. 11, 49 L. ed. 643;
Muller v. Oregon (1908), 208 U.S. 412, 52 L. ed. 551;
Bunting v. Oregon (1917), 243 U.S. 426, 61 L. ed. 830;
West Coast Hotel Co. v. Parrish (1937), 300 U.S. 379, 81 L. ed. 703.
Parker v. Brown, supra (317 U.S. 341).

In the *Jacobson Case*, the Court sustained a compulsory vaccination law, and took judicial notice of the fact that "it is the *common belief* of the people of the United States" that vaccination prevents smallpox.

In the *Bunting Case*, the Court sustained the Oregon 10-hour law applicable to men factory-workers, and referred in its opinion to the "*well-known fact* that the custom in our industries does not sanction a longer service than ten hours per day;" and said, therefore, that it could not be held, as a matter of law, that the legislative requirement was unreasonable or arbitrary.

In the *Muller Case*, the Court, in passing upon the validity of an Oregon statute limiting the hours of labor of

women to not more than 10 hours per day, took into consideration the fact that there is "a *widespread belief* that woman's physical structure, and the functions she performs in consequence thereof, justify special legislation restraining or qualifying the conditions under which she should be permitted to toil." The Court further definitely indicated that common belief or opinion may readily serve to support either side of a controversy over the validity of a statute, saying (208 U.S., at pp. 420-421):

> "Constitutional questions, it is true, are not settled by even a consensus of present public opinion, for it is the peculiar value of a written constitution that it places in unchanging form limitations upon legislative action, and thus gives a permanence and stability to popular government which otherwise would be lacking. At the same time, when a question of fact is debated and debatable, and the extent to which a special constitutional limitation goes is affected by the truth in respect to that fact, a widespread and long continued belief concerning it is worthy of consideration. We take judicial cognizance of all matters of general knowledge."

In the *West Coast Hotel Case*, the Court referred to the action of "many states" as evidencing "a deep-seated conviction;" and relied upon "common knowledge" and "judicial notice" as affording added support for its views, saying (300 U.S., at p. 399):

> "We may take *judicial notice* of the unparalleled demands for relief which arose during the recent period of depression and still continue . . . It is unnecessary to cite official statistics to establish what is of *common knowledge* through the length and breadth of

the land. While in the instant case no factual brief has been presented, there is no reason to doubt that the State of Washington has encountered the same social problem that is present elsewhere." (Emphasis supplied.)

In *Parker v. Brown*, supra, this Court took "judicial notice" (317 U.S., pp. 363-365) of available data respecting the nature of the problem involved, including material from such sources as bulletins issued by federal and state departments of agriculture, studies made under the auspices of the state university, reports issued by the Federal Farm Board, and the like.

In the instant case the record shows that although train-limit legislation has been advocated in the legislatures of many states, and before Congress, those proposals have been rejected in all but four of the states, and that train limit laws have actually been enforced in only two states: Arizona and Oklahoma. The practice of standard long-train operation, as defined in Finding No. 1 of the trial court, R. 3888, is the general, uniform, and standard practice everywhere in the United States on all, or practically all, major railroads, except only in the two states mentioned. The testimony specifically shows, in considerable detail, the nature and character of such operations, upon appellant's lines and also in every section and in almost every state of the United States, and covers not only the entire national transportation system, in a general way, but also, and specifically, the lines of appellant's principal competitors and connections. This specific showing relates to 16 major lines or systems, which operated in 1939 nearly 126,000 miles of railroad, or more than 54%

of the total mileage of the class I railroads of the United States, and handled approximately 60% of all the railroad freight and passenger traffic.

This evidence certainly justifies this Court in reaching the conclusion that there is a common, widespread and virtually uniform belief among those who actually operate the railroads that the standard long-train operating practice is highly desirable and beneficial, simply because it is so nearly universal, and that an arbitrary and inflexible limit is wholly improper and of no benefit to anyone except the limited class of employes* whose opportunities for employment are artificially increased. Because the Arizona law thus directly conflicts with the standard railroad practices throughout the United States, it should be regarded as opposed to common belief and opinion, and therefore as arbitrary and unreasonable. Certainly the term "common belief," as used by this Court, does not mean the belief held solely by the limited class of employes directly and financially benefited by this particular regulation. These are the only classes of persons who have urged or supported train-limit laws, appearing generally through their national organizations in arguing for such measures before various state legislatures and before the committees of Congress, and, as well, in litigation like the present case, including the various train-limit cases to which we have

*Exhibit 194 (R. 3106) shows that in 1939 644 train and engine-service employes, out of a total of 2,693 employes of all classes on appellant's Tucson Division in Arizona (or 23.9 per cent) would and did have their employment opportunities affected because of the increased number of trains operated by reason of the law's limitations.

referred. The financial interest of these employes is apparent.

There is no showing, nor any basis for assuming, that the other 76 per cent of railroad employes as a class hold any general opinion or belief favoring train-limit regulation. No representatives of any classes of employes other than the train and engine-service group (trainmen, conductors, engineers, and firemen), took part in the instant case, or have, to our knowledge, supported that group in any other train-limit disputes. The true interest of these other employes is clearly opposed to the law, for it not only does not make more jobs for them (as it does for the train and engine group), but actually makes their work much more hazardous. For example, Exhibit No. 276 (R. 3371) shows that in the 12 years 1929-1940, inclusive, 444 employes *in all classes of appellant's service* suffered reportable casualties as a result of train and train-service accidents in Arizona, as compared to 207 such casualties in Nevada; although the aggregate of appellant's Nevada traffic was about 5 percent greater, measured in car miles. During these twelve years long-train operation prevailed in Nevada, and short-train operation in Arizona, but conditions otherwise were practically identical. Clearly the common belief of the 76 percent of the employes whose hazards of employment are increased, though their employment opportunities are not improved at all by the law, may fairly be presumed to be opposed to the arbitrary limitation.

That "common belief" is opposed to the arguments of the restricted class of employes whose financial well-being

is improved is also shown by various facts of record, and other matters which the Court may properly notice judicially: that no state other than Arizona and Oklahoma has enforced any law limiting the length of, or number of cars in, a railroad train; that the National Government has refused to impose any *fixed maximum* limit, or any limitation at all, other than that which requires that trains shall not be longer than can be safely controlled with the air-brakes; and the repeated approval by the Interstate Commerce Commission, as the agency of Congress, of the purchase of larger and heavier locomotives designed and used principally for the handling of long trains. Although the Commission is authorized and required by law to investigate unsafe practices (which, according to the argument of those who favor the Train-Limit Law, includes the operation of trains of more than 70 freight or 14 passenger cars) and to take steps to eliminate such practices, or to recommend additional Federal legislation if necessary, it has never found or held that the operation of long trains is a dangerous practice, or recommended that train lengths be limited as required by this law. It conducted an extensive investigation into the operation of power brakes, and has now, as a result of that investigation, issued its tentative order which contemplates, among other things, operation of freight trains of 150 cars. It likewise conducted 1002 accident investigations during the 12-year period 1928 to 1939 (as tabulated in Exhibits 270, 271; R. 3310-3348); but it did not, in any of those investigations, make any reference to or recommendation concerning the length of trains, although empowered to do

so, and although recommendations were made respecting other features of operations.

It is clear that the common belief of all those, both in railroad circles and in public office, who are charged with responsibility for the operation of trains and the movement of traffic, including the safety of such operations, as well as the action of the vast majority of the states (compare the *West Coast Hotel Case*, supra), is decidedly opposed to the principle of arbitrary train limitation expressed in the Arizona law. The operation of long trains substantially exceeding the Arizona limits is the common and ordinary practice in every state, except Arizona and Oklahoma; that practice has been successfully followed by appellant on all parts of its system, except in Arizona and the adjacent affected territory, for more than 20 years last past, and is being followed today, under authority of Service Order 85, in that territory as well.

It is the common belief *of today, not of 1912*, which is to be given consideration in the present case.

Just at present, and in view of the existing national emergency, common belief and opinion are more than ever overwhelmingly opposed to the crippling impediments imposed by the law upon speedy, efficient and economical railroad transportation. Even in normal times it is highly important that the free flow of the interstate commerce of the nation should not be hampered by artificial restrictions. In time of war and national peril it is not merely important: it is absolutely vital to the national existence. Appellant's lines across Arizona and New Mexico constitute an inseparable and indispensable

part of an essential through route, over which move, and must move, not alone the ordinary commerce of the country, but also the men, materials and supplies required for the national war effort. That the enforcement of the law does, and will continue to, interfere with, delay and obstruct the free movement of that essential traffic, require the employment of more men and consequent wastage of manpower, and cause the wasteful use of locomotives, is completely established upon the record, and would, indeed, be obvious, even without the careful development of the facts which appears in the testimony.

Full recognition of these facts, which are notorious among those belonging to, or interested in, the railroad industry, was accorded by the Interstate Commerce Commission when it issued Service Order 85. In the recitals preceding the order, the Commission called attention to the delays, congestion, interference, and locomotive wastage caused by compliance with state train-limit regulations, and declared that long trains could be operated in accordance with existing safety standards, and that the free flow of traffic would be thereby facilitated. These recitals were not based upon any extended hearing or investigation, or any substantial evidentiary showing, for none was required, the order having been made as an emergency measure under par. 15 of Section 1 of the Interstate Commerce Act. They reflect rather the great body of common knowledge and informed opinion respecting the reasonableness of train-limit restrictions, as judged by their effects and results. The Commission's conclusion that the law *must* be disregarded, in the emergency, merely emphasizes, however, that even in normal times

the free flow of traffic is greatly impeded, wasteful practices are compelled, and interstate commerce is directly interfered with and burdened, without any tangible or compensatory benefits whatever, from the safety standpoint; for if it is true, as is undoubtedly the fact, that long trains can be operated "in accordance with safety standards *now* applicable" (i.e., during the present emergency), it is equally true that they can be operated, in normal times, in accordance with the highest safety standards. In its opinion dealing with the validity of Service Order 85, the Commission said (256 I.C.C. at p. 536):

> "The fact that freight trains in excess of 70 cars and passenger trains in excess of 14 cars are operated in other states is convincing evidence of its safety, except where unusual operating conditions exist."

The operating conditions on appellant's lines in Arizona are not unusual but, on the contrary, somewhat more favorable than in many states where long-train operation is the normal and ordinary practice. There is nothing to suggest that the present safety standards of railroad operation are any different than in 1938, 1939, or 1940, or in any recent period; and there have been no new enactments or amendments of existing federal laws, dealing with safety of train operations, since this case was commenced.

(e) A Purported Safety Measure Which in Fact Bears No Reasonable, Nor Any Relation Whatever, to Health or Safety, but on the Contrary Increases Certain Hazards and Creates Others Which Would Not Otherwise Exist, Is Unreasonable and Without Rational Basis, and Without Regard to Its Claimed or Actual Effects Upon Interstate Commerce, Should Be Held Invalid Because in Violation of the Due-Process Clause. The Train Limit Law Comes Within This Principle, and Is Therefore Invalid.

The first sentence of the above caption states a legal principle which is so well known and so widely accepted, that extensive citation of authority is probably unnecessary. We shall, therefore, refer to only a few of the leading decisions. In

Mugler v. Kansas, supra (123 U.S. 623, 31 L. ed. 205),

this Court said (at p. 661):

> "If, therefore, a statute purporting to have been enacted to protect the public health, the public morals, or the public safety, has no real or substantial relation to those objects, or is a palpable invasion of rights secured by the fundamental law, it is the duty of the courts to so adjudge, and thereby give effect to the constitution."

In

Minnesota v. Barber, supra (136 U.S. 313, 34 L. ed. 455),

the Court, after referring to the *Mugler Case*, said:

> ". . . It is our duty to inquire, in respect to the statute before us, not only whether there is a real and substantial relation between its avowed objects and the

means devised for attaining those objects, but whether by its necessary or natural operation it impairs or destroys rights secured by the Constitution of the United States."

In *Liggett Co.* v. *Baldridge*, supra, this Court said, in addition to the portions of the opinion already quoted (278 U.S., at pp. 111, 112):

> "The police power may be exerted in the form of state legislation where otherwise the effect may be to invade rights guaranteed by the 14th Amendment only when such legislation bears a real and substantial relation to the public health, safety, morals or some other phase of the general welfare."

After reviewing the facts relied upon to support the law under attack, the Court said further (at p. 114):

> "The claim, that mere ownership of a drug store by one not a pharmacist bears a reasonable relation to the public health, finally rests upon conjecture unsupported by anything of substance. This is not enough; and it becomes our duty to declare the act assailed to be unconstitutional as in contravention of the Due Process Clause of the 14th Amendment."

In *Washington, etc.*, v. *Roberge* (1928), 278 U.S. 116, 73 L. ed. 219, this Court, quoting from *Nectow* v. *Cambridge* (1928), 277 U.S. 183, 188, 72 L. ed. 842, said (278 U.S., p. 121):

> "'The governmental power to interfere by zoning regulations with the general rights of the landowner by restricting the character of his use, is not unlimited and, other questions aside, such restriction cannot be

imposed if it does not bear a substantial relation to the public health, safety, morals, or general welfare.' Legislatures may not, under the guise of the police power, impose restrictions that are unnecessary and unreasonable upon the use of private property or the pursuit of useful activities."

In *Chicago, St. Paul, M. & O. Ry.* v. *Holmberg* (1930), 282 U.S. 162, 75 L. ed. 270, this Court, in declaring invalid an order of the Nebraska State Railroad Commission requiring the installation of an underpass, made the following pronouncement (at p. 167):

> "It is plain that the Commission proceeded upon the assumption that the statute authorized it to compel plaintiff to establish the underground pass for the convenience and benefit of defendant in the use of his own property, and that that alone was the ground and purpose of the order. The application thus given to the statute deprives plaintiff of property for the private use and benefit of defendant, and is a taking of property without due process of law, forbidden by the Fourteen Amendment (citing cases)."

In *Nashville, C. & St. L. Ry. Co.* v. *Walters*, supra, already cited to the point that a statute valid as to one set of facts may be invalid as to another, or though valid when enacted may become invalid by change of conditions, the Court also said (294 U.S., at p. 415):

> "The police power is subject to the constitutional limitation that it may not be exerted arbitrarily or unreasonably. To this limitation, attention was specifically called in cases which have applied most broadly the power to impose upon railroads the cost of separation of grades." (Citing cases.)

In *Treigle* v. *Acme Homestead Assn.* (1936), 297 U.S. 189, 80 L. ed. 575, this Court said (at p. 197):

> "Though the obligations of contracts must yield to a proper exercise of the police power, and vested rights cannot inhibit the proper exertion of the power, it must be exercised for an end which is in fact public and the means adopted must be reasonably adapted to the accomplishment of that end and must not be arbitrary or oppressive."

In its own earlier decisions, which, however, were wholly ignored in its opinion in the case at bar, the state court has recognized the constitutional limitations upon the police power expressed in the cited decisions of this Court. Compare:

State v. Childs (1927), 32 Ariz. 222, 257 P. 366;
Atchison etc. Ry. Co. v. Arizona (1928), 33 Ariz. 440, 265 Pac. 602;
State v. Borah (1938), 51 Ariz. 318, 76 P.(2d) 767;
Buchman v. Bechtel (1941), 57 Ariz. 363, 144 P.(2d) 227; 134 A.L.R. 1374.

The fundamental principle being clear, the question whether it is applicable in the present case is essentially a question of fact: namely, whether the challenged law actually promotes safety, or on the other hand, not only fails to do so, but actually increases the hazards of train operation, both generally, and as to specific classes of accidents.

We do not propose at this point to argue at length all of the evidence bearing upon the safety issue; it is carefully reviewed in the safety findings (Nos. XI, XII, XIII; R. 3969-4032) adopted by the trial court, and also

discussed in some detail in Volume II of this brief. In preceding portions of the argument in this volume, we have called attention to some of the more significant features of this phase of the case. For example, in the discussion of the "Concurrent Field" (part 3 of this argument), we have contrasted the serious burdens and obstructions imposed, against the nebulous safety benefits actually realized. Again, in our review of the "Cost of Compliance" (subdivision (a) of the present topic), we show that even considering only the one minor class of hazards claimed by appellee to be favorably affected by the law, the most that can be said, upon the basis of experience gained during the twelve most recent years (1929-1940) for which statistics were available at the time of trial, is that operation under the short-train restriction is only a little more dangerous *in this respect*, than the long-train practice; this being equally true whether overall totals of casualties, or their relative frequencies, or both, are considered.* But when *all* classes of hazards to the same group of employees (road freight conductors and trainmen) claimed to be subject to the slack-action hazard are considered, the law increases the dangers substantially;† when all classes of hazards to *all* employes, in-

*Actually, in the restricted operation in Arizona, there were 62 slack-action casualties to trainmen on duty, during the twelve years, as compared to 61 in Nevada; on the basis of casualty rates, there was approximately one more casualty of this type, in Arizona, for each four hundred and seventeen million car miles, than under the long-train practice in Nevada. (Ex. 280, R. 3375)

†Ex. 279, R. 3374, shows, for example, 117 casualties to road freight conductors and trainmen on duty during the twelve long-train years (1929-1940) in Nevada, and 225 during the same twelve years in Arizona; the casualty rates per one hundred million car miles were: 7.23 for Nevada, and 14.57 for Arizona.

cluding both enginemen and trainmen, engaged in road freight train operation are considered, the increased hazards are still more clearly shown;* and finally when all classes of hazards, to *all* employees on duty, arising out of train operations generally are considered, the effects of the law as a consistent creator of unnecessary danger stand convincingly revealed.†

The conclusions drawn from these Arizona-Nevada comparisons, whose propriety is affirmatively declared in both the findings (R. 3985-3986), and the opinion (R. 4049-4050) of the trial court, are strongly confirmed by the comparisons of casualties in Arizona and New Mexico, including both the appellant's operations in those two states (Finding XII-j, R. 4001-4004; Exhibits 387, 388, 389, 397, R. 3549-3565, 3578), and those of the Santa Fe, which also operates in the two states, and likewise under substantially identical conditions, apart from the train limit law (Finding XII-k, R. 4004-4006; Exhibit 296, R. 3435); by the casualty experience of the Chesapeake and Ohio Railway, which has developed the long-train operating practice to a degree probably not exceeded by any other major carrier (Finding XII-l, R. 4006-4008; Exhibits 122, 123, R. 2982-2983); and by the national showing of the consistent

*Ex. 277, R. 3372, shows that the total of the Nevada casualties sustained by these employees during the twelve-year period was 134; the corresponding Arizona total was 290. The casualty rates per one hundred million car miles were: 8.27 in Nevada, and 18.77 in Arizona.

†Ex. 276, R. 3371, shows, for the same twelve-year period, 207 casualties in Nevada sustained by all classes of employees on duty occurring in train and train-service accidents, and 544 such casualties in Arizona. The casualty rates per million locomotive miles were: 4.77 in Nevada, and 9.22 in Arizona. This showing includes all passenger, freight, and other train operations.

general reductions in both numbers and frequency of all classes of accidents and casualties involving employes and passengers, from all classes of hazards, which have taken place side by side with the widespread development and adoption of the long-train practice, and the consequent increases in the length of trains and the number of long trains operated (Exhibits 262 to 267, inc., 269, 390, R. 3300-3305, 3307, 3566).

While the State Supreme Court, as already noted, omitted from its opinion any conclusion based upon the evidence relative to the safety aspect of the case, the memorandum opinion of the trial court was by contrast quite complete. We quote the following significant passages from that opinion (R. 4050-4053):

> "Long-train method of operation prevails in *passenger service* all over the United States, except in Arizona, and the statistics demonstrate, from the safety angle, that the fourteen-car limit has no logical or reasonable basis. Furthermore, long passenger-train operations in Arizona are entirely practicable and would result in greater efficiency, economy and safety.
>
> "Hence, certainly as applied to passenger-train operations, the challenged law bears no reasonable relation to its claimed object of safety, and instead of promoting that object actually increases many hazards, and creates many others which would not exist if the law were not enforced."
>
> * * * * * * *

After referring to freight-train operations, the opinion continued with the following comments, applicable to both classes of operations:

"Essentially then the question is not whether a given number of long trains may be operated with fewer casualties than an equal number of short trains, but rather whether the long-train method of moving the entire volume of traffic results in fewer casualties, of all classes, than the movement of the traffic in a larger number of trains of restricted length.

"In determining then whether the law bears any reasonable relation to safety, only the over-all result in casualties of the entire operation should be considered and when thus weighed *it is clear that the law not only does not increase safety of train operations in Arizona, but that as a matter of cold fact it makes these short-train operations more dangerous.*

"Thus the Arizona Train-Limit Law not only bears no reasonable relation to safety but, to the contrary, does, and if enforced will continue to, impair and lessen substantially the safety of defendant's train operations in Arizona and the adjacent affected territory." (Emphasis supplied.)

We have cited the *First Arizona* and *Nevada Train-Limit Cases* on the points of invasion of the exclusive national field, and occupancy of the field by Congress. These cases are also applicable in considering the extent to which a court may and should go in extending the protection of the due-process clause to one who is seriously interfered with and burdened by a statute defended under the "convenient apologetics of the police power." In each of those cases, as here, one of the important issues was whether, in fact, the regulation was reasonably required to protect life, limb and property, or whether it bore no reasonable relation to that object. The evidence

in support of the regulation was largely opinion evidence of men in train service, and their relation of the circumstances of accidents and the details and hazards of train operation. That was offset and overcome by statistics of actual operation—some of which are referred to in the opinions—which showed that the unusual hazards claimed by those witnesses had no foundation in fact. It was extensively and ably argued in briefs on the merits in both cases that the court had no power to substitute its judgment for that of the legislature if there was *any* evidence tending to support the claim that the statute was a safety statute. But both courts found no difficulty in holding on *conflicting* evidence that the statutes were void "because * * * so unreasonable as to deprive plaintiffs of their property without due process of law" and "that it is arbitrary and bears no reasonable relation to the safety of persons or property" (2 Fed. Supp. 862; 18 Fed. Supp. 393). In the case at bar there is *no conflict* in the evidence on the safety issue—or any other phase of the case.

We do not claim that either of these decisions controls the instant case on the facts. But we do believe that the result of the thorough trial, argument, and personal consideration by the judges of the issues of law and fact in those cases, should be of considerable assistance in the consideration of the issues of law and fact in the case at bar.

6.

IF THE DECISION OF THE LOWER COURT BE CONSTRUED AS A REVERSAL OF THE FINDINGS OF FACT OF THE TRIAL COURT, IT OPERATES TO DENY TO APPELLANT FEDERAL RIGHTS TO WHICH IT IS SHOWN BY THE EVIDENCE TO BE ENTITLED.

(Assignments of Error Nos. 7 and 8)

In the opening statement we have summarized the detailed findings of fact (R. 3879-4034) adopted by the trial court. As we there point out, these findings were rendered by the judge who, sitting without a jury, had heard and considered all of the testimony, both oral and documentary, offered by both parties. The findings are separately stated, and accompanied by formal conclusions of law (R. 4035-4039), in accordance with the established practice in the Superior Courts of Arizona, which is modeled after and follows closely the practice in the District Courts of the United States.

The findings, which cover every phase of the case, are carefully annotated to the testimony, by references to pages of the reporter's typewritten transcript, and the particular exhibits (by numbers) where the evidence relied upon is to be found. Thus they constitute a complete and accurate summary of all the material and relevant evidence of record in the case.

No reference whatever to the findings *of fact*, as such, appears in the opinion of the majority of the state court. Indeed, that court employs the word "findings" only once in the opinion, in the sentence (already cited in our State-

ment of the Case) near the end of the opinion reading in part as follows (R. 4067-4068):

> "the opinion, condensed as it is in the foregoing pages, expresses our reason for holding that the findings and judgment of the trial court to the effect that the Train Limit Law is unconstitutional were in error."

This expression could not have been intended by the state court, and certainly cannot be construed, as a determination that the trial court's findings *of fact* were either wholly erroneous, or even erroneous in any essential respect, in so far as any of said findings, or any portion thereof, may have constituted a determination of a material fact.

This is evident first, from consideration of the opinion itself. The quoted sentence declares that "the opinion, condensed . . . in the foregoing pages, expresses (the) reason" for holding the findings and judgment erroneous. But the opinion is wholly lacking in any discussion of the factual issues of the case, and fails completely even to mention any of the findings *of fact*, either as an entirety or in detail; notwithstanding that the state as appellant had presented to that court some 204 separate assignments of error addressed to the findings. The "foregoing opinion" contains literally no expression whatever capable of being construed as a reason for holding the findings of fact erroneous. Indeed, it contains no reference whatever to the evidence or to any factual matters at all, other than the early history of the law, the operation of the two trains which were the subject of the prosecution,

and, by i. direction, the heavy burden of expense imposed upon appellant (R. 4062-4063). If the court had intended to express actual disapproval of the trial court's findings *of fact*, or indicate that other, different, or contrary findings were warranted upon the evidence of record, it could hardly have avoided including in the opinion some discussion of the factual issues and the evidence. Its virtual adoption of the trial court's finding respecting the continuing heavy burden of expense imposed by the law thus strongly suggests a contrary intention.

That the quoted sentence is not intended and cannot be construed as a reversal of the trial court's findings is also strongly supported by the principle that findings of fact, when made by a trial judge sitting without a jury, are virtually conclusive upon an appellate court, and will not be modified or reversed unless substantial error is clearly shown. This principle is embodied in a statutory rule in Arizona (Sec. 21-1028, *Arizona Code Annotated*, 1939), reading as follows:

> "Findings of fact shall not be set aside unless clearly erroneous, and due regard shall be given to the opportunity of the trial court to judge the credibility of the witness."

This rule, which is identical with Rule 52-a of the Federal Rules of Civil Procedure, applies particularly to the case at bar, since it was tried upon the facts to the court sitting without a jury, and the court was duly requested to make special findings of fact and to state separately its conclusions of law thereon.

However, the state court, long prior to the enactment of the statutory rule (1939) had announced and followed the same principle:

Abernathy v. Reynolds (1903), 8 Ariz. 173, 71 Pac. 914:

"The rule, which we have often stated, is that *this Court will not disturb the findings of the trial court as to the facts if there is any evidence fairly tending to support them.* An examination of the record shows that the findings of fact were fairly supported by the evidence, and the conclusions drawn therefrom by the court are correct." (Emphasis supplied.)

California Development Co. v. Yuma Valley Land & Water Co. (1906), 9 Ariz. 366, 84 Pac. 88:

"The evidence is also conflicting upon the question of the acceptance of the dredge by Sexsmith in behalf of the development company. *We must* therefore *take the findings* of the court *as conclusive* upon both of these controverted questions of fact . . ." (Emphasis supplied.)

Curtis v. Peterson, et al. (1926), 31 Ariz. 235, 251 Pac. 723:

"The learned trial judge resolved the question in favor of appellees, and, under our decisions, we must accept his determination of that question as binding."

Blackford v. Neaves (1922), 23 Ariz. 501, 205 Pac. 587:

"Of course in passing on questions as to the sufficiency of the evidence in an appeal of this nature,

every presumption is in favor of the findings of the trial judge, and, if there is any evidence in the record which will sustain them, we must accept them as correct."

First Baptist Church of Willcox v. Connor (1926), 30 Ariz. 234, 245 Pac. 932:

"The evidence on this point is in conflict, and we are thereby bound to assume that the necessary finding of the trial court on this matter was correct. In our opinion there is sufficient evidence in the record, if believed by the trial judge as we must assume it was, to sustain the judgment."

Stillsbury, et al. v. School District No. 19 (1930), 37 Ariz. 43, 288 Pac. 1027:

"In determining this question, we must construe the evidence in the most favorable light possible in favor of plaintiff. And if from the evidence so viewed findings could reasonably be made which would support the judgment, we must assume that the court did make such findings."

Charlebois, et al. v. Renaud, et al. (1931), 38 Ariz. 378, 300 Pac. 190:

"We must assume that, where there is a conflict in the evidence, the trial court took that view of it which would support the findings of fact and judgment. In re Estate of Schuster, 35 Ariz. 457, 281 Pac. 38. And this is binding on us if any reasonable testimony sustains it. Moeur v. Farm Builders Co., 35 Ariz. 130, 274 Pac. 1043."

Cano v. Arizona Frozen Products Co. (1931), 38 Ariz. 404, 300 Pac. 953:

"We must assume, following our well established rule, that the trial court took that view of the evidence which would sustain its judgment."

Since 1939, the Court has followed the same rule, the entire doctrine of its decisions on this point being summed up in its opinion in

Daily Mines Co. v. Control Mines, Inc. (1942), ... Ariz. ....., 124 Pac.(2d) 324:

"In passing upon the appeal, there are certain principles of law governing our consideration thereof, which cannot be disputed: (a) If there is reasonable evidence to support the findings of fact of the trial court, they will be sustained by this court. Glaspie v. Williams, 46 Ariz. 381, 51 P.2d 254. (b) If there is sufficient legal and competent evidence to support such findings, the erroneous admission of other evidence by the trial court will not justify a reversal of the case. First Baptist Church v. Connor, 30 Ariz. 234, 245 P. 932; Glaspie v. Williams, supra. (c) If different inferences as to the ultimate facts may be drawn from evidentiary facts, we must accept the inference drawn by the trial court. First National Bank v. Osborne, 39 Ariz. 107, 4 P.2d 384."

The Arizona rule is thus substantially the same as that which this Court has frequently announced and followed; compare:

Butte & Superior Copper Co. v. Clark-Montana Realty Co. (1919), 249 U.S. 12, 30, 63 L.ed. 447;

District of Columbia v. Pace (1944), 320 U.S. 698, 88 L.ed., Adv. 319, 321.

The state court's opinion contains nothing to indicate an intention on its part to depart from its own consistent rule, let alone to abandon it completely. If there had been such intention, certainly the point would have been mentioned in the opinion, with some statement of the reasons why the court felt impelled to make an exception in the present case, or otherwise to hold the rule inapplicable. Absent such an express declaration, it can only be concluded that the court, following its own rule, accepted the trial court's findings without amendment, and did not intend to substitute instead its own views of the evidence.

That the quoted sentence was not intended and cannot be construed as a reversal of the trial court's findings is further strongly supported by the language of the mandate (R. 4072-4073), which merely ordered the lower court's judgment reversed, but did not direct that the findings be vacated. The trial court, in entering judgment as directed, though declaring the law constitutional, did not disturb its own earlier findings (R. 4073-4074).

That the quoted sentence was not intended and is not to be construed as a reversal of the trial court's findings is again supported by the wording of the sentence itself. That sentence, which we again quote in part for ready reference, refers to the "findings and judgment of the trial court *to the effect that the train limit law is unconstitutional.*" There is no punctuation in the portion of the sentence quoted, indicating a purpose to separate the findings from the judgment; in other words, as the sentence reads, the court was undertaking to declare erroneous "the findings . . . *to the effect* that the train limit law

is unconstitutional," as well as the judgment to that effect. In the strict and literal sense, the trial court made no such "*finding of fact*"; its findings may be searched in vain for any expression declaring the law invalid or unconstitutional. By far the greater part of the trial court's findings of fact contain no statement which can be construed as even *indirectly* holding, or holding "in effect" that the law is invalid.

It is true that in four rather brief and summary findings (Nos. XVI to XIX, incl., R. 4032-4034), appearing at the conclusion of the detailed findings of fact, the trial court stated certain factual conclusions respecting the character of the burdens imposed by the law, and their effect upon appellant's use of its property in its business as an interstate carrier; these findings might perhaps be regarded as "to the effect" that the law is invalid, though no such expression is actually used therein. All the remaining findings are, however, straightforward statements of fact, and express no legal conclusions at all. All the direct statements of the law's invalidity made by the trial court are contained in the separate conclusions of law (R. 4035-4039), or in the judgment (R. 4039-4041), or in the opinion rendered immediately prior to the entry of that judgment (R. 4042-4054). The word "findings," as it appears in the quoted sentence, can therefore be taken only to mean the conclusions, or those portions of the opinion or judgment corresponding thereto, which declare the invalidity of the law, including possibly also Findings Nos. XVI to XIX, inclusive; but it cannot, in the light of the context, be taken as meaning those findings of fact which simply reflect and summarize the pertinent evidence, and

thus do not hold or declare, even "in effect," that the law is invalid.

Notwithstanding these cogent reasons, the appellee may contend that the quoted sentence, or the opinion as a whole, should be construed as a determination that the trial court erred, as a matter of fact, in adopting the special findings; that other and contrary findings should have been made; and that upon the basis of such findings a judgment sustaining the law instead of holding it invalid should have been entered.

Assuming that that argument can be maintained, the state court's decision then becomes equivalent to findings, either of fact or of mixed fact and law, as a result of which important federal rights have been denied to appellant. In these circumstances there becomes applicable the consistent rule, repeatedly declared and followed, under which this Court, in order properly to exercise its own functions under the Constitution, will analyze the facts in order to determine whether or not federal rights duly asserted, have been denied as a result of a purported determination of fact by the state court which is without proper evidence to support it; and if this Court concludes that the lower court has thus acted, it will take such steps as may be warranted in the premises.

The following decisions of this Court particularly declare and illustrate this rule:

Kansas City Southern Ry. Co. v. Albers Commission Co. (1912), 223 U.S. 573, 591, 56 L.ed. 556;

Northern Pacific Ry. Co. v. North Dakota (1915), 236 U.S. 585, 593, 59 L.ed. 735;

Norfolk & Western Ry. Co. v. Conley (1915), 236 U.S. 605, 609, 59 L.ed. 745;

Aetna Life Ins. Co. v. Dunken (1924), 266 U.S. 389, 394, 69 L.ed. 342;

Postal Telegraph-Cable Co. v. Newport (1918), 247 U.S. 464, 473, 62 L.ed. 1215;

Truax v. Corrigan (1921), 257 U.S. 312, 324-325, 66 L.ed. 254;

Baltimore & Ohio Southwestern R. Co. v. Burtch (1924), 263 U.S. 540, 543, 68 L.ed. 433;

Fiske v. Kansas (1927), 274 U.S. 380, 385, 71 L.ed. 1108;

Beidler v. South Carolina Tax Commission (1930), 282 U.S. 1, 8, 75 L.ed. 131;

Norris v. Alabama (1935), 294 U.S. 587, 590, 79 L.ed. 1074;

Great Northern Ry. Co. v. Washington, supra (300 U.S. 154, 165-166, 81 L.ed. 573);

United Gas Co. v. Texas (1938), 303 U.S. 123, 143, 82 L.ed. 702;

Pierre v. Louisiana (1939), 306 U.S. 354, 358, 83 L.ed. 757;

Smith v. Texas (1940), 311 U.S. 128, 130, 85 L.ed. 84;

Milk Wagon Drivers Union v. Meadowmoor Dairies (1941), 312 U.S. 287, 293, 85 L.ed. 836.

The rule is well stated in *Norris v. Alabama*, supra, in which this Court said (294 U.S. at p. 590):

"When a federal right has been specially set up and claimed in a state court, it is our province to in-

quire not merely whether it was denied in express terms but also whether it was denied in substance and effect. If this requires an examination of evidence, that examination must be made. Otherwise, review by this Court would fail of its purpose in safeguarding constitutional rights. Thus, whenever a conclusion of law of a state court as to a federal right and findings of fact are so intermingled that the latter control the former, it is incumbent upon us to analyze the facts in order that the appropriate enforcement of the federal right may be assured." (Citing cases.)

Truax v. Corrigan, supra (257 U.S. 312), is of special interest because, like the case at bar, it involved a decision of the Supreme Court of Arizona, brought to this Court by writ of error, in which the state court had undertaken to deny the federal rights asserted by the plaintiffs in error on the basis of factual conclusions which did not accord proper recognition to undisputed facts. Assuming that the quoted sentence is construed as relating to the trial court's findings of fact, the same court has reached the same result in the present case, and by the same method. The cases differ only in that the facts in the *Truax Case* were presented by the complaint and exhibits, the decision having been rendered on demurrer; in the instant case they are developed by findings which rest upon testimony as to which there is no factual conflict. In the cited case this Court said (257 U.S., at pp. 324-325):

"In cases brought to this court from state courts for review, on the ground that a Federal right set up in the state court has been wrongly denied, and

in which the state court has put its decision on a finding that the asserted Federal right has no basis in point of fact, or has been waived or lost, this court, as an incident of its power to determine whether a Federal right has been wrongly denied, may go behind the finding to see whether it is without substantial support. If the rule were otherwise, it almost always would be within the power of a state court practically to prevent a review here. (Citing cases.) Another class of cases in which this court will review the finding of the court as to the facts is when the conclusion of law and findings of fact are so intermingled as to make it necessary, in order to pass upon the question, to analyze the facts. (Citing cases.) In view of these decisions and the grounds upon which they proceed, it is clear that in a case like the present, where the issue is whether a state statute, in its application to facts which are set out in detail in the pleadings and are admitted by demurrer, violates the Federal Constitution, this court must analyze the facts as averred and draw its own inferences as to their ultimate effect, and is not bound by the conclusion of the state supreme court in this regard."

In *Great Northern Ry. Co. v. Washington*, supra (300 U.S. 154), this Court, dealing with a similar issue, said (p. 165):

"Passing the appellant's contention that a federal right may not be denied under the guise of the application of a state rule of evidence, we come to the question whether, when the asserted right has been denied, this court is concluded by a finding of fact or a mixed finding of law and fact made by the state court. We have repeatedly held that in such case we

must examine the evidence to ascertain whether it supports the decision against the claim of federal right."

The Court then cited and quoted from *Norris v. Alabama*, supra (294 U.S. 587); *Beidler v. South Carolina Tax Commission*, supra (282 U.S. 1); and *Johnson Oil Co. v. Oklahoma* (1933), 290 U.S. 158, 159-160, and concluded its discussion of the point by saying (p. 167):

"Citation of authority for the same principle might be multiplied indefinitely."

In *Pierre v. Louisiana*, supra (306 U.S. 354), one of the most recent decisions involving this same principle, *Norris v. Alabama* is referred to with approval, the Court indicating that, while the factual conclusions reached by the state court are entitled to great respect, yet when a claim is properly asserted that a right guaranteed by the Federal Constitution has been denied, it becomes the solemn duty of the Court to make independent inquiry and determination of the disputed facts.

More recently still, in the *Milk Wagon Drivers Union Case*, supra (312 U.S. 287), this Court said (p. 293):

"Still it is of prime importance that no constitutional freedom, least of all the guarantees of the Bill of Rights, be defeated by any insubstantial findings of fact screening reality. That is why this Court has the ultimate power to search the records in the state courts where a claim of constitutionality is effectively made."

We shall not at this point argue at length the correctness of the findings of fact made by the trial court,

from the standpoint of evidentiary support, and the consequent error of the state court's conclusion (if its opinion be so construed) that those findings of fact are incorrect ("erroneous") and must be reversed. Volume II of this brief ("The Facts") contains a detailed discussion of each of the findings of fact, explaining its purpose and referring to the evidence which supports it. Volume II should be reviewed, however, only if the reader is convinced that the state court not only intended to pass upon the correctness of the findings of fact made by the trial court and to reverse those findings, but also actually did so through the medium of the quoted sentence, thereby giving rise to the questions of fact presented by appellant's eighth assignment of error.

If the Court undertakes to review the findings in the light of the evidence, it will be impressed with the fact that the findings, though somewhat detailed, are a very accurate summary of all the testimony. No pertinent evidence introduced by either party has been disregarded. Taken in their entirety, the findings present a complete picture of the entire case, and set forth every factual consideration necessary to a correct decision.

It cannot be too strongly emphasized that there is no real conflict in the evidence. This is primarily for the reason that it consists largely of statistical material, condensed into exhibits and accompanied by explanatory oral testimony, which material is taken from official or other unimpeachable sources; such as, for example, official publications of the Interstate Commerce Commission; periodical and other reports rendered to that Commission or to

state commissions, pursuant to statute; permanent underlying records of the appellant and of other railroads, and other records prepared and maintained by the railroads as a part of the ordinary course of their business; and studies based principally upon day-to-day records of actual train movements. The evidence is thus very largely of the same character as that presented in the recent *Retirement Act case* (*Railroad Retirement Board v. Alton R. Co. et al.* (1935), 295 U.S. 330, 79 L.ed. 1468). In fact, certain of the tabulated exhibits presented in the present case correspond closely to exhibits which were before the Court in the *Retirement Act Case*. Compare, for example, Exhibits Nos. 262 and 263 (R. 3300, 3301) with the tabulations appearing in the footnote on page 365 of the report in the cited case; and see also footnote 11 on page 366. Statistical showings of this type were referred to by this Court as "incontrovertible" (295 U.S. 364); and it was further stated that they constituted "overwhelming evidence," which demonstrated the results shown "without contradiction."

Only to a minor extent does the testimony include statements based upon the observation or experience of witnesses, as distinguished from written records; but even this testimony presents no *factual* conflict. The only differences between the appellant and the state, so far as concerns any of the testimony, arise because of either (1) the admission of evidence offered by appellant which the state considered immaterial, irrelevant or incompetent, and the exclusion of certain other testimony offered by the state, on corresponding grounds; or (2) opposing views as to the factual and legal conclusions to be drawn

from facts which are themselves undisputed. But it has not been asserted, and no such assertion could be genuinely made, that any part of the factual showing of either party is false, or erroneous because true only in part, or misleading as a representation of fact. Appellee has made no such assertion at any stage of the case; it has never challenged the truth of any of appellant's factual testimony, even though continuously insisting that much of said testimony was incompetent or otherwise inadmissible.

The issues before this Court do not involve, however, any alleged errors because of the admission or exclusion testimony. No such question was decided by the State Supreme Court; for even though 662 assignments of alleged error in the rulings of the trial court upon the admission of testimony were presented by appellee and argued to that court, the findings were not declared by that court to be erroneous because based upon supposedly inadmissible testimony. We point out again that the opinion, "condensed * * * in the foregoing pages," stated by that court to express its reasons for holding the "findings" erroneous, contains no discussion of evidence, nor any statement sustaining any fragment of the state's challenge upon the ground of error in the trial court's rulings. So far as the opinion reveals the court's views upon the evidence, it accepted the record as made in the trial court. Its statement in the quoted sentence now under discussion must therefore be taken as either relating to the trial court's conclusions rather than its findings of fact (the construction we suggest above), or as holding that, despite the evidence of record, contrary findings of fact should have

been and should now be made. If the latter, the court's action was a mere arbitrary refusal to recognize the facts: in effect a denial of the truth of matters which on the record were and are factually unchallenged, and thus a deliberate misfinding of the facts in order to support the declared conclusion. In such circumstances, this Court's duty as proclaimed in its decisions is clear. This Court has both the power and the duty to review the record, and thereby determine for itself that the state court has reached factual conclusions which are without substantial or indeed any evidentiary support, and upon that basis has denied to appellant rights guaranteed under the Federal Constitution which, upon the actual record, should have been sustained.

CONCLUSION

In conclusion we submit that:

1. The matter of the regulation of the length and consist of interstate railroad trains is a subject as to which a national or uniform system of regulation is necessary if any regulation at all be required; and it therefore falls within the exclusive national field. The Train Limit Law invades this exclusive national field of regulation.

2. The Train Limit Law necessarily, practically, and inevitably regulates and controls the length and consist of appellant's interstate trains, and other railroad operations of appellant, not only within Arizona but also, as appellee has conceded, in adjoining states and for substantial distances beyond the boundary lines of Arizona. It is

therefore wholly void, because it undertakes to and does regulate interstate commerce with extra-territorial effect.

3. Even though it should be considered, for the sake of argument, that the regulation of the lengths of interstate trains falls within the "concurrent" field, the Train Limit Law, because it imposes direct and substantial burdens and restrictions upon and directly and materially obstructs and interferes with the free flow of interstate commerce, goes far beyond any powers which the state may have in the concurrent field, and is therefore invalid.

4. The Train Limit Law, if considered or claimed to be an attempted limitation of the lengths of trains for the sake of proper handling and safe control, infringes upon, conflicts with, and attempts to supplement existing Federal legislation and regulations having the same or similar purposes and effects, and is therefore invalid.

5. The Train Limit Law is not fortified or assisted by any presumption of reasonableness based upon assumed legislative knowledge of conditions existing at the date when this case arose. Although claimed to be an exercise of the police power in the interest of safety (despite the fact that no legislative declaration of the purpose of the law was made, and no purpose is evident on the face of the law), it bears no reasonable or any relation whatever to health and safety. It is clearly in excess of the legislative power; and also arbitrary and unreasonable, and deprives and will continue to deprive appellant of its property without due process of law.

6. The opinion and decision of the Supreme Court of Arizona, if construed as a reversal by that Court of the

findings of fact made by the trial court, are equivalent to an attempted finding upon factual matters not supported by and in conflict with the evidence, as the result of which appellant has been deprived of federal rights to which it is shown by the record to be entitled.

7. Upon the record, and in the light of the controlling principles, the Train Limit Law should be held invalid and unconstitutional, upon each and all of the grounds above set forth, because it violates and infringes upon the Commerce Clause of, and the Due Process Clause of the 14th Amendment to, the Constitution of the United States. The decision and judgment of the Supreme Court of Arizona should be reversed, and the cause remanded with instructions to enter judgment in favor of appellant.

(APPENDIX FOLLOWS)

Appendix

ORDER

At a Session of the
INTERSTATE COMMERCE COMMISSION,
Division 3,
held at its office in Washington, D. C.,
on the 29th day of July, A. D. 1944
No. 13528

INVESTIGATION OF POWER BRAKES AND APPLIANCES FOR OPERATING POWER-BRAKE SYSTEMS

It appearing, That on July 18, 1924, the Commission made and filed a report in this proceeding in which there were enumerated certain general requirements which should be met by power brakes for passenger and freight trains, in the interest of increased safety in train operation; and that the proceeding was held open to afford opportunity for the formulation of full specifications and requirements and for consideration of the form of order to be entered;

It further appearing, That respondents, through the American Railway Association (now Association of American Railroads), after extended investigation and tests, adopted, on August 16, 1933, specifications and requirements for power brakes, and appliances for their operation, in freight service to comply with certain of the general requirements referred to in the preceding paragraph hereof, and promulgated a rule requiring that all freight cars built new after September 1, 1933, be equipped with power brakes which conformed to said specifications and

requirements; and on November 20, 1934, modified their interchange rules to require that on and after January 1, 1945, all freight cars in interchange service must be equipped with air brakes meeting the requirements of said specifications;

And it further appearing, That reports filed semi-annually with the Commission by the Association of American Railroads show that the progress in equipping freight cars in interchange service with air brakes meeting said specifications has not been as rapid as anticipated, and that only approximately 50 per cent of such cars are now so equipped,

It is ordered, That all common carriers by railroad subject to section 25 of the Interstate Commerce Act be, and they are hereby, cited to show cause, if any there be, in writing, on or before August 26, 1944, why—

(1) Specifications and requirements as set forth in the appendix to this order should not be prescribed by the Commission for power brakes and appliances for operating power brake systems, to be applied to cars used in freight service; and

(2) If specifications and requirements in substantial conformity with those set forth in the appendix to this order are prescribed by the Commission, an order should not be issued requiring that all cars used in freight service be equipped with power brakes and appliances for operating power brake systems, conforming to such specifications and requirements, on or before January 1, 1946;

It is further ordered, That a prehearing conference to discuss and consider the subject-matter of this order, at

which Chairman Patterson will preside, be, and it is hereby called for September 6, 1944, at 10:00 o'clock A.M., at the Morrison Hotel in Chicago, Ill.

And it is further ordered, That a copy of this order be served upon all common carriers subject to section 25 of the Interstate Commerce Act and upon all national organizations of railroad employees and that notice be given the general public by depositing a copy of this order in the Office of the Secretary of the Commission at Washington, D. C.

By the Commission, Division 3.

W. P. BARTEL,
Secretary.

No. 13528

INVESTIGATION OF POWER BRAKES AND APPLIANCES FOR OPERATING POWER-BRAKE SYSTEMS

APPENDIX TO ORDER OF JULY 29, 1944*

Specifications and Requirements for Power Brakes and Appliances for Operating Power Brake Systems for Freight Service

PURPOSE

The purpose of this specification is to define and prescribe requirements for power brakes and appliances for operating power brake systems.

DEFINITIONS

For purpose of this specification, terms used herein are defined as follows:

1. Power Brake—A combination of parts operated by compressed air and controlled manually, pneumatically or electrically, by means of which the motion of a car or locomotive is retarded or arrested.

2. Power Brake System—The power brakes on locomotives and cars of a train so interconnected that they can be operated together and by means of which the motion of the train is retarded or arrested.

3. Brake Valve—The valve of the locomotive equipment by means of which operation of the power brake system is controlled.

*As modified by the further order of October 19, 1944.

4. Equalizing Reservoir—The small reservoir connected to the brake valve only, the pressure of which is reduced by the engineer for making service applications.

5. Brake Pipe—The line of pipe and hose extending throughout the length of the train by means of which compressed air is supplied to the brake devices on the several cars and the pressures so controlled as to effect the application and release of the brakes.

6. Operating Valve—Device on each car, the operation of which results in:

(a) Admission of air to brake cylinder,

(b) Release of air from brake cylinders, and

(c) Charging of one or more reservoirs.

7. Service Reduction—A decrease in brake pipe pressure, usually of from 5 to 25 pounds, at a rate sufficiently rapid to move the operating valve to service position, but at a rate not rapid enough to operate the valve to emergency position. Quick service is that feature of the operating valve which provides for local reduction of brake pipe pressure.

8. Service Application—A brake application which results from one or more service reductions.

9. Full Service Reduction—A service reduction sufficient in amount to cause equalization of pressure in brake cylinder with pressure in the reservoir from which compressed air is supplied to brake cylinder.

10. Full Service Application—A brake application which results from one or more brake pipe reductions sufficient in amount to cause a full service reduction.

11. Emergency Reduction—A depletion of brake pipe pressure at a rate sufficiently rapid to move the operating valve to emergency position.

12. Emergency Application—A brake application which results from an emergency reduction.

13. Emergency Brake Cylinder Pressure—The force per square inch exerted upon piston in brake cylinder by compressed air which is admitted to brake cylinder as a result of an emergency reduction. Effective emergency brake cylinder pressure is a pressure not less than 15 per cent nor more than 20 per cent greater than the brake cylinder pressure obtained from a full service reduction on the same car and from the same initial pressures.

Specifications

General Requirements.

14. The design of the operating valve shall be such as will insure efficient and reliable operation, both in its application and release functions and when intermingled with other types of power brakes. It shall be so constructed that the rate of brake cylinder pressure development may be adjusted to meet such changes in train operating conditions as may develop in the future.

15. The design of the service and emergency valves shall be such as to permit their removal for cleaning and repair without disturbing pipe joints.

16. The portions of the car brake which control the brake application and release, and also the brake cylinder, shall be adequately protected against the entrance of foreign matter.

17. The apparatus conforming to the requirements of these specifications shall be so constructed, installed and maintained as to be safe and suitable for service.

Service Requirements.

The apparatus shall be so designed and constructed that:

(Based upon 70 pounds brake pipe pressure and train length of 150 cars.)

18. With a service reduction of 5 pounds in the equalizing reservoir at the brake valve all brakes will apply.

19. An initial 5-pound equalizing reservoir reduction at the brake valve will produce substantially 10 pounds brake cylinder pressure throughout the train, including brakes having piston travel in excess of 8 inches.

20. With an equalizing reservoir reduction of 10 pounds, the difference in time of obtaining substantially 10 pounds pressure in the brake cylinder of the 1st and 150th brakes will be nominally 20 seconds or less.

21. A brake pipe reduction of 10 pounds will result in pressure in each brake cylinder of not less than 15 pounds nor more than 25 pounds.

22. A total brake pipe reduction of 25 pounds will result in equalization of brake cylinder pressure with pressure in the reservoir from which compressed air is supplied to the brake cylinder, and brake cylinder pressure

of not less than 48 pounds nor more than 52 pounds will be obtained.

23. Quick service activity of the train brakes will cease when the initial quick service action has been completed.

24. The quick service feature of the brake will produce substantially uniform time of quick service transmission regardless of the unavoidable variations in frictional resistance of the parts.

25. The brake will so function as to prevent a degree of wave action in brake pipe pressure sufficient to cause undesired release of any brakes while the brakes are being applied.

26. The degree of stability will be sufficient to prevent undesired service application occurring as a result of unavoidable minor fluctuations of brake pipe pressure.

27. The brake cylinder pressure increase resulting from quick service operation will be less when the brake is reapplied with pressure retained in the brake cylinder than with applications made when the brake cylinder pressure is zero.

28. Undesired quick action will not result with any rate of change in brake pipe pressure which may occur during service application or release of the brake.

29. In the normal release of train brakes, individual car brake will not start recharging from the brake pipe until brake pipe pressure has increased sufficiently to have accomplished the release of adjacent valves.

30. The recharge of auxiliary reservoirs in the forward portion of the train will be automatically retarded while full release position of the brake valve is being used to initiate the release of train brakes.

31. After 15-pound service reduction has been made and brake valve exhaust has closed, in a release operation in which brake valve is moved to release position and after 15 seconds is moved to running position, all operating valves will move to release position within 40 seconds after brake valve is placed in release position.

32. After a 15-pound service reduction has been made and brake valve exhaust has closed, in a release operation in which brake valve is moved to release position and after 15 seconds is moved to running position, brake pipe pressure at car 150 will be increased 5 pounds within 1½ minutes after brake valve is placed in release position.

33. The rate of release of pressure from the brake cylinder will be nominally 23 seconds from 50 pounds to 5 pounds.

Emergency Requirements.

The apparatus shall be so designed and constructed that:

(Based on 70 pounds brake pipe pressure and train length of 150 cars.)

34. Emergency application operation will always be available irrespective of the existing state or stage of brake application or release.

35. Emergency application initiated during a release of a previous brake application will produce a material

increase in brake cylinder pressure over that which would result from a full service application made under the same conditions.

36. When operating valve acts in emergency it will so function as to develop nominally 15 pounds brake cylinder pressure in not more than 1½ seconds and maximum pressure in nominally 10 seconds.

37. With an emergency reduction of brake pipe pressure all brakes, including the 150th, will start to apply within 8.2 seconds and develop not less than 15 per cent nor more than 20 per cent in excess of 50 pounds brake cylinder pressure within 18.2 seconds from the movement of the brake valve to emergency position.

38. The operating valve will so function that, when an emergency application is made subsequent to a service application which has produced not less than 30 pounds brake cylinder pressure, the maximum brake cylinder pressure will be attained in nominally 4 seconds from the beginning of the emergency action of the valve.

39. Emergency application will produce from a charged system between 15 and 20 per cent increase in brake cylinder pressure over that which results from a full service application and irrespective of any degree of prior service application.

40. With any group of three consecutive brakes cut out, an emergency reduction made with the brake valve will cause the remainder of the brakes to operate in emergency and produce normal emergency pressures in the same time as when all brakes are cut in.

41 The brake will so function as to accomplish the release of an emergency application with the same degree of certainty secured in the release of service applications.

42. When releasing brakes following an emergency application, each brake will so function as to decrease the auxiliary reservoir pressure prior to the actual release.

43. Both service and emergency brake applications will be released when the brake pipe pressure is increased to not more than 1¾ pounds above that of the auxiliary reservoir and irrespective of the increased frictional resistance to release movement of the piston and slide valves after a period of operation in train service.

Foreword	1
The Preamble	3
I. Definition of terms	3
II. Nature of the case: the parties involved	5
(a) The parties	5
(b) The issues	5
III. Description of defendant's lines of railroad	6
(a) General description of the system	6
(b) The lines in the affected territory	7
(1) Location; principal stations; double track	7
(2) Ruling grades and curvatures	8
(3) Helper districts	11
(4) The affected lines well constructed	12
(c) Defendant's lines in Nevada and Utah: description: comparison with Arizona lines	14
IV. Character of freight and passenger traffic handled upon defendant's lines in Arizona and adjacent territory: comparison with Nevada traffic	16
(a) Predominant interstate character of Arizona freight and passenger traffic	16
(b) Character of commodities transported: need for expedition	19
(c) Arizona traffic compared with traffic across Nevada	21
V. The Train-Limit Law: history and text	23
VI. Recent improvements in defendant's transportation plant, both generally, and in the territory affected by the law	24
(a) Improvements in track, roadbed, bridges and other fixed structures	24

Page

(b) Improvements in locomotives, cars and equipment 27

(c) Purpose of the improvements made by defendant: adequacy of defendant's present track, structures, and equipment to permit operation of long trains 33

VII. Defendant's methods of operation, past and present 35

(a) Operating subdivisions: runs of crews and locomotives: operating rules: inspections 36

(1) Operating divisions and subdivisions 36

(2) Runs of crews and locomotives 37

(3) Operating rules 37

(4) Inspections 38

(5) Similarity of operating methods, rules, records, etc., on defendant's lines in Nevada and Utah to those in the affected territory 40

(b) Lengths of defendant's trains 41

(1) Train lengths on the system generally 41

(2) Train lengths in Arizona, past and present: comparison with other portions of the system, and with the system as a whole 42

(c) Reductions in schedules of freight trains 45

(d) Effect of long-train program upon the efficiency and economy of defendant's train operations 49

(1) As to the system generally 49

(2) In the Nevada-Utah territory 56

(3) Defendant's inability to achieve comparable efficiency and economy in the territory affected by the Arizona Train-Limit Law 61

VIII. Comparison of defendant's methods of operation with those followed on United States railroads generally 69

(a) Improvements in road and equipment 69

(b) Increased train lengths 71

Page

(c) Improved schedules and performance 72
(d) Increased efficiency and economy 73
(e) Results of the long-train program from the standpoint of the public, the employes, and the railroad owners 76
(1) Reduction in average transportation charges paid by the public 76
(2) Increases in average wages paid to employes 77
(3) Effect on returns to owners of the railroads 78
(f) Similarity of operating conditions and operating rules on other railroads to those prevailing upon defendant's lines in the affected territory 79
IX. Recent long-train operations of defendant in Arizona; intention to undertake future long-train operations 81
(a) Long-train operations of defendant in Arizona in 1940 81
(b) Future long-train operations contemplated by defendant; changes in plant and equipment 83
X. Effect of the Train Limit Law upon defendant's operations 84
(a) The redispatching studies 88
(b) Interference with and delays to interstate traffic 99
(1) Terminal delays 100
(2) Delays to trains en route; Meets and passes 104
(3) Delays to and interferences with passenger trains and traffic 109
(4) Summary of effect of delays and interferences 110
(c) Reduction in train lengths; increase in number of trains operated 113
(1) Freight-train operations 113

Page

(2) Passenger train operations 118

(d) Increased annual expense of operation, etc., imposed by the law 119

XI. Slack and slack-action in trains: nature, cause and effects 125

(a) Description of draft rigging 126

(b) Action of draft gears 126

(c) Slack and slack-action defined 127

(d) Factors affecting slack-action: Amount developed in operation 127

(e) Slack-action in passenger-train operation 130

XII. Safety of operation as affected by train lengths: Accident and casualty statistics 132

(a) Accident reports to Interstate Commerce Commission 142

(b) Bases for computing accident and casualty rates 142

(c) National accident and casualty statistics 148

(1) All employes 150

(2) Road trainmen and enginemen on duty, all classes 152

(3) Road freight trainmen and enginemen on duty 152

(4) Road freight conductors, brakemen and flagmen 153

(5) Conductors, brakemen and flagmen—slack-action 154

(6) Passengers on trains 158

(d) Train accidents—national 162

(e) Commission's investigation of train accidents—national 163

(k) Santa Fe casualty statistics comparing short-train and long-train operations ... 181

(l) Chesapeake and Ohio Railway casualty statistics ... 183

Page

(m) Decrease in casualties—Nevada compared with Arizona 184
(n) Casualties while train standing 184
(o) Passenger-train safety 185
(1) Passenger casualties—Class I railroads of the United States 186
(2) Passenger casualties—Nevada and Arizona 186
(p) Grade-crossing accidents 187
(q) Freight-train derailments—Nevada, Arizona, and New Mexico 188
(r) Emergency applications of air by engineer 188
(s) Heavier graduating springs 188
(t) Arizona long-train operations, 1940 189
(u) Employes affected by train-limit law 189
(v) Increase in accident and casualty hazard inherent in increase of train units 191

XIII. Analysis of certain contentions advanced by plaintiff 192
(a) The contention that, with long-train operation, trains would be delayed at meeting and passing points because of inadequate siding capacities 193
(b) The contention that trains should be limited to 70 cars in order that the members of the crews may see and interpret signals more readily 194
(c) The contention that members of the crews on long trains are in constant fear of injury, and are thereby rendered less alert and efficient in the performance of their duties 196
(d) The contention that long trains cannot be properly inspected or supervised while in operation, but that short trains can be and that long-train operation therefore results in greater hazards 198
(e) The contention that the present type of air-brake equipment is inadequate to control the speed of and to stop long trains, but is more efficient and adequate upon short trains 201

Page

XIV. Extent of penalties imposed by the law 204

XV. The permissible number of cars in an interstate train is a subject of national and not local concern 205

XVI. Financial burden imposed by the law a factor in determining its unreasonableness 206

XVII. Further arbitrary effect of the law 206

XVIII. Impairment of defendant's facilities by the law 207

XIX. Financial burden on interstate commerce 207

SUPREME COURT OF THE UNITED STATES

OCTOBER TERM, 1944

No. 56

SOUTHERN PACIFIC COMPANY,
a corporation,
Appellant,

vs.

STATE OF ARIZONA ex rel. JOE CONWAY,
Attorney General of the State of Arizona,
Appellee.

BRIEF FOR APPELLANT

VOLUME II — THE FACTS

FOREWORD

This second volume of appellant's brief, submitted as a supplement to the brief on the law (Vol. I), contains a discussion of the findings of fact adopted by the trial court (R. 3879-4034), with particular reference to the evidence and other matters of record which support those findings.

The purpose of this discussion is to assist this Court, if it should conclude that the Supreme Court of Arizona has

undertaken to reverse the trial court's findings of fact (a point which we discuss in some detail in Subdivision 6 of the argument in our brief on the law: Vol. I, at pp. 314-330), in that examination and determination which this Court has declared that it is bound to make whenever federal rights, duly asserted, have been denied by a state court because of findings of fact not supported by, or contrary to, the evidence.

No findings of fact in this cause appear of record, other than those made and adopted by the trial court. No proposed amendments to or substitutions for such findings were ever presented to the State Supreme Court, by the State, upon its appeal to that court from the judgment of the trial court; nor were any new findings, or any specific changes or even general suggestions for changes in the findings already made, adopted by the State Supreme Court or even discussed by it in its opinion. The trial court's findings thus constitute the only concrete and specific findings of fact, or proposals with respect thereto, which are of record before this Court, and so afford the natural and logical objective of this discussion of the evidence.

In this review we show that those findings are fully in accord with the evidence, and present an accurate review and summary of all the evidence; that they respond to the issues of fact as presented by the pleadings in the case; and that no other, contrary or inconsistent findings, if any should now be proposed, would be fairly warranted or adequately supported upon the record.

For the sake of easy reference, we here employ the same topical headings as in the findings. Citations of the oral testimony are by names of witnesses and pages of the printed record; citations of exhibits are by the numbers assigned at the time of their tender in evidence.

We suggest that each subdivision of each finding, as it appears in the printed record, should be reviewed before reading the section of this brief carrying the same number and topical heading. The discussion and review of the evidence herein has been written with that method of review in mind, so that duplication or repetition in the recital of facts may be avoided.

THE PREAMBLE (R. 3887).

The preamble is simply a brief history of the proceedings in this case up to and including the rendition of the trial court's initial decision. All of the recitals in the preamble relate to matters of record, as to which no dispute or challenge is possible.

I.

DEFINITION OF TERMS (R. 3888)

For convenience it was believed desirable to incorporate in the initial paragraph of the findings a definition of certain terms frequently used thereafter.

The terms "Train-Limit Law" and "the law" were generally used, by both counsel and witnesses, during the course of the trial and later proceedings, to designate the statute under which the case is brought, the validity of which is challenged herein.

The terms "long trains" and "short trains" are used to apply, respectively, to trains of more than 70 freight or other cars (exclusive of caboose), or more than 14 passenger cars, and trains containing less than those numbers of cars. These terms were also commonly used by both counsel and witnesses, during the course of the litigation. The definitions correspond to the limitations fixed by the Train-Limit Law, and in fact incorporate the law's limitations by express reference.

"Interstate trains" are defined as all trains which carry any interstate commerce or are engaged in interstate transportation. This is the ordinary definition, frequently used in decisions of courts and the Interstate Commerce Commission.

The definition of "standard long-train operation", as the practice of hauling freight traffic in long freight trains, and passenger traffic in long passenger trains, whenever efficiency and economy can thereby be subserved, and of handling such traffic in short trains when economy and convenience are not promoted by long-train operation, is likewise desirable. The standard long-train practice, as thus defined, does not contemplate that *every* train operated shall be a long train; but only that traffic shall be moved in such units when greater efficiency and economy results.

The expression "the affected territory" is frequently used in the findings to designate the lines in Arizona, and in the adjacent portions of California, New Mexico, and Texas where, according to the testimony, the Train-Limit Law affects the railroad operations carried on by appellant.

II.

NATURE OF THE CASE: THE PARTIES INVOLVED (R. 3889-3890).

(a) THE PARTIES (R. 3889).

This paragraph simply reproduces, in summary form, certain portions of the complaint and the answer, the accuracy of which is either not challenged, or is apparent on its face. The finding is necessary, as a preliminary to the remainder of the findings of fact, in that it sets forth the status and identity of the parties to the cause.

Complaint, Par. (1) (R. 1).
Answer, Par. (1); Part III (R. 7).

(b) THE ISSUES (R. 3889-3890).

This paragraph is likewise a summary of certain essential allegations and admissions of the complaint and the answer. It is desirable to have such a summary appear at the outset of the findings, in order that the character of the issues involved may be set forth in advance of the more specific findings upon the various points presented by the testimony at large.

III.

DESCRIPTION OF DEFENDANT'S[1] LINES OF RAILROAD (R. 3680-3897).

(a) GENERAL DESCRIPTION OF THE SYSTEM (R. 3890-3891).

This finding describes the appellant's railroad system as to general location, and shows also that in view of its connections with other interstate carriers, it enters into and forms a part of the nation-wide railroad transportation system. The finding is essential, as a preliminary to the further discussion of appellant's position as an interstate carrier which appears in connection with later findings, particularly those relating to the effect of the law upon appellant's operations in interstate commerce.

Answer, Par. 2, Part III (R. 7-9).
Sines, R. 58-61.
Exhibits 1 (R. 2851), 175 (R. 1284).

There is also included in the findings, as a proper foundation for later detailed discussion, a brief statement of the total system mileage, the total investment in fixed property (not including equipment), and the mileage in the main lines in the territory immediately affected by the law: i.e., the lines of Arizona, including also the entire main-line mileage between Yuma and El Paso, Texas.

Masson, R. 860-861.
Exhibits 110 (R. 2964), 111 (R. 2965) 115 (R. 2975).

---

[1]The defendant in the trial court is appellant before this Court; however, we preserve for the purpose of this discussion the topical headings as they appear in the trial court's findings of fact.

The transcript references appended to the finding include references to the oral testimony and the exhibits which directly describe appellant's system, and also to the testimony of operating officials of other railroads, showing that the appellant actually participates in through transportation service with these other carriers, and thus enters into and becomes a part of the nation-wide railroad transportation system.

Wright, R. 151-158; *Kirk*, R. 253-258; *Young*, R. 301-302; *Fertig*, R. 500-501, 503-505, 511; *Green*, R. 537-538; *Kraemer*, R. 561-563; *Randall*, R. 591; *Triem*, R. 634; *Hammond*, R. 667-668; *Warfel*, R. 691; *Peckenpaugh*, R. 754-755; *Mahoney*, R. 1024, 1037-1039; *F. P. McDonald*, R. 1615; *Judson*, R. 1625.

(b) THE LINES IN THE AFFECTED TERRITORY (R. 3891-3896).

(1) Location; principal stations; double track (R. 3891-3892): This paragraph contains a description in some detail of the appellant's main lines in the territory between Yuma, Arizona, on the west, and El Paso, Texas, on the east, with some reference as well to the main lines between Los Angeles and Yuma, and between El Paso and Tucumcari, New Mexico; particular mention being made of the principal stations, the extent of single and double track, and the points where the main lines enter and leave Arizona. Reference is also made to the branch lines in Arizona, principally for the sake of completeness; the fact being that the law apparently has little, if any, effect upon such branch-line operations. For convenient refer-

ence, we here insert a copy of the system map in evidence as Exhibit 1 (R. 2851).

Sines, R. 58-59, 66-67; *Masson*, R. 861-863.
Exhibits 1 (R. 2851), 115 (R. 2975), 154 (R. 3028), 175 (R. 1284).

The finding also sets forth that the line principally used by appellant for the handling of interstate freight traffic across Arizona extends from Yuma via Gila, Tucson, Bowie, Arizona, and Lordsburg, New Mexico, to El Paso, Texas. That line is frequently referred to in the findings as appellant's Yuma-Gila-Lordsburg line. The two auxiliary main lines via Wellton, Phoenix and Picacho, and via Mescal, Douglas and Anapra, which handle a lesser proportion of the interstate freight traffic moving across Arizona, are for brevity referred to, the former as the Phoenix line, and the latter as the Douglas line. A substantial proportion of the passenger traffic across the state is routed over these two lines; in fact, the major proportion of the passenger traffic between Picacho and Yuma moves via Phoenix.

Masson, R. 861; *Sines*, R. 1375; *Herbert*, R. 1653-1654, 1663, 1665-1668.
Exhibits 1 (R. 2851), 175 (R. 1284), 176 (R. 3065).

This paragraph corresponds to and largely reproduces part of paragraph 2 of Part III of the answer (R. 7-8).

(2) Ruling grades and curvatures (R. 3893-3895):

This subparagraph describes the grade conditions encountered in the affected territory, dealing first with the

grade conditions in the territory between Indio, California, and Lordsburg, and then more generally with the grades and curvatures east of Lordsburg and west of Indio. This finding is based largely on the descriptive testimony offered through Witness Kirkbride, and also upon the showing of grades and curvatures which appears in detail upon the profiles introduced in evidence by and through that witness.

The finding itself responds to an allegation embodied in paragraph 2 of Part III of the answer (R. 8-9). That allegation relates particularly to grade conditions in southern Arizona and New Mexico. The finding as proposed includes reference to the grades encountered in the California portion of the affected territory, because they are material to the consideration of the ultimate effect of the law upon appellant's freight and passenger-train operations.

Kirkbride, R. 1126-1127, 1176-1177.
Exhibit 155 (R. 3029).

We call particular attention to the comparatively favorable operating conditions which exist on the main lines throughout the affected territory, and particularly those portions east of Yuma. Between Yuma and Tucson the line ascends eastward on comparatively gentle grades, which nowhere exceed 1 per cent, except for the short distance from Lava to Sentinel, a distance of 4.1 miles, and from Gila to Estrella, 18.9 miles, where the ruling grade in each case is 1.02 per cent.

There are long stretches between Yuma and El Paso where the track is level or nearly so, or the grades nominal. There are four comparatively short districts east of

Tucson, three for eastward traffic and one for westward traffic, where the opposing grades are somewhat more severe. These are all between Tucson and Lordsburg. Between Tucson and Mescal, about 40 miles, the ruling grade eastward is 1.06 per cent. From Benson to Dragoon, about 21 miles, the ruling grade is 1.4 per cent; and from San Simon to Steins, 14.7 miles, the ruling grade is 1.4 per cent. Westward from Lordsburg there is a very short ruling grade of 1.4 per cent near the summit of Steins Pass; and between Benson and Mescal, about 9 miles, the westward ruling grade is 1.4 per cent. The only other grade in excess of 1 per cent opposed to westward traffic is between Cochise and Dragoon, where the ruling grade is 1.1 per cent, for about 12 miles.

The curvatures, like the grades, are comparatively light and infrequent upon the lines in the affected territory. Less than one-sixth of the total main-line mileage between Yuma and El Paso via Gila and Lordsburg consists of curved track; and there are only 5.5 miles of track in that line (or less than 1 per cent), consisting of curves of more than 6 degrees. Curvatures on the alternate main lines are similarly of minor importance.

In all cases, where curvatures exist in grade territory, the grades are compensated for the curves, in that the rise of the line, expressed in feet of distance per mile, or in percentage, is reduced around each curve so that the combined effect of the resistance to the movement of traffic afforded by the grade itself, and also by the curvature considered apart from the grade, are together equal to and in all events not greater than the resistance contrib-

uted by the grade itself upon a corresponding and usually adjacent stretch of "tangent" (straight) track. In other words, in territory where grades and curves are both encountered, the ruling grade, including allowance for resistance afforded by curves, may be expressed in terms of percentage rise alone, because all the grades are "compensated." It may be added that this practice of compensating for curves in grade territory prevails on all parts of appellant's Pacific Lines.

Kirkbride, R. 1131-1136, 1139-1140, 2190-2193, 2194-2196.

Exhibits 155 (R. 3029), 175 (R. 1284), 301 (R. 2097), 302 (R. 2101), 303 (R. 2102), 309, 310 (R. 2210).

In districts other than in Arizona where 1.4 per cent or heavier grades are encountered, the operation of long trains is not prevented nor even hampered by the grade and curve conditions. Such long-train operation is, and has been in fact, the regular and standard operating practice of the appellant; and, as shown elsewhere in the testimony and in the findings predicated thereon, it is a general practice on practically every other major railroad in the United States, under conditions which are in many instances less favorable than in Arizona.

Kirkbride, R. 1176-1178; and see *Findings* VII(b), R. 3915-3920, VIII(b), R. 3937, and VIII(f), R. 3945-3946, with annotations.

(3) **Helper districts (R. 3985-3986):**

In this subdivision helper districts are defined; and the location of the freight helper districts in Arizona specified.

We emphasize the point that the mileage of the helper districts in the affected territory east of Yuma is comparatively small. There are less than 95 miles of regular freight helper districts on the main lines between Yuma and El Paso, although, as shown by subparagraph (a) of this finding, the total mileage of the main lines between Yuma and El Paso is 1,069 road miles.

For the sake of completeness this finding includes a reference to the helper districts between Colton and Indio, California. These districts are a part of the affected territory, in that the enforcement of the law affects appellant's operations, particularly of passenger trains, as far west as Los Angeles.

Dyer, R. 1116-1118; *Sines*, R. 1414-1415, 1417-1420, 2285-2286.

Exhibits 155 (R. 3029), 175 (R. 1284).

(4) The affected lines well constructed (R. 3896):

This subparagraph summarizes into two short sentences the extensive testimony of witnesses Kirkbride and J. B. Baker, whereby the essential facts were established. Mr. Baker's testimony shows the amount invested by appellant in its lines in the affected territory, particularly during the years since and including 1924; while Mr. Kirkbride's testimony establishes the adequacy of the track and track structures to carry the heaviest type of locomotive or other equipment owned or used by appellant. This same testimony likewise establishes that block signals and numerous other safety devices of approved modern type have been installed on every part of the affected main line.

There was no showing, or even suggestion, on the part of appellee that any portion of the track or structures in the affected territory would be overloaded or impaired by, or inadequate to permit, the operation of long trains. As fully explained by Mr. Kirkbride, the ability of track or bridges to sustain the weight of heavy locomotives is largely determined by the speed at which locomotives are operated, subject to consideration of the load upon each individual driving axle of the locomotive unit. The locotives now operated by appellant in the affected territory, particularly in freight service, have an average load per driving axle approximately equal to and, in some instances, greater than that of the heavier and larger types used elsewhere on the system. In so far as concerns speed, the strains and stresses imposed upon track and track structures by relatively light locomotives in high-speed passenger-train service are far more serious than those imposed by substantially heavier locomotives used in freight service and moving at the maximum speeds (45 miles per hour) permitted in freight-train operation. Furthermore, no freight or passenger cars, even including freight cars loaded to maximum capacity, impose any strains or stresses greater than those imposed by the locomotives hauling the trains; consequently the capacity of the track is measured by its capacity to withstand passenger locomotive usage.

J. B. Baker, R. 824-830, 837-839, 846-856; *Dyer*, R. 1115, 1117-1118; *Kirkbride*, R. 1140-1176.

Exhibits 110 to 114 (R. 2964-2974), 157 to 159 (R. 3031-3033).

This finding bears directly upon the question whether the lines in the affected territory are of sufficient strength to permit the operation of long trains, in the event the law's restrictions should be removed; i.e., whether the law imposes any real restriction upon appellant's operations, or whether they should be properly restricted regardless of the fixed limitation imposed by law. This finding, taken together with the preceding subdivisions hereof, shows that there is no limitation inherent in the present physical plant in Arizona which renders impossible or impracticable the commencement and continuance of long-train operation which, as set forth in the findings hereafter, has been followed by appellant on all parts of its system, other than Arizona, for more than 18 years last past, and was in fact followed upon a limited scale and for a brief period in the affected territory as well.

(c) DEFENDANT'S LINES IN NEVADA AND UTAH: DESCRIPTION: COMPARISON WITH ARIZONA LINES (R. 3896-3897).

For the purpose of showing the effects of the law, both as a purported safety measure, and as a regulation imposing burdens and interference on appellant's operations, numerous comparisons have been made between such operations in Arizona and the affected territory generally, and the operations in Nevada and Utah. To support these comparisons, appellant has shown that the operating and traffic conditions which prevail in Nevada and the adjoining territory are essentially similar to, or at least fairly comparable with those which prevail in the territory affected by the Arizona law.

Finding III(c) relates primarily to the operating conditions, as distinguished from the character of traffic handled, in Nevada and Utah. It shows that in that territory the ruling grades and curvatures are approximately the same, and in any event no more favorable, than in Arizona; and that there are no ruling grades encountered in Arizona which exceed those in Nevada. The main lines in Nevada and Utah, like those in Arizona, are constructed in accordance with the best modern standards, and well maintained and equipped throughout with block signals and other safety devices.

We invite especial attention to the profiles of the lines across Arizona: Exhibits 155, 309 and 310, which should be compared with the profiles of the lines across Nevada: Exhibits 156, 306, 307 and 308. Further comparisons showing the percentage of the mileage on which the grades exceed one per cent in relation to total mileage, in both Nevada and Arizona, and the curvatures and other principal characteristics as well, expressed in percentages of total main-line mileage, are set forth in the testimony. This showing establishes the essential similarity of the operating conditions, and particularly shows that in Nevada and Utah conditions are certainly no more favorable than in Arizona, and may properly be considered, in view of the severe winter climate, to be somewhat less so.

None of the testimony, either oral or statistical, referred to in support of this finding, was in any way challenged as to its accuracy, nor was there any question whatsoever of the qualifications of appellant's witnesses. The finding

is fully supported, and is germane and essential for the reasons stated.

Answer, Par. 2, Part III (R. 9).

Dyer, R. 1111; *Kirkbride*, R. 1135-1140, 1161-1163, 1167-1176, 1177-1178, 1182-1183, 2102-2105, 2185-2200.

Exhibits 110 (R. 2964), 155-159 (R. 3029-3033), 301, (R. 2097), 302 (R. 2101), 303 (R. 2102), 306-308 (R. 2188), 309-310 (R. 2210).

IV.

CHARACTER OF FREIGHT AND PASSENGER TRAFFIC HANDLED UPON DEFENDANT'S LINES IN ARIZONA AND ADJACENT TERRITORY: COMPARISON WITH NEVADA TRAFFIC (R. 3897-3901).

(a) PREDOMINANT INTERSTATE CHARACTER OF ARIZONA FREIGHT AND PASSENGER TRAFFIC (R. 3897-3898).

An outstanding fact in this case is that substantially all of the traffic handled across Arizona, and thus subjected to the interferences and burdens imposed by the law, is interstate; that is to say, it either originates at or is destined to points outside of Arizona. In fact, approximately two-thirds of such traffic appears to be "bridge" traffic: i.e., it has both origin and destination outside of the state.

Witness Masson's Exhibits 141 to 148 inclusive (R. 3917-3924), contain an analysis of the freight and passenger traffic handled by appellant in Arizona for various years

and groups of years, and in various classifications, up to and including the year 1939. Thus, Exhibit 143 contains an analysis of the freight traffic actually carried by appellant in Arizona for the years 1925 to 1939, inclusive, as measured in revenue freight ton miles; while Exhibit 147 contains a similar analysis of passenger traffic as measured in revenue passenger miles. A computation from Exhibit 143 shows that for the five years 1935 to 1939, inclusive, 92.74 per cent of the revenue freight ton miles related to interstate freight traffic; while a similar computation, from Exhibit 147, shows that 95.49 per cent of the revenue passenger miles in Arizona related to interstate passenger traffic. Exhibit 144 contains a more detailed analysis of the freight traffic carried in four typical years, 1925, 1929, 1938 and 1939; the segregation being made as between traffic originating without and terminating within the state, that originating within and terminating without the state, that passing through the state but having both origin and destination outside, and that which is wholly intrastate in character. In both the years 1938 and 1939, the traffic originating and terminating outside of the state, and passing through the state, exceeded 68 per cent of the total traffic. A similar analysis of passenger traffic is found on Exhibit 148, which shows that the so-called "bridge" traffic was, in both 1938 and 1939, more than 74 per cent of the total.

Exhibit 141 contains an analysis of freight revenue, associated with the handling of freight traffic within or across Arizona, the revenues on interstate shipments being allocated to the state in accordance with mileage prorate formula adopted and followed by the Arizona Cor-

poration Commission though not subscribed to by appellant as accurate. This formula, which allocates to Arizona the same proportion of the total revenues earned by an interstate shipment which the distance traveled in Arizona bears to the total distance traveled by the shipment, is inaccurate particularly in so far as bridge traffic is concerned, because it makes no allowance for originating or terminating services, but assumes that all mileage is entitled to the same proportion of earnings. Regardless of such inaccuracies, the allocation shows that in every year since 1912, more than 90 per cent of the total freight revenues within Arizona have accrued with respect to interstate traffic; for the 5-year period 1935-1939, the proportion was approximately 93 per cent. In the year 1939, moreover, as shown by Exhibit 142, the bridge traffic passing across Arizona was responsible for more than 64 per cent of the total freight revenue earned in the state; and the figure for 1939 is representative generally of the years since and including 1930. In so far as concerns passenger earnings, the results are similar. In the most recent five years, more than 95 per cent of the passenger earnings within Arizona have accrued with respect to interstate passenger traffic.

Masson, R. 1058-1078, 1225-1226, 1236-1239; *Sines*, R. 1368-1373.

Exhibits 167 (R. 3041), 170 (R. 3044), 189 (R. 3082), 190 (R. 3083).

There can be little doubt that every freight and passenger train upon the main lines in the affected territory is an interstate train, within the meaning of the definition

set forth in Finding I. It is noteworthy that there was no attempt, on the part of appellee, to challenge or contest this showing of the predominant interstate character of the Arizona traffic; nor has there been any contention that any trains operated upon appellant's main lines during any recent period, or at the present time, consist or have consisted exclusively of cars moving in intrastate commerce.

The finding responds to the allegations of paragraph 6 of Part III of the answer (R. 22-23), and is important and essential, because it establishes that the trains moving upon the lines in Arizona, which are affected and regulated by the law, are all interstate trains, and carry interstate traffic almost exclusively; in other words, that the law is a regulation of commerce which is almost entirely interstate in character.

(b) CHARACTER OF COMMODITIES TRANSPORTED: NEED FOR EXPEDITION (R. 3898-3900).

In paragraph 6 of Part III of the answer (R. 22-23), it is also alleged that a substantial portion of the interstate traffic handled across Arizona consists of perishable agricultural products, which must be so transported as to avoid delay in delivery at eastern market destinations, with consequent losses due to price fluctuations, and decay and deterioration en route.

The evidence shows that more than 120,000 carloads, or 46 per cent of the approximately 262,000 carloads of all kinds of freight, both interstate and intrastate, handled on appellant's lines in Arizona in 1939, consisted of

products of agriculture or livestock; that approximately 89,000 carloads consisted of fruits and vegetables, and other perishable agricultural products. In the same year, out of approximately 191,000 carloads handled by appellant in New Mexico, 109,500 consisted of products of agriculture or livestock, and 87,000 carloads of perishable agricultural products. The predominant direction of movement of such perishables is shown to be eastbound.

As showing further the importance of the perishable traffic in the affected territory, 59 per cent of the eastbound cars handled into El Paso by appellant during the five years ending in 1939 were loaded refrigerator cars, while about 53 per cent of the westward cars handled out of El Paso were empty refrigerator cars. Refrigerator cars are, as stated in this finding, designed and in nearly all cases used for the transportation of perishable traffic. While this count of refrigerator cars and other traffic was made at El Paso, the evidence leaves no doubt that a traffic analysis at that point shows with close accuracy the character of the traffic moving across Arizona, because there are no stations between El Paso and the Arizona-New Mexico line at which any substantial number of cars moving either eastward or westward would be received, delivered, or diverted.

The necessity is apparent for prompt handling of this perishable and livestock traffic, and as well of the manufactured products of high intrinsic value referred to in the first paragraph of the finding; and moreover, such necessity is demonstrated by uncontested testimony. There is equal necessity for the prompt return of empty refrig-

erator cars, moving westward to the producing areas, and of other empty equipment used in handling this traffic.

Sines, R. 67-68, 1368-1373; *Kirk*, R. 255-257; *Fertig*, R. 505-506; *Cartmill*, R. 982-983, 986-987; *Mahoney*, R. 1022-1024; *Dyer*, R. 1110-1111; *Masson*, R. 1225-1228, 1236-1239, 1726-1730; *G. C. Baker*, R. 1284-1287, 1456.

Exhibits 167 (R. 3041), 168 (R. 3042), 170 (R. 3044), 175 (R. 1284), 189 (R. 3082), 190 (R. 3083), 217 (R. 3204-3208), 218 (R. 3206-3207).

The purpose of the finding is to show that the interstate traffic which is subjected to the restrictions, delays, and regulations of the Train-Limit Law is of the type which requires speedy handling, and suffers most directly from such delay and interference; and thus to show that the law operates with particularly drastic effect upon the principal traffic handled in the affected territory.

(c) ARIZONA TRAFFIC COMPARED WITH TRAFFIC ACROSS NEVADA (pp. 20-21).

This finding is a companion to Finding IV(c), and responds also to the allegations contained in paragraph 6 of Part III of the answer (R. 22-23). It is based upon undisputed statistics, which show that the traffic handled upon appellant's lines across Nevada and Utah is similar in character, both in that it is predominantly interstate, and in its distribution as between perishable products and other types of freight, to the traffic in the affected territory.

It also appears that the volume of appellant's freight traffic in and across Arizona does not vary to any marked extent from the volume handled in and across Nevada. This is definitely shown by the comparisons of the total volume of the traffic, measured in car miles, in the States of Nevada and Arizona, which appear upon many of the exhibits: notably Exhibits 149, 150, 277, 279 and 280. Exhibit 277 shows that during the six-year period 1935-1940, there were about 859,500,000 freight-car miles accumulated in Nevada, and 828,000,000 accumulated in Arizona. In the 18-year period 1923-1940 there were 2,391,000,000 freight-car miles accumulated in Nevada, and 2,283,000,000 in Arizona. In 1940 there were 164,482,000 car miles accumulated in Nevada, and 155,909,000 in Arizona, a difference of about 5 per cent.

The analysis of traffic moving over appellant's lines into Ogden, Utah, eastward, and out of Ogden, westward, which appears in Exhibit 189, and as well the analysis of loaded and empty car miles made by Pacific Fruit Express Company refrigerator cars and other cars in the two states, which appears in Exhibit 190, indicate approximately the same distribution as between refrigerator-car traffic, empty-car movements, and other car traffic, in Nevada as in Arizona. Ogden is comparable to El Paso, in that appellant's principal main line across Nevada and northern Utah connects there with the lines of several other carriers, and a count of eastward and westward traffic can readily be made; moreover, there are few if any stations between Ogden and the Nevada-Utah line at which any considerable volume of traffic is diverted, received, or delivered by appellant. Just as in the case of El Paso, sub-

stantially all of the traffic moving over appellant's line west of Odgen in either direction is interstate traffic moving either from or to points in or beyond Nevada. The distribution of the Arizona and Nevada traffic as between refrigerator-car traffic and other types is in substantially the same proportions in both states.

Dyer, R. 1110-1111; *Masson*, R. 1228-1239, 1726-1729; *Sines*, R. 1368-1373, 1386-1387.

Exhibits 167 (R. 3041), 169 (R. 3043), 170 (R. 3044), 189 (R. 3082), 190 (R. 3083), 217 (R. 3204-3205), 219 (R. 3208-3209).

The purpose of this finding is like that of Finding IV(c); namely, it indicates that from the standpoint of the traffic handled, appellant's lines in Nevada can also properly be compared with the lines in the affected territory.

V.

THE TRAIN-LIMIT LAW: HISTORY AND TEXT (R. 3901-3902).

This finding reproduces without any material variation (except the addition of the reference to the most recent compilation of the Arizona Statutes) the allegations of the initial paragraphs of each of the two causes of action set forth in the complaint (R. 1-4). These allegations were expressly admitted in paragraph 1 of Part I (R. 5), and paragraph 1 of Part II (R. 6) of the answer. The finding was incorporated for the purpose of setting forth in full the text of the challenged statute, and in order that the findings as a whole might be a complete recital of all matters involved in the case.

VI.

RECENT IMPROVEMENTS IN DEFENDANT'S TRANSPORTATION PLANT, BOTH GENERALLY, AND IN THE TERRITORY AFFECTED BY THE LAW (R. 3902-3908).

(a) IMPROVEMENTS IN TRACK, ROADBED, BRIDGES AND OTHER FIXED STRUCTURES (R. 3902-3904).

This finding responds to that part of the allegations contained in section (a) of paragraph 3, Part III, of the answer (R. 9), which relates to the improvements in the track and fixed structures on appellant's lines in the affected territory, made since 1912 and particularly since 1920. The finding refers in detail to all of the various permanent improvements which have thus been made, such as: replacement of lighter rail by heavier sections; use of crushed rock and slag ballast in place of gravel ballast, and in greater quantity; constant renewal and replacement of ties, and use of better ties in greater number; repair, renewal and replacement of bridges; separation of grades, and construction of automatic warning signals at highway crossings; construction of double track, and of additional yard and terminal facilities; the installation of block signals and interlocking signal plants; and the acquisition, reconstruction, and improvement of the lines formerly owned by the Arizona Eastern and El Paso and Southwestern railroad companies.

Kirkbride, R. 1132-1133, 1155-1176; *Herbert*, R. 1540-1545.

Exhibits 157 (R. 3031), 158 (R. 3032), 159 (R. 3033), 200 (R. 3149), 201 (R. 3150).

This finding is in part predicated upon Exhibits 110 to 114, inclusive (R. 2964-2974), which present the detail of

the additional investment in track and fixed structures made since January 1, 1924. We call special attention to the fact that in the 16 years, 1924 to 1939, inclusive, more than $21,000,000 in new money was invested by appellant for permanent improvements to the roadbed and fixed structures in the territory between Yuma and El Paso, which figure does not include any moneys expended in acquiring the El Paso and Southwestern or Arizona Eastern properties. The net additional investment in Arizona alone, for permanent improvements to roadbed and fixed structures, during said 16-year period, was about $18,400,000.

J. B. Baker, R. 824-830, 837-839, 846-856.

The finding also reflects the detailed testimony of witness Kirkbride, appellant's Chief Engineer, as to the manner in which renewals, replacements and new construction have been carried on in the affected territory, and the present state of the appellant's fixed physical plant.

Finally, the finding includes reference to the fact that the sidings and passing tracks on appellant's lines in Arizona, in 1912, the year when the Train-Limit Law became effective, were not generally of greater length than just sufficient to accommodate a 70-car train of that day, with its engine and caboose. While, as stated in the finding, such sidings have been generally improved since 1912, by being relaid with heavier rail or in other ways, and there have been some changes at various stations, the sidings in Arizona at the present time, apart from those at the more important stations, are still generally not longer than approximately 70 car lengths, including engine and

caboose. Many such sidings will not accommodate a full 70-car train.

Dyer, R. 1105.
Exhibit 197 (R. 3114).

While it is not necessary to discuss the point in connection with this finding, it is worth while to point out that there has been no reason or incentive for appellant to extend its Arizona sidings beyond the lengths prevailing in 1912. Sidings are necessarily adjusted to the lengths of the trains which they are called upon to accommodate. To install additional siding capacity would involve useless and unnecessary expense. It cannot properly be argued, however, that appellant has in any way neglected a desirable improvement in its fixed plant in Arizona, by having failed to extend siding capacities beyond those necessary for 70-car trains; nor can it be argued that appellant would be unable to operate long trains even if the restrictions of the law were removed. If the law is to be observed, as has been the consistent course of appellant throughout the years since 1912 (except for the period of limited long-train operation in 1940, and since 1942, under authority of Service Order 85), extensions of sidings would be a useless and unnecessary investment. On the other hand, a limited long-train operation is practicable, as was demonstrated in April, 1940, even with present siding capacity. Moreover, as stated elsewhere in the findings and fully shown by undisputed testimony, the siding extensions necessary to long-train operation on a substantial and virtually unlimited scale are wholly prac-

ticable, and can be accomplished by a relatively moderate investment.

See *Findings* IX(a) and (b): R. 3947-3950.

Finding VI(a) responds to an essential allegation of the affirmative defense, as to which there was no opposing testimony offered by appellee. In fact, to the extent that the subject-matter was treated at all in the testimony of appellee's witnesses, that showing tends to confirm the facts set forth in the finding.

(b) IMPROVEMENTS IN LOCOMOTIVES, CARS AND EQUIPMENT (R. 3904-3907).

Finding VI(b) corresponds to the preceding finding, in that it sets forth the improvements in the motive power and equipment used in the affected territory, corresponding to the improvements in fixed property which are the subject of the preceding finding. It will be noted that the finding also states that the same types of equipment are in use upon appellant's lines in Nevada and Utah.

This finding responds to the issues tendered by sections (a) and (b) of paragraph 3 of Part III of the answer (R. 9-10).

As to the locomotives in service or available for service in the affected territory, the testimony shows the consistent improvement of appellant's motive power, and the present ownership and use of modern-type locomotives, fully adequate to handle long trains with speed, economy, efficiency, and safety. These locomotives are equipped with the various devices, referred to in the finding, which promote economy of operation while permitting the attain-

ment of greater speeds, accompanied by better control of trains while on the road. The locomotives in use in the affected territory are among the latest and most modern types owned by appellant; and are the same types which have recently been and presently are in use in Nevada, as well as in those adjacent portions of California and New Mexico where the traffic handled and the service rendered is substantially the same as in Arizona. These locomotives have demonstrated, over several years of use, that they are fully capable of handling and controlling appellant's long trains, including both loaded and empty cars, at the speeds made necessary by present-day schedule requirements, in territory not essentially different from Arizona.

The amount expended by appellant in acquiring this new and more efficient motive power is not a matter of dispute. The detail of the expenditures made since 1922 in the acquisition of new locomotives, pursuant to authority granted by the Interstate Commerce Commission under Section 20a of Part I of the Interstate Commerce Act, is shown on Exhibit 7; while the dates and citations of the Commission's orders in connection with each such authority appear on Exhibit 174. In each such proceeding it was made to appear and was found, in conformity with Section 20a, that the expenditures proposed were for a purpose necessary to the conduct of appellant's obligations as a common carrier and consistent with the performance of that obligation, and would reasonably be necessary in furtherance of such performance of appellant's common-carrier duty. In each proceeding the character of the locomotives to be purchased, including the power which they would develop and the amount of the tonnage which they

would haul, were all expressly set forth in the applications, and generally referred to in the Commission's decisions. It was particularly made to appear, at least as to the more recent acquisitions of heavier locomotive types, that such locomotives were individually capable of hauling many more than 70 freight cars in ordinary operation, and thus that they were being acquired expressly for the purpose of operating or continuing the operation of long trains, in accordance with appellant's established practice. The Commission, by giving the express authority required by law for the acquisition of these locomotives has thus approved, authorized, and encouraged the long-train operating method followed by appellant on all parts of its system except in the affected territory.

Russell, R. 97-112; *Masson*, R. 1261-1264; *Sines*, R. 1350-1354, 1710-1711, 2285-2286; *Burke*, R. 1609-1611; *F. P. McDonald*, R. 1612-1614; *Fifield*, R. 2792, 2799, 2800-2801, 2806; *Menzies*, R. 2815-2816.

Exhibits 5 (R. 2855), 6 (R. 2856), 7 (R. 2857), 174 (R. 3064), 183 (R. 3075), 212 (R. 3196).

That portion of the finding which relates to improvements in the freight and passenger car equipment used in the affected territory and elsewhere is equally important, in that it shows the greater factor of safety (from the standpoint of the strength and other characteristics of the freight and passenger cars in service) introduced into appellant's train operations, side by side with the adoption and carrying out of the long-train program.

Improvements in freight-car construction have included the complete elimination of the wooden-underframe car, insofar as through or interchange service is concerned. This restriction means that such wooden cars cannot be loaded with freight to be interchanged, without transfer of the lading, at El Paso or Tucumcari or any other interchange point. In a practical sense, wooden-underframe cars are no longer used in main-line service.

The arch-bar type of truck, which appears to have been a point of weakness and thus responsible for accidents involving freight cars in earlier years, has likewise been eliminated; all cars in use in interchange service in the affected territory are entirely equipped with trucks having cast-steel side-frames. Another important improvement is the elimination of the older double-plate type of wheel; single-plate cast-iron wheels are now in universal use upon all freight equipment in the affected territory.

Other improvements have included the use of heavier types of graduating springs in the triple valves, described by one of appellee's witnesses (*Cooper*, R. 2442) as one of the best improvements ever accomplished. The effect of this replacement, which is now complete as to all cars in interchange service, has been to eliminate in a practical sense the so-called "quick-action" triple valve, which in the past was a common source of unintended ("undesired") emergency action. A further improvement, now in progress, is the adoption of the improved type of freight-brake valve known as the "AB" valve. This valve is now standard upon all cars built new during the last ten years, and by express requirement of the Interstate Commerce Com-

mission will shortly be required upon *all* cars used in revenue freight service.

A further important improvement in freight-car equipment has been the widespread use of the modern friction draft gear, in place of the older-type tandem-spring draft gear. All refrigerator cars, and more than 80 per cent of all of the other freight cars owned by appellant and used in interchange service, are equipped with friction draft gears.

The finding states, and the evidence likewise establishes, that substantial improvements have been made in passenger-car equipment. Among such improvements have been the complete elimination of wooden passenger cars; the substantial reconstruction and improvement of the braking appliances; the strengthening, and improvement otherwise, of the couplers, draft gears, and draft riggings; and the installation of many other devices, shown in detail in the evidence, all contributing to the safety and comfort of the traveling public and the employes on the passenger trains, and greater ease, safety and economy of passenger-train operation.

Leriche, R. 72, 78, 80-94, 113; *Parke*, R. 787-798, 805-824; *Cartmill*, R. 989-1012; *Browning*, R. 1557-1575; *Bohnstengel*, R. 1673-1706; *Barker*, R. 1866-1868.

Exhibits 2 to 4 (R. 2852-2854), 107 to 109 (R. 2960-2963), 135 (R. 3002), 136 (R. 3003-3005), 204 (R. 3153-3180), 210 (R. 3194), 247 (R. 3253), 396 (R. 3572-3577).

The purpose of this finding is to sustain the important allegations above referred to, which are incorporated in the affirmative defense. The annotations show that there is no real conflict in the testimony. The finding is directly material and essential, because it serves to show that the equipment available to appellant, in actual use in its trains in the affected territory as well as in Nevada and elsewhere upon its system, is of the same adequacy to permit long-train operation, as the roadway, track, and fixed structures described in Finding VI (a); that the arbitrary restriction created by the law is unnecessary, and defeats the very purpose for which were incurred the substantial outlays made by appellant, and expressly authorized by the Interstate Commerce Commission; and thus, to a very large extent, unnecessarily deprives appellant of the use and usefulness of such property.

At the risk of repetition, we emphasize again the initial sentence of Finding VI(b), and in this connection refer also to the initial sentence of Finding VI(a). These sentences call attention to the fact that the improvements, set forth in detail in each of these findings, have taken place during the years since 1912, when the Train-Limit Law was enacted, and more especially since 1923. We believe that they were incorporated in the findings for the particular purpose of calling attention to the very great changes in the railroad properties, both fixed and movable, operated by appellant in the affected territory. No principle is more universally recognized than that which declares that a rule or regulation directed to a particular set of circumstances, and which might be reasonable in the light of the facts then existing, may become wholly

unreasonable, and necessarily subject to change or rescission, when the essential circumstances themselves are changed. Even though it be argued that the Train-Limit Law had some ostensible warrant as a safety measure, in the light of appellant's plant, equipment, and operating methods in Arizona in 1912, the extensive and virtually complete redesign and reconstruction of that plant and equipment in the intervening 29 years, accompanied (as shown in succeeding findings) by equally extensive revisions of operating methods, creates at least a strong presumption, if it does not fully establish, that the Train-Limit Law is outmoded and obsolete, addressed to a state of affairs which no longer exists, and therefore wholly unreasonable and unnecessary as applied to present-day conditions.

(c) PURPOSE OF THE IMPROVEMENTS MADE BY DEFENDANT: ADEQUACY OF DEFENDANT'S PRESENT TRACK, STRUCTURES, AND EQUIPMENT TO PERMIT OPERATION OF LONG TRAINS (R. 3907-3908).

This paragraph of the findings responds very largely to the allegations in the concluding sentence of section (a) and also the concluding sentence of section (c) of paragraph 3 of Part III of the answer (R. 10-11).

There can be no question, in the light of the testimony of appellant's witnesses, particularly Messrs. Dyer and Kirkbride, that the heavy expenditures for the improvement of appellant's road and equipment were undertaken for the primary purpose, as stated in the finding, of enabling the appellant's railroad properties to be operated with the greatest possible safety, efficiency, and economy,

and in furtherance of the proper discharge of its public duty as a common carrier. Appellee has never contended that such was not the purpose, or that any other purpose was intended.

The finding refers to the expenditures undertaken by appellant, particularly those since 1923, as being part of the general program of betterment of the railroad transportation plant commenced in that year by United States railroads generally. The testimony of Dr. Parmelee establishes that the general program was agreed upon and instituted in 1923, and that appellant participated therein.

Parmelee, R. 186-190.

The careful inspection and maintenance of the track, bridges, and other structures in the affected territory, and their present adequacy to permit the operation of the heaviest locomotives and trains owned or used by appellant, are matters of fact as to which there is no conflict. As to the locomotives, it is shown that those presently in use in that territory are fully adequate to handle long freight and passenger trains; moreover, there are available heavier and more powerful locomotives which will handle such trains with even greater efficiency and economy. There is no question as to the adequacy, from the standpoint of strength and construction, and the devices and appliances with which they are equipped, of the cars operated or to be operated in appellant's trains. In short, long-train operation, with equipment which appellant now has in use or available for use in the affected territory, and upon the lines in that territory in their present condition, is completely practicable. Climatic con-

ditions, and all other conditions affecting train operation, are favorable, or do not in any event constitute a limiting factor. The intention of appellant to operate long trains at once if relieved of the restrictions, to the extent that present siding capacities permit, and to increase siding capacities in order to develop the long-train program more fully, is likewise fully shown.

Dyer, R. 1115-1117.

The final and convincing demonstration of the practicability of long-train operation in Arizona is set forth in the concluding paragraph, which refers to the experience gained during the months of March and April, 1940, when appellant operated 62 long passenger trains and more than 302 long freight trains in Arizona, without any sacrifice of efficiency, or schedule requirements, or safety of operation; in fact, as is stated more fully in subsequent findings, with substantially increased efficiency and economy, and without any casualty or accident which could be in any way ascribed to or associated with train length.

VII.

DEFENDANT'S METHODS OF OPERATION, PAST AND PRESENT (R. 3909-3934).

Finding VII embodies a description of the methods of operation, past and present, followed by appellant upon its system generally, with particular reference to operating methods and the results of such operations in the affected territory.

The finding describes, first, the operating subdivisions, the runs of crews and locomotives, and the general topics

of operating rules and inspections, and then deals with the subject of train lengths, and the development of the long-train program upon the system generally and in the various states other than Arizona. Appellant's freight-train schedules, both past and present, are also referred to in some detail. Finally, there are set forth the effects of the long-train program upon the efficiency and economy of operations, as reflected in the operating statistics, regularly maintained by appellant, and brought from appellant's permanent records into the testimony. The finding thus deals with the issues specifically tendered in section (d) of paragraph 3 of Part III of the answer (R. 11-12) and the first sentence of section (g) of the same paragraph (R. 14).

(a) OPERATING SUBDIVISIONS: RUNS OF CREWS AND LOCOMOTIVES: OPERATING RULES: INSPECTIONS (R. 3909-3915).

(1) Operating divisions and subdivisions (R. 3909-3911):

The first subdivision of Finding VII(a) is essentially preliminary to the later paragraphs. This paragraph defines the divisions and subdivisions in the affected territory, and also in Nevada and Utah, and names the stations designated as freight-train terminals. The operations at those terminals are likewise briefly described, as well as the manner in which the trains are operated. The finding is based upon the undisputed testimony of the several witnesses for appellant who dealt with this subject-matter.

Sines, R. 66-69, 1360-1363, 1384-1385, 1519-1526, 1718, 1721-1722, 1795-1797, 2283-2284; *Kirkbride*, R. 1124-1125; *G. C. Baker*, R. 1285-1286, 1305-1306, 1455-1470; *Herrell*, R. 1487-1488, 1492-1497.

(2) Runs of crews and locomotives (R. 3911-3912):

Subdivision 2 is a continuation of the general description of the operations in the affected territory, containing a brief reference to the customary runs of crews and locomotives in both freight and passenger service.

This paragraph is complementary, in a sense, to paragraph (1), and has been incorporated in the findings with the same purposes in mind. It is also based upon undisputed testimony, principally that of Mr. Sines, as supplemented by Chief Dispatchers Baker and Herrell.

Sines, R. 66-69, 1411-1420, 1423-1424, 1721-1722, 1768, 2284; *Baker*, R. 1456-1463; *Herrell*, R. 1489-1490.

(3) Operating rules (R. 3912-3913):

The general subject of operating rules is discussed at length in the record, particularly in the examination of certain of appellee's witnesses. Paragraph (3) of Finding VII(a) condenses that testimony into one rather brief paragraph, which states that such rules exist, and are codified into the two printed books referred to by name in the text of the finding. It will be noted that the finding also expressly states that these rules apply to operations in all parts of the system, including both the affected territory and the lines in Nevada and Utah.

Dyer, R. 1109-1110; *Cheek*, R. 2482; *Durnil*, R. 2384; *Stevenson*, R. 2490; *Fifield*, R. 2808-2811; *Menzies*, R. 2820-2824.

Exhibits 319, 320 (R. 2287).

This finding is essential, because it deals with a subject matter important to the case from the standpoint of both

parties. The finding does not contain any statement as to which there is any conflict of testimony or opinion. We call especial attention to the specific statement therein to the effect that the rules under which appellant's operations are carried on are complete and adequate, and insure safe operations, *provided that they are fully observed and complied with.*

(4) Inspections (R. 3913-3914):

This paragraph deals rather fully with the matter of car inspections, covering the purpose and character thereof; the places where made; the employes by whom made; the frequency; and the results which follow.

The subject of inspections of cars was dealt with at some length in appellant's testimony, and was also mentioned, somewhat more briefly, by certain of appellee's witnesses. Appellant's witnesses also referred to and produced the code promulgated by the mechanical division of the Association of American Railroads, of which association appellant is a member; and established that appellant, by reason of its membership, of necessity complies with and conforms to the code. Testimony was also offered through Mr. L. E. Cartmill, General Superintendent of the Car Department of the Pacific Fruit Express Company, describing in detail the additional and separate inspections given to refrigerator cars. These refrigerator cars form approximately 50 per cent of the consist of the through freight trains operating over the appellant's lines in both the affected territory and across Nevada.

Cartmill, R. 998-1003; *Browning*, R. 1557-1569.
Exhibits 137 (R. 3006), 204 (R. 3153-3189).

As the finding states, there are frequent inspections of trains and cars by car forces at terminals and interchange points, and by train crews at terminals, and while trains are on the road between terminals. The result of such inspections, as made by trainmen upon long and short trains in that portion of the affected territory between Lordsburg and El Paso, during the six months' period January to June, inclusive, 1940, was made the subject of special and separate study: Exhibit 397 (R. 3578). That exhibit demonstrates that such inspections are effective, on both long and short trains, to discover defects of equipment and other conditions which might cause delay or accident, or otherwise interfere with train movements.

Sines, R. 1423-1425, 1758-1759; *Reid*, R. 1596-1600, 1603-1604; *Burke*, R. 1607-1609, 1611; *F. P. McDonald*, R. 1614-1616.

See also *Finding* XIII(d) (R. 4026-4029).

This paragraph is thus a condensed summary of the pertinent testimony upon this subject, which, however, avoids any disputed or controverted matters. It is based upon competent and unchallenged testimony, and reflects all of the essentials thereof. The finding is necessary, to present a fair and complete description of train operations in the affected territory and elsewhere upon the system, and of the factors which enter into the safety of those operations, and thus, in particular, to afford a foundation for subsequent findings dealing more directly with the subject of safety.

(5) Similarity of operating methods, rules, records, etc., on defendant's lines in Nevada and Utah to those in the affected territory (R. 3914-3915).

This paragraph is similar in purpose to subparagraph (c) of Finding III and subparagraph (c) of Finding IV; in that it sets forth that the operating methods, rules, and records relating to operations in Nevada and Arizona are substantially identical; that the same system officials have jurisdiction over operations in both states; and that the full-crew laws of both states, insofar as they concern appellant's train operations, are also practically the same. The finding likewise emphasizes that the same equipment is used interchangeably in both the affected territory, and Nevada and Utah.

We call particular attention to that portion of the finding which states that the records maintained by appellant, and the numerous statistical and other reports required by regulatory commissions, are developed, maintained and rendered in accordance with substantially identical rules and standards. It follows that operating and other statistics relating to operations in the affected territory or in Arizona, on the one hand, and in Nevada and Utah, or in the State of Nevada alone, on the other, are fully and properly comparable, and reflect operating results upon identical bases.

Dyer, R. 1108-1119; *Masson*, R. 1236-1239; *Sines*, R. 61-62, 1354-1355, 1708-1711, 3145-3149.

Exhibits 8 (R. 114), 9 (R. 115-116), 170 (R. 3044), 184 (R. 3076), 191 (R. 3084), 195 (R. 3107-3112), 212 (R. 3196), 260 (R. 3272), 305 (R. 3430).

This finding is likewise essential, because it shows that a proper and adequate—indeed, a complete—foundation has been laid, for reference to and reliance upon the numerous comparisons between operations in the affected territory and those in Nevada and Utah, which afford the basis for a number of important subsequent findings.

(b) LENGTHS OF DEFENDANT'S TRAINS (R. 3915-3920).

(1) Train lengths on the system generally (R. 3915-3916):

In section (d) of paragraph 3 of Part III of the answer (R. 11-12) it is alleged that the operation of through long freight trains is a common practice on main trunk lines throughout the United States, including appellant's lines; and in section (e) of the same paragraph (R. 12) it is stated that the operation of long freight trains is a general practice on appellant's main lines, and likewise on the lines of its competitors and connections, except in Arizona. In section (a) of paragraph 4 of Part III (R. 16-17) somewhat similar allegations are made as to passenger-train operations.

Subparagraph (1) of Finding VII(b) responds in part to the issues thus tendered. It sets forth the date when long freight and passenger-train operation was first undertaken on a substantial scale; the continuance of the practice ever since; the fact that it prevails on all the system, except in Arizona and the adjacent affected territory; that it has resulted in a substantial increase in the average length of all trains operated; and finally presents figures showing the increases in average train lengths, and the percentage of long trains to all freight trains operated during a recent representative period, upon the

principal main-line districts in the several states, other than Arizona, where appellant operates.

Dyer, R. 1106-1107, 1115, 1119-1120; *Masson*, R. 1078-1082; *Herbert*, R. 1315-1316, 1324-1325, 1337-1339; *Sines*, R. 1359-1366, 1707-1708; *Fifield*, R. 2784-2786, 2805-2806.

Exhibits 149 (R. 3025), 150 (R. 3026), 162 (R. 3036), 177-180 (R. 3066-3072), 185-188 (3077-3081), 211 (R. 3195).

The finding is based upon unchallenged testimony. The showing is very complete, having been compiled from appellant's original records. The finding is essential, because it has direct bearing upon the point that enforcement of the law has prevented and continues to prevent the adoption, in the affected territory, of an operating method which has been successfully followed for many years last past upon all other parts of the system; and, as shown by subsequent findings, particularly Findings VII(d) and XII, with constantly improving efficiency, economy, and safety.

(2) Train lengths in Arizona, past and present: Comparison with other portions of the system, and with the system as a whole (R. 3917-3920):

The purpose of this subparagraph of Finding VII(b) is to set forth the extent of long-train operations in Arizona during the period immediately preceding the effective date of the law, and to show how the law has operated to keep the average train lengths in Arizona at a fairly constant figure, throughout all the period since 1912. The

finding sets forth comparisons between Arizona and Nevada average freight-train lengths, and also compares Arizona and Nevada average train lengths with those which have developed on the system as a whole, and on the main lines of the Tucson and Salt Lake Divisions. This finding thus really carries forward the history of long-train operations on appellant's system, set forth in part in subparagraph (1).

The effect of the long-train program in Nevada, in enabling appellant to move the traffic with a substantially less number of freight trains, by comparison with Arizona, is also set forth. In the four years, 1922-1925, inclusive, the actual traffic handled in Nevada, expressed in car miles, was approximately 420,673,000, or about 11.2 per cent more than was handled in Arizona during the same period (the Arizona figure having been 378,372,000). To move these car miles in Nevada, appellant operated a total of 7,924,000 train miles, or about 14.0 per cent more than the 6,953,000 train miles which were operated in Arizona in the same period for the purpose of handling the Arizona traffic. During the years 1922-1925 the total volume of traffic in Nevada thus exceeded the total volume of traffic in Arizona by a margin slightly lower than the percentage by which the total number of trains run in Nevada (expressed in train miles produced) exceeded the corresponding figure for Arizona.

These results were obtained before the initiation of the long-train program on a substantial scale in Nevada. They may therefore be compared with results obtained during the most recent typical four-year period for which statistics were available at the time the testimony was

received: the years 1936-1939. During that period appellant produced in Nevada 564,256,000 freight-car miles, or approximately 3.9 per cent *more* than the 543,210,000 which were produced in the same period in Arizona. It handled the Nevada traffic with 7,397,000 train miles, or 26.7 per cent *less* than the 10,086,000 train miles which were produced in Arizona for the purpose of handling the smaller volume of the Arizona traffic. It should be noted, also, that in the four years, 1936-1939, appellant handled in Nevada a volume of traffic 34.1 per cent greater than in the four years 1922-1925, but actually produced 6.7 per cent fewer train miles in so doing.

The effect of the Train-Limit Law in requiring the operation of additional and unnecessary trains is further developed by the comparison between the Tucson and Salt Lake Divisions, set forth in the finding. If appellant had disregarded the Train-Limit Law, and thereby obtained on the Tucson Division the same average train lengths as prevailed on the Salt Lake Division during the fifteen years 1925-1939, it could have saved 6,325,000 train miles; i.e., some 32.7 per cent *more* train miles were produced than would have been necessary if the long-train practice had prevailed. For the one year 1938, approximately 565,000 train miles, or 37.7 per cent of the total produced on the Tucson Division, were excessive and unnecessary, and could and would have been eliminated by long-train operation.

This subfinding concludes with the statement that long-train operation is entirely practicable in Arizona, subject only to certain siding extensions and other comparatively minor alterations of the physical plant, and the asssign-

ment of locomotives of the larger types now in use upon other parts of appellant's system. This finding is based upon undisputed testimony, as to which appellee offered no challenge.

Masson, R. 1078-1082; *Dyer*, 1106-1108, 1114-1115, 1117-1118; *Herbert*, R. 1234-1236, 1343-1345; *Sines*, R. 1346-1355, 1710-1714, 1831-1832.

Exhibits 149 (R. 3025), 150 (R. 3026), 180-183 (R. 3072-3075), 213 (R. 3197).

(c) REDUCTIONS IN SCHEDULES OF FREIGHT TRAINS (R. 3920-3924).

In sections (d) and (e) of paragraph 3 of Part III of the answer (R. 11-12) it is alleged in general terms that freight is transported between all parts of the United States upon dependable schedules, and in long trains, except that such trains are not operated in Arizona and the adjacent affected territory; that such schedules are one-half to one-third faster than prevailed prior to 1924, and that such long-train operation does not retard or delay such freight traffic, but on the contrary expedites it materially, and promotes and makes possible its early delivery.

Finding VII(c) describes the prior and present schedules in effect in both the affected territory and likewise in Nevada and Utah, and thus corresponds directly to such allegations. The finding explains how present-day schedules for eastbound perishable freight have been worked out, based upon definite departure hours and times en route from specified concentration points; together with the provisions for "run-off" time, made necessary

because, *first*, cars containing perishable freight and intended to move under these schedules cannot all arrive at the concentration points, and be made ready for departure at the same time each day; *second*, when more than one train is to leave a concentration point with cars moving on schedule, not all of the trains of the same day can leave at the same moment. In practice, therefore, those cars and trains which leave after the initial scheduled departure hour on a particular day are so operated as to make up ("run off") the time interval prior to their departure, so that they arrive in Chicago or other eastern markets upon a parity with all other shipments leaving upon the same day, and moving under the same schedule.

G. C. Baker, R. 1285-1295.
Exhibit 176 (R. 3065).

The finding contains a history of the reductions in the schedules, both eastbound for perishable freight, and westbound for manifest and similar freight; and shows that the present-day schedules are very much faster than those in effect previously, particularly prior to about the year 1924. In 1924, for example, the basic eastward schedule from California concentration points to Chicago was 154 hours over-all, with no provision for run-off time; today, the schedule contemplates an over-all time of 139 hours and 30 minutes, but also provides for 16 hours of run-off time, so that the net elapsed time is 123 hours and 30 minutes. This represents a reduction of 31 hours and 30 minutes in net time, as compared to 1924, or a net reduction of more than 20 per cent. The history of the westbound schedules shows a reduction from an over-all time of 226 hours, which existed up to 1926, to a present-day

over-all time of 109 hours: a reduction of substantially more than 50 per cent. The schedules applying from northern California, and in general from all Pacific Coast points served by the routes through Nevada and Arizona, are upon the same bases.

G. C. Baker, R. 1296-1302.

Although the faster schedules necessarily import greater difficulty in achieving and maintaining on-time performance, the record indicates that there has been no failure in this regard. Nevertheless, the schedule performance of those trains directly affected by and subject to the restrictions of the law has not been as satisfactory as in the case of those trains where the law's effects are either wholly absent or somewhat less in proportion. Thus, for those eastbound trains or blocks which moved from Colton, California, to El Paso, in 1939, and were directly affected by the law for the entire distance between Yuma and El Paso, the on-time percentage was 82.5. For those trains or blocks which moved from Colton to Tucumcari, New Mexico, and were unaffected by the law between El Paso and Tucumcari, the on-time percentage was 94.8 per cent. On the Nevada route, for traffic out of Roseville, California, a concentration point corresponding to Colton (and where the movement is entirely free of any train limit), the on-time percentage at Ogden was 88.8 per cent. For those westbound trains which moved across Arizona, the on-time performance at Los Angeles was 90.7 per cent; but for the westbound trains moving across the Nevada route to San Francisco, the on-time performance was 95.4 per cent.

G. C. Baker, R. 1478-1482.

The fact that freight-train schedules applying to transcontinental movements have been so substantially reduced, side by side with the institution and development of the long-train program, is no mere coincidence. The reductions in schedules are not merely theoretical. The participating carriers hold these schedules out to the general public as an index of expected performance, and are subject to claims if loss of market or spoilage should result from a schedule failure for which a carrier is responsible. In fact, as the percentages just recited show, the schedule reductions have been accompanied by operation of the scheduled trains in substantial conformity with the guaranteed schedules; and it is noteworthy that as the influence of the Train-Limit Law is absent, or is reduced in proportion to the total transportation service performed, the percentage of schedule performance becomes better. It will be borne in mind that the adoption of the long-train program, in connection with transcontinental schedules via Arizona, is not completely prevented by the Arizona law. That statute affects these transcontinental movements principally over the district between Yuma and El Paso; but once the traffic has passed through El Paso or Yuma, long-train operation is again possible except to the extent that Oklahoma's train-limit law, effective since 1941, imposes a barrier; and, as established by the testimony of witnesses representing the various carriers with which appellant connects, such long-train operation, particularly in the handling of through traffic, both perishable and non-perishable, is the customary, standard, and regular practice.

The finding is an accurate summary of the undisputed testimony of record, and responds directly to allegations of appellant's affirmative defense.

(d) EFFECT OF THE LONG-TRAIN PROGRAM UPON THE EFFICIENCY AND ECONOMY OF DEFENDANT'S TRAIN OPERATIONS (R. 3924-3934).

(1) As to the system generally (R. 3924-3927):

In Section (g) of paragraph of Part III of the answer (R. 14-15) it is alleged that appellant's compliance with the Train-Limit Law results and has resulted in greatly reducing the efficiency and economy of its freight-train operations in the affected territory. Finding VIII(d) responds to the issue thus presented.

As to the system generally, in Finding VII(b) it is set forth that the average length of appellant's freight trains on the entire system has increased from 42.4 cars per train, exclusive of caboose, in 1922, to 51.7 cars in 1934, and 53.6 cars in 1939. In Finding VII(d) are set forth the improvements in efficiency and economy of railroad operation on appellant's system, which have accompanied this increase in average train lengths, and have been experienced side by side with the adoption of long-train operation upon all parts of the system, except in Arizona and the adjacent territory affected by the law.

An important index of operating efficiency, which particularly reveals the effect of long-train operation, is found in the average speed of all freight trains. The importance of this index and also of the indices of gross ton miles and net ton miles per freight-train hour, as

reflecting efficiency, was recognized by this Court in the *Retirement Act Case: Railroad Retirement Board v. Alton R. Co., et al.* (1935), 295 U.S. 330 (366); 79 L.ed. 1468 (1485).

The term "average train speed", as used in Finding VII(b) and elsewhere, means the average speed of trains while on the road between terminals, including all stops en route, but not including time spent in terminals. The average speed of appellant's main-line freight trains increased from 11.2 miles per hour in 1922 to 17.8 miles per hour in 1939; an improvement of 58.9 per cent. It is clear, from this fact alone, that the long-train program has not resulted in the slowing down of the movement of main-line freight traffic on the system; on the contrary, there has been an acceleration amounting to almost 60 per cent.

Herbert, R. 1338, 1340-1341.
Exhibit 180 (R. 3072).

As stated above, the "average gross ton miles per freight-train hour" was also recognized by this Court as an important index of efficiency of operation. This index is determined by first multiplying the total tonnage transported (which includes the weight of the cars and their contents, but not the weight of the locomotives) by the miles over which it is moved. The product represents the total gross ton miles produced. This total is then divided by the total number of hours spent on the road by the freight trains whose total gross ton miles were determined. The quotient represents the average performance, in gross ton miles per freight-train hour. This index

thus reflects both the speed and the loading of the trains, and provides a test of both factors: the higher the figure, the better the relative performance. For appellant's system, and considering main-line freight trains only, the total of gross ton miles per freight-train hour was 20,727 in 1923; and increased to 41,886 in 1939: an improvement of 102.1 per cent, or more than double. These figures simply mean that, coincident with the adoption and development of the long-train program on the system, appellant was enabled to and did move more tonnage, for greater distances, during each freight-train hour on the average: in other words, both heavier train loading, and higher train speeds were made possible and were accomplished. It should be borne in mind that the year 1923 was prior to the adoption of the long-train program, whereas 1939 was a year of general long-train operation.

Masson, R. 1207-1209.
Exhibits 162 (R. 3036), 193 (R. 3105).

A corresponding index is afforded by net ton miles per freight-train hour. This figure takes into account only the net weight of the lading transported, and does not include the weight of locomotives, or of cars exclusive of their contents. In 1922, this index, for all freight trains on the system, both main and branch, was 7,258; it increased to 12,490 in 1939: an improvement of 72.1 per cent. That is, the combined effect of greater train loading, and greater train speeds, which accompanied the adoption of the long-train program, thus enabled appellant to obtain more than 72 per cent greater efficiency in the movement of the

freight, considered separately from the equipment in which it was carried.

Masson, R. 1204.
Exhibit 162 (R. 3036).

Another important index of operating efficiency is found in the relationship between fuel consumed and traffic moved. This index is sometimes expressed in total of performance, measured in gross ton miles, for each ton of fuel consumed. In the case of a railroad such as appellant, which uses comparatively little coal, the consumption of fuel oil is measured in units equivalent to pounds of coal, the total equivalent pounds of coal being divided into the total gross ton miles produced in order to obtain the average figure. For all freight trains, both main and branch, on the system, the average gross ton miles per ton of fuel in 1922 was 11,405; in 1939 it was 17,318; an improvement of 51.8 per cent. This result simply means that with longer and heavier trains; and despite greater train speeds, nearly 52 per cent more actual performance was obtained for each ton of fuel consumed in freight-train operation.

Exhibit 162 (R. 3036).

The relationship between the total of operating expenses, and the revenue traffic handled, likewise affords an important index, particularly in comparing the over-all economy of operations year by year. The lower the average cost, the better the performance; i.e., the greater the efficiency. For the system, the average cost per thousand revenue ton miles, for all operating expenses, declined from $11.10 in 1922, to $7.05 in 1939; an improvement of

36.5 per cent. The average for the years 1922-1925 (the period immediately preceding the general adoption of long-train operation) was $9.94; the average for the four years 1936-1939 was $7.15: an improvement of 28.1 per cent.

Exhibit 151 (R. 3027).

The index last referred to, which includes all operating expenses, takes into account those costs of maintenance and general overhead which enter into costs of operation. The finding also includes reference to the average cost per thousand revenue ton miles for transportation expenses only. These expenses include those directly associated with freight-train operations, but do not include costs of maintenance of way, or other general expenses not directly incident to the running of trains. For the system, the 1922 figure of average cost per thousand revenue ton miles was $5.47; for 1939 the corresponding figure was $3.82: an improvement of 43.2 per cent. For the four years 1922-1925 the system figure was $5.03, and for the four years 1936-1939 $3.95: an improvement of 21.5 per cent. These figures simply mean that coincident with the adoption and development of the long-train program on the system, there was a reduction in the direct expense of freight-train operations of more than 20 per cent.

Exhibit 151 (R. 3027).

A further important index, particularly for the purpose of making comparisons between operating costs for different periods, on the system or on the same division, or as between different portions of the system, is afforded by the so-called selected direct operating expenses. These

selected expenses include fuel costs, trainmen's and enginemen's wages, enginehouse expenses, other locomotive supplies, and train supplies and expenses; and thus include all of the major items directly associated with the movement of trains. They exclude all indirect items of expense, such as wages of yard employes, maintenance costs, wages and expenses of supervisory employes and officers, and the like. The finding shows that the average cost per thousand gross ton miles, for these selected direct expenses, for all freight trains operated on the system, decreased from 93.4 cents in 1924, to 63.6 cents in 1939: an improvement of more than 31 per cent. In 1932 the figure was 60.3 cents. We call particular attention to this figure, because the principal development of long-train operation occurred during the period 1924-1932. The increases in average train lengths have been less marked since 1932 than during the previous eight years.

Exhibit 179 (R. 3068-3071).

We call attention also to the comparison by two-year periods, which is set forth in the portion of the finding dealing with the improvement in the system average cost per thousand gross ton miles for selected direct expenses. This comparison by two-year periods avoids any possible criticism which might be made of a direct comparison between individual years; it tends to iron out any inequalities or peculiar conditions which may be associated with particular years. This comparison shows that the combined total improvement, as between the two-year period 1924-1925, and the two-year period 1938-1939 was more than 25 per cent.

This subfinding concludes with a reference to the index of efficiency afforded by the quantity of fuel consumed per thousand gross ton miles. This index corresponds to the other index of fuel efficiency previously mentioned: gross ton miles per ton of fuel. In obtaining this index, the fuel consumed is converted into its equivalent in pounds of coal; the total gross ton miles produced is then divided into the total fuel consumed in order to obtain the amount consumed for each unit of one thousand gross ton miles. On the basis of comparisons by two-year periods, between 1924-1925, and 1938-1939, this index shows an improvement, for all freight trains on the system, amounting to 22.38 per cent.

Exhibit 249, (R. 3258-3261).

We have suggested before, in this discussion, that the substantial improvements in the efficiency and economy of train operations on the appellant's system is no mere accident or coincidence. The finding compares the improvement as between the years, such as 1922, 1923 and 1924, when the long-train program had not yet been adopted, and 1932, 1938 and 1939, all of which were years when the long-train program had reached substantial development everywhere on the system except in the affected territory. The record shows that the improvement has been continuous and progressive year by year, with only incidental departures from the general trend, just as the development of the long-train program has also been continuous and progressive. If only one or a comparatively small number of these several indices indicated improvement, while others were stationary, it might be possible

to argue that the long-train program had had no effect; but where the improvement in efficiency and economy is so definite and consistent, and has continued year after year, side by side with a continuing increase in the average lengths of trains and the proportion of long trains operated, there can be no question but that the increased efficiency and economy must be credited to the long-train program. Certainly there is no possible foundation for any contention, nor has any been suggested by appellee, that the long-train program has prevented or impeded the development of efficiency and economy on the system.

(2) In the Nevada-Utah territory (R. 3927-3929):

Paragraph 2 of Finding VII(b) summarizes the showing made on appellant's various exhibits which set forth the improvements in efficiency and economy of freight-train operations in Nevada and Utah during the period 1922 to 1939, inclusive. This showing relates to both the State of Nevada and, more particularly, to the Salt Lake Division, because the underlying data from which the statistics were directly computed largely relate to division operations. In the same manner any of the indices of efficiency and economy referred to in subparagraph (3) of this finding, which relates to results of operations in Arizona and the affected territory generally, are taken from statistics of the Tucson Division. It is not disputed that Salt Lake Division statistics reflect the Nevada operations with reasonable accuracy, for practically all of the lines in Nevada are included within the Salt Lake Division.

Exhibit 154 (R. 3028).

In Finding VII(b) are set forth the average lengths of freight trains on the system, and in Nevada and on the Salt Lake Division, for certain years between and including 1920 and 1939. It is there shown that there has been a rather consistent increase, year by year, in both Nevada and on the Salt Lake Division, commencing in about 1925, and continuing to the present time. Throughout the years, the Nevada and Salt Lake Division average train lengths have consistently been much greater than the system average; and this is particularly true since and including 1927.

If the theory were correct, as has sometimes been suggested, that long-train operation results in greater difficulty of freight-train handling, average train speeds on the Salt Lake Division should be less than the system average, and particularly less than the Arizona or Tucson Division averages; and the substantial increase in average lengths on the Salt Lake Division should have been accompanied by a decline in average train speeds, or at least by a failure to achieve the same improvement as on the system or the Tucson Division. The results, as presented upon appellant's exhibits, particularly Exhibit 180 (R. 3072), are exactly the contrary. In 1922, the average speed of main line freight trains on the Salt Lake Division was 14.7 miles per hour, at which time the average train length (52.0 cars) was considerably less than on the Tucson Division; in 1932 the corresponding figure was 19.7 miles per hour, the average train length having increased to 81.0 cars; and in 1939 the average speed was 21.4, the average train length being 85.4 cars. The improvement, contrasting 1939 with 1922, was 45.5 per cent. It is clear that the

predominant long-train operation in Nevada and Utah had the effect of causing rather than preventing substantial increases in average speed of freight trains.

The index of average gross ton miles per freight-train hour likewise shows a consistent and very substantial improvement on the Salt Lake Division; and the absolute figures are much higher than for the system as a whole, or for the Tucson Division. The Salt Lake Division improvement, contrasting 1939 with 1922, was 146.4 per cent, and the absolute figure on the Salt Lake Division in 1939 was nearly 75 per cent greater than the system figure, and about 53 per cent greater than the Tucson Division figure. The average cost per thousand revenue ton miles, for all Nevada freight-train operations, both main and branch, declined by 37.8 per cent during the period 1922-1939; the system improvement during the same period was 36.5 per cent; while the corresponding improvement in Arizona was only 25.7 per cent.

Exhibits 161 (R. 3035), 193 (R. 3105).

We have previously referred to the selected direct expenses associated with operation, and the figures of average cost per thousand gross ton miles, for all freight trains operated on the system. Similar figures are of record for the Salt Lake Division. This cost on the Salt Lake Division declined from 56 cents, in 1924, to 35.4 cents in 1939; an improvement of 36.7 per cent. On the basis of comparisons by groups of two-year periods, the improvement as between 1924-1925, and 1938-1939, was 27.72 per cent. The earlier period was, of course, prior to the general development of long-train operation on the divi-

Superior Court, Pima Co., Arizona
State v. S.P.Co. No. 20087

Defts. Ex. No._____(Witness_____)

sion; while the latter figure represents the costs obtained after the long-train program had reached practically full development.

Exhibit 179 (R. 3068-3071).

The operation of substantially longer trains, and of more long trains in proportion to the total, has resulted in a particularly favorable showing of fuel economy on the Salt Lake Division. In 1924, when the average length of all trains (main and branch) on the division was 51.6 cars, the average fuel consumed per thousand gross ton miles for all such freight trains was 100 pounds. In 1939, when the corresponding average train length was 81.2 cars, the corresponding index of fuel consumption had dropped to 73 pounds; an improvement of 27 per cent. The comparison by groups of two-year periods shows a similar result: the index for the two-year period 1924-1925 having been 96.2, and for the two-year period 1938-1939, 73.9. The combined total improvement was 26.06 per cent.

Exhibits 178 (R. 3067), 249 (R. 3258-3261).

For convenient reference we here reproduce Exhibit 178, which sets forth a graphic comparison of efficiency and economy in relation to average train lengths, as between the system and the Tucson and Salt Lake Divisions.

The effect of variations train lengths upon the average cost of performing freight-train service is well exemplified by Exhibit 177 (R. 3066). The exhibit shows the month-to-month variations in average expense per thousand gross ton miles, for freight-train service on the

Tucson and Salt Lake Divisions, set side by side with the average train lengths, month to month, for the 36 months included in the years 1937, 1938, and 1939. The exhibit demonsfrates precisely that in those three years, as the average train length varied from month to month, the average expense of freight-train service varied inversely; increasing train lengths were accompanied by reductions in average cost, almost in precise proportion. Thus, on the Salt Lake Division in January, 1938, the average train length was 70.6 cars; the average selected expense cost per thousand gross ton miles was 45.5 cents. In February the average train length declined to 66.8 cars, and the average expense increased to 48.6 cents. In May, with an average train length of 80.3 cars, the average expense declined to 37.8 cents. A slight decline in average train length during June brought a slight increase in average expense. Further increases in train length, to a high figure of 85.4 cars per train during August, brought a reduction of expense to 34.8 cents. As train lengths tended to decline thereafter, during the balance of the year, reaching a figure of 78.3 in December, so average expenses tended to rise, reaching a figure of 39.3 cents for the same month.

Even on the Tucson Division, where variations in train length are much less marked than on the Salt Lake Division, primarily because of the 70-car maximum and the natural tendency of the appellant to operate as many of its trains as possible with the maximum number of cars permitted, the close relationship between variations in train length and inverse variations in unit cost are equally apparent. The showing demonstrates that not only in

Nevada, but also in the affected territory, increases in train lengths tend to be accompanied by reductions in average unit cost of train operation; and equally that an arbitrary restriction which compels the operation of trains of shorter average lengths, and in greater number than otherwise required, is accompanied by a definite tendency toward increase in cost.

We emphasize again the fact that substantially greater efficiency and economy are shown to have been accomplished in the Nevada-Utah territory than on the system generally, or in Arizona. This result is due to a combination of several causes. In the first place, the traffic handled over the Nevada-Utah lines is almost entirely through traffic, and the operating and other conditions in that territory, like those in Arizona, are favorable to the movement of traffic in long-train units; whereas on the system generally, operating conditions vary greatly, and there is much local traffic in certain districts. Furthermore, the greater efficiency and economy in Nevada and Utah have been achieved independently of any influence of the Arizona law; whereas the restrictions of that law prevent the attainment of comparable efficiency and economy in Arizona and the adjacent affected territory, and tend to bring down the system performance, but do not affect the results of the Nevada-Utah operations.

(3) Defendant's inability to achieve comparable efficiency and economy in the territory affected by the Arizona Train-Limit Law (R. 3929-3934):

In the subfinding bearing the above title, we set forth an analysis of the Arizona operations, from the stand-

point of efficiency and economy, employing the same indices as for the system generally and for the Nevada-Utah operations.

The statistics thus summarized relate largely to the Tucson Division, but to some extent to the State of Arizona. The main lines of the Tucson Division include nearly all of appellant's principal main lines in Arizona, excluding only the alternate main line between Mescal and the Arizona-New Mexico boundary west of Rodeo, New Mexico (the so-called Douglas line), and including about 17 miles of main line in New Mexico west of Lordsburg, where the Arizona law operates with extra-territorial effect. The main lines of the Tucson Division thus include all of the Yuma-Gila-Lordsburg line west of Lordsburg.

Exhibit 154 (R. 3028).

Reference is made in the finding to the fact that the boundaries of the Tucson Division were changed in 1930, by the addition of the main line between Tucson and Lordsburg, and the branch line between Bowie and Live Oak. As stated in Finding VII(a), the boundaries of the Salt Lake Division were also changed in 1929, by the addition of the main line between Wendel and Alturas, California, and at the same time the Fernley-Wendel line was reclassified as main line. These changes in divisional boundaries do not, of course, affect any comparisons between the states of Nevada and Arizona; for the lines affected by the changes were of course continued in their previous locations. The method of comparison employed, whereby the years are grouped according to periods prior

and subsequent to the changes of divisional boundaries, eliminates any disturbing effect which might otherwise result therefrom. In point of fact these disturbances are very minor, and in so far as concerns comparisons either between the two divisions, or between the earlier or later groups of years, could very properly be disregarded.

It was possible to group the years prior and subsequent to 1930, in making these comparisons, because the Tucson Division operating statistics for the year 1930 were recomputed, or "restated," in 1931, so as to reflect operations for the year 1930 as if the change of divisional boundaries had taken place at the beginning of that year instead of in July. This restatement permits a true comparison between 1931 and 1930 operations, and likewise between 1930 and later years in the same manner. The Salt Lake Division statistics were likewise available for the year 1930, without any disturbing effect caused by the change made in November, 1929.

Mason, R. 1212.

The outstanding conclusion, to be drawn from the showing for the affected territory, is stated in the initial paragraph of subfinding VII(d)(3). The improvements in road and equipment made in Arizona are comparable to and as extensive as in Nevada and Utah, or on other parts of the system; the operating rules are the same; and the volume and character of the traffic handled, and the operating conditions, are essentially similar in both Arizona and Nevada; but nevertheless the improvements in efficiency and economy achieved in the affected territory are substantially less than in Nevada and Utah. Since the

only differentiating factor, as between Nevada-Utah, on the one hand, and the affected territory, on the other, is the Train-Limit Law itself, this failure to achieve comparable efficiency and economy can and must be ascribed only to the law's restrictions.

Thus, dealing first with the matter of average freight-train speeds: the Tucson Division improvement in speeds of main-line freight trains was 40.8 per cent as between 1923 and 1939; on the system the improvement was 58.9 per cent, and on the Salt Lake Division 45.5 per cent. It is particularly significant that between the years 1922 and 1932, which were the years of major development of the long-train program, the Salt Lake Division improvement was 34 per cent; the system improvement was 47.3 per cent; but the Tucson division improvement only 21.1 per cent.

Exhibit 180 (R. 3072).

The important index of efficiency, presented by gross ton-miles per train hour, shows some improvement on the Tucson Division as between 1923 and 1932 (26.7 per cent); but the corresponding improvement on the Salt Lake Division was 98 per cent. Comparing 1939 with 1923, the Tucson Division improvement was 55.5 per cent; but the Salt Lake Division improvement was 146.4 per cent.

Comparison may also be made between 1939 and 1930 for both divisions. This comparison escapes any possible criticism which may be made because of the fact that the division limits on both divisions were changed about the year 1930. It also compares a period of general long-train operation on the Salt Lake Division with a period

of completely restricted operation on the Tucson Division. In this period the gross ton miles per train hour for all trains on the Tucson Division improved 24.5 per cent; but the corresponding improvement on the Salt Lake Division was 41.8 per cent. Clearly this much greater improvement simply reflects the advantage of the long-train program in Nevada-Utah on the one hand, and the hampering effect of the law's restrictions in Arizona on the other.

Exhibit 193 (R. 3105).

The index of average net tons of freight per main-line freight train shows an actual reduction on the Tucson Division from 1923 to 1932, amounting to 24.1 per cent, whereas on the Salt Lake Division during the same period there was an increase of 9.9 per cent. Comparing 1939 with 1932, the increase on the Tucson Division amounted to approximately 24 per cent; but on the Salt Lake Division it was 33.4 per cent.

Exhibit 193 (R. 3105).

Turning to cost figures: the average cost per thousand revenue ton miles, for all operating expenses for all freight-train operations within Arizona, shows an improvement (reduction) of 25.7 per cent, comparing 1939 with 1922; but the improvement in Nevada over the same period was 37.8 per cent. Comparing the four-year period 1936-1939 with 1922-1925, the Arizona improvement was 19.5 per cent; but the Nevada improvement was 30.7 per cent.

Considering the average cost per thousand revenue ton miles, for transportation expenses only, for freight-train operations in the two states, there was but little change

in Arizona between 1922 and 1939, the improvement (reduction) having been only 8.7 per cent. The corresponding Nevada improvement was 31.6 per cent. Comparing the same four-year periods previously mentioned the Arizona improvement was 6.8 per cent; but the Nevada improvement was 24.4 per cent. Cost figures for transportation expenses only, as above stated, take into account the costs directly associated with train operations, a substantial proportion of which consists of fuel, locomotive repairs and wages of train and engine service employes. These items tend to increase directly with the number of trains run; and the failure to obtain any substantial improvement in Arizona clearly reflects the influence of the Train-Limit Law, in compelling the running of many more trains, and the consequent production of a substantially increased volume of train miles, than would otherwise be necessary for the handling of the traffic. By contrast, the Nevada figures attest the economies in these particular items of expense, which have been achieved as the result of the long-train practice, and the consequent elimination of unnecessary trains and train miles in that state.

Exhibit 160 (R. 3034), 161 (R. 3035).

Two of the comparisons set forth in Finding VII(d)(3) are by groups of years prior and subsequent to 1930. These comparisons include particularly, cost per thousand gross ton-miles for selected direct expenses of freight-train operations, and figures of fuel consumption per thousand gross ton-miles for freight trains on the Tucson and Salt Lake Divisions. This method of comparison, as before stated, has the effect of producing figures showing

relative improvements over the years considered, without any possible distortion resulting from the changes in the boundaries of the two divisions during the period. These comparisons show combined total improvements, comparing 1924 and 1925 together with 1928 and 1929, and then comparing 1930 and 1931 together with 1938 and 1939, amounting, in the case of average cost per thousand gross ton-miles for direct expenses of freight-train operations, to 15.93 per cent on the Tucson Division, and 27.72 per cent on the Salt Lake Division; and, considering average pounds of fuel consumed per thousand gross ton-miles, to 12.62 per cent on the Tucson Division, but 26.06 per cent on the Salt Lake Division. Considering fuel consumption during the years following 1930, there was a decrease, in the index of gross ton-miles per ton of fuel for all freight trains, on the Tucson Division, of 0.5 per cent, comparing 1939 with 1930; but an improvement on the Salt Lake Division of 15.3 per cent.

Exhibits 179 (R. 3068-3071), 249 (R. 3258-3261).

The finding concludes with the statement that appellant's inability to effect improvements in the efficiency and economy of its freight-train operations in Arizona, comparable to those achieved in Nevada or upon the system generally, has been and is largely and directly due to the restrictions imposed by the Arizona law. This conclusion of fact is not merely justified; it is unavoidable. In preceding findings it is set forth that the operating conditions in Arizona are essentially similar to, if not slightly more favorable than, those in Nevada; that the characteristics of the traffic handled are practically the same;

that the volume of the traffic, over the years studied, has been about the same, year by year, in both states. The operating rules are virtually identical. The same equipment is used interchangeably in both states, and the same standards of construction and maintenance are observed. No attempt was made to show that Nevada employes render any better or more efficient service in the handling of trains, within the limits imposed by rule, law and custom, than their fellow employes in Arizona. Appellee called no employes of appellant as witnesses to testify respecting Nevada operations, and made no attempt in its case in rebuttal to draw any distinction between operations in Nevada and Arizona. In these respects our showing is wholly uncontradicted. Since there is shown to be substantial identity of all of the conditions which may or might affect the result, except the single factor contributed by the restrictions of the law, the substantial differences in the results obtained from the Arizona operations must be ascribed to that one differentiating factor, and to that alone.

This finding is not only material, but highly important, because it bears so directly upon the results which have followed from compliance with the Arizona law, and also indicates clearly the results which would unquestionably follow if the restrictions of the law were removed. It presents the results of appellant's actual experience with methods of operation exactly as they would be carried on if the law were not in effect, and under conditions which, as we again emphasize, are as nearly identical to those existing in Arizona as could well be obtained.

Like all other subdivisions of Finding VII(d), subdivision (3) is predicated upon the competent testimony, which is reproduced or carefully excerpted from basic records and accounts regularly kept by appellant; and again we point out that this showing was not disputed or challenged in any way by opposing testimony.

VIII.

COMPARISON OF DEFENDANT'S METHODS OF OPERATION WITH THOSE FOLLOWED ON UNITED STATES RAILROADS GENERALLY (R. 3934-3947).

(a) IMPROVEMENTS IN ROAD AND EQUIPMENT (R. 3934-3937).

In subparagraph (a) of paragraph 3 of Part III of the answer (R. 9) it is alleged in substance that in recent years "great improvements have been made in both road and equipment . . . on railroads throughout the United States generally." Finding VIII(a) responds to the issue thus tendered.

This finding not only disposes of this issue of fact, but also and more precisely demonstrates, by an affirmative statement, that the improvements in its own property, accomplished by appellant, as detailed in Finding VI, were not isolated or exceptional, but part of a nation-wide program agreed upon and carried out by all of the major railroads of the United States, acting more or less in concert.

Parmelee, R. 187-190, 194-195.
Exhibit 15 (R. 2863).

The essential fact is that when appellant undertook its extensive investments, and constructed or purchased the improvements which have enabled it to adopt and follow the long-train practice, and thereupon did adopt and now employs that practice, it was proceeding along the same progressive course, followed at the same time by other railroads generally, including the major trunk lines with which it competes and connects. The Arizona law obstructs the development and employment of progressive modern methods of railroading, by forbidding appellant and the Atchison, Topeka & Santa Fé Railway Company, the other major Arizona line, to use one of the most essential and universal of these methods, and imposes instead upon these two railroads an additional and arbitrary restriction from which many of their principal competitors are free.

In a sense, Finding VIII(a) is the preliminary part of what may properly be termed, collectively, the "national finding." We shall not undertake to analyze in detail the testimony upon which the finding is based. The statistical showing is founded largely, if not entirely, upon official publications of the Interstate Commerce Commission. The competency of such statistics cannot properly be challenged. The oral testimony was given by experienced and fully qualified statisticians (Messrs. Parmelee and Otterback), and by experienced railroad operating officers, presently engaged in the active supervision and conduct of the operations of their respective systems. No opposing showing of any character was attempted by appellee.

(b) **INCREASED TRAIN LENGTHS (pp. 68-71).**

Paragraph VIII(b) responds to the allegations of subparagraph (d) and (e) of paragraph 3 of Part III of the answer (R. 11-12), wherein it is stated that the long-train practice has been since about the year 1924, and now is, the common practice throughout the United States; that the maximum length of freight trains on main trunk lines throughout the nation is much greater than permitted by the Arizona law; and that the standard long-train practice is general on major trunk lines, including the main lines of appellant's principal competitors and connections.

Parmelee, R. 223-225.
Exhibit 22 (R. 2870).

The finding in this paragraph thus carries forward the story of the national situation. It shows that the operation of long trains by appellant was and is in line with the best and most progressive modern practices which have been and now are regularly followed; and that the restricted operation which the Arizona law compels is unusual, extraordinary, and, in the light of national experience, both unwise and unnecessary.

We call attention to the number of systems and the total mileage as to which specific testimony of operating methods was introduced. This detailed testimony covered methods of operation followed upon railroad systems extending into every section of the United States. These carriers, in 1939, operated 125,885 miles of line, or more than 50 per cent of the total of the mileage of Class I railroads in the United States, and produced more than 13 billion freight-train miles, about 59 per cent of the total

of all Class I railroads, and more than 13½ billion revenue passenger miles, or about 60 per cent of the total for all Class I carriers. The railroads covered by this testimony include all or nearly all of appellant's competitors, and likewise nearly all of the lines which connect with and join appellant in handling through traffic between Pacific Coast points, on the one hand, and destinations on and east of the Missouri and Mississippi Rivers, on the other.

Exhibit 248 (R. 3257).

(c) IMPROVED SCHEDULES AND PERFORMANCE (R. 3939-3940).

In paragraph 3(b) of Part III of the answer (R. 10), and again in paragraph 3(e) (R. 12), it is alleged that freight is transported between all parts of the United States in long trains upon dependable schedules which are from one-half to one-third faster than performed prior to 1924; that the practice of standard long-train operation does not retard the movement of traffic, but expedites such movement materially and promotes and makes possible early delivery. Finding VIII(c) is addressed to the issue thus tendered.

Schedules similar to those maintained by appellant and its connections, between Pacific Coast points and eastern destinations (described in Finding VII(c), R. 3920-3924), are generally maintained by the major railroads in the United States, and frequently participated in by three or more connecting carriers. These schedules were instituted as a part of an organized effort of the railroads of the nation toward betterment of service; and as improved

operating methods were developed, including particularly the long-train practice following 1923, these schedules and the performances under them were improved. . .

This finding condenses the lengthy testimony of numerous witnesses, officials of railroads other than appellant, who testified as to the operations of the carriers by which they are employed. It is not necessary to review this testimony in detail; the finding presents its essentials. Every part of the finding is fully supported by highly competent testimony, the correctness of which has never been challenged.

(d) INCREASED EFFICIENCY AND ECONOMY (R. 3940-3942).

Finding VIII(d) presents another phase of the national picture, and corresponds in that respect with Finding VII(d), wherein the effect of the long-train program on the efficiency and economy of appellant's operations is set forth. This finding sets forth the results for both the United States carriers as a whole, and in a general way for a number of individual railroads, of the adoption and development of the 1923 program of betterment, and particularly the long-train operating method which forms an essential part of that program.

In the finding reference is made to a number of the indices of efficiency and economy which were also used in Finding VII(d). For example, referring to road speed of freight trains, the finding shows an increase in the average for all Class I railroads from 11.1 miles per hour in 1922, to 16.7 miles per hour in 1939: an improvement of 50.5 per cent. As to fuel consumption, indicated by the

gross ton miles produced per ton consumed, the index increased from 10,750 in 1923, to 15,528 in 1939: an improvement of 44.4 per cent. Freight train performance, expressed in gross ton miles per train hour, for all freight trains of Class I carriers, more than doubled between 1922 and 1939; the increase was from 16,188 in 1922 to 32,808 in 1939: an improvement of 102.7 per cent.

Exhibit 22 (R. 2870).

In the *Railroad Retirement Act Case*, supra, this Court discussed statistics of the same kind, there presented for the purpose of showing the efficiency and economy of carrier operations generally. The Court said (295 U.S., at p. 366):

> "How stands the case for efficiency? Here again the record without contradiction demonstrates that in step with the alleged progressive superannuation on the railroads their operations have increased in efficiency. The trial court found, and its finding is not assigned as error: 'Railroads were, when the Act was enacted, and are now, operated efficiently and safely and more efficiently and much more safely than at any time in history.'"

In a footnote to the excerpt just quoted, the Court said further:

> "Thus it appears that the average speed of freight trains between terminals in 1928 was 10.9 miles per hour, in 1929 was 13.2 miles per hour, and in 1933 was 15.7 miles per hour. Excluding weight of locomotive and tender each freight-train hour in 1928 produced 16,764 gross ton-miles; in 1929 produced 24,539 gross ton-miles; and in 1933 produced 27,34[illegible]

gross ton-miles; and net ton miles per freight-train hour increased 41.2 per cent. from 1923 to 1933, and 3.7 per cent. from 1929 to 1933. Cost of transportation is also shown to have decreased in the same periods."

It will be noted that the Court recited the fact that the cost of transportation was shown to have decreased. The finding sets forth that the average expense per thousand revenue ton miles, for all freight operating expenses of Class I railroads, declined from $8.71 for the four years 1922-1925, to $6.49 for the four years 1936-1939; a reduction or improvement of 25.5 per cent. Referring to average expense per thousand revenue ton miles, for freight transportation expenses only, the corresponding improvement (reduction), comparing the two 4-year periods just mentioned, was 23.6 per cent. Turning to expenses in passenger-train service, the improvement in expense per passenger-train car mile, again comparing the two periods just referred to, was 21.74 per cent; or, taking into account passenger transportation expenses only, the improvement, again contrasting the same two periods, was 20.06 per cent.

Exhibits 20 (R. 2868), 21 (R. 2869).

We call particular attention to the increase in efficiency and economy evidenced by the fact that the Class I railroads were able to handle their aggregate revenue freight traffic in the four years 1936-1939, which amounted to only 15 per cent less in volume than in the four-year period 1922-1925, with an average ownership of 34 per cent less locomotives, and 26 per cent less freight cars; although, as

the evidence establishes, the traffic was handled more cheaply, at higher speeds, and on faster schedules.

Exhibits 20 (R. 2868), 33 (R. 2882-2883), 37 (R. 2889).

The record of efficiency and economy for individual railroads, as shown by the testimony of witnesses representing sixteen major systems other than appellant, corresponds to the record of the United States railroads as a group. These sixteen systems include carriers in every major section of the country; the long-train operating method is the standard practice on their lines, except to the extent that the Santa Fe cannot operate long trains in Arizona and adjacent territory.

The finding responds to the allegation found in subparagraph (e) of paragraph 3 of Part III of the answer (R. 12) that long trains are commonly, safely and economically operated throughout the United States, and the allegation that the long-train operating practice has proved an efficient method of operation (answer, Part III, paragraph 3(b); R. 10).

(e) RESULTS OF THE LONG-TRAIN PROGRAM FROM THE STANDPOINT OF THE PUBLIC, THE EMPLOYES, AND THE RAILROAD OWNERS (R. 3943-3945).

(1) Reduction in average transportation charges paid by the public (R. 3943).

In subparagraph (d) of paragraph 3 of Part III of the answer (R. 11-12) it is alleged that the improved methods of operation, of which long-train operation is an essential part, adopted following 1923, have resulted in substantial

public benefits. Finding VII(e) sets forth that these benefits have extended to the public at large which patronizes the railroad industry, and to railroad employes; but shows also that the same benefits have not been experienced by the railroad owners, in spite of the generally increased efficiency, economy and safety of railroad operation.

Subparagraph 1 particularly shows the benefits realized by the general public from the reduction in average transportation charges paid. It is shown that the reduction in average freight charges was, between 1922 and 1939, 17.4 per cent; and in average passenger fares, 39.2 per cent. These are benefits directly received by and accruing to the general public.

Exhibit 16 (R. 2864).

(2) Increases in average wages paid to employes (R. 3943-3944):

Subparagraph 2 of this finding sets forth particularly the benefits accruing to railroad employes, as an incident of and accompaniment to the long-train practice, and the general betterment program adopted following 1923. Expressed in average rates per hour, the wage-level for all employes advanced 22.1 per cent since 1922, to an average figure of 74.9 cents per hour in 1939. Dealing particularly with train and engine-service employes, who form the classes of employes particularly affected by the Train-Limit Law, the average hourly wage increased between 1922 and 1939 to 92.2 cents, an increase of 16.5 per cent. These are, of course, substantial and continuing benefits to the employes concerned.

Exhibits 17 (R. 2865), 18 (R. 2866).

(3) Effect on returns to owners of the railroads (R. 3944-3945):

This paragraph of the finding presents the results of the 1923 betterment program, from the standpoint of the financial returns to the railroad owners. It shows that the benefits have been largely, if not entirely, absorbed in the reductions in charges extended to the general public, and increases in wages given to the railroad employes. In so far as concerns actual income from the operations of the railroad properties, the returns earned, particularly since and including the year 1930, have been very small; in at least four years substantial deficits were experienced, and in no year since and including 1931 has there been a percentage return in excess of 2.57 per cent.

Exhibit 19 (R. 2867).

These findings thus emphasize that the 1923 betterment program, and the long-train operating practice as an essential feature thereof, have not operated merely to promote the self-interest of the owners of the properties; on the contrary, they have principally contributed genuine and long-lasting benefits to the general public which the railroad industry serves and to the vast number of persons who depend directly upon the railroad industry for their employment and support; but they have not operated, except to the extent of preventing or minimizing operating losses, to benefit the actual owners of the railroads in any corresponding degree.

(f) SIMILARITY OF OPERATING CONDITIONS AND OPERATING RULES ON OTHER RAILROADS TO THOSE PREVAILING UPON DEFENDANT'S LINES IN THE AFFECTED TERRITORY (R. 3945-3947).

In paragraph 3(e) of Part III of the answer (R. 12), after referring to nation-wide operation of long freight and passenger trains, it is alleged that the operating conditions under which such operations are carried on are substantially as favorable as those on the appellant's main lines in Arizona. Finding VIII(f) relates directly to the issue thus tendered.

The operating conditions in the affected territory are set forth at length in Findings III and VII. The testimony and exhibits relative to operations upon the other individual railroads which were severally represented by witnesses called by appellant contain a showing of the operating conditions upon these railroads, particularly in the districts covered by the several "long-train" exhibits. In general, it appears that the traffic handled under the long-train practice, upon other railroads, is largely of the same kind as handled in appellant's trains in the affected territory; that the grades vary from level to 1.5 per cent or less, about the same as in Arizona; that there are both single-track and double-track operations on these railroads, and in the particular districts studied, which is also true of Arizona operations; that the same general code of operating rules is followed; in short, that the circumstances under which the long-train practice is followed on these other railroads, from whatever standpoint considered, and while they present a variety of situations are such as to duplicate to a greater or less extent the con-

ditions encountered in at least some part of the affected territory.

One purpose of this finding is to make clear that there is no substance to the objection, continually insisted upon by counsel for appellee, that comparisons between operations of the appellant in Arizona and the adjacent affected territory, and operations on other railroads were incompetent or immaterial. The finding shows also that no special or unusual conditions exist in Arizona which justify the arbitrary imposition of a restriction which compels appellant to depart from the accepted and ordinary methods of operation, generally followed upon the lines of other carriers in the United States, both at the present time or for at least sixteen years last past; and that in seeking to conform its practice to the practice of other carriers, including its principal competitors and connections, appellant only desires to follow methods found by experience to be efficient and economical, and to result in speedier and safer transportation service, under conditions not essentially different from those which prevail in Arizona; in other words, to show that it is impossible to point to any experience of operating results gained upon the other railroads of the United States under conditions similar to those encountered in Arizona, which does not condemn as unreasonable, illogical, and unnecessary, the purely arbitrary limitations created by the Train-Limit Law.

IX.

RECENT LONG-TRAIN OPERATIONS OF DEFENDANT IN ARIZONA: INTENTION TO UNDERTAKE FUTURE LONG-TRAIN OPERATIONS (R. 3947-3950).

(a) LONG-TRAIN OPERATIONS OF DEFENDANT IN ARIZONA IN 1940 (R. 3947-3948).

In this finding there is included specific reference to the limited long-train operations undertaken in Arizona by appellant during the months of March and April, 1940. The complaint refers (R. 2-4) to two such long trains; but the testimony shows that long passenger trains were operated in Arizona on 62 different occasions between and including March 2nd and April 30, 1940 (*Exhibit* 246, R. 3255) while 302 long freight trains were operated during the 27 days between April 4 and April 30, 1940 (*Exhibit* 234, R. 3231). Practically all of the testimony relating to these long-train operations was adduced by appellant, either through its own witnesses or by questioning of appellee's witnesses; except, of course, the purely formal testimony of appellee's witnesses in chief, offered for the purpose of proving the operation of the two trains particularly referred to in the complaint. The finding shows the total volume of the traffic handled in the long trains operated by appellant, measured in passenger and freight car miles accumulated within Arizona; and shows also that the long freight trains had an average length of 85.36 cars.

Exhibit 295 (R. 3424).

It is also stated, and we call particular attention to the fact, that this long freight-train operation was necessarily

upon a limited scale, because the fixed physical plant in Arizona is not presently adapted to long-train operation upon the same scale as prevails upon appellant's lines in Nevada, for example; furthermore, because the necessary changes in locomotive assignments, which would be carried out if unrestricted long-train operation were undertaken, were not made for the purposes of the 1940 operation.

One particular and important limitation is afforded by the fact that most of the passing tracks along the single-track main lines in Arizona will not accommodate trains of more than 70 cars. Because of this, the long freight-train operation was largely confined to the movement of long trains in the westward direction only.

This finding is important in that it serves as a foundation for the subsequent finding setting forth the effect of the law upon appellant's operations, and the amount of savings and other benefits capable of being realized if the law's restrictions are removed. It is also preliminary to certain findings relative to safety; for, as appears more fully in those findings, the long-train Arizona operations of 1940 were not attended by any accident or casualty occurring upon a train operated in disregard of the law's provisions, as to which it was made to appear or could reasonably be contended that the length of the train had any bearing whatsoever upon the accident.

Sines, R. 1820-1835, 1860-1863.

Exhibits 197 (R. 3114), 234 (R. 3231), 235 (R. 3232), 246 (R. 3255), 295 (R. 3424).

The finding is important also because of its direct bearing upon the fundamental question in the case: namely, whether long-train operation is feasible and practicable, and capable of being conducted with reasonable safety, in Arizona; or whether there are, on the other hand, some peculiar conditions which justify the continuance of the restrictions. The Arizona 1940 long-train experience clearly demonstrates the entire practicability of such operations, and refutes any contention that peculiar conditions exist in Arizona which set that state apart from the other states in which the long-train practice has been so long and so successfully followed.

(b) FUTURE LONG-TRAIN OPERATIONS CONTEMPLATED BY DEFENDANT: CHANGES IN PLANT AND EQUIPMENT (R. 3948-3950).

In this finding there is set forth the fact, which is both undisputed and directly material to the question whether appellant suffers any substantial injury or impairment because of the law, that appellant plans and intends, if the law's restrictions are removed, immediately to commence and thereafter to continue the operation of long trains in the affected territory. The finding then sets forth the changes in physical plant and equipment necessary for the purposes of such operation on the same substantial scale as is followed in Nevada and elsewhere upon appellant's system.

The necessity for these changes, and the cost of the changes thus contemplated, are fully established by competent testimony. There will be need for a considerable number of siding extensions, and other changes in the

physical plant in order to permit larger locomotives and longer trains to be readily operated; also 30 larger locomotives will be required (on the basis of 1938 traffic volume), and will be substituted for some 51 locomotives presently in service, which will be displaced and made available for use in other territory. With the reduction in the number of train units operated, 21 cabooses now in use will become unnecessary (again assuming the same volume of traffic as in 1938), and there will be a substantial saving on this account.

This finding serves as a preliminary to and foundation for those portions of the next succeeding finding which deal with the amount of the net saving capable of being realized, if long-train operation should become the standard practice in the affected territory, in that it develops the annual charges on additional capital investment, which are deductible from the larger annual operating savings.

Exhibits 197 (R. 3114), 202 (R. 3151), 205 (R. 3190), 222-255 (R. 3211-3214).

X.

EFFECT OF THE TRAIN-LIMIT LAW UPON DEFENDANT'S OPERATIONS (R. 3950-3969).

In subparagraphs (f), (g), (h) and (i) of paragraph 3, and also in paragraph 4, of Part III of the answer (R. 13-18) are set forth general allegations relative to the

results which follow from appellant's enforced observance of the Train-Limit Law. Thus in paragraphs 3(f) (R. 13), and 4(a) (R. 16-17), it is alleged that the law affects appellant's operations and controls the lengths of its trains, not only in Arizona, but also in adjacent portions of California, and in New Mexico and Texas as far east as El Paso; in paragraphs 3(g), 3(h) (R. 14-15), and 4(c) (R. 18), that the law imposes continuing annual burdens of additional expense upon appellant, amounting to more than $300,000 in the case of freight traffic upon the Yuma-Gila-Lordsburg line alone, and $10,000 in the case of passenger traffic; in paragraphs 3(i) (R. 15-16) and 4(b) (R. 17-18), that the law causes interstate trains and traffic in the affected territory to be greatly interfered with and delayed. In paragraph 5 of Part III (R. 19-22) it is further alleged that the law interferes with and burdens interstate commerce, and produces and increases congestion and train interferences. In paragraph 14 of Part III (R. 28) the allegation appears that the added expense to appellant of enforced obedience to the law is not less than $300,000 annually.

Finding X in its various subdivisions deals with the issues of fact thus tendered. In the interest of a more precise treatment, we shall take up each such subdivision separately in the discussion which follows but before doing so we shall point out how the evidence supporting this finding corresponds and is directly related to the other evidence of record tending to show the effects of the challenged law, and the results which would follow if the restrictions of the law were removed.

In presenting the "national picture", appellant brought before the trial court testimony which showed that the operation of long freight and passenger trains is a practice followed by numerous major railroad systems throughout the country; that it has resulted in greatly increased efficiency and economy of railroad operations; that improved schedules, made possible by the higher train speeds and greater efficiency resulting from the long-train program, have been placed in effect, with resulting benefit to the public at large. The evidence relative to the national picture also shows, as we point out in our discussion of Finding XII, that there has been a marked, continuous, and substantial reduction in the frequency of accidents and casualties, occurring side by side with the development of the long-train program. This national showing, supported as it is by evidence that conditions in Arizona are not essentially distinguished from those in other parts of the United States generally, is of itself sufficient to sustain a finding that the challenged law, in that it prevents the adoption of the same methods of operation in Arizona, impairs the efficiency and economy of railroad operations in that state, reduces the possible benefits to the general public, and hinders the program elsewhere attained in the reduction or elimination of the hazards of railroad operation.

However, appellant did not rest with the presentation of the national picture alone, or the showing of similarity of conditions as between its lines in Arizona, on the one hand, and the lines of United States railroads generally. It presented also a showing of the effects of the long-train program from the standpoint of efficiency, economy, and

safety upon its system as a whole. This testimony, in so far as it bears upon efficiency and economy, and the general achievement of better railroad performance for the benefit of appellant's patrons, is discussed at considerable length in the various subdivisions of Finding VII, and, in so far as it concerns safety, in connection with appropriate subdivisions of Finding XII. By this means appellant has shown that it has achieved upon its own line results substantially similar to those achieved nationally by the carriers as a whole, and individually by its several competitors and connections which were the subject of separate individual showings.

Appellant did not, however, rest its case even with a system showing. It went still further: it selected a portion of the system where the essential conditions, other than the existence of the arbitrary restrictions of the law, are essentially the same as in Arizona. We refer, of course, to the comparisons between Arizona, and the Tucson Division on the one hand, and Nevada and the Salt Lake Division, on the other. In the light of the substantially greater efficiency and economy experienced in the Nevada-Utah territory, as compared to the affected territory, and the substantially greater safety of operation in Nevada than in Arizona, particularly during the period since about 1925 when the long-train practice has prevailed in Nevada, there could no longer be any possible doubt that the law, and the law alone, imposes direct restrictions and hindrances upon appellant's Arizona operations, and instead of promoting safety, actually prevents the elimination of accidents and hazards.

The showing to which Finding X directly relates constitutes a still further method of proving, with a precision not possible in conjunction with the other evidence just discussed, the effects of the Train-Limit Law in imposing additional and unnecessary expense upon appellant, and creating or aggravating delays to and interferences with the traffic handled in the affected territory. In other words, while the experience of appellant in Nevada and upon its system generally, coupled with the experience of the railroads of the United States as a whole or as individuals, compels the conclusion that the Arizona restrictions impose substantial and unnecessary expenses upon appellant, and cause a very definite and inevitable loss of efficiency, that experience does not of itself and naturally cannot indicate precisely what the added expense and loss in efficiency amount to. Furthermore, there is no means of determining from that experience, except in a rather general way, the other effects of the law, such as the interferences with and delays to trains and traffic.

(a) THE REDISPATCHING STUDIES (R. 3950-3953).

For these reasons, appellant undertook the detailed analyses of traffic actually handled in the affected territory, which were presented to the trial court as the "redispatching studies".

In making these studies the methods generally adopted were as follows:

A typical period was selected, during which trains had been operated and traffic had moved, in accordance with the restrictions imposed by the law; and then, having the

records and the results of actual operations available for study, those results were contrasted with the results of the operations which would take place, if precisely the same traffic had moved, under precisely the same conditions, except as modified by removal of the law's limitations.

In other words, the determination was made by following the method employed, for similar purposes, in both the *First Arizona Train-Limit Case*, and the *Nevada Train-Limit Case*, using the experience there gained for the purposes of the instant case.

The initial study (the 1938 freight redispatch) involved the selection of two months in 1938, one of them (June) the month of heaviest traffic and the other (August) the month of lightest traffic. The traffic which actually moved during those two months was studied; and it was contemplated, in that study, that it would move under the same actual conditions, except in so far as the removal of the law's limitations would have permitted or required modifications in appellant's operating methods, and warranted certain changes in equipment and facilities, particularly the substitution of more powerful locomotives, the extension of sidings at certain stations and passing tracks in the affected territory where siding lengths are now 70 cars or less, and necessary changes in locomotive round-house and shop facilities. Because of the fact that the traffic had actually moved in trains limited to 70 cars, it had to be redistributed into longer trains, and those trains had to be "redispatched". The study in its entirety was therefore named the "redispatching study", and is so

referred to in the testimony and findings, and in this discussion.

Sines, R. 1402-1407.

Exhibits 196 (R. 3113), 198 (R. 3115), 205 (R. 3190).

The passenger redispatching study for the year 1938 was conducted in the same manner as the freight redispatching study, except that it was unnecessary for the purposes of that study to assume changes in locomotive assignments, facilities, or siding capacities.

Sines, R. 1406, 1448-1449.

A redispatching study covering Phoenix-Tucson operations for the month of December, 1938, was also undertaken. This study likewise assumed that the traffic would be recast into longer trains, and contemplated the use of longer sidings and locomotives having increased hauling capacity.

Appellant also conducted two separate, but closely related, redispatching studies of the traffic handled during the period April 4th to April 30th, inclusive, 1940, when as stated in Finding IX, appellant operated some 302 long freight trains in Arizona. In the first of these studies the traffic actually handled was redistributed into short trains, it being assumed for the purposes of that study that the restrictions of the law were observed. In this manner appellant was able to ascertain the amount of the saving in train miles and certain direct expenses associated with train operations, achieved by the (actual) limited long freight-train operation, and also to determine

whether there had been any improvement in freight-train performance. For the second of these studies it was contemplated that long-train operation should be undertaken upon the same scale as in connection with the 1938 redispatching study; in other words, the second 1940 study contemplated the use of the more powerful locomotives, extended sidings, and other permanent facilities planned in connection with the 1938 study. The two 1940 studies taken together enable comparisons to be made between (1) a completely restricted operation, (2) the limited long-train operation which prevailed and was hampered by inadequate siding capacities, and (3) a long-train operation predicated upon the use of appropriate locomotives and with adequate sidings and other facilities.

Sines, R. 1397-1410, 1416-1437, 1448-1455, 1517-1526, 2251-2252, 2284-2285; *Baker*, R. 1469-1474, 1483-1486, 1513-1516, 1575-1588; *Herrell*, R. 1487-1509, 2201-2205; *Cassady*, R. 1530-1540, 2214-2215, 2217-2219.

The redispatching studies were supervised and conducted by responsible employes of appellant whose qualifications could not be and were not questioned. The actual work of reconsisting and redispatching the trains was performed by and under the supervision of the chief train dispatchers who had jurisdiction over the lines in the affected territory. Each of these men had had many years of experience in his position and in prior subordinate positions leading to the position of chief dispatcher, and had necessarily become thoroughly familiar with the operation of trains in his particular district or division.

Sines, R. 1401-1402.

The permanent records of the movement of the trains and traffic, consisting of the dispatchers' train sheets, the conductors' time returns and delay reports, the conductors' wheel reports; the train consists, the dispatchers' letters and message files, the yardmasters' log books at the Yuma, Tucson and Lordsburg terminals, and all other necessary records were gathered and placed at the disposal of the dispatchers, who were relieved of other duties and gathered together as a working party for a period of several months. The redispatching work was then performed directly from the original train-sheet records of the actual movements.

Sines, R. 1402-1403, 1426-1427.

The work was done with great care and accuracy; the methods were sound; the assumptions reasonably made were wholly justified; and the results are unimpeachable. *All of the underlying records, together with the working papers, including the redispatched train sheets and the white work sheets (Exhibit 198, R. 3115) upon which were recorded, side by side, the actual and redispatched movements, were tendered to and accepted by the appellee's counsel, for examination and study, and were retained (and presumably, closely studied) by them for substantial periods; but no opposing testimony was offered, challenging in any way the accuracy, as to either detail or result, of the redispatching studies, or criticizing the soundness of the methods employed.* No serious question was raised during the trial as to any of the assumptions necessarily made for the purposes of the studies. *It may properly be said that, in so far as its methods, details and*

mathematical results are concerned, the redispatching studies rest upon a secure and unshaken foundation, and stand unchallenged in the record.

Appellee's counsel have suggested, however, that the redispatching studies should be regarded as purely imaginary, in that the redispatched trains were never operated except "on paper"; that consequently no worthwhile showing of actual results is possible. We doubt whether this criticism was seriously intended; in any event, it was properly regarded by the trial court as entirely without merit. The redispatching studies are no more imaginary than any other reliable calculation which results from the use of standard methods, and is made by experienced and qualified experts, who base their conclusions upon careful surveys of all of the relevant factors.

The long-train operating practice is not imaginary or merely potential. It has been developed by the appellant, in common with practically all of its competitors and connections; and it is now followed on every part of the appellant's system, except in Arizona and the immediately adjacent territory. Appellant's officers, particularly the men who made the redispatching studies, are fully familiar with long-train operations, the methods by which they are carried on, and the results which follow. It required no effort of the imagination for them to apply their knowledge in order to reconstruct the handling of a known and definite movement of traffic, as to which a complete and continuous record was available, when all of the conditions governing the movement were either known, or capable of being readily determined from broad experience.

Many situations comparable to those presented by the redispatching studies can be thought of; the following may serve as an example:

Suppose an individual owns several office buildings, located in various parts of the same city. All of these buildings, except one, are of 10 stories or more; one is limited to 7 stories, because of a local ordinance. All have been designed by the same architect and built by the same contractor. The owner wishes to find out the cost of adding 3 stories to his 7-story building in the event the ordinance should be repealed or set aside, and whether, from the standpoint of income and operating costs, the outlay would be justified. He calls in the architect and contractor, asks them to prepare plans and estimates, and draws upon his operating and income experience with all his buildings. Could such an estimate be called unreliable or imaginary, or an unsatisfactory foundation for a decision by the owner as to the practicability of the proposed investment? On the contrary, men in every-day transactions use such estimates as the bases of their business decisions. In fact, municipal zoning ordinances, which are nothing more than police-power regulations of the same character as claimed for the Train-Limit Law, have been set aside or modified, largely or entirely upon the basis of showings by property owners of contemplated uses not permitted by the challenged ordinances, and consequent deprivations, measured in money; although no buildings had actually been constructed on the lands affected.

The redispatching studies are nothing less than careful surveys of the changes in operating methods which will follow if the restrictions are removed, and determinations

of the results thereof, based upon the application of known factors and actual experience to known and determined movements of traffic. They are at least as accurate as would be the study and estimate of the costs of construction and operation of the addition to the 7-story building, above cited for the purposes of illustration, and equally above the criticism or suggestion of being imaginary.

It is important to note that while the redispatching studies represent weeks and even months of detailed study and analysis by the individuals who participated in and presented them to the trial court, the basic problems were, nevertheless, comparatively simple. Essentially, the studies are comparisons between train operations, with the maximum lengths permitted by the law, and operations with maxima of 100 or 125 freight cars, and whatever convenient number of passenger cars might be required. It is beyond controversy, and indeed obvious without analysis, that the handling of the same quantity of traffic in longer trains will result in fewer train miles and train interferences, and less operating expense. While the redispatching studies may appear to be complicated, in that the review of a multitude of details was required, they are really quite simple; for they involve only the four basic arithmetical operations: (1) *dividing* a given amount of traffic into short trains, and again into long trains; (2) *adding* the number of train miles thus required; (3) *multiplying* the train miles by known costs, and aggregating the separate costs, so as to produce a lump sum for each method of operation; and (4) *subtracting* the total for one method from the total for the other. All of these are elementary

operations, with which opposing counsel have no quarrel, and in fact could not quarrel.

It may also be pointed out that in so far as the redispatching study involves the determination of the additional train service required by compliance with the law (or alternately the train service saved by noncompliance), or the number of interferences thus contributed, the problem was even simpler than stated, for the multiplication by unit cost factors became unnecessary.

The redispatching studies present probably less favorable results, and thus a lower estimate of the savings in train service and expense, than would actually be realized. For example, in the 1938 redispatching study, all delays due to locomotive defects, which occurred in actual operation, were also taken into account and assigned to redispatched trains; although a considerably less number of redispatched trains were operated, and fewer locomotives were used, with consequent less opportunity for the occurrence of locomotive failures. Again, the times allowed for inspections of the redispatched long trains by train crews were substantially greater than actually used in corresponding inspections of short trains. No saving in time or delay was assumed for the redispatched trains on account of assumed non-occurrence of accidents or casualties occurring in connection with the starting and stopping of trains although obviously with the fewer and longer trains, there would be much less starting and stopping and much less opportunity for such accidents. On the contrary, all starting and stopping accidents, and all delays incident thereto, which occurred on short trains, were

reproduced and respectively assigned to redispatched long trains, operating at or near the places and times of the short trains on which such delays occurred. No account was taken, in the redispatching studies, of any savings in yard or terminal expense which might accrue from the operation of fewer and longer trains; although it is apparent that with long-train operation, trains would undergo much less switching and reconsisting at Yuma and Lordsburg than with short-train operation. No account was taken of the considerable saving in switching operations of passenger trains at Yuma and El Paso, although again it is obvious that such switching expense would largely be saved with long passenger-train operation, although now occurring frequently where trains have to be readjusted to the 14-car limitation. It is clear that the results of redispatching studies are at least conservative, and understate rather than overstate the savings in train service, expense, delay, and interference which would follow if the restrictions of the law were removed.

Sines, R. 1420-1428, 1448-1450, 2234.

We have referred above to the fact that the redispatching studies follow methods previously employed in both the *First Arizona Train-Limit Case* and the *Nevada Train-Limit Case*. The studies in those cases were conducted largely in the same manner as in the instant case: that is to say, under the direct supervision of a member of the executive staff, the actual work of redispatching the trains being performed by the chief train dispatchers having jurisdiction over the operating divisions and subdivisions affected or threatened to be affected by the Arizona

and Nevada laws. The Arizona redispatching studies received the favorable comment and approval of the United States District Court for Arizona; that court having said in part, in its final opinion in that case (2 Fed. Supp. at p. 862):

> "The financial burden imposed upon the plaintiff by the Arizona law is another important question. * * * The bill of complaint of the Southern Pacific Company alleges that its cost study shows that by long train operation on its main line between Indio, California, and El Paso, Texas, via Maricopa and Lordsburg, their freight train expenses could be reduced over $400,000.00 annually. * * * Vaile S. Andrus, assistant to the Vice President, conducted the Southern Pacific study, and the evidence shows that * * * (he) * * * has had vast experience in that line of work. (He) prepared work sheets containing 33 items necessary to be considered in making a careful estimate, including tonnage, number of cars in the various trains, time of departure and arrival and mileage traveled by all locomotives in connection with the movement of traffic. Timekeepers inserted the wage information called for by the work sheets, including wages of engine men on train engines, double-header engines, helper engines while double-heading and wages of train men. There is also an estimate of fuel consumption and many other factors. * * * The showing of estimated savings for the Southern Pacific Company is $417,858.81. These estimates seem to be accurate and reliable and to fully justify and establish the allegations of the bills on this question."

In the findings adopted by the United States District Court for Nevada, in the *Nevada Train-Limit Case*, that

Court, in referring to the Nevada redispatching study, said in part:

> "* * * The redispatching study was carefully conducted under the direct supervision of experienced and qualified operating and executive officers of the plaintiff, by chief train dispatchers who now and for many years past, have supervised the operation and movement of plaintiff's trains on the Nevada lines. The result of this study presents as accurate a determination as possible of the effects of the law in the following particulars: (1) in requiring additional train service to be operated by plaintiff on the Nevada lines; (2) in creating or aggravating delays to and interference with plaintiff's trains and cars and the traffic transported therein; and (3) in imposing additional expense upon plaintiff's operations."

(b) INTERFERENCE WITH AND DELAYS TO INTERSTATE TRAFFIC (R. 3953-3962).

The question whether the law causes and creates delays to and interferences with the handling of traffic and movement of trains upon appellant's lines in the affected territory is one of the important issues of the case. It is presented by the allegations of paragraphs 3(f) and 3(h) (R. 13-15), and 6 (R. 22-23), of Part III of the answer.

Appellant's showing upon this issue was very complete; on the other hand, appellee offered but little testimony having any bearing thereon, and that testimony tends to confirm appellant's showing.

The delays to and interferences with the traffic and the trains handled in the affected territory are of three kinds. As enumerated in the findings they are: (1) interferences with and delays to cars and trains at terminals, principally at points outside of or at the boundary of Arizona, at which trains moving toward Arizona are reduced to sizes conforming to the law, and trains moving from Arizona built up, from 70 cars or less to the greater lengths prevailing in the adjoining states; (2) delays to individual cars, as distinguished from trains, at terminals and other stations; and (3) interferences with and delays to trains while en route, due principally to the increased number of meets and passes created by the operation of the increased number of trains compelled by the law.

(1) Terminal delays (R. 3953-3957):

The nature and character of terminal delays occasioned by the law are set forth in considerable detail in the subparagraph of this finding which carries the above title.

The evidence cited in the finding, relating to delays incurred at points on the boundary of or just outside of Arizona for the purpose of reducing or building up trains, shows that these operations are performed at Yuma on the west, and Lordsburg and Rodeo on the east; except that in many cases, particularly where passenger trains are involved, such trains are made up and broken up at El Paso, on the east. It is immaterial, however, whether these operations be actually performed at the stations mentioned, or at some other stations either nearer to the boundary line on the east or beyond the boundary line on the west. The reasons for selecting Yuma, Lordsburg

and Rodeo, in the case of freight trains, as the points of make-up and break-up of trains are simply that the yard and other facilities required exist at those points.

The reasons that El Paso is the point of make-up or break-up of passenger trains to or from Arizona are twofold. First of all, it is a terminal point where the facilities exist; second, it is a junction point of the lines through Lordsburg and Douglas, so that cars from a westward train which exceeds the limit can, in some cases, be shifted to another westward train proceeding over the alternate route, thereby avoiding at times the operation of extra sections. Similar considerations govern in the case of eastbound passenger trains.

The construction of a terminal nearer to the state line than Lordsburg, if not impracticable because of topography, would at least be difficult and expensive; moreover, the operation of a terminal at the state line would entail serious difficulties because of the grade (approximately 1.4 per cent) at the point where the Tucson-Lordsburg line crosses the boundary.

The delays incident to making up and breaking up trains are not so directly associated with the points at which the operations take place, as with the character and extent of the operations required. These delays are not avoided by shifting the scene of the operations; they are necessarily and inevitably the result of the compulsion of the law, in that trains entering Arizona must be reduced to the permitted size before they proceed across the state, while those leaving or about to leave the state must, as a matter of economic necessity and in order to avoid addi-

tional expense and train interferences, be brought up to the larger sizes which make for efficient and economical operation.

It is especially to be noted that appellee has not asserted that the methods of operation now followed by appellant, and dealt with at length in the testimony and in this portion of the findings, are not proper and economical; that is to say, appellee does not contend that the most efficient, economical, and logical method of complying with the law is to follow the present long-train method of operation in the adjoining states, and to bring long trains approaching Arizona as near to the boundary as practicable before reducing them, while building up trains which have left Arizona into long trains as soon as possible.

It will be noted, and indeed the finding emphasizes, that the delays and interferences incident to observance of the law in connection with freight trains approaching Arizona from the east, or leaving Arizona at the eastern boundary line, are experienced at points outside of the state; in other words, that all such delays and interferences are extra-territorial. Similar extra-territorial effects are avoided at the westerly boundary only because appellant has for many years followed the practice of operating its long freight trains into and out of Yuma, and there performing the reconsisting operations, even though the yard at Yuma is well within the boundary of Arizona. Appellee's counsel appear, in effect, to concede that this is the logical and proper method of operation, and that the law could be complied with otherwise, only

by running short trains over the lines west of Yuma, to and from some station where they might be reduced or built up in the same manner as presently followed at Yuma (R. 1918). To follow such a method would, of course, transfer the delays to a point outside of Arizona, and thus give the law extra-territorial effects similar to those experienced at Lordsburg, Rodeo and other stations east thereof; but it could not conceivably eliminate or even reduce the delays at all. The burden of extra-territorial expense imposed by the law would, of course, also be materially increased over and above what is now experienced, as set forth in subparagraph (b) of this finding.

We ask the Court to note particularly that the delays to trains and cars incurred at Lordsburg and points east thereof, as set forth in the subdivision of this finding carrying that sub-heading, are wholly extra-territorial and can be avoided, in so far as eastbound trains are concerned, only if the 70-car restriction is observed for the entire 171 miles between Cavot and El Paso. In practice, and because the great preponderance of the eastward trains arriving at Lordsburg contain perishable freight and, in many instances because of schedule requirements, cannot be held at that point for consolidation, a large proportion of the trains arriving from the west at Lordsburg with 70 cars or less are run through Lordsburg, and all the way to El Paso, without being built up.

Cars intended for westbound movement into or across Arizona, particularly refrigerator cars which at times are urgently required, are nevertheless delayed at Lordsburg

and points east thereof, solely because trains must be reduced to 70 cars at that point, and the surplus cars held to await movement on following trains. It frequently happens that space is not available on trains immediately following, and special trains must be run when locomotives and crews are available at Lordsburg. At times the storage space at Lordsburg available for these empties is completely filled; in which event the cars are stored at Deming or Strauss, N. M., or even at El Paso, until such time as they can be moved in trains conforming to the Arizona restriction. These delays are, of course, wholly extra-territorial in character, and emphasize the widespread effect of the law.

Sines, R. 66-69, 1721-1723, 1795-1797, 2076-2082, 2246-2247; *Baker*, R. 1294-1295, 1305-1307; *Herrell*, R. 1493-1497; *Herbert*, R. 2070-2075.

Exhibits 1 (R. 2851), 175 (R. 1284), 185 (R. 3077), 215 (R. 3199), 297 (R. 3426).

(2) Delays to trains en route: Meets and passes (R. 3957-3958):

Meetings and passings of trains are necessary incidents of train operation and they cause delays to the trains involved or at least some of them; for when a meet or pass occurs between two trains, one of the two must take siding, and occasionally it must wait, after clearing the main track, for a considerable time until the other train has either arrived or left. Naturally, however, an effort is made by appellant's operating officials to reduce delays at meetings and passing points to the minimum. Apart from the mere factor of delay, meets and passes are a source of hazard to trainmen, because

of the additional stops, and the necessity of mounting and dismounting trains while in motion in order to open or close switches.

In fact, at least one of appellee's witnesses agreed that the most desirable operation occurs when a train is able to proceed from terminal to terminal, with as few stops for meets or passes, or other purposes, as possible.

Ash, R. 2596; *Durnil*, R. 2372-2376.

The Train-Limit Law causes the numbers of meets and passes to be greatly increased, simply because it compels a substantially greater number of trains to be operated. An increase in the number of trains increases the number of meets and passes involved in the operation, not merely in direct proportion to the increase, but practically in proportion to the square of the total number of trains.

The formula which determines the number of meets and passes which will occur in conjunction with operations over a particular district (as, for example, between Yuma and El Paso via Gila, Tucson and Lordsburg) is capable of mathematical determination; and in this case that formula was carefully and accurately determined for the district just mentioned, by means of a series of computations predicated upon actual operations as shown on the original dispatcher's train sheets. Applied to the instant case, the formula gives the following results: The operation of 4,304 additional freight trains, during the year 1938, over the principal main line between Yuma and El Paso via Gila and Lordsburg, which additional trains were run solely because of the restrictions of the

law and would have been eliminated if the law were not in effect, created about 16,500 additional meets and passes, which would not have occurred if long-train operation had prevailed; or, alternately expressed, an increase of about 28.4 per cent over and above the number of trains (both freight and passenger), which appellant would have run if it had not been for the law, caused an increase in the total number of meets and passes, between all trains operated, amounting to about 63.0 per cent.

Exhibits 220 (R. 3210), 298 (R. 3427).

The effect of the increased number of trains, in the way of added train interferences due to the greater number of meets and passes, is shown graphically upon the chart of train movements received in evidence as Exhibit 220. This exhibit traces the movement of every freight and passenger train operated on the Yuma-Gila-Lordsburg-El Paso line during the twenty-four hours, midnight to midnight, on June 18, 1938; that day being selected because it was the day of heaviest movement in June, 1938, which month was, in turn, the month of heaviest traffic volume in that year. Side by side with the chart of actual movement, upon that exhibit, are charted the trains operated during the same twenty-four hour period, as they appear on the redispatched train sheets of the redispatching study. Although this exhibit was the subject of considerable cross-examination by appellee's counsel, who were also furnished the underlying data from which the exhibit was made, and in fact retained that material in their possession for some time, no opposing testimony was adduced, nor was the essential accuracy of the exhibit challenged, except in minor details.

Appellee's counsel affected to regard our exhibits and testimony relative to the increased number of meets and passes as speculative and theoretical, apparently believing that the computations thereby presented to the Court were of little value. These computations, and the results therefrom submitted to the Court, present a purely mathematical calculation based upon a series of observations, from which is deduced a precise mathematical formula. That formula is no more speculative or theoretical than any other natural mathematical law: for example, the mortality tables, upon which are based the fundamental calculations of the life-insurance companies; the experience tables of fire and casualty insurance companies; the basic formulae used in the highly accurate science of naval gunnery; the formulae relative to the flow and measurement of water; or the formula representing the law of gravity. It is no more difficult for a competent engineer or mathematician to calculate the formula which will represent the normal and expected incidence of the meets and passes for a particular district or territory, given an adequate number of observations on which to base that calculation, than for the same or a similarly competent engineer or mathematician to calculate any other formula which he may need as to the strength, behavior, or occurrence, of natural phenomena; provided only a sufficient number of observations have been made. Since there is no question in this case as to the competency of the engineer who made the calculations, nor the adequacy of the observations taken from actual experience, the correctness of the result is not open either to challenge by appellant's counsel or to the suggestion or inference that it is speculative.

It is quite true that the mathematical method of calculating as closely as possible the exact number of additional meets and passes created by compliance with the law employs an analytical process with which the ordinary layman is not familiar; and this very fact may have influenced opposing counsel and inspired their suggestions. Nevertheless the basic principle remains, and is not challenged in any way, that an increase in the number of trains operated brings about a disproportionately greater increase in the number of meets and passes, with the attendant delays, interferences and hazards. Therefore, even giving every effect to counsel's criticism, there is still no avoidance of the result that the operation of the additional trains compelled by the law (and we emphasize that the undoubted effect, if not the outspoken purpose, of the law is to compel such additional operation) brings about a very much larger increase in the number of meets and passes. Whether this increase is 16,500, on the principal main freight line via Gila and Lordsburg, because of the operation of 4304 additional trains, or as few as 10,000 or as many as 20,000, is perhaps unimportant; the important fact is that the law necessarily creates these additional delays, interferences and hazards, although they could readily be avoided by removing the restrictions on the train lengths, and thus reducing the number of trains operated.

Herbert, R. 1341-1342; *G. C. Baker*, R. 1463; *Sines*, R. 1731-1745, 2086-2090, 2231-2234, 2281-2282; *Durnil*, R. 2375-2377; *Menzies*, R. 2819.

Exhibits 220 (R. 3210), 226 (R. 3215), 298 (R. 3427).

(3) Delays to and interferences with passenger trains and traffic (R. 3959-3960):

The finding carrying the above sub-heading is predicated upon the elaborate studies of trains and traffic introduced as Exhibit 199 (R. 3116), as supplemented by the supporting oral testimony and certain other exhibits.

The delays to and interferences with passenger trains and traffic are much more widespread, and particularly experienced to a much greater degree outside of Arizona, than in the case of freight traffic. The very nature of passenger traffic renders these results inevitable, and they are accentuated by the fact that the limitation (14 cars) is so comparatively small. It is not possible, in passenger-train operation, ordinarily to set out excess cars at a station at or near the state boundary with the purpose of having them moved on some following train; nor is it possible ordinarily to stop short trains at or near the state boundary for the purpose of consolidating with other trains. Such set-outs and consolidations, if made, must be at points such as El Paso or Yuma, where alternate routes converge and other passenger trains are available to handle the excess cars. If set-outs are made at points or at times where other trains having capacity to handle the excess cars are not available, extra sections must be made up and run, thus contributing additional train interferences and possible delays. Necessarily, the operations of reswitching trains at points where cars are set out or picked up involve delays, not only to the trains themselves, but in even greater degree to the cars.

It also sometimes happens that cars at intermediate points such as Phoenix or Tucson, and occasionally Yuma, intended for movement in particular passenger trains, must be left behind to follow on some other train, or handled as a special movement, solely because the train in which they were intended to be handled is already at the limit when it arrives at the station. Special movements of large parties who, with their baggage and other property, occupy more than 14 cars cannot be made in single passenger-train units across Arizona; the trains must either be broken up or, as sometimes happens, the entire movement diverted to some other line (usually a competitor) which is not compelled to observe a 14-car restriction.

Mahoney, R. 1049.

The finding sets forth the detail of the various interferences taking place during the year 1938. It is shown that these interferences occurred 222 times during that year, and involved 359 trains, and that a substantial proportion of the interferences were at points outside of Arizona. The correctness of this showing was not challenged by appellee, nor was there any opposing testimony.

G. C. Baker, R. 1306-1309; *Sines*, R. 1364-1367, 1449-1450, 1517-1526, 1805-1812, 2226-2230.

Exhibits 187 (R. 3079), 188 (R. 3081), 199 (R. 3116-3148), 230 (R. 3228).

(4) Summary of effect of delays and interferences (R. 3961-3962):

The combined results of all the delays to and interferences with freight traffic caused by the law, as well as

any speeding-up which long-train operation might permit, are set forth in Exhibits 227 (R. 3217), 228 (R. 3223), 237 (R. 3235), 238 (R. 3240), 243 (R. 3248) and 244 (R. 3252), the substance of which is stated in the finding bearing the above caption. These exhibits present the results of the redispatching study for June and August, 1938, and the other redispatching studies for April, 1940. Comparing the number of trains and traffic handled in the redispatched trains with movement of the same traffic as it took place and was recorded upon the train sheets of actual movement, they demonstrate that if the law had not been in effect in 1938, and appellant had then been able to operate its freight trains free of the 70-car restriction and with the changes in power assignments, siding capacities, and other facilities contemplated in connection with the 1938 redispatching study, the scheduled and identified fruit blocks and manifest sections operated during June and August, and individual cars handled in that month, would have spent less time en route on the average between El Paso and Yuma, and arrived upon or ahead of scheduled times more frequently, and late on schedule less frequently, than was the case in actual experience with the short-train operation.

The first 1940 redispatching study, which relates to the limited long-train operation actually undertaken during the period April 4th to April 30th, 1940, shows, according to the summaries presented by Exhibits 237 (R. 3235) and 238 (R. 3240), that the redispatched short trains made slightly better times, on the average, than the actual limited long-train operation. Eastward, out of 185 blocks

and manifest sections involved, 134 made the same times as the actual; 40 made slightly better times; and 11 arrived on the average a little later. The total time gained by the 40 redispatched blocks which arrived earlier was 38 hours, 55 minutes; the total time lost by the 11 redispatched blocks which arrived later was 8 hours and 10 minutes. Of the 185 actual trains involved, however, all but five arrived at El Paso on or ahead of schedule; and only two of the five were more than 15 minutes late. Westward there were 96 blocks and manifest sections involved; all but 14 of the redispatched blocks made the same times, 8 arriving in advance of the actual, and 6 later than the actual. This comparison, it may be emphasized, was between a short-train operation in conformity with the law and a limited long-train operation, which was inevitably hampered by the absence of the adequate siding capacities necessary for satisfactory long-train operation and the non-availability of the proper types of locomotives to handle the heavier trains most efficiently. The results which would obtain, however, if long-train operation with proper facilities had been conducted in April, 1940, are shown on Exhibits 243 (R. 3248) and 244 (R. 3252). Exhibit 243 shows that out of 179 blocks and manifest sections involved, 106 made better time and only 60 made poorer time eastward than in actual operation, while out of 96 blocks or manifest sections operated eastward, 24 made better time than actual, and only 17 made poorer time. The average variation from the actual time of both those arriving earlier and those arriving later than actual was only slightly more than 20 minutes.

Sines, R. 1790-1800, 1835-1839, 1852-1857, 1868-1871.

The results shown on Exhibits 243 and 244 confirm very strongly the direct comparison between restricted operations, and long-train operations with proper facilities, as set forth on Exhibits 227 and 228. They demonstrate the truth of the allegation, found in paragraph 3(e) of Part III of the answer (R. 12), that the practice of standard long-train operation does not retard, but on the contrary expedites materially, the movement of traffic, and does not delay but on the contrary promotes and makes possible the early delivery of such traffic.

(c) REDUCTION IN TRAIN LENGTHS: INCREASE IN NUMBER OF TRAINS OPERATED (R. 3962-3966).

(1) Freight train operations (R. 3962-3965):

This finding sets forth the undisputed fact that the enforcement of the law causes and will continue to cause both the average and the maximum lengths of the freight trains operated in the affected territory to be greatly reduced, and correspondingly compels the operation of a substantially larger number of trains and necessarily a substantially greater number of train miles and locomotive miles, than would be necessary for the handling of the same total volume of traffic if it were not for the law.

The finding also contains a statement, which we again emphasize, that the effects of the law in this respect are not confined to Arizona, under the methods of operation now followed in order to comply with the law. The 70-car restriction is completely effective, and train lengths are completely controlled thereby, as far east as Lordsburg and Rodeo, New Mexico. To a large extent the law also controls the lengths of trains as far east as El Paso.

The exact extent of the effects of the law upon average train lengths is set forth graphically upon Exhibits 215 (R. 3199), 235 (R. 3232) and 241 (R. 3245). The substance of those exhibits is stated in the findings, and to avoid repetition we here reproduce the exhibits. We call especial attention to the showing of the effect of the law in the district between the Arizona-New Mexico line and El Paso.

The showing on these exhibits is based directly upon the redispatching study. The comparison on Exhibit 215 is between the average length of the trains operated during the months of June and August, 1938, and the length of the redispatched trains, shown on the redispatched train sheets and work sheets A (Exhibit 198, R. 3115), which handled the same traffic. The overall effect of the law, succinctly stated, as applied to 1938 traffic, was to cause the average length of the freight trains operated between Yuma and El Paso via Gila, Tucson and Lordsburg to be reduced from 90.1 cars per train, to 66.0 cars: a percentage reduction of 26.7 per cent (Exhibit 226, R. 3215). The comparison on Exhibit 235 is between the actual limited long-train operation of April, 1940, and a redispatched operation conforming to the law; while the showing on Exhibit 241 is between the actual limited long-train operation, and a long-train operation employing the proper facilities: that is to say, the more powerful locomotives, the longer sidings, and the other additions to permanent facilities which are referred to in Finding X(b) (R. 3948). The effect of compliance with the law in holding train lengths below the figures which would otherwise be obtained, as determined from the 1940 redispatching studies, may readily be seen by studying Exhibits 235 and 241

together. It will be observed that the figures representing actual operations, and the graphic representations of the actual operations, are identical in both exhibits.

The effect of the law, as it appears from the 1940 studies, is also shown on Exhibits 236 (R. 3233) and 242 (R. 3246). From these two exhibits, taken together, it appears that for the 27 days of April, 1940, the average train lengths between Yuma and El Paso via Gila and Lordsburg, if the law had been complied with, would have been 64.4 cars; whereas if long-train operation with larger locomotives and longer sidings had been undertaken the average train length would have been 85 cars: so that the reduction incident to compliance would have been 20.6 cars, or 24.3 per cent.

If the law had not been in effect during 1938, appellant could and would have handled the traffic which moved over the main line between Yuma and El Paso via Gila and Lordsburg and over the alternate line between Tucson and El Paso via Douglas with 4304 fewer freight trains. The actual additional operation caused by the law, expressed in train miles and locomotive miles, is shown on Exhibit 226 (R. 3215). Based upon the study of two months' operations, and expanding the figures by the appropriate ratio, it appears that the additional train miles required by the law amounted to 638,569; the additional locomotive miles to 798,424. Expressed in percentage, the law compelled appellant to operate 30.8 per cent more freight trains, and produce 33.1 per cent more freight-train miles, and 35.9 per cent more freight-locomotive miles, than would otherwise have been required. The additional

locomotive miles are somewhat greater in number than the additional train miles, because of helper-engine and light-engine movements which accumulate locomotive miles, but not train miles. For ready reference, particularly as showing the substantial proportion of the additional operation compelled by the law in the territory east of Lordsburg and Douglas, we here reproduce Exhibits 226, 236 and 242:

The showing on Exhibit 226 relates to the year 1938, as stated; but the accuracy of the showing thereon can readily be confirmed by examination of Exhibits 236 and 242. Those exhibits show that for the 27-day period short-train operation in compliance with the law would have required the running of 378 more trains than if "unrestricted" long-train operation had prevailed; the additional train miles produced would be 56,182, and the additional locomotive miles 74,329. The 27 days from April 4 to April 30, inclusive, represent a little more than 1/13th of all the days of the year 1940; and an approximation of the total amount of the annual savings by unrestricted operation can therefore be obtained by multiplying the figures for the 27-day period by 13. On this basis appellant would have saved approximately 5,000 trains, about 700,000 train miles, and about 900,000 locomotive miles, as compared to short-train operation, if it had followed unrestricted operation throughout the year 1940.

Sines, R. 1846-1852.

We ask the Court to note particularly the statement in the finding that 151,789 of the additional freight-train miles which the law compelled in 1938, or 23.8 per cent of

(1) - INCREASE

(1) YUMA - GILA DISTRICT: Decrease of 618 engine water cars and 25 deadhead cabooses, and increase of 70 loads which moved via Phoenix Line in actual operation and via Gila Line in redispatched operation, produces net decrease of 567 cars.

(2) GILA - TUCSON DISTRICT: Decrease of 338 engine water cars and 34 deadhead cabooses, and increase of 70 loads which moved via Phoenix Line in actual operation and via Gila Line in redispatched operation, produces net decrease of 290 cars.

(3) TUCSON-LORDSBURG DISTRICT: Decrease of 23 deadhead cabooses, 231 east empties and 642 west empties, which moved North Line in actual operation but South Line in redispatched operation, offset by an increase of 155 west empties which reached Tucson on the redispatch but which were left at Bowie on the actual, produces a net decrease of 741 cars.

(4) LORDSBURG-EL PASO DISTRICT: Decrease of 231 east empties and 642 west empties which moved North Line in actual operation but South Line in redispatched, offset by an increase of 17 deadhead cabooses in redispatched operation, produces net decrease of 856 cars.

(5) EL PASO - STRAUSS DISTRICT: Average cars per train computed for Strauss turnarounds in westward direction only (two trains in actual, and 28 trains in redispatch) as eastward trains were without cars.

(6) TOTAL NORTH LINE: Average cars per train computed, omitting El Paso-Strauss turnaround trains and cars handled by those trains.

(7) TUCSON - DOUGLAS DISTRICT: Increase of 231 east empties, and 642 west empties which moved North Line in actual operation but South Line in redispatched, plus 20 westward empties which reached Tucson on the redispatch but which were left at Douglas on the actual, plus 25 west empties which reached Tucson on the redispatch, but which were left at Rodeo on the actual in order to comply with the law, produces total increase of 918 cars.

(8) DOUGLAS - BISBEE JCT. (Turnaround trains only): Increase of 231 empties handled Douglas to Bisbee Jct., by redispatched turnaround trains to avoid helping redispatched through westward trains Douglas to Bisbee Jct.

(9) DOUGLAS - EL PASO DISTRICT: Increase of 231 east empties and 642 west empties which moved North Line in actual operation but South Line in redispatched, plus 25 westward empties which reached Douglas (and Tucson) on the redispatch, but which were left at Rodeo on the actual in order to comply with the law, produces a total increase of 898 cars.

(10) TOTAL SOUTH LINE: Average cars per train computed omitting Douglas-Bisbee Jct., turnaround trains and cars handled by those trains.

(11) TOTAL NORTH AND SOUTH LINES: Average cars per train computed omitting Strauss and Douglas-Bisbee Jct., turnaround trains and cars handled by those trains:-

ACTUAL:	4	Strauss turns with	200 cars
	52	Douglas-Bisbee Jct. turns	2,851 cars
	56	trains omitted with	3,051 cars
REDISPATCH:	56	Strauss turns with	2,800 cars
	52	Douglas-Bisbee Jct. turns	3,082 cars
	108	trains omitted with	5,882 cars

D - Indicates Decrease

(1) Yuma - Gila District: Increase 20 additional engine water cars east, 20 additional deadhead cabooses, 21 additional engine water cars west, and 95 west empties which moved via Phoenix Line in actual operation, and via Gila line in redispatched operation, total 156 cars.

(2) Gila - Tucson District: Increase 12 additional deadhead cabooses east, 21 additional engine water cars west, and 95 west empties which moved via Phoenix line in actual operation and via Gila line in redispatched operation, total 128 cars.

(3) Tucson - Lordsburg District: Increase, 14 additional deadhead cabooses and 57 west empties which moved via south line in actual operation and via north line in redispatched operation, total 71 cars.

(4) Lordsburg-El Paso District: Increase 57 west empties which moved via south line in actual operation and via north line in redispatched operation.

(5) Increase - sum of (1), (2), (3) and (4) in column (a) on sheet 1.

(6) Tucson-Douglas (Through trains only): Decrease account 57 west empties which moved via south line in in actual and via north line in redispatched operation, and 8 loads, 4 empties, which moved on eastward Bisbee Jct. turnaround train in actual operation and on eastward through train in redispatched operation, produces net difference of 45 cars.

(7) Douglas-Bisbee District (Turnaround trains only): Decrease account 33 west empties from Douglas and 30 west empties from Calumet which were moved on turnaround trains in actual operation, and by through trains in redispatched operation, and 8 loads, 4 empties which were moved by an eastward turnaround train in actual operation and by a through eastward train in redispatched operation, total 65 cars.

(8) Douglas-El Paso District: Account 57 west empties which moved via south line in actual operation and north line in redispatched operation.

(9) Average cars per train computed for total south line omitting 48 Douglas - Bisbee Jct. turnaround trains and cars handled by those trains. (Actual 3,171 cars; redispatched 3,106 cars.)

(10) Average cars per train computed for total north and south lines omitting 48 Douglas - Bisbee Jct. turnaround trains and cars handled by those trains. (Actual 3,171 cars, redispatched 3,106 cars.)

I - Indicates Increase

(Sheet 2 of 2 sheets)

(1) Yuma - Gila District: Decrease of 156 engine water cars east, and 167 west; increase of four deadhead cabooses east. Total decrease of 319 cars on the redispatched trains.

(2) Gila - Tucson District: Decrease of 112 engine water cars and 4 deadhead cabooses.

(3) Tucson-Lordsburg District: Decrease of 14 deadhead cabooses east and 2 west. Total decrease of 16 cars on the redispatched trains.

(4) Lordsburg-El Paso District: Increase of 2 deadhead cabooses east, and 1 west. Total increase of 3 cars on the redispatched trains.

(5) El Paso - Strauss: Average cars per train (redispatch) computed for Strauss turnarounds by omitting 12 trains in the eastward direction as those trains handled none of the 1,057 cars, (all of these cars moved westward).

(6) Average cars per train (redispatch) computed omitting 24 El Paso - Strauss turnaround trains and 1,057 cars handled by those trains.

(7) Average cars per train computed for total south line omitting 48 Douglas - Bisbee Jct. turnaround trains and 3,171 cars handled by those trains.

(8) Average cars per train for total north and south lines omitting Strauss, and Douglas - Bisbee Jct., turnaround trains and cars handled by those trains

ACTUAL	No Strauss turnarounds	
	48 Douglas-Bisbee Jct. turnarounds with	3,171 cars
Total	48 trains omitted	3,171 cars omitted
REDISPATCH	24 Strauss turnarounds with	1,057 cars
	48 Douglas-Bisbee Jct. turnarounds with	3,171 cars
Total	72 trains omitted	4,228 cars omitted

the total, were produced in New Mexico and Texas. The 1940 studies show that about 21.4 per cent of the additional freight-train miles which the law would have required, contrasting full compliance with unrestricted operation, would have been produced extra-territorially in New Mexico and Texas.

The figures of additional train miles, both within Arizona and extra-territorially, set forth in Finding X(c), are based upon the redispatching study; however, they find confirmation in another independent computation which appears in the record. We refer to Exhibit 181 (R. 3073), which shows the traffic handled on the Tucson Division, measured in freight-car miles, the train miles required, and the average cars per train thus obtained, for the years 1925 to 1939, inclusive. The exhibit also shows the average train lengths which prevailed on the Salt Lake Division during the same years, and the number of train miles which would have been produced on the Tucson Division, if the average train length had been equal to that obtained on the Salt Lake Division. The differences between the train miles computed as last described, and those which were actually produced, represent the excess train miles incident to the compelled short-train operation on the Tucson Division. For 1938, the "excess" train miles thus derived amounted to 564,717. When it is considered that this figure relates only to operations between Yuma and Lordsburg, not including any operations on the Douglas main line, it serves to confirm very closely the showing on Exhibit 226. That exhibit shows a total train-mile saving for the main-line districts west of Lordsburg, not including the Phoenix line, of 92,675 train

miles for the two months of June and August; which figure, duly expanded to the annual basis as heretofore explained, produces a saving of 515,757 train miles for the districts mentioned, capable of accomplishment by unrestricted long-train operation. The variation between this figure and that obtained from the redispatching study is less than 9 per cent, which is readily accounted for when we remember that the calculation on Exhibit 181 takes into account all operations on the Tucson Division, including the alternate or auxiliary main line, and the branch lines; whereas the figure taken from the redispatching study relates only to operations on the principal main freight line between Yuma and Lordsburg via Gila and Tucson.

This finding likewise rests upon testimony not controverted in the least by appellee. It is directly material to the important issues presented by subparagraphs (f) and (g) of paragraph 3 of Part III of the answer (R. 13-15); and it also leads up to the succeeding finding, relating to the additional expense imposed upon appellant in the affected territory, by reason of its enforced compliance with the law.

(2) Passenger-train operations (R. 3965-3966):

This finding is a companion to Finding X(c)(1), setting forth a summary of the showing of record as to the effects of the law in restricting the lengths of passenger trains and compelling the operation of additional trains. The total of the compelled additional passenger-train service in 1938 amounted to 14,218 train miles, 3,900 of which were

extra-territorial, and 18,860 locomotive miles, 5,042 of which were extra-territorial.

There is no question of the practicability of long passenger-train operation in Arizona. The experience of March and April, 1940, is of itself a sufficient demonstration; but if it were not, the fact that appellant regularly and continually operates long passenger trains across Nevada and Utah, under conditions which are certainly no more favorable than in Arizona, amply attests the practicability of long passenger-train operation in Arizona.

Sines, R. 1365-1367, 1804-1912, 1815-1817, 1860-1863.
Exhibits 187 (R. 3079-3080), 188 (R. 3081), 230-232 (R. 3228-3230), 246 (R. 3255).

This finding responds to the essential allegations contained in paragraph 4 of Part III of the answer, particularly subparagraph (c), (R. 18) and is supported by undisputed testimony.

(d) INCREASED ANNUAL EXPENSE OF OPERATION, ETC., IMPOSED BY THE LAW (R. 3966-3969).

The question of the added expense imposed by the law is of much importance.* It was the subject of lengthy testimony, including numerous detailed exhibits. The finding, although it presents with some completeness the items which go to make up the total of the additional expense which the law would compel, really condenses the testimony within a comparatively brief compass.

*As pointed out at various places in Volume I of this brief, the State Supreme Court has conceded, by inference at least (its opinion, R. 4062-4063), that appellant's enforced compliance with the law compels it "to expend great sums of money."

The first paragraph of the finding (R. 3966) undertakes to state its entire substance: viz., that the additional expense imposed upon appellant amounts to not less than $394,900 per year, all of which expense is and will continue to be recurring and irreparable, and could be saved and avoided if the restrictions of the law were removed. There can be no real question that the added expense, whatever its amount, is continuous and irreparable. The precise amount shown in our exhibits and stated in the findings may possibly be disputed; but that it is substantial, recurring, continuous, and irrecoverable, even though the law should be set aside, must be conceded. The very fact that this prosecution has been so vigorously sponsored by the interested railroad labor organizations shows that the amount of the wage item alone must be very substantial.

Most of the items which go to make up the total are not seriously questioned. These include in particular: (1) the wages of additional enginemen and trainmen, now incurred because of the additional freight trains compelled by the law, but which would not be incurred if such trains were not compelled to be operated, amounting to $285,653.42; (2) the additional passenger operating expenses, including wages, enginehouse expenses, locomotive supplies and locomotive repairs, incident to the additional passenger train service compelled by the law, amounting to $10,884.00 per year; (3) interest, maintenance, and depreciation charges upon the additional investment in 21 cabooses which would not be required if the law were disregarded, and are now required solely because of the

additional freight-train service compelled by the law, amounting to $8,747.00 per year.

Exhibits 225 (R. 3214), 229 (R. 3227), 231 (R. 3229).

The total of these undisputed items is $305,284 per year. They are somewhat offset, however, by the annual charges for interest, maintenance, and depreciation upon the additional facilities which appellant would construct or acquire in order to conduct long freight-train operations readily, efficiently and economically in the affected territory; that is to say, the extensions of yard tracks and sidings, the increased investment in larger locomotives, and the expanded roundhouse, water service, and shop facilities required for the proper maintenance and servicing of those locomotives. The total of these offsetting charges amounts to $87,752 per year.

Exhibit 225 (R. 3214).

In addition to the above mentioned items of savings, as to which there is apparently no dispute at all, there are two additional items of potential savings which appellee has sought to question: locomotive fuel; and locomotive repairs for locomotives in freight-train service. The saving in locomotive fuel during the months of June and August, 1938, for locomotives operating between Lordsburg and Yuma amounts to $17,352 (Exhibit 250, R. 3262), and for locomotives between Lordsburg and El Paso $2,660 (Exhibit 251, R. 3263), a total of $20,012; which when expanded to the annual basis, gives a total potential saving in locomotive fuel, on the basis of the 1938 traffic volume, amounting to $111,860. The derivation of the

figures showing the fuel saving for the year 1938, and also the corresponding saving achieved or capable of achievement by long-train operation during the period April 4th to 30th, 1940, are fully set forth on Exhibits 249, 250, and 251 (R. 3258-3263), and in the accompanying testimony (*Sines*, R. 1875-1891); and to save repetition we invite attention to the testimony. The potential fuel saving in the affected territory is based upon the showing of actual fuel savings achieved by long-train operations on other portions of the system; but the fuel saving shown for the affected territory is understated, being considerably less than actually achieved by appellant's long-train operations elsewhere.

The showing of potential savings in locomotive repairs is likewise based upon actual experience in the affected territory, and upon the system as a whole, for the types of locomotives presently in use and those contemplated for use in the long-train operation. Locomotive repairs are of two general classes: so-called "shop" repairs, as to which an accurate cost record is compiled, by individual locomotives and by types, for years and groups of years; and "running" repairs, where no such individual or type record is compiled, only the total amounts expended, by divisions and for the system, being recorded. Appellant thus has a record for each year of the cost of all locomotive repairs; and a record, by types and individual locomotives, of all shop repairs; and by experience can determine, on the basis of the relationship borne by all shop repairs to all repairs, the total cost of all repairs to a particular class or type of locomotive. Locomotive repair costs are calculated on the cents-per-mile basis, for each

mile operated by each class of locomotive. Since the locomotive miles actually run by the locomotives in freight service in the affected territory during June and August, 1938, were of course available, and the locomotive miles made by the various types used on the redispatched trains were also capable of being computed and were in fact compiled, there was no difficulty in obtaining, on the one hand, the computed aggregate cost of locomotive "shop" repairs of the locomotives actually run, or the corresponding computed aggregate cost of "shop" repairs of the locomotives handling the redispatched trains.

Sines, R. 1897-1913.

Exhibits 254 to 257 (R. 3260-3269).

The difference, amounting to $36,024 (Exhibit 317, R. 3435), represents the actual saving in shop repairs, which would have been achieved if long freight-train operation had been undertaken throughout the year 1938 in the affected territory. This figure, however, represents only 55.5 per cent of the total cost of all repairs; for the system experience over the last ten years shows that on the average running repairs are 44.5 per cent of the total locomotive repair bill (Exhibit 257, R. 3269). Expanding the figure of savings in shop repairs to a proper figure representing the savings in both shop and running repairs, the total is $65,500.00.

Adding together all of the potential savings, including the items of wages, fuel, locomotive repairs, caboose interest and maintenance, and savings in passenger train operations, and offsetting them by the added annual charges previously referred to, the net potential saving,

which is also the measure of the added annual expense imposed by the law, and which could be avoided if it were not for the law, amounts to not less than $394,900.

Extra-Territorial Portion of the Added Expense Imposed by the Law (R. 3968).

Just as a substantial proportion of the added train service compelled by the law is performed outside of Arizona, so a substantial proportion of the added cost incident to that train service is incurred extra-territorially. The concluding portion of Finding X(d) sets forth that that total extra-territorial expense, based upon the 1938 redispatching study, amounts to $94,600. The computation by which this figure is derived is comparatively simple. It consists merely of obtaining, in the case of freight service, the average cost per train mile for the particular items as to which a saving is established by the testimony, and applying that average saving to the extra-territorial train miles compelled by the law. A similar method is followed in computing the additional expense involved in extra-territorial passenger train operations.

Sines, R. 1894-1897.

Exhibits 232 (R. 3230), 253 (R. 3265), 299 (R. 3429).

Separate computations appear in the record, based upon the 1940 redispatching studies, showing the additional expense imposed by the law, both in the aggregate, and as related to extra-territorial operations. (Exhibits 256, R. 3268, 258, R. 3270, and 259, R. 3271). Without going into the detail of these exhibits, it may be said that, as stated in the concluding paragraph of the finding, they

confirm very closely the showing of additional expense based on the 1938 study.

XI.

SLACK AND SLACK-ACTION IN TRAINS: NATURE, CAUSE AND EFFECTS (R. 3969-3974).

Appellee's counsel, in the course of the examination of certain of its witnesses, laid considerable stress upon slack and slack-action in moving trains, as an alleged source of potential hazard and injury; taking the position that the length of a train, and that factor alone, determines the amount and severity of the slack-action, and that the challenged law has, as its purpose and result, the elimination of that supposed source of hazard by means of the fixed limits imposed upon train lengths. On the other hand, appellant sharply challenges this position and contention of appellee, and presented testimony, summarized in Finding XII, which shows the nature and extent of that alleged hazard, as reflected in the casualty and accident statistics.

The trial court concluded that it was essential that the findings should present a complete and accurate description of slack, and the slack-action associated therewith, as to their nature, extent and controlling factors; and accordingly it adopted Finding XI, wherein is summarized the testimony of witnesses for both parties on this phase. We see no need to argue this finding at length; the facts, as presented by the finding, are themselves the best argument. We shall, however, emphasize certain of the more

significant points developed by the record, and summarized in the finding.

(a) DESCRIPTION OF DRAFT RIGGING (R. 3969-3970).

This portion of the finding is based upon undisputed testimony, and is included primarily for the purpose of permitting a proper understanding of the following subdivisions. None of the facts set forth in this paragraph is questioned.

Exhibit 210 (R. 3194).

(b) ACTION OF DRAFT GEARS (R. 3970-3971).

This portion of the finding enumerates and describes the two types of gears, the tandem-spring type, and the friction type, now in use on freight cars, and explains briefly the means whereby these draft gears absorb and reduce the pushing and pulling shocks imparted to cars in the course of operation. This portion is likewise based upon undisputed testimony: primarily of Witness Bohnstengel, whose qualifications upon the subject matter are outstanding.

Bohnstengel, R. 1679-1698, 1705-1706.
Exhibit 210 (R. 3194).

The portion of the finding which states the amount of force which a friction draft gear can absorb, before the complete amount of the movement of which it is capable is produced (i.e., "complete closure"), is particularly significant because of the apparent contention of at least one of appellee's witnesses (*Purnil*, R. 2372) that there is a foot (12 inches) or more of slack in every car of a freight

train, when the train is running. The fact is that the total movement (or so-called "free slack", plus "controlled resistance") is much less than 12 inches in normal operation (apparently about 7½ inches); but whatever the amount it is not fully extended in a moving train by the pulling force of the locomotive.

(c) SLACK AND SLACK-ACTION DEFINED (R. 3971).

This paragraph of the finding consists simply of definitions, as to which there has been no dispute. It was included, apparently, for the purpose of avoiding the confusion, revealed at times in the testimony of appellee's witnesses, between "slack" (i.e., relative motion of the cars, on the one hand) and "slack-action", which, as the finding states, is the accumulated effect of that motion, as created or brought into play in train operation.

(d) FACTORS AFFECTING SLACK-ACTION: AMOUNT DEVELOPED IN OPERATION (R. 3971-3973).

This paragraph of the finding reproduces in summary form, statements made by appellant's witnesses, and confirmed by several of appellee's witnesses, principally in admissions made in their answers to cross-examination. It demonstrates that appellee's counsel err completely, when they suggest or contend that the extent and severity of slack-action, as experienced in train operation, depend entirely or even principally upon the number of cars in the train.

The fact is that a wide variety of circumstances affect or may affect slack-action; and the combination of these circumstances determines whether, when the opportunity for slack-action occurs, the action will be severe, or mild,

or possibly not developed at all. The principal factors which thus affect and determine slack-action are: the speed of the train at the time; consist of the train (whether loads or empties, and if partly loads or empties, the proportion of each); weights of the loads in the train; distribution and relative position of loaded and empty cars; grade upon which the train is running; whether the train is starting, accelerating, or slowing down; and the action taken by the engineer, in the use of the air brakes and the locomotive power.

The train length is of minor importance, compared to any of these other factors; if other conditions exist favorable to the development of severe slack-action, the result may be much more serious at the rear of a train substantially shorter than the law permits, than would be produced, under other conditions adverse to the development of shock, at the rear of a much longer train. The law, since it is only a "make-work" measure masquerading as a safety statute, cannot and does not attempt to take any of these other factors into account; and therein resides one of its most arbitrary and indefensible characteristics.

The contention or suggestion of opposing witnesses, that emergency stops of long freight trains almost always cause severe slack action at the rear end of the trains, with resulting injuries, or possibility thereof, to persons riding in the caboose, is likewise shown to be untenable by the testimony summarized in this part of the finding. The fact is that emergency stops of long freight trains, both desired and undesired, can and do occur without severe shock; on the other hand, as shown by the testimony sum-

marized in Finding XII and our discussion of that finding, emergency stops of short trains, when they occur, sometimes cause severe shocks with results which, from the casualty standpoint, are at least as unfavorable as those experienced in long-train accidents.

Bohnstengel, R. 1692-1697, 1701-1702; *Durnil*, R. 2390-2392; *Kennedy*, R. 2415-2416, 2429-2430, 2433-2437; *Cooper*, R. 2443-2446; *Stevenson*, R. 2489-2491, 2493, 2496, 2498-2501; *Ash*, R. 2576-2577, 2579-2580, 2596-2603; *Fail*, R. 2611-2613; *Shaw*, R. 2649-2650, 2652-2653; *Fifield*, R. 2786-2799, 2800-2804, 2805-2806; *Menzies*, R. 2815-2823.

Exhibits 210 (R. 3195), 266 (R. 3304), 270 (R. 3310-3335), 274 (R. 3351-3363), 275 (R. 3364-3370), 280 (R. 3375), 295 (R. 3424), 386 (R. 3533-3547), 387 (R. 3548-3557).

The contention that the challenged law results in eliminating or even reducing slack-action casualties is wholly unfounded. The ultimate test of that contention is found in the results of the regulation of train lengths in Arizona, as contrasted with the results of operation without that limitation in Nevada and other states. That analysis will be found in those parts of our proposed Finding XII comparing the Nevada, Arizona, and other slack-action casualties over a period of years. The experience with the Arizona law demonstrates that the mere limitation of length is quite ineffective for the purpose asserted by appellee. That ineffectiveness is plainly due largely to the fact that the law operates arbitrarily upon train length alone, without regard to the other factors enumerated in

subfinding (d), all of which may and do contribute to and determine the extent and severity of slack-action.

(e) SLACK-ACTION IN PASSENGER-TRAIN OPERATION (R. 3974)

The finding concludes with a brief paragraph relating to slack-action in passenger-train operation.

The evidence wholly fails to indicate that there is any hazard whatever, from a practical standpoint, because of slack and slack-action in passenger-train operation, no matter what the length of the train. It is particularly noteworthy that the showing upon this subject is almost entirely negative in character. Appellee was unable to point to any slack or slack-action casualties in passenger-train operation and in fact indicated, by the testimony of its only witness who discussed the subject, that such casualties rarely if ever occurred; and appellant's witnesses confirmed this showing. In the exhibits which describe and list the passenger-train casualties occurring in Nevada, Arizona and New Mexico, there are no casualties described as having occurred by reason of slack-action in a passenger train of more than 14 cars, occurring in circumstances where the operation of that train would not have taken place if the Train-Limit Law had been observed. There is no showing of any Nevada or New Mexico casualty occurring on a long train where slack-action was involved. There is a showing (Exhibit 294, R. 3423) of a claimed "sudden-jerk" injury to a woman passenger on a consolidated train in Arizona, consisting of 26 cars; but the train, though exceeding the 14-car limit, was within the provisions of the Arizona law, be-

cause of the exception permitting trains to be consolidated in the event of engine failure between terminals.

Exhibits 271 (R. 3336-3348), 292 (R. 3412-3421), 294 (R. 3423), 362 (R. 3501-3506).

The fact is that in passenger-train operation, and whether the train be considerably less than 14 cars or considerably over that figure, the action of the brakes, when an emergency application takes place, although not simultaneous through the train is very rapid; and there is practically no opportunity for slack-action to develop. A sudden stop of a passenger train is therefore, to all intents and purposes, much like the sudden stop of an automobile or a street car; while the stop may be severe, the surge and shock is the same in the head cars of the train as in the rear cars. The shock in the rear cars is due, as in the forward cars, to the sudden application of the braking power throughout the train, rather than to any sudden stopping of the rear cars because of running into the forward cars already halted by the brake application.

Cheek, R. 2467-2471, 3477-2480, 2483-2486; *Hardwicke*, R. 2731; *Fifield*, R. 2799-2800, 2806.

The total lack of significance of the 14-car limitation, insofar as slack-action is created or the engineer's ability to control the train affected thereby, is pointedly illustrated by the testimony of appellee's witness Cheek. Although Engineer Cheek handled two long passenger trains between Tucson and Yuma during the month of April, 1940 (Exhibits 393 and 394, R. 3569-3570), he was

apparently unaware of that fact until it was demonstrated to him by inspection of the permanent records. Compare also the testimony of witness Fifield, appellant's Road Foreman of Engines, to the effect that an engineer handling a passenger train is frequently uninformed whether his train exceeds 14 cars or not, and neither seeks nor requires that information, insofar as good train handling is concerned (R. 2806).

General recognition of this fact, by appellee's counsel and witnesses, was apparently responsible for their failure to contend seriously that slack and slack-action constitute a factor of importance, or indeed of any significance at all, from the standpoint of hazard to persons and property, growing out of or connected with passenger train operation.

XII.

SAFETY OF OPERATION AS AFFECTED BY TRAIN LENGTHS: ACCIDENT AND CASUALTY STATISTICS (R. 3974-4022).

While the safety findings are lengthy, they are not argumentative except by the inexorable logic of established facts.

To avoid needless repetition in this discussion we again suggest that the finding be examined before reading the comment thereon in the subsections under this chapter heading. What we shall have to say as to Finding XII is largely a series of footnotes to its respective subdivisions.

Statistical trends and comparisons.

When an attempt is made to express in statistical form the frequency of accidents or casualties on modern railroads or even on one large railroad system, the units of service or performance to which the comparatively small number of such occurrences must be related are almost astronomical in their immensity.

Thus, the standard bases of measurement used by the Interstate Commerce Commission and carried in the statistical tables with which this chapter will largely deal are translated into terms of everyday experience and observation:

A *million freight-train miles* would provide 2551 trips across Arizona (392 miles) on appellant's main line, or 2257 trips across Nevada on appellant's line from Calvada to the Utah line (443 miles). A trainman on a regular freight run seldom makes more than 3500 miles in a month.

A *hundred million freight-car miles* equals 3644 seventy-car freight trains traveling across Arizona, or 3225 across Nevada.

A *million man hours* equals 125,000 eight-hour work days.

A *million passenger miles* equals 155 eight-day round trips, San Francisco via Chicago to New York and return (6446 miles).

It is only by comparison of such frequencies over periods of time sufficient properly to discount fluctuations and to present trends and averages, rather than casual hap-

penings widely differing in resulting damage or injury, that proper conclusions can be reached as to the relative merits of different methods of operation.

That is particularly true of a selected class of accidents or casualties, such as those charged to slack action, which arise from a combination and concurrence of a number of factors, lack regularity of occurrence and are so infrequent that—particularly referring to Arizona, Nevada, and New Mexico—one or two, even of minor consequence, will distort frequency rates, overweight averages, and impair comparisons, unless the period considered is of sufficient length to be fully representative.

In statistical presentations, trends are particularly significant when they appear in a fully representative period and consistently rise or decline, even though there may be fluctuations in individual years during the period.

When as here methods of operation have radically changed over a series of years, a comparison of a representative period during which the old method prevailed with the latest similarly representative period of the changed operation is of great value. For it should be remembered that the reasonableness of the challenged law is to be measured by present-day conditions and not by those obtaining in 1912, more than thirty years ago.

Use of the year 1923 as the starting point in practically all of the statistical tables hereinafter referred to is justified because it was in 1923 that railroads in general, including appellant, adopted the standard long-train method of operation and initiated the improvements neces-

sary to carry that method into effect. (*Parmelee*, R. 189-190).

In *St. Louis and O'Fallon Ry. Co. v. United States* (1929), 279 U.S. 461, 73 L.ed. 798, Mr. Justice Brandeis graphically described (p. 523) the changes that were made to produce what he termed the "efficient post-war railroad plant"; those changes, as shown by the evidence in the case at bar, were determined upon in 1923, and at once begun and continued.

As practically all of the statistical tables of accidents and casualties introduced by appellant were based on the Accident Bulletins of the Interstate Commerce Commission, or reports to that commission from its Bureau of Safety in special cases, or on Form T reports made to the commission under the Accident Reports Act, it is in point here to quote the language of this Court in: *Retirement Board v. Alton Railroad Co. et al.*, supra (295 U.S. 330, at p. 364):

> "*Incontrovertible statistics* obtained from the records of the Interstate Commerce Commission *show a steady increase in safety of operation* during this period of alleged increasing superannuation."

The tables appended as a note to that statement were taken from the Accident Bulletins of the Interstate Commerce Commission, cover the period 1923-1932, and were the same as those for the years 1923-1932 contained in the exhibits offered through Mr. Sullivan, who carried the same statistical comparisons down to the latest available dates.

Again, the Court said (p. 366):

> "The trial court found, and its finding is not assigned as error: 'Railroads were, when the Act was enacted, and are now, operated efficiently and safely and more *efficiently* and *much more safely* than at any time in history.'" (Emphasis ours).

We have previously referred to the note on that page, in which the Court called attention to the progressive increase in speed of freight trains and in the average gross ton miles and net ton miles per freight train, using many of the same figures, from the same sources, as used by Dr. Parmelee in the instant case.

The trends in operating averages commented on by the Court in that opinion which was written in 1935, have continued to the last available statistical date, as we showed in detail on a series of exhibits we now briefly review.

The foundation and background for the national statistics relating to train and train-service accidents are summarized in our discussion of preceding findings and in the findings themselves. First there were the exhibits and testimony from Dr. Parmelee and Mr. Otterback, who dealt with the railroads as a national transportation plant composed of a large number of railroad systems, physically connected, freely exchanging cars and their contents under uniform interchange rules and joint schedules, whose operating rules are in general standardized, and who through mutual understanding have collectively improved the national transportation plant since 1923 by an expenditure of more than seven billion dollars.

Testimony and exhibits were produced by appellant from officers of seventeen railroads, including appellant, which in 1939 performed about sixty per cent of the freight-train car miles and revenue-passenger miles of Class I American railroads.

At this point we summarize the exhibits covering the Class I railroads as a group, as well as the individual railroads.

FREIGHT TRAIN STATISTICS
PERCENTAGE INCREASES 1939 OVER 1922

Exhibit Number	Name of Railroad	Cars per Train	Net Tons per Train	Tractive Power per Locomotive	Speed M.P.H.	Gross Ton Miles per Freight Train Hour
22	Class I Rys. of U. S.	27.9	20.3	34.6	50.5	102.7
12	New York Central	12.7	16.0	24.4	52.3	83.0
25	Missouri Pacific	32.4	15.4	41.4	53.9	113.9
29	Illinois Central	8.0	—	36.6	44.2	59.1
47	Great Northern	36.6	30.2	45.2	44.7	115.0
49	Northern Pacific	26.3	22.8	36.2	25.6	72.3
52	Rock Island	23.1	9.9	43.3	55.5	103.5
56	Erie	35.3	17.3	33.6	63.5	128.4
60	St. Louis S. W.	22.2	1.5	29.5	84.1	128.9
64	Chicago & N. W.	42.2	41.2	24.4	36.4	111.2
68	Pennsylvania	55.6	39.1	34.9	50.0	133.1
79	Union Pacific	32.5	15.3	39.1	60.0	122.0
87	Boston and Maine	63.3	65.1	34.9	35.3	144.9
95	Chgo., Mil., St. P. & Pac.	21.2	17.6	27.1	45.1	92.9
103	Chgo., Burl. & Quincy	11.6	—	39.9	47.9	74.3
121	Chesapeake & Ohio	53.2	59.3	38.2	68.2	170.1
131	A. T. and S. Fe	10.6*	3.1*	29.9	51.9*	83.3*
162	So. Pac. Co. Pac. Lines	25.8*	13.3*	40.2	53.2*	105.6*

*The Santa Fe and Southern Pacific System average percentages of improvement were of course subject to the depressing influence of the Arizona Train-Limit Law.

The operations of those railroads were described in considerable detail. The development of their motive power

and equipment, including the refrigerator and Pullman cars that have a widespread and interchangeable use, was also testified to. In general that development followed along the same lines as the motive power, equipment, and refrigerator cars of the appellant shown pictorially and by description on Exhibits 2 (R. 2852), 3 (R. 2853), 4 (R. 2854), 5 (R. 2855), 6 (R. 2856), 107 (R. 2960), and 135 (R. 3002).

Copies of the exhibits just mentioned by number are, for convenient reference, bound inside the last cover page of this brief.

From annual reports of the carriers to the Interstate Commerce Commission exhibits were introduced, showing the character and volume of commodities handled in freight service (Exhibits—S. P. Co., Arizona, 167, R. 3041, 217, R. 3204; S. P. Co., Nevada, 169, R. 3043, 219, R. 3208-3209; S. P. Co., New Mexico, 168, R. 3042, 218, R. 3246; Illinois Central, 105, 106, R. 2958-2959; Erie, 57, R. 2908; Chicago and Northwestern, 65, R. 2916; Pennsylvania, 69, R. 2920; Northern Pacific, 70, R. 2921; Rock Island, 71, R. 2922; Great Northern, 72, R. 2923; Union Pacific, 80, R. 2932; Boston & Maine, 88, R. 2941; Chicago, Milwaukee, St. Paul & Pacific, 96, R. 2949; Chicago, Burlington & Quincy, 104, R. 2957; Santa Fe, 132, 133, 134, R. 2994-3001).

These exhibits further support the comparability of the operating statistics.

Witness Browning went fully into the development of the interchange rules (Exhibits 203, R. 1559-1562, 204, R. 3153-3189), and Chief Engineer Parke of the Pullman

Company into that of Pullman equipment (Exhibits 107, 108, 109, R. 2960-2963).

As far as practicable, and without protracting the trial to inordinate length, the increase in operating efficiency and freight-train lengths and speeds was shown by the series of exhibits which we have summarized in tabular form above.

Feeling that the mere statistical average of average freight-train lengths obtained by dividing car miles by train miles was not completely representative of long-train operation as a standard national practice, appellant submitted a series of exhibits showing typical freight and passenger-train operations on the sixteen railroad systems referred to, which is summarized in Finding VIII(b).

It is obvious that an individual safety showing could not have been made for each of those sixteen railroads, such as made for appellant, without taking an enormous amount of time in preparation and trial. It is equally obvious that such a showing would merely have confirmed the national showing of trends of train and train-service accidents which we made in great detail.

However, a casualty showing was made as to the Santa Fe which is summarized in Finding XII(k), R. 4004-4006; and the Chesapeake and Ohio, an outstanding example of long freight-train operation, summarized in Finding XII(l), R. 4006-4007.

The foundational findings for the national comparisons are grouped under the following subdivisions of Finding VIII, and are, by subdivisions:

(a) Improvements in Road and Equipment (R. 3934).

(b) Increased Train Lengths (R. 3937).

(c) Improved Schedules and Performance (R. 3939).

(d) Increased Efficiency and Economy (R. 3940).

(e) Results of the Long-Train Program From the Standpoint of the Public, the Employes, and the Railroad Owners (R. 3943).

(1) Reduction in Average Transportation Charges Paid by the Public (R. 3943).

(2) Increases in Average Wages Paid to Employes (R. 3943).

(3) Effect on Returns to Owners of the Railroads (R. 3944).

(f) Similarity of Operating Conditions and Operating Rules on Other Railroads to Those Prevailing Upon Defendant's Lines in the Affected Territory (R. 3945).

No useful purpose can be served by a mere collection of casualties or accidents occurring on or to trains within or without the law's limitations. Such a list affords no criterion of hazard unless it is related to some proper basis of frequency measurement.

We can and did match every reported "long-train" casualty or train accident referred to by appellee with one or more "short-train" casualties or train accidents of the same character. But that alone would not materially assist the Court in concluding which is the safer method of operation.

Relation of the frequency of such occurrences to some unit of performance is necessary to informed judgment.

On this branch of the case the law under attack must be sustainable, if at all, under the state's police power. Neither by title nor by recital does it declare any reason for its enactment, or describe any situation to be remedied or prevented.

Appellee's counsel have contended, and will doubtless again contend, that it is a "safety regulation". No opinion evidence on that point is before the Court; the proof pro and con is wholly statistical as to occurrences, and descriptive as to conditions. The claim of "safety" has been largely if not entirely confined to the so-called slack-action accidents, but the evidence shows that since 1912 great improvements in road-bed, signals, motive power, and equipment, and the consequent increase in train lengths, have so reduced accidents from that cause that they have decreased to a point that is difficult to express statistically; and further, that as a practical matter the frequency of such accidents is generally the same on both classes of trains, on a train-mile basis, and substantially less on a car-mile basis, in moving the traffic by the long train method of operation. If "safety" means, as it should mean, safety from all causes and to all persons subject to the hazard of train operation, then the evidence shows—not "beyond a reasonable doubt", but beyond *any doubt*—that the long-train method of operation is by far the safest.

We again emphasize that the railroad plant of today, in Arizona, on the appellant's Pacific Lines, and in the

nation as a whole, is entirely different from that of 1912. Safety of operation is to be measured by the standards of the present. The railroad management has the duty to receive, transport, and deliver freight and passengers, when and as presented for transportation. We believe that it is not even "debatable" that that duty can be performed with the greatest safety to all persons and property so transported, by using as few train miles as the character and volume of traffic, and the physical characteristics of road, motive power and equipment wil permit.

Having made that showing, the appellant has proven its case under the due-process clause of the Fourteenth Amendment, and has fully measured up to the degree of proof required by even the most extreme opinions that have considered attacks on state police power statutes.

(a) ACCIDENT REPORTS TO INTERSTATE COMMERCE COMMISSION (R. 3974-3975).

This finding is necessary as a proper foundation for the finding that follows and is based on the exhibits shown in the annotation, which are excerpts from the Interstate Commerce Commission's rules governing reports of train and train-service accidents. Its correctness has never been challenged by appellee.

(b) BASES FOR COMPUTING ACCIDENT AND CASUALTY RATES (R. 3976).

This finding is the basis for the constant references in the successive findings to the various methods of measuring frequency of train and train-service accidents. Its correctness likewise has never been disputed by appellee.

Most of the exhibits pertaining to freight-train operation covered by the series of findings under Finding XII are on both the train-mile and car-mile basis. Some of them include as well one or both of the bases of man hours and locomotive miles, explanation for the bases used having been given in most cases when the exhibit was identified.

As to the *car-mile basis* Mr. Sullivan said (R. 1939) that it "is a recognized measurement of the occurrence of casualties to the movement of a given amount of traffic."

That basis was not always available, but when statistics afford its use it is peculiarly applicable to the instant issue. The railroad is a common carrier and holds itself out as ready, able and willing to carry property for hire. It must do so when and as that property is tendered to it for transportation. It is liable under bill-of-lading provisions for delay or damage to freight due to its negligence.

Freight traffic is measured in units of cars because practically all freight moves in carload lots; only a very small percentage of the total volume moves in less-than-carload lots, and even those are handled in cars.

The fairest and most accurate method of measuring casualty frequency as to different types of freight operation is to use the car-mile basis, because the purpose and obligation of the carrier is to move and deliver cars and not trains, and the duty and concern of the management is to handle the cars under the operating practices that will expose employes and the public to the least hazard

of casualty; a secondary but important consideration in the protection of equipment and lading.

In some of the exhibits casualties are related to *man hours* because neither train miles nor car miles were statistically available; e.g., in terminal yards, where neither of those classes of miles is accumulated (*Sullivan*, R. 1939-1940).

Locomotive miles also appear in some of the exhibits which include terminal operations, where train miles are not produced and therefore not statistically reported. But locomotive miles are also accumulated in train operation. A train with a single locomotive running 100 miles would be statistically reported to the Interstate Commerce Commission as producing 100 train miles and 100 locomotive miles; whereas if two locomotives were used for the trip 200 locomotive miles but only 100 train miles would be reported. The same applies to helper service.

But let us take the illustration of three trains instead of two being used to handle 210 cars on the road—the wasteful practice compelled by the Arizona law. Assuming the run to take eight hours with one engineer, one fireman, one conductor and three brakemen on each train, as would be required in Arizona, the movement of the 210 cars by short trains would produce 144 man hours of exposure to occupational hazard, while the long trains performing the same amount of transportation service would furnish a similar exposure of but 96 hours; this does not take into account the multiplication of hazard by the increased number of trains.

The same trains in single engine operation would produce 300 short-train locomotive miles and but 200 long-

train locomotive miles. In the latter case there would be one-third less hazard from the causes of train and train-service accidents inherent in the operation of a train drawn by but one locomotive, again disregarding the unnecessary trains that used the same trackage and yards.

The *train-mile* basis is not to be disregarded. Cars are moved in trains and the number of trains used to move a given number of cars has an important bearing on the safety of operation. It is a controlling factor in the hazard of transportation, to individuals as well as to motive power, cars and contents.

The train-mile basis is less satisfactory than the car-mile basis when comparisons are undertaken between long-train operation in one territory and restricted operation under a compulsory maximum limit in another; especially if the purpose of the comparison is, as in the present case, to develop whether the hazards incident to the discharge of the railroad's obligation to move the traffic are increased or reduced by the compulsory limitation. For such a purpose the car-mile basis is obviously more accurate, because the amount of traffic to be moved (which is the measure of the carrier's performance of its obligation) is measured in car miles, not train miles. Again, the artificial limitation compels the production of a far larger number of train miles than otherwise would be necessary for the movement of the traffic; and thus, while increasing the exposure and (as is shown by experience) the actual number of accidents and casualties incurred in proportion to the traffic moved, also arti-

ficially increases the base against which their frequency is measured, if the train-mile basis alone be used. As a concrete example, accidents and resulting casualties are, and have been in general, substantially more numerous in Arizona than in Nevada, although the traffic volume in the two states has been approximately equal (from 3 to 5 per cent greater in Nevada); but because of the artificial increase in the number of trains run, and the number of train miles made, in Arizona (solely because of the law's limitations) comparisons between the two states on the train-mile basis show somewhat less differences in the frequency rates than corresponding comparisons on the car-mile basis.

Of course, no such infirmity obtains in comparisons on the train-mile basis, when made between different years or groups of years, in the same states or on the same system, and where the differentiating factor of an artificial limit is absent. And in the national statistics where the enforced limitation on the Santa Fe and Southern Pacific in Arizona affects a relatively small percentage of the national totals, the train-mile basis affords instructive comparisons between different years and groups of years.

Thus if, as is compelled in Arizona, three freight trains must be run to handle the same number of cars that might be, and on other parts of the system are, handled in but two trains, eighteen employes instead of twelve are exposed to whatever hazards are inherent in the operation of a single train. And those hazards are further increased by the multiplication of hazards from collisions, grade-

crossing accidents, meeting and passing other trains, etc. This demonstrable increase in hazard accounts for the substantially more favorable casualty showing of long-train operation, even on the *train-mile basis*. There are inescapable and unpredictable *hazards* inherent but of irregular occurrence in the movement of any train; the movement of any means of conveyance, whether it be a horse, a bicycle, a motor vehicle, a street-car or a steam or electric train, has known dangers. Common observation tells us this, and actuarial tables based on experience and used in fixing premium rates for casualty insurance are merely calculations of hazard based on experience statistics such as we have produced.

The tables we analyze show beyond any doubt that the so-called slack-action casualty is so infrequent and subject to so many factors of production that limiting trains to the Arizona maxima has no perceptible limiting effect on that class of accidents. In fact, as we show statistically as well as by reason, the limit of 70 cars to a freight train tends to increase that class of accident. There is no hazard from slack action that can be statistically shown as to passenger trains of any length.

Whatever method of measurement be used, the "incontrovertible" statistics leave no room for debate as to the extreme arbitrariness and unreasonableness of a regulation that compels appellant to use additional and unnecessary man hours, locomotive miles and train miles to handle a volume of traffic that can be far more safely handled by the method it and other railroads use elsewhere.

(c) NATIONAL ACCIDENT AND CASUALTY STATISTICS (R. 3976-3980).

This sub-finding first states the source of the statistics above referred to, and is further divided into six classifications to which we shall now briefly refer.

The first paragraph of this sub-finding refers to the national accident and casualty exhibits in general terms, calling attention to Finding VIII(b) for a description of the increases of the lengths of freight trains on Class I railroads of the United States during the 17-year period, 1923-1939. The subdivision of that finding which deals with increased train lengths is on pages 3937-3938 of the record and is fully annotated to the testimony. It states the growth and prevalence of standard long freight-train operation in the United States. The significance of the national statistical tables covering train and train-service accidents cannot be appreciated, without considering that the improvement in accident and casualty rates therein shown is accompanied by and closely corresponds to the increases of average length of freight trains shown by the various tables referred to in the annotations to Finding VIII(b). It should also be borne in mind that the national figures on freight-train lengths are arrived at by dividing freight-car miles by freight-train miles, and that the averages are depressed because the only available statistics include all freight trains, through and local, main line and branch line. It is a fair conclusion from the testimony of the witnesses who represented 125,885 miles of the 232,026 road miles operated by Class I American Railroads in 1939, and produced 58 per cent of the freight-train car miles operated and 60.06 per cent of the revenue-

passenger miles (Exhibit 248, R. 3257), that the percentage decreases in the various classes of train and train-service accidents throughout the period covered by the study have accompanied a very much greater percentage increase, in the lengths of the freight trains that carry through traffic, than the national average of all freight trains would indicate.

It has been argued by appellee that the substantial national improvement in accident and casualty frequencies is due primarily to the improvements in road and equipment. To whatever extent that be true, it is an additional reason for striking 32-year-old fetters from the hands of interstate commerce. Unquestionably those improvements have had a large share in the lessening of railroad operating hazards, but they were made for the very purpose of permitting the *safe, economical* and *efficient* operation of long trains; and it is evident from the record that the improvements were in and of themselves merely one of the factors, and not the sole major factor, in producing the decrease of accident and casualty rates. If this were not true, appellant's operations in Arizona, which shared with Nevada the appellant's program of improvement in road and equipment, would have shown relatively the same rate of decrease in train and train-service accidents during and following that program of improvement; but this has not occurred, as we shall hereafter show. Also, the Santa Fe, whose improvement program covered the entire line from Needles to Belen—part long-train and part short-train operation—would have shown the same or relatively the same ratio of improvement in both the long and short-train portion of that line; but this has not fol-

lowed, as pointed out in Finding XII(k) (R. 4004-4006), which we shall later discuss.

Negligence of employes is the major factor in the production of train and train-service accidents. See Exhibits 270 (R. 3310-3335), 271 (R. 3336-3348), and 312 (R. 2266-2267), discussed and summarized in Finding XII(e) "Commission's Investigation of Train Accidents—National" (R. 3982-3983). Improvements in roadbed and equipment can have had but a negligible part in lessening such negligence, while the use of a lesser number of train units to handle a given volume of freight or passenger traffic will obviously have a great effect in lessening accidents due to negligence, because less opportunities are thereby provided for human failure. Casualties to individuals caused by their momentary forgetfulness or inattention, or that of fellow-employes, of which there are a number of classes and a large volume, are increased by an increased number of men employed. The fewer train units that are run to handle a given volume of traffic, the less opportunity there is for such casualties; and the increase in the length of trains, both freight and passenger, has undoubtedly had that effect. These observations do not apply to train and enginemen exclusively. For example, the train dispatcher, skillful as he is, is only human, and the more meets and passes he has to carry in his mind or on his sheet, the more opportunity there is for serious oversight.

(1) All Employes (R. 3977):

This finding is based on Exhibit 262 (R. 3300), as explained by Mr. Sullivan in his testimony (R. 1937-1939,

Superior Court, Pima Co., Arizona
State v. S.P. Co. No. 20087

2107-2108). The casualty rates, 1923-1939, are computed on the four bases of car miles, train miles, locomotive miles, and man hours. The exhibit relates to casualties to all classes of employes on duty sustained in train and train service accidents. Man hours were added to the other three bases, because the work of such employes as section foremen, section laborers and extra gangs engaged in construction work, track walkers, signal supervisors and maintainers, station forces, etc., is in connection with the movement of trains which they themselves do not take any part in operating. This work is measured by hours, not by accomplishment. There is a hazard in their employment, as the detailed statistics show, which arises from the possibility of being struck or run over by a train, and, of course, an increase in train miles correspondingly increases that hazard. The exhibit includes train and enginemen as well as the employes just referred to. It deserves study, and for that reason we insert it opposite this page. It shows (line 20) that for the five-year period, 1935-1939, the average casualty rate for all classes of employes on duty who are subject to being killed or injured in train and train service accidents was less than one-third of what it was in the years 1923-1928, on the car-mile basis (30.28 to 102.04); less than one-third on the train-mile basis (8.59 to 26.02); about one-third on the locomotive-mile basis (6.15 to 18.49), and less than one-half on the man-hour basis (3.12 to 7.08). The comparisons of average casualty rates in lines 22, 23 and 24 of the exhibit are also striking.

(2) Road Trainmen and Enginemen on Duty, all classes (R. 3977-3978):

This finding is based on Exhibit 263 (R. 3301), prepared and offered by Mr. Sullivan (R. 1944-1947). For convenient reference we insert the entire exhibit opposite this page.

As stated before, the car-mile basis is the most accurate basis for determining casualty rates in comparing one method of freight operation with another as we are here doing, especially when the transition from the operation of so-called short trains as a standard practice was gradual over a period of years while the plant was being fully prepared for the long-train operation, when there then came the full standard long-train operation which has continued to the present time. During the first or transitional six-year period, the average casualties were 53.11 per 100 million car miles, which dropped during the second six-year period to 23.16, and again during the five years ending with 1939 to 16.35, a total decline of 69.21 per cent on a car-mile basis; somewhat greater than the decline of 65.73 per cent during the same period on the train-mile basis; or the decline of 55.92 per cent on the man-hour basis.

(3) Road Freight Trainmen and Enginemen on Duty (R. 3978):

This classification narrows the comparisons by excluding all employes except those actually engaged in operating road freight trains, such as engineers, firemen, conductors, brakemen, and flagmen (rear brakemen), and is based on Exhibit 264, R. 3302 (a copy of which we insert opposite this page), and the explanatory testimony of Mr. Sullivan

Columns (d), (e) and (f), I.C.C. Annual Accident Bulletins, table No. 5

(R. 1947-1948, 2109-2110). The same remarks as to trends and comparisons apply to this exhibit as to the preceding Exhibit 263. It is noteworthy that the decrease in average casualty rates for the period 1935-1939, compared with the period 1923-1928, is shown by line 24 of this exhibit to have been 69.32 per cent on the car-mile basis as compared with 69.21 per cent on the same basis for all road trainmen and enginemen on duty, as shown by line 24 of Exhibit 263. The other comparisons of decreases are relatively the same. In fact, considering the tremendous performances to which the casualties are applied in both of these exhibits—100 million car miles, one million train miles, one million man hours—it may fairly be said that the rate of decrease on any period-comparison is the same in both exhibits.

(4) Road Freight Conductors, Brakemen and Flagmen (R. 3978-3979):

This subfinding is based on Mr. Sullivan's testimony (R. 1949-1950) explaining his Exhibit 265 (R. 3303), a copy of which we insert opposite this page.

It further narrows the study to those classes of employes which have been claimed in all of the former train-limit cases, as well as in the Congressional hearings and hearings before State Legislatures, to be most directly and injuriously affected by the long-train method of operation; the claim being based on the theory that that method was productive of a substantially greater hazard from slack-action accident to these classes of employes than where the freight-train operation was limited to 70 cars or less. Such is the claim repeatedly advanced by appel-

lant as shown by its briefs at earlier stages of this case. We anticipated the challenge and were fully prepared to meet it. Again we say that the safety of a given method of freight-train operation is not to be judged by selecting one type of accident of comparatively infrequent occurrence, and which is produced, if at all, by the concurrence of a number of factors, practically all of which are potential in all freight train operation. The true criterion is that of the hazard from all causes which may produce death or personal injury to the class of employes under consideration. Exhibit 265 again shows the downward curve of casualty rates measured on any of the three bases, the curve on the car-mile basis quite naturally being steeper in its descent, for the reasons which we have perhaps tiresomely stated and reiterated.

When we compare the decreases in average casualty rates, as shown in lines 22, 23 and 24 of this exhibit, with the corresponding lines in Exhibits 263 and 264, we find a close correspondence between all three sets of percentages of decrease, a correspondence so close that, considering the great mass of performances to which the casualties in their aggregate are related, from a practical and realistic standpoint the occupational hazard of the classes of employees covered by Exhibit 265 is practically the same as that of the larger classes of which they form a part, who are covered in the two preceding exhibits.

(5) Conductors, Brakemen and Flagmen—Slack Action (R. 3979-3980):

This subfinding is based on Exhibit 266 (R. 3304), as explained by Mr. Sullivan at the time of its introduction (R. 1951-1955).

A complete copy of that exhibit is inserted opposite this page. The title of the subfinding is relatively short, but the exhibit covers the years 1923 to 1939 inclusive, and is entitled "Casualties to Road Freight Conductors, Brakemen and Flagmen, from Train and Train Service Accidents Caused by Sudden Stop, Start, Lurch or Jerk of Locomotive, Car or Train: All Railroads of the United States".

The casualty rates are calculated on the bases of 100 million car miles and one million train miles.

First we call attention to the fact that in the 17 years covered by Exhibit 266 the total number of casualties from the code causes described in the title was 17,791 (line 21, column f), or 6 per cent of the 294,252 casualties to all classes of employes on duty, sustained in train and train service accidents during the same period, as shown in line 21, column h, of Exhibit 262, hereinbefore discussed and inserted.

During the first six years shown, 1923-1928, the rate per 100 million car miles in Exhibit 262 (line 7, column i) was 102.04, as contrasted with 6.54 in Exhibit 266 (line 7, column g), which was but 6.4 per cent of the all-employe casualty rate thus stated. That was during the transitional period from the short-freight-train method to the long-freight-train method of operation. A gradual decline is shown on both exhibits during the middle period, 1929-1934 inclusive; and a comparison of the last five years, 1935-1939, shows that of a total of 37,346 (line 20, column h, Exhibit 262) all-employe casualties in train and train-service accidents, there were but 2,473 accidents of

the character described in Exhibit 266 (line 20, column f) a percentage of 6.6 per cent. The average number of casualties per 100 million car miles, to all employes on duty (line 21, column i, Exhibit 262) was 30.28 during the latest five-year period; while Exhibit 266 shows that during the same period the corresponding rate for this particular type of casualty was but 2.27. It is apparent that the advocates of train-limit laws such as the Arizona statute are in reality proposing to increase the hazard of casualties in train and train-service accidents which inevitably accompanies an unnecessary increase in the number of trains run, for the sake of what is shown to be an ineffectual effort to minimize the occurrence of casualties which amounted to but 6.6 per cent of the total number sustained in train and train-service accidents during the five years ending with 1939. We are justified in using all casualties in train and train-service operation as a basis for this argument, even though those figures include passenger-train employe casualties, because both classes of trains are operated on the same tracks, have meets and passes, and the safety of their operation is directly affected by the number of trains of all classes operated in a particular district.

We again call attention to the comparison of average casualty rates on lines 22, 23 and 24 of Exhibit 266, with the corresponding figures in Exhibits 263, 264 and 265. For all practical purposes the decreases in the so-called slack action casualty rates have been practically the same, in percentages, as the decreases just mentioned; and the percentage trend as shown by Columns (h) and (i) in all

of the four exhibits, likewise descends as steeply in one as in any of the others.

We think it clear, taking the other evidence in the case into consideration, that a very important factor in the decrease of the slack-action accidents has been the running of less train miles to handle the same volume of traffic measured in car miles. The speed of a freight train is one of the factors that concurs with other factors in producing slack-action shock, and it is apparent from the testimony, and particularly the detailed list of accidents in Nevada and Arizona which usually show the speed of the train when casualties occur, that slack-action shocks are more severe at slow speeds than at higher speeds. When air-brakes are applied a car is decelerated in proportion to its speed. In running fewer trains to handle the same volume of traffic, a substantial increase in the average speed of freight trains has been attained, as shown by the evidence, and, what is more important in its bearing on slack-action accidents, long-train operation has necessitated fewer stops and startings of freight trains and fewer occasions for taking sidings to pass trains approaching on single track in the opposite direction, or to allow superior trains to overtake and pass on either single or double track. Thus the frequency of slack-action accidents in handling a given number of cars bears a direct relation to the number of trains operated to handle that volume of traffic; because the additional trains give more occasion to stop and start and take sidings.

As shown by Finding X(b), "Delays to Trains Enroute: Meets and Passes" (R. 3957-3958), in the year 1938 the

4,304 additional freight trains which the law compelled the appellant to run between Yuma and El Paso via Gila and Lordsburg entailed 16,512 additional meets and passes over and above those which would have occurred if long-freight-train operation had prevailed, an increase of about 63 per cent in meets and passes between all the trains, both freight and passenger, run in that territory.

These national statistics are particularly valuable in considering the hazard of slack-action accidents. There are, relative speaking, so few of those accidents during the year in any state on the appellant's Pacific Lines—as illustrated by the Nevada and Arizona comparative statistics—that a very few accidents of that character, causing slight and almost trivial disability, will weigh heavily in arriving at either the train-mile or the car-mile frequency rate in a given year or even in a period of two or three years. It is only when trends are considered, or a substantial period of time is taken, that dependable conclusions can be reached. The comparison of slack-action casualties in Arizona and Nevada, which later will be dealt with, illustrates this thought. But when one takes the accidents on all of the railroads of the United States, the absolute number in each year clearly indicates the minor importance, relatively speaking, of this class of casualties, and the trend eloquently speaks of their rapid decrease coincident with the running of fewer and consequently longer trains to handle the same volume of traffic.

(6) Passengers on Trains (R. 3980):

This sub-finding is based on Mr. Sullivan's Exhibit 267 (R. 3305), as explained in his testimony on pages 1959-1961 of the printed record.

Although there may have been some reason advanced for this law in 1912, as applied to passenger trains, we have yet to hear any one seriously suggest what it was. If there was one, it has long since vanished. The improvements in road bed and signals, as well as in passenger equipment, shown by the chronological exhibits 4 (R. 2854) and 6 (R. 2856), and by the similar exhibit 107 (R. 2960) relating to Pullman cars, are responsible. These improvements are shown by the testimony of the officials of the other sixteen railroads to correspond closely to those made in their own motive power and equipment. The testimony of Mr. Parke, Chief Engineer of The Pullman Company, is particularly illuminating, when it is considered that Pullman equipment is nationally used and is practically the only sleeping-car equipment in use (*Parke*, R. 787-798, 805-824). It was not seriously suggested, by cross-examination or in rebuttal, or indeed at any stage of the case, that there is any difficulty or hazard in handling passenger trains of substantially over fourteen cars; and that practice is shown by the evidence to be prevalent on all of the railroads whose testimony was presented. There is not the shadow of an argument in favor of the regulation of the length of passenger trains, not even the nebulous argument that revolves around slack action.

Exhibit 267 is on two different bases of calculation of casualty rates, neither of which for obvious reasons appears in any of the preceding exhibits. The number of passengers carried, no matter how far carried, and the number of revenue passengers carried one mile are given in separate Columns (b) and (c). The casualties are then

given, divided between train accidents and train-service accidents. The casualties in the aggregate are then related in Columns (m) and (n) to "million passengers carried" and "100 million passenger miles". Mr. Sullivan explained Exhibit 267 as follows (R. 1959-1960):

"Mr. Booth: In respect to the length of time of disability, how do the casualties shown in this exhibit; where they did not result in death, differ from those shown in the preceding exhibits insofar as they dealt with employes?

A. Well, as indicated in the note at the foot of the exhibit an injury to a passenger is reportable if the injury is sufficient to incapacitate the injured person from following his customary vocation or mode of living for a period of more than one day. In the case of employes, the injury is not reportable unless it disables the employe for more than three days within the ten days immediately following the occurrence of the accident.

Q. Under the reporting rules of the Commission, how are deaths to passengers handled in reporting the accident?

A. In the same manner as the deaths to any person. If death results within twenty-four hours after the occurrence of the accident, it is reported in the statistics as a person killed. If death results after the expiration of twenty-four hours, it is reported as a person injured and a report made of the subsequent fatality.

Q. You are shown the casualty rates by two methods, per million passengers carried and per hundred million passenger miles. Have you any observations you desire to make as to that?

A. Yes, million passengers carried represents the absolute number regardless of the distance that the individual passengers may have travelled. In order to give an idea as to the occurrence of accidents and the exposure to injury, generally, casualties are measured against the miles travelled by the passenger which is shown in column C, and the rate is shown in column N."

The exhibit shows that the average casualty rates, based either on the number of passengers carried or the number of passenger miles traversed, have remained fairly constant since 1923. This is largely accounted for by the fact that the great improvements in the strength and appurtenances of passenger equipment took place prior to that year. See Exhibit 4, "Chronology of Passenger Coach and Chair Cars", and Exhibit 107, "Chronology of Advances in Sleeping Car Construction of Cars Owned by The Pullman Company". These exhibits will be found among those inside the last cover page of this brief. The practice of handling through passenger trains, when and as traffic and operating conditions permit, in train units of substantially more than fourteen cars has apparently, considering Exhibit 267, failed to increase the hazard to passengers.

And finally, passenger train operation, considering the country as a whole, had evidently reached in 1940 a practically irreducible minimum of casualties to passengers, measured on any recognized basis.

(d) TRAIN ACCIDENTS—NATIONAL (R. 3980-3981).

Exhibit 269 (R. 3307) is the primary basis for the testimony (R. 1967-1970, 2760-2762) upon which the finding is predicated.

The exhibit is an elaborate study, in three sheets, showing on bases of car miles, train miles, and locomotive miles the number of train accidents by Interstate Commerce Commission classes, the number resulting in casualties, and the number of casualties occurring on all United States railroads during the years 1923-1939, inclusive. The third sheet of the exhibit relates these train accidents and their attendant casualties to car miles and train miles. The exhibit is fairly analyzed in the finding. We have few additional comments to make.

Sheet 3, Columns h, i, j, and k, relate the rear-end and head-end collisions, and the casualties occasioned thereby, to train miles and locomotive miles. The locomotive-mile basis is used because the locomotive is the active agent in a collision. During the five years 1935-1939, there was an improvement of 62 per cent in the frequency of such collisions, on the train-mile basis, and 61.76 per cent on the locomotive-mile basis; a result due largely, if not almost entirely, to the lesser number of the locomotives used to handle the traffic. The casualty rate to trainmen and enginemen during the same period declined 61.54 per cent on the train-mile basis, and 61.11 per cent on the locomotive-mile basis. The almost immediate effect on the frequency of collisions arising from the long-train method of operation is shown by comparing the averages for the first six years, while the long-train program was under

way and near the end of which barely reached standardization, with the second six years when the standard long-train program was an accomplished fact. The collision rate per million train miles dropped from .50 in the first period to .23 in the second, per million locomotive miles from .34 in the first period to .16 in the second, and the casualty rate correspondingly dropped from .26 per million train miles in the first period to .11 in the second, and from .18 per million locomotive miles to .08 in the second. These decreases were far greater, in percentage, than the decreases in the total number of train miles and locomotive miles from the first six-year period to the second six-year period (Columns c and d, lines 7 and 14, Sheet 1).

(e) COMMISSION'S INVESTIGATION OF TRAIN ACCIDENTS—NATIONAL (R. 3982-3983).

The first paragraph of this finding deals generally with the official investigations by the Bureau of Safety of the Interstate Commerce Commission, authorized by Section 3 of the Federal Accident Reports Acts. Mr. Sullivan presented two exhibits, analyzing the printed results of those investigations of freight-train accidents for the 12-year period, 1928-1939 (Exhibit 270, R. 3310-3335), and of passenger-train accidents for the six-year period, 1934-1939 (Exhibit 271, R. 3336-3348).

(1) Freight-Train Accidents (R. 3982-3983):

This sub-finding is based on Mr. Sullivan's Exhibit 270. This 26-sheet exhibit analyzes those investigations in great detail, so far as they are related to freight trains. For convenient reference we insert opposite this page a reproduction of sheet 2 of that exhibit, at the bottom of which there

is a summary of the exhibit. In addition to the statements made in the sub-finding, it will be seen that collisions accounted for 298 of the 561 accidents involving freight trains which were covered in that exhibit. Sheet 3 of the exhibit reproduces the statute which confers broad authority upon the Commission to investigate railroad accidents.

(2) Passenger-Train Accidents (R. 3983):

The companion exhibit to Exhibit 270 is Exhibit 271 which relates to the Interstate Commerce Commission investigation of passenger-train accidents for the years 1934 to 1939. It is a 13-sheet exhibit, sheet 1 of which we insert opposite this page for convenient reference. That summary sheet shows that 232 accidents involving passenger trains are tabulated and explained in the exhibit. Of that number 96 were due to collisions; and 112 of the total number which, of course, included some of the collisions, were due to negligence of employes. Nothing could show more clearly than Exhibits 270 and 271 that any law that requires a railroad to run more passenger-train miles and more freight-train miles than are necessary to handle its traffic, and consequently to increase the number of employees who may be negligent or forgetful, is distinctly a measure that will promote train and train-service accidents of all classes instead of diminishing them.

(f) ACCIDENT STATISTICS—DEFENDANT'S PACIFIC LINES (R. 3983-3985).

This sub-finding is divided into two sub-divisions which are practically self-explanatory:

BRIEF DESCRIPTION OF ACCIDENTS INVOLVING TRAINS WHICH CONSISTED OF MORE THAN 14 CARS

I. C. C. INVESTIGATION NUMBER

1973 A freight train consisting of 41 cars and a caboose collided with the third car from the engine of a 17 car passenger train which was entering a siding. No fatalities resulted, but injury to 35 passengers and 4 Pullman employes occurred. The accident was caused by the failure of the enginemen of the freight train to control the speed of his train approaching the meeting point.

1993 The engine, its tender, and the first 8 cars of a 16 car passenger train were derailed, caused by a washout due to an unusually heavy local rainstorm. There were no fatalities; 18 passengers, 1 dining car employe, 1 train porter and 3 railroad employes were injured.

2016 The engine and first 2 cars of a 16 car passenger train were derailed when it collided with a motor truck at a grade crossing, caused by the motor truck being driven upon the railroad crossing directly in front of the approaching train. There were no fatalities; 9 passengers, 2 dining car employes, 1 Pullman employe, and the driver of the truck were injured.

2212 A 1 car passenger train collided with the 13th car from the engine of a 24 car milk and passenger train which was passing over a cross-over, caused by the failure properly to control the speed of the 5 car train when passing a grade signal and approaching a cross-over at the end of double track. There were no fatalities; the fireman and the baggageman of the milk train and the conductor and fireman of the 5-car train were injured.

2265 The engine and 5 first cars, which had been detached from a 29 car milk train, derailed one of the milk cars while backing into a siding, caused by the separation of a switch point from the stock rail due to the throw-lever of the switch stand being unlatched. The head brakeman was fatally injured.

2314 A 16 car passenger train collided with the side of a 10 car passenger train at a railroad crossing at grade, caused by failure of the enginemen to control the speed of a train in compliance with interlocking signals. One passenger and one employe were killed, and 16 passengers and 2 dining-car employes were injured.

(1) Employes on Duty—All Classes of Service—Train and Train-Service Accidents (R. 3984):

This sub-finding is based on Exhibit 272 (R. 3349). At pages 1985-1986 of the record, Mr. Sullivan explained the reason for the use of locomotive miles to obtain the casualty rate:

"The Court: Mr. Sullivan, I notice on Exhibit No. 262 that you computed your casualty rates on car miles, train miles, locomotive miles, and man hours, whereas on this exhibit the computation apparently is on locomotive miles?

A. It could have been calculated on the other bases, but as I explained before when you take all classes of employes on duty, it includes classes of services where train miles or car miles are not involved; they are not accumulated. I believe I explained my reason on Exhibit No. 262 for showing all of the various bases, not that they were appropriate in all cases but to give as complete a picture of the national showing as could be reflected. Now, the train miles and car miles and man hours can be calculated for Exhibit No. 272; but as to individual railroads the Interstate Commerce Commission statistics do not make all of the various segregations as they do for the railroads as a whole; so we are limited in our ability to draw off statistics by classes where we only use the accident bulletins themselves. . . .

The Court: Do I understand that the Interstate Commerce Commission uses the locomotive miles as their unit of computing these?

A. Locomotive miles and man hours, those two, but they make frequent reference to train miles and other statistics in comparisons.

Mr. Booth: Q. That is where they are considering all employes?

A. That is true.

Q. Train service and nontrain service?

A. I may explain the reason for not using the man hours among the other bases of measurement for a system showing. There are so many varied factors entering into it that rather discolor the comparisons. Various states have different full-crew laws. A considerable mileage of the Southern Pacific is in California and all of the casualty comparisons, either one state with another or even a system showing is distorted by the provisions of the California law."

The rates of decrease correspond favorably with the comparable national statistics.

(2) Trainmen on Duty—All Classes of Service (R. 3984-3985):

This sub-finding is based on Exhibit 273 (R. 3350), and covers Southern Pacific Company-Pacific Lines. The term "trainmen" there used is shown by the exhibit to include engineers, motormen, firemen and helpers, conductors, brakemen and flagmen engaged in passenger, freight, yard or work service; also train baggagemen, but not hostlers. The sources are the Annual Accident Bulletins of the Interstate Commerce Commission.

There is little to add to the finding. The percentages of decrease shown on lines 21, 22 and 23 of the exhibits are practically the same as for the comparable national statistics. The three bases used are locomotive miles, man hours, and car miles. Comparing the five-year period 1935-1939, with the six-year period 1923-1928, line 23 of

the exhibit shows that on the locomotive-mile basis there was a decrease in total casualties of 25.98 per cent; on the man-hour basis a decrease of 14.56 per cent, and on the car-mile basis of 38.16 per cent. An interesting comparison with those figures is afforded by lines 7 and 20, which show that in the year 1923, 51,136,000 locomotive miles were run in the handling of 875,630,000 car miles, while in 1939 but 45,299,000 locomotive miles were run to handle 1,113,826,000 car miles—this despite the inflationary effect on locomotive miles caused by the enforcement of the Arizona law.

(g) NEVADA AND ARIZONA CASUALTY STATISTICS (R. 3985-3996).

This sub-finding consists of nine subdivisions, all of which relate to the comparisons made by us between the accident and casualty results of train operations in Nevada and in Arizona, insofar as relevant to the issues in the case at bar.

For the purposes of this showing appellant used its own reports to the Interstate Commerce Commission of reportable train and train-service accidents and casualties as the basis of the statistical presentation; the appellee afterwards on rebuttal adopting similar source material. Practically speaking, the exhibits relating to the two states merely carry forward to and including the year 1940, the same statistical showings that were made by appellant, as plaintiff in the *First Arizona Train-Limit Case* and in the *Nevada Train-Limit Case*. If one takes the tables in evidence in this branch of the case and stops with 1929, the date when the trial of the *First Arizona Case* began, or

1935, when the casualty tables in the *Nevada Case* were closed, it will be seen that the twelve years which have elapsed since the first case, and the five since the other, have only served to confirm the conclusions drawn by the respective courts as to the weight and value of the Nevada-Arizona comparisons; the same may be said of the Santa Fe casualty statistics (Finding XII(k), R. 4004-4006), which were also on the same basis in each of the three cases. The reason is that the conclusions to be drawn from the comparisons are not mere matters of opinion, but are ultimate facts, and the only facts deducible from a mass of interrelated probative facts.

The tables dealt with in the nine subdivisions of sub finding (g) cover the eighteen years, 1923-1940, inclusive, in both Nevada and Arizona.

Ordinarily we would preface the discussion of their presentation by referring to the evidence offered in support of comparisons between Nevada and Arizona operations in all respects relevant to the issues in this case.

By reason of the arrangement of the findings that course is unnecessary to be followed in this section of the brief, and we respectfully refer the Court to Findings III(c) (R. 3896-3897), IV(c) (R. 3900-3901), and VII(a)(5) (R. 3914-3915).

(1) Propriety and Significance of the Comparison of Nevada-Arizona Statistics on Defendant's Line (R. 3985-3986):

The similarity of operations, traffic, construction, and all other conditions that might have any bearing on the validity of a comparison between Nevada and Arizona

in this inquiry, was shown in detail and at great length. It is summarized in this sub-finding with references to the record and to the preceding Findings III(c), IV(c), and VII(a)(5).

For the general purpose of considering trends and comparing accident and casualty frequencies in Nevada with those in Arizona, the following special table, which is constructed by dividing the freight-train car miles, as shown in Exhibit 279 (R. 3374), by the freight-train miles, shown in the same exhibit, may be helpful in arriving at a conclusion. It appears that in 1923 and 1924 the average length of freight trains in Nevada was less than in Arizona, and that the most marked increase began in 1926.

AVERAGE FREIGHT TRAIN LENGTHS ARRIVED AT BY DIVIDING TOTAL FREIGHT-TRAIN CAR MILES BY TOTAL FREIGHT-TRAIN MILES (Data from Exhibit 279).

	Arizona	Nevada		Arizona	Nevada
1923	56.45	49.51	1932	54.73	73.33
1924	55.42	52.44	1933	55.85	76.73
1925	51.04	56.20	1934	56.84	80.71
1926	50.91	62.41	1935	56.48	77.39
1927	50.41	65.22	1936	54.04	75.01
1928	50.98	64.88	1937	53.40	75.42
1929	52.01	64.94	1938	56.52	79.74
1930	54.98	71.85	1939	55.81	79.44
1931	54.43	73.12	1940	56.28	80.39

(2) All Classes of Employes—All Classes of Service (R. 3986-3988):

This sub-finding is based on Exhibit 276 (R. 3371), explained by Mr. Sullivan at pages 2000-2002 of the printed record. It presents a comparison of casualties to all classes of employes on duty, and in all classes of service, sustained in train and train-service accidents in Nevada and Arizona for the eighteen years, 1923-1940. Opposite this page we insert a copy of Exhibit 276. The frequency rates

are based on locomotive miles, because the exhibit includes a number of employes whose work cannot be measured in train miles or car miles.

The exhibit shows that the operations in Nevada, considered as a whole, have consistently been much safer, so far as train and train-service accidents were responsible for casualties, than the comparable operations in Arizona. The figures speak eloquently for themselves. While there has been some improvement in Arizona, comparing the first six-year period with the last six-year period, it has not been so great as that in Nevada, where the increase in the average length of freight trains has been marked and continuous. The exhibit includes of course all classes and lengths of trains.

(3) All Classes of Employes—Road Freight Trains (R. 3988-3989):

This sub-finding is based on Exhibit 277 (R. 3372), a copy of which we insert opposite this page. It compares casualties to all classes of employes on duty in road freight-train operation in Nevada, with those in Arizona. Here are shown the freight-train miles and the freight-car miles in each state for each of the 18 years, with the casualties related to that operation, on the million train-mile and 100 million car-mile bases. By this exhibit we begin to see a striking illustration, on the appellant's lines, of the advantages from a safety standpoint of the standard long-train method of operation. In considering this exhibit the Court should also examine the table of average freight train lengths which we submit above in commenting on sub-finding (1).

During the six-year period 1923-1928 when, if all of the freight trains operated in those states during that period be considered, there was not a great amount of difference between the average lengths in Arizona and those in Nevada (Nevada, 58.51 cars per train; Arizona, 52.05 cars per train), the casualties on the million train-mile basis are shown to have been 13.18 in Nevada, and 18.03 in Arizona, and on the 100 million car-mile basis 22.54 in Nevada, and 34.65 in Arizona. Then in the second period of six years, 1929-1934, adding together the freight-train car miles in each state for those six years, and dividing the result by the total of the freight-train miles for the six years, we find an average of freight cars per train in Nevada of 72.66 and in Arizona of 54.52. The difference in casualty rates is striking—in Nevada on the train-mile basis 7.46, in Arizona 11.64. On the car-mile basis the comparison is still more significant as it directly bears out our argument that the long-train method of operation is far safer, considering all causes of accidents, than the short train method. On the car-mile basis for the second six-year period, Arizona's average was 21.35, and Nevada's practically one-half of that amount, or 10.27. The comparison between the two states in the third six-year period, 1935-1940, is again of great significance. Obtaining the average length of freight trains during that period by the same statistical method above described, we find for the six years an average length in Nevada of 77.86 cars, and in Arizona of 55.36 cars. On the train-mile basis the casualty rate in Nevada was 5.07 per million train miles, and in Arizona 9.16. On the car-mile basis the superiority of the long-train method of operation

from the safety standpoint is still more apparent, the Nevada rate, per 100 million car miles, being 6.52, and the Arizona rate 16.54. In view of the similarity of operating conditions above referred to, the substantial identity of character and volume of traffic, and all of the other conditions that justify the comparison between Nevada and Arizona, Exhibit 277 standing alone would, we believe, be a sufficient basis for finding that the Arizona law has decreased rather than promoted the safety of freight-train operation.

But we went further and refined the study by producing Exhibit 278 (R. 3373), as a breakdown of Exhibit 277. Exhibit 278 classified the casualties occurring during the 17 years, 1923-1939, by 15 causes, all of which are definitely recognized in the Interstate Commerce Commission classifications of casualties for the purpose of reporting accidents. The year 1940 was not included because when this exhibit was introduced on February 6, 1941 (R. 2002-2003), the 1940 figures were not fully available.

The comparison between Arizona and Nevada with respect to these causes further bears out our contention as to the advantage of long-train operation. Without going into great detail we call attention to the totals. During those 17 years there were, from the 15 causes there tabulated, 528 casualties in Arizona and 300 in Nevada (total car miles for the 17 years, in thousands: in Nevada, 2,226,760; in Arizona, 2,127,554). An analysis of the exhibit will show that as to all of the causes of casualties there shown, which may fairly be said to be related to the number of locomotives or number of train miles operated the Arizona showing is distinctly worse than that of Nevada.

(4) Road Freight Conductors, Brakemen and Flagmen (R. 3989-3990):

This sub-finding is based on Exhibit 279 (R. 3374), a copy of which we insert opposite this page; the exhibit having been prepared by Mr. Sullivan, who explained it, beginning at page 2007 of the printed record:

"The Court: Mr. Sullivan, from these various exhibits it would appear that as compared with the engineers and firemen the conductors, brakemen, and flagmen have a more hazardous occupation?

A. There are more injuries, that is true. Of course, there is an explanation that may be seen by an examination of exhibit No. 278. Engineers and firemen, except in unusual cases, are not required to couple or uncouple locomotives or cars or air hose or steam hose or safety chains. In the performance of their duties, they are always on the moving locomotive, they are not required to get on and off a moving locomotive. They are not required to operate hand brakes, and rarely are required to operate switches unless they are on a light engine, and it is seldom while they are on duty that they are exposed to the other type of injury, being struck or run over by locomotives or cars. As to engineers and firemen, they are exposed to one type of accident that only one member of the train crew is exposed to, and that is collisions, and the collisions and derailments resulting from striking vehicles at grade crossings.

Mr. Strouss: That does not include all collisions, does it, as classified by the Interstate Commerce Commission?

A. Yes, if they were injured, they would be included because this exhibit includes both train and train-service accidents.

Q. When you say 'collisions' that includes collisions between cars that may be switched or collisions of that sort as well as collisions between engines?

A. That is true, but head-on collisions invariably involve one or more locomotives and the engineer and fireman on those locomotives.

Q. Of course the trainman would be exposed if he were on cars that collided in switching?

A. Yes, and the trainmen are exposed to the rear-end collisions."

In addition to the analysis of Exhibit 279 made by the sub-finding, the same observations apply thereto as to Exhibit 277 in comparing one period with another on a train-length basis.

We here print a special table to illustrate that point.

CASUALTIES TO ROAD FREIGHT CONDUCTORS, BRAKEMEN AND FLAGMEN ON DUTY: TRAIN AND TRAIN-SERVICE ACCIDENTS (Data from Exhibit 279).

	Average Cars per Freight Train		Casualties Per Million Train Miles		Casualties Per 100 Million Car Miles	
	Nevada	Arizona	Nevada	Arizona	Nevada	Arizona
1923-1928	58.51	52.05	11.44	15.07	19.56	28.96
1929-1934	72.66	54.52	6.22	9.36	8.56	17.17
1935-1940	77.86	55.36	4.71	7.49	6.05	13.53
18 years	68.93	53.99	7.73	10.62	11.21	19.66

Even if the Arizona law is for the sole benefit of conductors, brakemen, and flagmen, it is apparent that it has entirely failed of its purpose, because it has compelled a method of operation which we show conclusively to be substantially less safe to them than the standard long-train method as defined in the findings.

(5) Slack-Action Casualties to Trainmen—Nevada-Arizona (R. 3990-3993):

This sub-finding is based on Exhibit 280 (R. 3375), and also Nos. 274 and 275 (R. 3351-3370), which contain the detailed lists of all the reportable casualties to employes on duty, in Nevada and Arizona, sustained in train and train-service accidents 1923-1940, including those shown in Exhibit 280.

We insert opposite this page a copy of Exhibit 280. That exhibit covers the years 1923 to 1940 inclusive, and is confined to the states of Nevada and Arizona and to casualties to road freight conductors, brakemen and flagmen on duty, sustained in train and train-service accidents caused from sudden stopping, starting, lurch and jerk of trains—the so-called "slack-action" accidents—related to both train-mile and car-mile bases.

As pointed out in the sub-finding, the infrequency of occurrence of that type of casualty makes it difficult to make any adequate statistical presentation thereof. During the past six years, 1935-1940, appellant (line 21, Exhibit 280) operated over 11 million train miles in Nevada and very nearly 15 million in Arizona, and handled nearly 860 million freight-car miles in Nevada, and over 828 million in Arizona. Yet in neither of those states was there during that period any death attributable to slack-action, and but 27 reportable injuries in Nevada and 24 in Arizona; slightly more than 3 such casualties in Nevada per hundred million car miles, and slightly less than 3 in Arizona. This cannot fairly be called an exposure to any special hazard under present operating conditions and with the existing motive power and equipment. But as we have shown, the necessity for additional and unneces-

sary starting and stopping of trains is merely an added inducement to slack-action, which is at least as frequent train for train in short-train as in long-train operation.

Further considering this exhibit, it is obvious from what has been said before that the car-mile basis is the fair one to apply to this comparison; and the comparisons on that basis are fully analyzed in the finding.

(6) Caretakers in Cabooses—Nevada-Arizona (R. 3993):

This sub-finding is self-explanatory and is based on Exhibit 288 (R. 382) and the testimony (R. 2027-2029) shown in the annotation. Of course, persons riding on freight trains are equally entitled to protection with those operating them, and the evidence shows that the class of licensees described in the sub-finding has uniformly been safer in Nevada than in Arizona.

(7) Serious Casualties—Nevada-Arizona (R. 3994):

This sub-finding is annotated to the record (Exhibits 274, R. 3351; 275, R. 3364; 281, R. 3376), and requires no further comment.

(8) Casualties Classified—Nevada-Arizona (R. 3994-3995):

This sub-finding is based on the evidence and exhibits shown in the annotations thereto.

No matter what period or class of casualties is viewed in the summary table set forth in the finding, it is evident that the Nevada road freight-train operation has uniformly been substantially safer than that in Arizona. In the past six years, ending with the year 1940 (Exhibit 279, line 21; R. 3374), Nevada road freight trains handled 859,501,000 car miles with 11,039,000 train miles, while Arizona used

14,957,000 train miles to handle 828,051,000 car miles. The 3,918,000 additional and obviously unnecessary train miles used to handle an approximately 4 percent smaller volume of loaded and empty cars can fairly be held to have been responsible for the adverse Arizona showing made in the special table printed in this sub-finding (R. 3994): in Arizona total casualties to road freight conductors, brakemen, and flagmen, 112, in Nevada 52; in Arizona when operating hand brakes, 16, in Nevada 4; in Arizona, getting on or off cars or locomotives 27, in Nevada 9 (this classification is directly related to the stopping and starting of trains as well as to their handling while on the road); miscellaneous train and train-service accidents, 61 in Arizona and 35 in Nevada.

(9) Derailments Reportable as Train Accidents—Nevada-Arizona (R. 3995-3996):

This sub-finding is based on elaborate detailed exhibits (Exhibits 286, R. 3383; 287, R. 3384; 288, R. 3384; 389, R. 3565) which are referred to in the annotation, and a summary of which is printed as a special table in the finding. We refer again to the illustration we gave under finding (8) immediately preceding, in which we compared the train miles and car miles in Nevada and Arizona for the six-year period ending with 1940. In each of the six-year periods, as well as in the 18 years covered by the tables, the comparison is uniformly favorable to Nevada when the number of such derailments is considered on either the train-mile or car-mile basis; so it is as to damage to property, with two slight exceptions which are apparent from the table. And a very significant fact is, as stated in the proposed finding, that of the 70 derailments

in Nevada 35 occurred on long trains and 35 on short trains, with the result that, during the 18 years covered by the tables, 141 of the 176 derailments reported as train accidents in both states occurred to trains of 70 cars or less.

(h) COMPARISON OF SHORT AND LONG-TRAIN PERIODS IN NEVADA WITH EACH OTHER (R. 3996-3997).

This sub-finding is annotated to the record (see Exhibit 282, R. 3377, in particular), and is so explicit and illustrative that it seems to require no comment, except to say that the comparison between the three-year long-train period and the three-year short-train period in Nevada is entirely consistent with all of the other showings of the relative hazard in the two classes of operation. The year 1940 was not available at the time the exhibit was prepared on which this sub-finding is based, but the other exhibits show that its use would not have invalidated the comparison.

(1) Comparison Nevada with Arizona—Three-Year Periods (R. 3997-3998):

This sub-finding includes a special table made up from Exhibits 277 (R. 3372) and 282 (R. 3377), and compares Arizona and Nevada operations for the three years 1923-1925, and the three years 1938-1940, showing the number of casualties on road freight trains to all employes on duty in train and train-service accidents. The special table demonstrates that notwithstanding the improvement in roadbed, signals, equipment, etc., in both states, Nevada, whose average number of cars in freight trains increased from 52.73 to an average of 79.88, had a substantially better safety performance than Arizona, with a corresponding increase from 53.88 to but 56.19.

(i) CASUALTY STATISTICS—DEFENDANT'S LOS ANGELES DIVISION (R. 3999-4000).

It was not our intention to make a detailed showing of casualties on the Los Angeles Division and relate them to any accepted basis for ascertaining frequency rates. There was no more reason for us to select the Los Angeles Division for that purpose than any other of the California divisions, or the operations in Oregon. There is evidence in the record (R. 2166) that the California Full-Crew Law requires substantially more brakemen in freight-train operation than are required in either Nevada or Arizona. For that reason, as explained by Mr. Sullivan (R. 1985), statistics of reportable casualties to train crews would not be on a comparable basis. Each additional employe furnishes additional exposure to whatever hazard there may be incident to the operation of the particular train and additional opportunity for human failure. This is especially true as regards accidents to men in cabooses, where additional brakemen ride while the trains are under way. But in spite of our first intention, the Los Angeles Division came into the case and thus, despite its lack of entire comparability because of the full-crew law provisions just mentioned, there was considerable evidence produced regarding it, which is fully analyzed in the finding.

(j) ACCIDENT AND CASUALTY STATISTICS—DEFENDANT'S LINES IN NEW MEXICO (R. 4001-4004).

Standard long-train practice has never been fully adopted on appellant's lines in New Mexico, primarily because of the controlling extra-territorial influence of the Arizona law on appellant's operations between the eastern

boundary of Arizona and Lordsburg, and also because that compelled operation has a bearing-down effect on the length of freight and passenger trains between Lordsburg and El Paso. The result has been that in respect to the average length of trains, New Mexico operations have been between the standards of Arizona and those of Nevada, but very much closer to the former than to the latter. Results of those operations from a casualty as well as a train-accident standpoint are also between those attained in the two states, and serve in a measure as a check upon and confirmation of the individual statistics in those two states, and the preceding comparisons between them.

(1) Casualties to Persons—Freight-Train Operation (R. 4001-4003):

This sub-finding is annotated to eight exhibits (185, R. 3077; 277, R. 3372; 279, R. 3374; 280, R. 3375; 338, R. 3465; 364, R. 3518; 387, R. 3548-3557; and 397, R. 3578), the significant figures of which are put together in narrative form in the finding. Those exhibits confirm the position of the appellant that its operations can be more safely conducted by the standard long-train method of operation.

(2) Train Accidents—Freight-Train Operation (R. 4003-4004):

This sub-finding is annotated to the exhibits (Nos. 280, R. 3375; 289, R. 3386-3393; 290, R. 3399-3408; 340-349, R. 2680-2682; 388, R. 3558-3567) upon which it is based and completely self-explanatory.

(3) Passenger-Train Accidents and Casualties (R. 4004):

Appellant's passenger-train experience in New Mexico, as shown by Exhibits 362 (R. 3501) and 368 (R. 3527),

summarized in this sub-finding, is in further confirmation of our statement that no plausible theory can be seriously advanced in support of the limitation of passenger trains to the maximum of 14 cars.

(k) SANTA FE CASUALTY STATISTICS—COMPARING SHORT-TRAIN AND LONG-TRAIN OPERATIONS (R. 4004-4006).

This sub-finding is supported by the testimony and exhibits referred to in the annotation thereto. The statistical exhibits summarized in the tables printed in the finding are merely continuations on the same bases as those used by the same railroad in the *First Arizona Train-Limit Case*, and offered by the same witnesses and accepted by the court in the *Nevada Train-Limit Case*. They are strongly confirmatory of the position we have taken with respect to the safety of freight-train operation under the Arizona method, as contrasted with the method used in Nevada and generally throughout the nation. While the case did not call for as elaborate a showing of Santa Fe operations as of those of the appellant, we did, however, lay the foundation for its safety exhibits by detailed testimony of its operating and accounting officials.

We submit that the particular value of the Santa Fe safety showing is twofold. First, it is the only major railroad other than the appellant that operates in Arizona. Second, the trains considered in its safety tables are, so far as the through main-line trains are concerned, the same trains in the long-train as in the short-train territory shown in the table, carrying for the most part the same cars and commodities between California and states east of New Mexico in both east and west-bound move-

ment. The tables cover casualties resulting to road freight trainmen and enginemen on duty from the operation of the through, local and mixed road freight trains, and occurring while on or getting on or off road freight trains, as such casualties were reported to the Interstate Commerce Commission. That group of casualties includes all of the casualties classified under the various code numbers included within the general definition of sudden stop, lurch or jerk of car or train. They also include all or practically all of the accidents that may happen to road freight conductors and brakemen in the additional stopping and starting, signalling, and protection of trains incident to the multiplication of meets and passes by the running of unnecessary trains, additional to those which normally would be required to handle the same volume of traffic. The run of these through trains between Needles, California, and Gallup, New Mexico, is, of course, controlled by the Arizona law; that between Gallup and Belen is somewhat modified as to eastbound trains by the effect of the Arizona law, just as the appellant's operations east of Lordsburg, New Mexico, are modified. The operation between Belen and Clovis is an unrestricted and unmodified standard long-train operation. The average freight-train lengths of 72.69 cars in 1929, and 71.7 in 1939, indicate a very much higher average in through freight trains, as the averages just stated included local and mixed road freight trains. This conclusion is confirmed by the exhibit introduced by witness Weeks of the Santa Fe (Exhibit 138, R. 3007-3009), which for the ten-day typical period selected by him showed representative freight-train lengths in the New Mexico territory east of Gallup as follows: of a total of 263 trains, 113 were of 70 cars or

less; 123 were of 71 to 100 cars; and 27 were of 101 to 125 cars.

We do not suggest, and have not at any time suggested, that the findings of the Special Master or the three-judge court in either the *Nevada Case* or the *First Arizona Case* are binding in this action, even though they were upon the same general issues which are controlling here and based upon the same line of, and in many cases the identical, testimony now in the instant record. We have no more right to suggest compliance with those findings than the appellee has to insist that the *Oklahoma* opinion, based on affidavits submitted without the privilege of cross-examination, is controlling here. But the fact remains, for whatever it may be worth, that in the two similar cases to which this appellant has been a party two Special Masters and six Judges arrived at the same conclusion with respect to the ultimate facts, and did so upon practically the same statistical showings which are merely strengthened by being brought down to include the period which has intervened since those cases were decided. It can be said of the Santa Fe statistics that they clearly illustrate the fact that no matter how the theory of greater safety by long-train operation may be tested statistically, the same result is always obtained and the same conclusion follows.

Truth is always consistent.

(1) CHESAPEAKE & OHIO RAILWAY—CASUALTY STATISTICS (R. 4006-4007):

This sub-finding is based on the exhibits (Nos. 116-118, R. 2976-2978; 121-123, R. 2981-2983) and testimony (R.

867, 872-884) referred to in its footnote. In the body of the sub-findings we have inserted tables giving summaries of the Chesapeake & Ohio exhibits. That railroad was selected because of its outstanding character as an operator of long freight trains, and its highly successful record from a casualty standpoint. The tables are self-explanatory. They stop with 1938, because they were taken from the Annual Statistics and Annual Accident Bulletins of the Interstate Commerce Commission, the latest available at the time the testimony was given having been those for 1938. The testimony of its operating official, Mr. Beale, should leave no doubt of the admissibility of the results of these operations in arriving at findings on the general safety issue. Similar statistics from the Chesapeake & Ohio, brought down to the year 1934, were before the Master and Court in the *Nevada Train Limit Case*.

(m) DECREASE IN CASUALTIES—NEVADA COMPARED WITH ARIZONA (R. 4008-4009).

This sub-finding brings together in a convenient and graphic form the three important exhibits, Nos. 277 (R. 3372), 279 (R. 3374) and 280 (R. 3375), which relate to the reportable casualties in road freight-train operation shown in the three special tables printed in the sub-finding and which summarize those exhibits. These tables are wholly self-explanatory.

(n) CASUALTIES WHILE TRAIN STANDING (R. 4009-4010).

Obviously the occurrence of casualties happening while the train is standing cannot be related to the length of the train although the evidence shows, as abstracted in the finding, that 58 of 73 casualties of that character in Ne-

vada in 18 years occurred on short trains, and, of course, all of those accidents in Arizona were on short trains. It would seem to be evident that any unnecessary increase in the number of trains would have a tendency to increase the number of accidents that occur while trains are standing, particularly in freight service where brakemen are required to get off and on the train for the purpose of flagging. The increase of hazard is in proportion not merely to the additional number of trains but to the increased number of stops made necessary by the running of unnecessary trains.

(o) PASSENGER-TRAIN SAFETY (R. 4010-4013).

The showing of casualties under this subheading is divided between those occurring nationally and those occurring on appellant's lines in Nevada and Arizona. Back of that showing there is the testimony relating to the development of passenger-train locomotives and passenger cars which has been substantially uniform throughout the United States. There is also the testimony of Mr. Parke, Chief Engineer of The Pullman Company, showing the great development in Pullman equipment.

Under sub-finding "XII(e)(2) Passenger Train Accidents" (R. 3983) the discussion covers the Bureau of Safety Investigations of 320 passenger-train accidents during the six-year period 1934-1939, and refers to Exhibit 267 (R. 3305). Over 18 per cent of the passenger-train accidents so investigated were due to collisions with vehicles at grade crossings. The effect of an arbitrary limitation of the length of trains and the consequent increase in the hazard of grade-crossing accidents is discussed hereafter

under Sub-finding (p), "Grade-Crossing Accidents"; but it should be remembered, and the reports of the Bureau of Investigations show, that every collision at a grade crossing carries with it the hazard of the derailment of the locomotive and the following cars, so that whatever lessens the possibility of grade-crossing accidents increases the safety of the employes and passengers on the trains that may collide with the vehicles.

(1) Passenger Casualties—Class I Railroads of the United States (R. 4010):

This sub-finding is based on Exhibit 267 (R. 3305) and needs no amplification.

(2) Passenger Casualties—Nevada and Arizona (R. 4010-4013):

This sub-finding is based on Exhibits 291 and 292 (R. 3409-3421), and analyzes them in some detail. So far as safety is concerned, no form of transportation has made greater progress since 1912 than the passenger train. This is graphically shown by the testimony as well as by the exhibits showing chronologically the development of passenger-car equipment, including Pullman cars. The wooden passenger car is a thing of the past. The rules for reporting accidents are such that necessarily the one-day disability provision results in a great number of reportable accidents that, if they occurred to a pedestrian on the street, would never be reported to the police or find their way into newspaper columns. But they are reported by railroads nevertheless.

Although passenger-train operations, except for the average length of the train, are practically the same in Arizona as they are in Nevada, we find the showing of

casualties adverse to Arizona as related in the finding. Again we say that we are completely at a loss to imagine any even slightly plausible argument in favor of the limitation to fourteen cars as applied to the passenger train of today. If ever a litigant attacking a police power statute has succeeded in proving the "universal negative" to a moral certainty and beyond any reasonable doubt, the appellant has done so, we believe, in the case at bar with respect to the passenger-train limitation. The only individuals that can possibly benefit are those who are unnecessarily employed, and that is not a ground for sustaining an arbitrary regulation of common-carrier transportation.

(p) GRADE-CROSSING ACCIDENTS (R. 4013-4015).

This sub-finding is copiously annotated to the record. It would seem to be perfectly clear that whatever hazard may exist at grade crossings from the running of ten trains of any character across those crossings would be proportionately reduced by the running of but seven trains to handle the same cars and the same traffic. The police power of the State has been and constantly is invoked to compel separation of grades, automatic and manual signals, and other forms of protection to the joint users of grade crossings. But the statute under consideration makes no such attempt and could not be held to do so by indirection. Instead of decreasing hazards by affording fewer opportunities for collisions, it obviously and directly increases those hazards.

(q) FREIGHT-TRAIN DERAILMENTS—NEVADA, ARIZONA AND NEW MEXICO (R. 4015-4017).

Seven exhibits (Nos. 286-290, R. 3383-3408; 388, R. 3558-3564; and 389, R. 3565), bear on this subject. A train derailment is frequently but not always initiated by the derailment of a locomotive, as the detailed statistics show. And, of course, a forced increase in the number of locomotives would, other things being equal, result in a greater number of derailments. The improvements in roadbeds, roadway structures, motive power, signals and equipment have, as shown by the statistics, resulted in a marked decrease in the number of derailments, but notwithstanding those improvements Arizona, as in all other matters pertaining to safety, continues to lag behind. The conclusion is inescapable that this is directly due to the dead hand of the 1912 law.

(r) EMERGENCY APPLICATIONS OF AIR BY ENGINEER (R. 4017).

This sub-finding shows by citations to the evidence (R. 2804, 2817-2818) and exhibits (Nos. 274, 275; R. 3351-3370) that there is nothing whatever in the claim that such emergency applications can be prevented or the number reduced by limiting the cars in a train.

(s) HEAVIER GRADUATING SPRING (R. 4017-4018).

This sub-finding is on a point which was made mention of by the defense and the employe organizations in the *First Arizona Train-Limit Case*. As shown by the evidence, slack-action accidents on either long or short trains, due to weak graduating springs, are no longer to be considered a factor of any consequence in train operation.

(t) ARIZONA LONG-TRAIN OPERATIONS, 1940 (R. 4018-4019).

The operation in Arizona in March and April, 1940, of 62 long passenger trains with 15,587-train miles and 243,749 car miles, and 302 long freight trains with 37,257 train miles and 3,180,278 car miles (average length 85.36 cars) resulted in a striking confirmation of appellant's claim that greater safety of operation could be secured by adopting the standard long-train method of operation in Arizona; this in spite of the fact that primarily because of the shortness of the sidings and passing tracks, full standard long freight-train operation was not possible of accomplishment for the reasons stated by our witnesses.

Sullivan, R. 2053-2055, 2057-2059.
See also *Finding* IX(a) (R. 3947-3948).
Exhibits 246 (R. 3255), 294 (R. 3423), 295 (R. 3424).

We consider that this operation furnished a demonstration of the practicability of safer train operation *in Arizona* if the law is lifted. It added to and confirmed the uniform showing made by the casualty statistics—national, state, and division.

(u) EMPLOYES AFFECTED BY THE TRAIN-LIMIT LAW (R. 4019-4021).

This sub-finding assembles, brings together, and gives record references to the evidence relating to the question of just who are, or may be, affected by enforcement or disregard of the law. The Legislature of 1912 did not see fit to give in the title of the statute, or by way of recital or preamble, any specific reason for its enactment; nor did it describe any condition, the result of which the law was desired to prevent or minimize. But it

is common knowledge that laws of that character have been urged nationally, as well as in the Legislatures of most of the states, by the employe organizations usually referred to as the Train-Service Brotherhoods. Nearly always their primary argument has been that the limitation of the length of trains was necessary to prevent or minimize casualties and other occurrences resulting from slack-action shock.

Counsel for the appellee have adopted this theory; it was forecast in their arguments on objections to testimony and their questions on cross-examination, and formed the principal basis of their presentation of the safety issue to the State Supreme Court. That theory of the law results in the position that the Legislature, under some hidden theory or undeclared intention, may have legislated in behalf of a supposed greater freedom from a minor class of accident for a limited group of employes, regardless of the law's effect on the hazards to all classes of employes who may and occasionally do suffer casualties from the operation of freight and passenger trains, as well as on the hazards to the public, which we have endeavored to describe in the preceding discussion. This sub-finding puts in condensed and narrative form a description of the classes of employes who are adversely affected by the legislation. We have endeavored to show, and we have shown, that the employes for whose protection the law is ostensibly designed are really placed in a more precarious condition by compelled short-train operation, than if appellant were permitted to adopt and practice the standard long-train method of operation.

(v) INCREASE IN ACCIDENT AND CASUALTY HAZARD INHERENT IN INCREASE OF TRAIN UNITS (R. 4021-4022).

The evidence shows beyond any question or doubt that the enforced limitation of train lengths in Arizona has resulted in no decrease of hazard to any group of employes or persons from any recognized cause of reportable casualties; that it has prevented the improvements in roadbed, signals and equipment that have taken place since 1923 from having their full and intended effect and consequently has increased the hazard of train operation instead of lessening it. To illustrate this conclusion we now print a special series of comparisons taken from exhibits with which we have dealt separately under preceding sub-section heads.

COMPARISONS OF IMPROVEMENT PERCENTAGES IN CASUALTY RATES AS SHOWN BY APPELLANT'S STATISTICAL EXHIBITS

Class I Railroads of U. S. A.

Five-year period 1935-1939 compared with six-year period 1923-1928

		PERCENTAGES OF DECREASE BASES	
		Car Mile	Train Mile
Ex.	(Train and Train Service Accidents)		
262	All classes employes on duty	70.33%	66.99%
263	Road Trainmen and Enginemen on duty	69.21%	65.73%
264	Road Freight Trainmen and Enginemen on duty	69.32%	66.15%
265	Road Freight Conductors, Brakemen and Flagmen on duty (all R. R.'s U. S.)	66.21%	62.72%
266	Same employes as Ex. 265, "slack action" casualties	65.29%	61.82%

Nevada-Arizona

Six-year period 1935-1940 compared with six-year period 1923-1928

Ex.		PERCENTAGES OF DECREASE (Car Mile) Nev.	Ariz.	(Train Mile) Nev.	Ariz. (Loco. Miles)
	(Train and Train Service Accidents)				
276	All classes of employes on duty in all classes of service			46.7%	38.7%
277	All classes of employes on duty—Road Freight Train Operation	71.1%	52.3%	61.5%	49.2%
279	Road Freight Conductors, Brakemen, Flagmen on duty	69.1%	53.3%	58.8%	50.3%
280	Same classes as Ex. 279, "slack-action" casualties	57.5%	47.7%	43.3%	44.6%

This concluding sub-finding summarizes and puts in bold relief the additional opportunities for casualties afforded by requiring the appellant to operate additional and unnecessary trains. It concludes with the statement of an ultimate fact which we believe is fully supported by the evidence, and which we desire to repeat in closing our discussion of Chapter XII of the Findings:

> **"Thus the Arizona Train-Limit Law not only bears no reasonable relation to safety but, to the contrary does, and if enforced will continue to, impair and lessen substantially the safety of defendant's train operations in Arizona and the adjacent affected territory."**

XIII.

ANALYSIS OF CERTAIN CONTENTIONS ADVANCED BY PLAINTIFF (R. 4002-4032).

In the interest of a complete disposition of certain contentions suggested in appellee's rebuttal testimony, which

have not been separately treated in preceding findings, appellant as defendant proposed and the trial court adopted a series of findings upon the following emphasized points:

(s) THE CONTENTION THAT, WITH LONG-TRAIN OPERATION, TRAINS WOULD BE DELAYED AT MEETING AND PASSING POINTS BECAUSE OF INADEQUATE SIDING CAPACITIES (R. 4022-4023).

The contention covered by the finding captioned as above was suggested in the cross-examination of appellant's witness Herrell (R. 2203-2204), and also in the direct testimony of witness Fail (R. 2554). The point was not developed to any great extent, apparently for the reason that counsel became convinced that it was wholly untenable.

The fact is that the delay incident to the single or simple "saw-by", the only type referred to in appellee's rebuttal testimony, is comparatively slight, because the operation is not at all complicated. Even these minor delays would, however, be completely eliminated, and, if the siding extensions contemplated by appellant in connection with long-train operation were to be constructed, would not affect operations even in the territory east of Lordsburg where they now occasionally occur. As stated elsewhere (Finding IX-h, R. 3948-3950), appellant did not at the time contemplate any attempt at unrestricted long-train operation with present siding capacities, even if the law's restrictions should be removed in the near future; for the time being, long-train operation would be largely in one direction at one time. The practicability of such limited operation, pending the construction of the longer sidings, has been demonstrated by the experience of April,

1940. Even under the conditions then existing, and in spite of the fact that occasionally saw-by's were involved because some of the trains so operated were obliged to meet opposing trains at sidings where one of the trains exceeded the siding capacity, no serious delays were involved, and the operation as a whole was entirely successful.

(b) THE CONTENTION THAT TRAINS SHOULD BE LIMITED TO 70 CARS IN ORDER THAT THE MEMBERS OF THE CREWS MAY SEE AND INTERPRET SIGNALS MORE READILY (R 4023-4025).

The finding bearing the above title deals with a contention apparently considered to be of some importance by appellee's counsel, inasmuch as it was the subject of extended discussion in appellee's briefs to the courts below. It was apparently advanced in all seriousness, though a careful analysis demonstrates that even if it were true, the fact would be quite unimportant from the safety standpoint.

The facts themselves afford a conclusive answer to appellee's contention. The specific hazards against which the law is directed, according to the claim and contention of our opponents, can arise only while trains are in motion. It has not been claimed, nor is it possible to understand how it could be claimed, that the law prevents or minimizes any train or train-service accidents of the kinds which occur while trains are standing. So far as hand or lantern signals are concerned, there is no authorized signal which might be given while the train is in motion except the stop signal. If the members of the engine crew observe an attempted signal being given from the caboose

they cannot misunderstand; they know that it must be a stop signal. At night, if the signal from the caboose is not seen by the engine crew and the stop must be made, a red fusee may be used, and the stop signal thus conveyed is almost certain to be seen. However, if even that signal is not seen or complied with, then the conductor has both the right and duty to use the emergency valve in the caboose, and thus bring the train to a stop without any hazard at all of slack-action to persons riding in the caboose.

Durnil, R. 2377-2379, 2387-2394, 2404-2406; *Kennedy*, R. 2431-2436; *Cooper*, R. 2446; *Check*, R. 2480-2481; *Stevenson*, R. 2495-2497; *Ash*, R. 2574-2576; 2578-2580, 2599-2603; *Fail*, R. 2618-2622, 2625.

The casualty testimony in this record is very complete, and shows without contradiction that the use of the conductor's valve has not resulted in a casualty of any kind in either Nevada or Arizona, or elsewhere upon a long train, during the last 18 years. There is likewise an affirmative and uncontradicted showing that failure to receive or understand a hand or lantern signal, given while the train was moving, has not resulted in or contributed to a reportable accident or casualty in either Arizona or Nevada during the past 18 years, or in New Mexico or on the Los Angeles Division, California, during the past 11 years. The supposed hazard from failure to see or understand signals on long trains while in motion is purely imaginary.

Exhibits 274 (R. 3351-3363), 275 (R. 3364-3370), 289 (R. 3386-3398), 290 (R. 3399-3408), 386 (R. 3533-3547), 387 (R. 3548-3557).

The challenged law, to the extent that it is considered to be a purported safety regulation, having the purpose of permitting signals on moving trains to be given and received, is clearly unreasonable and arbitrary.

(c) THE CONTENTION THAT MEMBERS OF THE CREWS ON LONG TRAINS ARE IN CONSTANT FEAR OF INJURY, AND ARE THEREBY RENDERED LESS ALERT AND EFFICIENT IN THE PERFORMANCE OF THEIR DUTIES (R. 4025-4026).

Perhaps the most fanciful and illogical of all of the reasons for the law indicated by appellee is the suggestion that compulsory short-train operation eliminates apprehensions, and improves the efficiency, of trainmen who, in cabooses of long trains, are claimed to be in constant fear of injury; that the fixed limitation prevents the slack and slack-action which are alleged to cause such fear.

Whether or not a man suffers fear under any particular set of circumstances is largely determined by his personal reactions. Usually, however, fear is a wholly involuntary emotion, and arises because of circumstances which the individual would like to control but cannot. But the so-called fear testified to by appellee's witnesses is of an unusual and remarkable type: it seems to be easily controlled, and capable of being summoned or dismissed at will. If the contention of appellee is correct, and the testimony of its witnesses is to be accepted, trainmen in cabooses are fearful to the point of inefficiency when a train contains even one car more than 70; but they are largely if not wholly relieved of that fear when that one car is cut off. Fear of that type, manufactured to order for purposes of a particular situation, is too imaginary to be of moment. Indeed, the complete unreality of this

supposed fear is forcefully demonstrated by the fact that the two witnesses who principally made the suggestion have voluntarily elected to serve, for many years, as trainmen and conductors in the long-train territory between Lordsburg and El Paso, where approximately a quarter of all of the freight trains upon which they run are long trains, although each of them has ample seniority to permit him to obtain and hold equivalent positions in train service, in the short-train territory west of Lordsburg. It will be recalled that the entire main-line district between Yuma and El Paso constitutes a single seniority district, and that employes working between El Paso and Lordsburg have equal seniority rights in the remainder of the territory.

Stevenson, R. 2488-2489; *Ash*, R. 2566-2571; *Fail*, R. 2609-2615, 2629-2631.

Even if the fear really exists, there is still no logical basis for contending that it is diminished or eliminated by the restraints of the law. Comparing and combining Nevada and Arizona experiences, the frequency of slack-action casualties, over the past 18 years, has been about as great, if not greater, on short trains as on long trains. Such casualties have not been eliminated by the short-train statute; on the contrary, they have occurred at the rate of about 5 per year, during the last 12 years, upon Arizona short trains operated in full conformity with the law's requirements.

Exhibits 274 (R. 3351-3363), 275 (R. 3364-3370), 280 (R. 3375), 395 (R. 3571).

(d) THE CONTENTION THAT LONG TRAINS CANNOT BE PROPERLY INSPECTED OR SUPERVISED WHILE IN OPERATION, BUT THAT SHORT TRAINS CAN BE, AND THAT LONG-TRAIN OPERATION THEREFORE RESULTS IN GREATER HAZARDS (R. 4026-4029).

The finding bearing the above title relates to a subject which was also discussed at some length in the testimony of appellee's witnesses, and thereafter given considerable emphasis in appellee's presentation to the courts below. In that discussion, as in much of the other testimony relative to the asserted hazards of long-train operation, these witnesses were generally quite ready—even eager—to describe how accidents "might" happen as the result of the supposed impossibility of proper supervision of a moving long-train by the members of the train crew; but were also quite embarrassed and unresponsive when asked to cite specific instances.

The finding states, accurately reflecting the record, that no reportable accident or casualty was referred to, by any of these witnesses, as to which it was claimed or shown that the accident would have been avoided or minimized, if the law's restrictions had been complied with; particularly, that no accident or casualty was referred to, asserted to have been due to a defect in or failure of freight-car equipment on a long train, as to which it was claimed or shown that it was due to the inability of the crew to supervise the operation or that the supervision would have been effective to prevent the accident if the train had consisted of 70 cars or less.

The inspections of the freight cars and freight-car equipment, made by members of the train crews while at inspection or other stops, and equally the supervision

which they undertake from various points of observation along the train, including the engine and caboose, while the train is in motion, are for one primary purpose: to locate existing or possible defects in or failures of the equipment, which may lead to derailments or other accidents, with resulting casualties and damage. If the contentions of appellee's counsel and witnesses were correct, it should follow that in Nevada, where long-train operation predominates, and the other conditions permitting close supervision and inspection of trains are certainly no more favorable than in Arizona (the number of trainmen and other employes making up the crew on a train of over 50 cars is the same as in Arizona), accidents and casualties of this class should be more frequent in the aggregate, and particularly in relation to the traffic moved, than in Arizona; and, in particular, should be much more frequent on the Nevada long trains than on the Arizona short trains. The actual record of derailments due to these causes is the best evidence that long-train operation does not prevent effective supervision. The Nevada accident rates, for reportable derailments due to defects in or failures of freight-car equipment, are much lower than in Arizona; the total number of such derailments is considerably less than in Arizona; and of the Nevada derailments a substantial proportion were on short trains. For the 11-year period 1930-1940, there were only 31 such reportable derailments in Nevada, 11 on short trains; and the rate was 2.11 per 100 million car miles. The corresponding total for Arizona was 42, all on short trains; and the rate was 3.03 per 100 million car miles. Both the actual number and frequency rate of such derailments, were

about 59 per cent greater in Arizona during the six-year period 1935-1940. In New Mexico, where long-train operation takes place, although on a very much smaller scale than in Nevada, the frequency rate of such derailments was lower, during the 11-year period 1930-1940, than in Arizona; moreover, of the 29 derailments which took place in New Mexico, 23 were on short trains, and only 6 on long trains.

Direct comparison between long-train and short-train operation over the same territory, during the first six months of the year 1940, is also available in the record (Exhibit 397, R. 3572). This exhibit relates to operations between Lordsburg and El Paso during the period mentioned. The time returns and delay reports of the conductors who handled the freight trains over that district during that period contained references to 123 defects and occurrences having to do with the operation of freight cars in such freight trains, 88 of which defects and occurrences were detected and discovered on 1900 short freight trains and 35 on 562 long freight trains. Short trains constituted 74.4 per cent of the total; 71.6 per cent of the defects and occurrences were reported on such short trains. Long trains constituted 25.6 per cent of the total; and 28.4 per cent of the defects were reported on such trains. The long trains averaged 94 cars per train; the short trains 63.3 per train. The defects and occurrences thus reported were at the rate of one for each 202,860 car miles on the short trains; and one for each 260,000 car miles on the long trains.

There can be no doubt that inspections at terminals and en route, and the supervision of trains by members

of the train crew while the same are in motion, can be and are as properly and adequately performed on long trains as on short trains; and any claim or contention by appellee that the limitation is necessary for the purpose of permitting more complete inspection is wholly unfounded.

See annotations to *Finding* XIII(d): R. 4029-4303.

(e) THE CONTENTION THAT THE PRESENT TYPE OF AIR-BRAKE EQUIPMENT IS INADEQUATE TO CONTROL THE SPEED OF AND TO STOP LONG TRAINS, BUT IS MORE EFFICIENT AND ADEQUATE UPON SHORT TRAINS (R. 4030-4032).

Although appellee's counsel did not at the trial expressly declare their position to be that the present type of air brakes and their appurtenances are insufficient and inadequate to permit long trains to be adequately controlled and safely stopped, if operated in the affected territory, nevertheless it is impossible to ascribe any other purpose to their repeated questioning of their own witnesses, and as well of certain witnesses called by appellant, all having to do with the operation of air brakes, the methods employed by engineers in handling trains with the air brakes, and particularly their ability to control such trains while in operation. If it were not appellee's contention that the present types of air brakes are inadequate for long-train operation, then all of the testimony referred to would have been immaterial, and without apparent purpose in the case.

Indeed, appellee was virtually compelled either to take this position, or else concede that the law has no safety purpose or relation to safety at all. The briefs filed in the lower courts have sufficiently revealed that its contention is accurately described in the title to the finding,

The analysis of the testimony, set forth in the text of the finding above-captioned, is perhaps the best argument in its support and further extended review is unnecessary. We emphasize, however, that none of the engineers called by appellee was willing to testify that he had ever experienced an accident or casualty through failure to control his train, or that he could not adequately control any train which he might be called upon to handle in the affected territory. The engineer employes of appellant who testified for appellee expressly agreed that the controlling of long trains did not involve any greater *difficulty*, but simply required *more care*. Both of the engineer witnesses called by appellant, each of whom has had at least as much experience in train handling as any witness called by appellee, and possibly much more, testified directly that it is no more difficult to handle and control long trains than short trains; in fact, engineers who handle long trains as a regular practice frequently must take more care than usual, when occasionally called to handle short trains.

One of the best methods of proof is to resort to actual experience and in this case we have not only the experience of years on the system at large, but also the actual experience in the affected territory: the 302 long freight trains operated in Arizona in April, 1940. The finding states, and we here emphasize, that there is no evidence whatever that any of the engineers who handled these trains was unable to control or stop his train, or had any unusual or substantial difficulty in its operation. We are quite sure that if any difficulty or lack of control had developed, appellee's counsel and witnesses would have

made the most of it in evidence. However, as to many of said trains, the record affirmatively shows, from the testimony of the very men who handled or rode upon them, that no difficulty or other notable incident was encountered.

See annotations to *Finding* XII(e): R. 4032.

We do not, in this discussion, overlook the voluminous testimony of appellee's witness Cooper, who testified generally on the subject of air brakes and brake appliances in freight trains. This witness' experience is confined to the Santa Fe, but includes both long-train and short-train operations. His seniority extends into both California and Arizona and he stands sufficiently high on the seniority list in his district to be able to select the position of his choice in freight-train service. At present, and for some time past, he has held a position in long-train territory, where, if any train-control difficulties exist peculiar to long-train operation, he is certain to confront them sooner or later. He voluntarily does not choose to work in Arizona, although if the 70-car limitation removed the difficulties he could have that advantage.

Cooper, R. 2438, 2440.

Clearly there is no foundation whatsoever for any claim that engineers cannot safely control and stop long trains by the use of the present types of the air brakes and their appurtenances, and with no greater difficulty than in the case of short trains.

XIV.

EXTENT OF PENALTIES IMPOSED BY THE LAW (R. 4032).

In response to the issue tendered by paragraph 14 of Part III of the answer (R. 27-28) a specific finding was proposed and adopted showing the extent of the penalties imposed by the law. This finding is based upon computations from Exhibit 214 (R. 3198) and 246 (R. 3255). Exhibit 214 shows that in June and August, 1938, if appellant had disregarded the law entirely and had gone to long-train operation with extended sidings and heavier power, it would have operated some 1,386 long freight trains over the districts between Yuma and Lordsburg via Gila and Tucson, and between Tucson and the New Mexico-Arizona state line near Rodeo (the Douglas line). Expanding this figure to the annual basis, by dividing by 17.89 per cent, we derive a total of approximately 7,800 long freight trains which would thus have been operated during 1938. This figure takes into account an allowance for whatever long-train operation might also have taken place on the Phoenix main line. It is necessarily approximate, but is adequate for the purposes of the finding, which merely states in round figures the total amount of the penalties which the law would impose.

The figure for passenger-train operation is taken from Exhibit 246, which shows that in a period of slightly less than two months in 1940 defendant operated passenger trains of more than 14 cars in Arizona on 62 occasions. Multiplying this figure by six gives a total of approximately 360 long passenger trains per year.

Since the penalties imposed by Section 3 of the law are from $100.00 to $1,000.00 for each offense, a simple com-

putation results in the figures, $816,000 and $8,160,000, which represent the range in the total amount of cumulative penalties for which appellant would be liable, if it were to disregard the Train-Limit Law throughout an entire year.

XV.

THE PERMISSIBLE NUMBER OF CARS IN AN INTERSTATE TRAIN IS A SUBJECT OF NATIONAL AND NOT LOCAL CONCERN (R. 4032-4033).

We desire to preface the discussion of this and the succeeding findings of fact by the suggestion that in the preparation of findings of fact in an action such as the instant case it is somewhat difficult to distinguish between the finding of an ultimate fact and the conclusion of law which follows therefrom. We think it better practice, and such practice has been followed in suits where equitable issues are presented, to follow the course we here adopted and for which there is ample precedent. Moreover, general findings of the character of Findings XV to XX, inclusive, round out the more specific findings that have preceded, and unmistakably express the ultimate conclusions of the Court.

Finding XV is very similar to Finding No. XXIX of the Special Court for Nevada in the *Nevada Train-Limit Case;* and in the respects in which it may be regarded as a conclusion, we believe amply supported by controlling decisions to which we refer in the volume of our brief addressed to the law of the case. Nothing could more clearly illustrate the extra-territorial effect of a law limit-

ing the lengths of interstate trains which are entering or crossing the state in a continuous journey in interstate commerce, or leaving the state on such a journey, than the evidence in the instant case.

XVI.

FINANCIAL BURDEN IMPOSED BY THE LAW A FACTOR IN DETERMINING ITS UNREASONABLENESS (R. 4033-4034).

This finding relates to a consideration of the additional expense that is incurred by appellant in obeying the law, as a factor in passing on the question whether it is unreasonable and arbitrary. As we show in Volume I of this brief, this Court has held that "the matter of expense is an important criterion to be taken into view in determining the reasonableness" of a statute or order made pursuant to the police power. This finding has been carefully phrased so as to confine it within the limits of what we understand to be the weight to be given to expense of compliance, in considering that question.

XVII.

FURTHER ARBITRARY EFFECT OF THE LAW (R. 4034).

This finding should be read in connection with the discussion of Finding XI regarding the various factors that jointly contribute to slack action and slack-action shocks. The finding states an ultimate fact which is fully sustained by the evidence.

XVIII.

IMPAIRMENT OF DEFENDANT'S FACILITIES BY THE LAW (R. 4034).

The probative facts in support of this finding fully state the effect the law has upon the facilities devoted to and used by appellant in interstate commerce, in and adjacent to Arizona.

XIX.

FINANCIAL BURDEN ON INTERSTATE COMMERCE (R. 4034).

This finding is a necessary conclusion from the preceding finding in which the character of the traffic handled by appellant is fully described, and the extent of the annual expense of complying with the law is defined and substantiated. It is a conclusion of fact from these probative facts.

XX.

SUBSTANTIAL ALLEGATIONS SUSTAINED (R. 4034).

A general finding of this kind is customary as a conclusion to special findings of fact in a case where an equitable defense is presented or where a special defense in an action at law is offered, equivalent to an equitable defense.

CONCLUSION.

The findings adopted by the trial court, though quite detailed in certain respects, are no more so than necessary

in a case such as this. They present an accurate condensation and summary of testimony which, as reduced to print for the purposes of the record in this Court, with the exhibits, covers approximately 3545 pages (R. 33-3578).

We have no doubt that this Court, if it deems that the occasion requires it to go behind the trial court's findings and examine the record in detail, will conclude that the trial court has found the facts correctly in the light of the evidence; and will also conclude that the State Supreme Court, to the extent that it has undertaken to reverse the trial court's findings and by implication used that reversal as a basis for its decision, has erred to the prejudice of appellant: because it has in effect made findings, either of fact or mixed fact and law, which are without proper evidentiary support and contrary to the evidence of record.

Upon the facts, no less than upon the law, the decision and judgment of the Supreme Court of Arizona in this cause should be reversed.

Respectfully submitted,

CLEON T. KNAPP,
C. W. DURBROW,
BURTON MASON,
Attorneys for Appellant.

JAMES P. BOYLE,
B. G. THOMPSON,
Of Counsel.

Dated November 10, 1944.

OCTOBER TERM, 1944

No. 56

SOUTHERN PACIFIC COMPANY, a corporation, *Appellant*,

vs.

STATE OF ARIZONA ex rel. JOE CONWAY, Attorney General of the State of Arizona, *Appellee*.

APPELLANT'S REPLY BRIEF

FOREWORD

Following the plan of our Opening Brief, this Reply is in two sections: the first addressed to those portions of appellee's brief which undertake to deal with the legal principles involved; the second to those portions wherein the facts are discussed.

I.

THE LEGAL ISSUES

1. THE EXCLUSIVE NATIONAL FIELD

(Appellee's Brief, pp. 20-41)

At the outset of its discussion of the "exclusive national field" appellee quotes from pages 82-83 of Volume I of appellant's Opening Brief, and then asserts that our position is based upon certain assumptions: (1) that the challenged law has a real relation to the safety of those within the state, and operates in a field not occupied by Congress; (2) that the right of the state to exercise its reserved police power depends upon a judicial determination whether the subject matter is of such exclusive national concern, that *as a matter of policy* it should be regulated by Congress and not by a state legislature; and (3) that in making this judicial determination this Court is "prohibited" from considering whether the state statute has a safety purpose. From these premises appellee concludes that we have contended that the validity of a state law, admittedly having a safety purpose and otherwise valid as an exercise of police power, would be made subject to the opinion of the Court as to whether the protection should be by federal or state legislation.

Appellee has misconceived our position upon the exclusive national field issue. We do not "assume" that the Train-Limit law was either enacted in the interest of safety, or has any relation to that asserted purpose; for we know the contrary to be true. Neither do we "assume" that the right of the state to legislate in the interest of safety, but upon a subject matter falling within the exclusive national field, is dependent upon considerations of policy to be de-

termined by this Court; for we know that in such a case the "policy" is that laid down by the Commerce Clause.

While we believe that our position is accurately stated in our opening brief (Vol. I, pp. 81-82, 155-156), it is desirable, in view of appellee's misconception, again to set it forth in precise language. It is our contention that the grant of power to Congress by the Commerce Clause, of its own force and without action by Congress, established the essential immunity of interstate commerce from direct control of the states with respect to those subjects which are of such nature as to demand that, if regulated at all, their regulation should be prescribed by a single authority; that as to those subjects which require a general system or uniformity of regulation, the power of Congress is exclusive. It is our further contention, supported by both unchallenged fact and abundant authority, that the length and consist of interstate railroad trains is a subject of such nature as to demand regulation by a single authority, and therefore within the exclusive national field.

We assert also that, as a necessary consequence of these principles, in considering the validity of the challenged law as an invasion of this exclusive national field the question of its *purpose*—i.e., whether it is a police-power measure, in the interest of safety or otherwise—need not and should not be considered. For if the subject matter falls within the national field, then the power of the national government is exclusive; the state cannot regulate for any purpose, or under any guise or pretext; and any purposes, whether of safety or otherwise, ascribed or claimed for attempted action by the state in the exclusive field, are wholly immaterial. It is only after the determina-

tion has been made that the subject-matter is not within the exclusive field, but instead within the concurrent or permissive field, that consideration need be given whether the asserted police power of the state has been properly exercised.

The determination whether the subject-matter is of exclusive national concern, and *as such*, within the exclusive national field, is not a determination of policy, but of law, to be made upon the basis of the facts developed by the record or judicially known to the Court, and in the light of applicable principles. This determination is one which the Court must make for itself (*LaCoste v. Dept. of Conservation*, 263 U.S. 545, 550), by looking to practical considerations (*Foster Fountain Packing Co. v. Haydel*, 278 U.S. 1, 10); and it will answer the question whether a challenged regulation is a direct burden upon and an obstruction to interstate commerce and therefore prohibited, or merely incidental and therefore permissible, by weighing the *nature* of the activities regulated and the propriety of local regulation of them, as disclosed by the record (*Milk Control Board v. Eisenberg*, 306 U.S. 346, 352); i.e., the question will be determined "upon a consideration of all the relevant facts and circumstances" (*Parker v. Brown*, 317 U.S. 341, 362-363). The "question of policy" has been settled by the Constitution, in that the Commerce Clause confers upon Congress the exclusive power to regulate those subject matters which, by their nature, are determined to be of exclusive national concern.

Appellee in this discussion takes the position that the law, because assertedly enacted in the interest of safety,

does not infringe the exclusive field, but instead is within the so-called joint or concurrent field, in which the states may regulate matters of local concern even though commerce is affected, and provided that Congress has not acted; for, according to appellee, "protection against accidents is a local matter or problem" (its brief, p. 40). From this premise appellee proceeds to the conclusion that in determining whether the law invades the exclusive national field, it must *first* be determined whether it is unreasonable or passes beyond the bounds of suitable local protection; for only if this is shown, appellee argues (its brief, p. 23), can it be concluded that the law *directly* regulates interstate commerce and so violates the Commerce Clause.

The fundamental fallacy of appellee's argument lies in its failure to distinguish between the *purpose* to which the challenged law is allegedly addressed, and the *subject-matter* regulated. The claimed *purpose* of the law is the protection of employees and others from dangers alleged to be peculiar to long-train operation, i.e., greater safety; but "safety" is *not* the subject-matter regulated. This is shown by the text of the law itself. Neither the word "safety," nor any word or phrase of similar connotation, appears therein. The title of the law declares it to be "An Act limiting the number of cars in a train"; the phraseology of the statute refers only to the operation of railroad freight and passenger trains. The subject-matter of the law is therefore the length and consist of railroad trains and, in its application to the present case, of trains operated by an interstate railroad in the transportation of interstate commerce.

Many decisions of this Court make clear the point that the claimed or stated purpose of a challenged law does not determine whether it invades the exclusive national field. That determination rests upon the nature of the subject-matter regulated and the incidence of the regulation upon interstate commerce. Thus, in the *Minnesota Rate Cases*, 230 U.S. 352, in the very portions quoted by appellee, the Court declared (p. 400) that the power of Congress is exclusive, and the states are deprived of power to regulate directly "under any guise," with respect to "those *subjects* . . . which are of such a nature as to demand that, if regulated at all, their regulation should be prescribed by a single authority"; i.e., "those subjects which require a general system or uniformity of regulation." In *Shafer v. Farmers Grain Co.*, 268 U.S. 189, 199, the Court pointed out that "a state statute which by its necessary operation directly interferes with or burdens such (interstate) commerce is a prohibited regulation and invalid, regardless of the *purpose* with which it was enacted." In *Union Brokerage Co. v. Jensen*, 322 U.S. 202, 210, it was said that "the incidence of the particular state enactment must determine whether it has transgressed the power left to the states"; i.e., whether it has invaded the exclusive national field; and in *Parker v. Brown*, 317 U.S. 341, 362, the Court repeatedly referred to the necessity of a consideration of all the relevant facts and circumstances, in order to determine whether a challenged regulation controls *matters of local concern*, which were declared to be appropriate subjects for local regulation, provided the national interest is not impaired nor the free flow of commerce obstructed.

Appellee asserts (its brief, pp. 25-26) that this Court has consistently held that state police-power legislation in a field not occupied by Congress comes within the permissive field and, if otherwise valid, is valid under the Commerce Clause until superseded by federal legislation. This is not a correct statement of the effect of the decisions of this Court, for it is equivalent to declaring that the Court has held that a state statute enacted for the purpose of health or safety or public welfare is always in the joint field, no matter whether directed at and directly regulating interstate commerce, and regardless of its effects upon that commerce. Contrary to appellee's contention, "the decisions of this Court have recognized that there is scope" for the operation of the Commerce Clause to strike down state legislation, when such legislation, though "nominally of local concern, is *in point of fact* aimed at interstate commerce, or by its necessary operation is a means of gaining a local benefit by throwing the attendant burdens on those without the state" (*South Carolina Highway Dept. v. Barnwell Bros.*, 303 U.S. 177, 185-186). Conspicuous examples of decisions of this type include those particularly cited at pages 105-109, 120-121, and 188-189 of Volume I of appellant's opening brief: e.g., *Kansas City Southern Ry. v. Kaw Valley Drainage Dist.*, 233 U.S. 75; *Seaboard Airline Ry. Co. v. Blackwell*, 244 U.S. 310; *Edwards v. California*, 314 U.S. 160; *South Covington R. Co. v. Covington*, 235 U.S. 537; *M. K. & T. R. Co. v. Texas*, 245 U.S. 484; and *St. Louis Southwestern Ry. Co. v. Arkansas*, 217 U.S. 136. In the *Kansas City Southern* and *Edwards Cases*, state regulations having an obvious relation to the public welfare were set aside under

the Commerce Clause, despite attempts to defend them "by invoking the convenient apologetics of the police power," because they directly obstructed the free movement of persons and property in interstate commerce. In the *Blackwell Case* a state regulation, plainly in the interest of safety because it would have greatly reduced if not entirely eliminated hazards at grade crossings, was set aside under the Commerce Clause because of the direct burden and interference with interstate commerce. In the *M. K. & T. Ry. Case*, a state regulation intended to promote the convenience of passengers, and thus a clear exercise of the police power, was set aside because it directly regulated the operation of interstate passenger trains. In the *Covington Case* a city ordinance intended to promote the comfort and convenience of passengers, and having an obvious relation to that purpose, was set aside because by limiting the number of passengers which could be carried in a car it would have compelled a street car company operating in and between adjoining cities in different states to run more cars, not only within Covington, but also across the state boundary, and in the neighboring city of Cincinnati. On the facts it was held that this was a direct regulation of interstate commerce in the exclusive national field.

It is apparent from these examples that the mere *purpose* claimed for a state regulation, or even a showing of reasonable relation to that purpose, is not sufficient to place it within the permissive field if *in fact* the subject-matter is within the exclusive national field and the effect is to regulate commerce directly. In such cases, particularly if the subject is one "demanding uniformity of regula-

tion . . . state action is altogether inadmissible." The Constitution itself occupies the field, even if there is no federal legislation (*Kelly v. Washington*, 302 U.S. 1, 9).

Apparently realizing that the question whether the *subject-matter* is of *national*, rather than *local* concern (and not the claimed purpose of the law), is determinative of the "national field" issue, appellee has attempted, in its references to the facts (its brief, pp. 7-8, 39, 131-132) to make it appear that there are special local conditions in Arizona which warrant separate treatment and indicate that because of the practical difficulties involved, the subject-matter cannot receive adequate attention from Congress. Thus it has been recognized that this question is one for judicial determination, upon the facts developed by the record or judicially known to the Court.

The special findings of the trial court (Findings VI(c), VII(b)(2); R. 3908, 3919) show that there are no special local conditions in Arizona which render the regulation of the length and consist of interstate trains operated in that state a matter peculiarly of *local*, as distinguished from *national*, concern, in the sense intended by this Court's decisions: e.g., *South Carolina Highway Dept. v. Barnwell Bros.*, supra; *California v. Thompson*, 313 U.S. 109, and *Parker v. Brown*, supra. Rather, the facts show that this subject-matter is not one admitting of diversity of treatment; that no practical difficulties are involved, such as to prevent adequate treatment by Congress; that it is outstandingly of national concern, for a variety of controlling reasons:

First, the traffic carried in the interstate trains regulated by the Arizona law is almost wholly interstate and

not local in character. These trains move in a continuous course in interstate commerce over lines (in Arizona) which are an integral and inseparable part of appellant's railroad, the latter in its turn being equally an essential and inseparable part of the entire national transportation system.

Second, the law imposes physical obstructions to the free flow and movement of interstate commerce amounting, if not to an absolute barrier, to at least a very effective hindrance, such that, as stated by the trial court (R. 4048), "practically . . . Arizona operations create a bottleneck." Even in times of light traffic these obstructions materially impede the free flow of commerce; but in times of heavy traffic and urgent demand such as have continued ever since the commencement of this case, their effects are much more serious, because they actually limit the traffic capacity of the appellant's railroad plant.

Third, if Arizona may validly regulate the length of interstate trains, so may all the other states; and such regulations need not be the same as in Arizona or confined, as is the Arizona law, to a maximum length. It is just as competent, and in the light of this record would be considerably more logical in the interest of safety, for a state to provide by law that trains *below* a specified *minimum* length should not be operated for the handling of through interstate traffic. The handicaps imposed by attempting to comply with even varying *maximum* limitations sufficiently show, however, that the subject-matter is one requiring a national and uniform system of regulation, if any be necessary.

Fourth, there are the inevitable and unchallenged extra-territorial effects of the law. Appellee makes no attempt to deny that the law can be fully observed *within* Arizona, only by complying with the limitations for substantial distances outside; that it is impossible to provide exactly at the state boundary lines the terminal and other facilities required to make the necessary changes in train lengths.

Fifth, the law effectively prevents the attainment of the improved efficiency, economy, safety, and adequacy of interstate transportation service by rail, especially declared by Congress in the preamble to the Transportation Act 1940 to be a national transportation policy, to be promoted, as Congress said, to the end of developing, coordinating, and preserving a national transportation system adequate to meet the needs of commerce and of the national defense.

Sixth, the subject-matter is of immediate and pressing national interest at the present time; because the law, though temporarily suspended, has interfered and still interferes with and obstructs the speedy and efficient use of equipment and manpower in the national defense, causes congestion, delay, and waste, and actually limits the transportation capacities of the affected lines. These are the specific findings of the Interstate Commerce Commission in the recitals of Service Order No. 85, affirmed when the order was sustained: *Ex Parte No. 156*, 256 I.C.C. 523.

Although the nature of the subject-matter regulated completely determines whether the exclusive national field

is invaded; we do not contend that the claimed or stated purpose of the challenged statute is not to be considered. If the facts show that the regulation has no legitimate purpose, it cannot be sustained even though the subject-matter is of local rather than national concern. It is for this reason that in many decisions, examples of which are among those cited by appellee, the safety or other correlative purpose has been so carefully set forth. This mention does not support appellee's erroneous theory that the claimed or intended purpose is one and the same with the subject-matter regulated; or that the purpose, though declared or apparent, constitutes any criterion whether the exclusive national field is invaded.—The purpose may be wholly legitimate, as in the *Kansas City Southern, Blackwell, South Carrington,* and *Edwards Cases,* for example; and yet the law will fall as a violation of the Commerce Clause.

Moreover, in the case at bar appellee's attempted emphasis on purpose is misplaced. The text of the law pointedly omits any reference to the safety purpose now claimed. There are no facts shown of record, nor any factual circumstances which the Court may judicially notice, which support appellee's theory that the law has or ever had a safety purpose. The evidence shows that when it was enacted the legislative purpose was quite different (R. 1107-1108; Exs. 149, 150, 182, 213). There was no contemporaneous long-train operation in Arizona, hence there could not have been any purpose to forbid an operating practice known or suspected to be unsafe. The law in fact made no change in operations as then conducted. The selection of the 70-car limit, at the time the effective oper-

ating maximum for Southern Pacific freight trains in Arizona because of prevailing siding capacities on its single track line, demonstrates that the purpose was to maintain employment levels by freezing the operations in the mold of 1912; so that, whatever might be future improvements in road, equipment, and railroad practice generally, permitting the operation of fewer and longer trains, the Arizona railroads would still be compelled to continue to operate many more trains and employ many more train and engine men than otherwise necessary. Certainly this is the sole effective result of the law, and the only purpose which can logically be assigned.

Appellee asserts (brief, p. 35) that the determination whether a challenged regulation imposes too severe a burden upon interstate commerce is for Congress and not for this Court, the function being assertedly legislative and not judicial; citing in particular, *California v. Thompson*, *Parker v. Brown*, and *South Carolina Highway Dept. v. Barnwell Bros.*, supra, and quoting at length from the latter (303 U.S., at pp. 189-190). This argument was anticipated, and is largely answered in Volume I of our opening brief, at pp. 97, 147-154, 169, 197.

This Court, while it has employed the expressions quoted by appellee, has carefully limited the effect of the doctrine stated to those regulations which fall within the concurrent or permissive field, as distinguished from the exclusive national field. Thus in the *Barnwell* opinion, in the paragraphs immediately preceding that from which appellee quotes (see 303 U.S., at pp. 187-189), the Court especially stated that the subject-matter of the regulation there challenged was peculiarly of local concern; and in

that respect, since it involved the use of local highways, quite unlike the regulation of railroad operations.

Appellee has omitted, from the quotation of this opinion at pp. 36-37 of its brief, the phrase "otherwise permissible," and thus overlooked its significance as applied to those state regulations concerning which the legislative rather than the judicial function is to be invoked. A state regulation of a matter of national concern, requiring a uniform standard and system of regulation, is not "otherwise permissible." In such a case the Commerce Clause itself, as applied by the Court, constitutes the prohibition which invalidates the attempted state action, and the exercise of the congressional function becomes unnecessary. In *California v. Thompson*, and *Parker v. Brown*, the emphasis was likewise upon the question of the validity of regulations "of matters of local concern," which also operate as regulations of interstate commerce; and there is no statement by the Court which indicates that as to matters of *national* concern the remedy lies only in the legislative branch.

To support this argument appellee also asserts (its brief, pp. 31-32) that "no real problem is presented as to how Congress may enter the field and thus exclude the states." Appellee then cites examples whereby state enactments in the *joint field* have been set aside: a wholly distinct situation, since the subject-matter of the Train-Limit law is of exclusive *national concern*. "In that class of cases the Constitution itself occupies the field, even if there is no federal legislation" (*Kelly v. Washington*, 302 U.S. 1, 9); the grant of power by the Commerce Clause having itself "established the immunity of interstate commerce from

the control of the states respecting all those subjects" which demand uniform regulation (*Milk Control Board v. Eisenberg Farm Products*, 306 U.S. 346, 351; *Edwards v. California*, 314 U.S. 160, 176). In this field, silence or inaction by Congress is equivalent to a declaration that interstate commerce shall be untrammeled (*Welton v. Missouri*, 91 U.S. 275, 282; *Hall v. De Cuir*, 95 U.S. 485, 489; *Missouri v. Kansas Natural Gas Co.*, 265 U.S. 298, 310; *Graves v. O'Keefe*, 306 U.S. 466, 479, n. 1). The fact that Congress has indeed refused several times (R. 184-185) to pass legislation directly imposing fixed maximum limits upon interstate trains clearly shows its conviction that no further regulation of this type is needed. It is therefore improper, as well as unnecessary, for those interested in removing the state restriction to address themselves to Congress. They are properly seeking relief in the courts, whose paramount duty is to interpret and apply the Constitution.

It is conceded by appellee (its brief, p. 21) that a state may not, under the guise of the police power or otherwise, *directly* regulate commerce. While this Court has indicated (*Parker v. Brown*, supra, 317 U.S., p. 362; compare *Di Santo v. Pennsylvania*, 273 U.S. 34, 44) that the terms "direct" and "indirect" are not wholly satisfactory for the purpose of characterizing the effects of a challenged state regulation, nevertheless they are quite significant in this case. This statute cannot be described as other than a *direct* regulation of the length and consist of interstate trains, and thus of interstate commerce. It has no other result. Every one of appellant's main line trains in Ari-

zona upon which this statute operates is an interstate train. About 93% of the traffic handled is interstate commerce; and some 65% thereof in the case of freight, and 75% thereof in the case of passengers, is moving between points outside of Arizona, as to which Arizona is simply a "bridge." Thus the statute, though claimed to be ("nominally") of "local concern, is in point of fact aimed at interstate commerce," and by necessary operation is a means of gaining a local benefit (of artificially increased employment) "by throwing the burdens on those without the state"; i.e., upon those who patronize the interstate trains crossing Arizona: compare *South Carolina, etc. v. Barnwell Bros.*, supra, 303 U.S., pp. 185-186.

2. THE EXTRA-TERRITORIAL EFFECT OF THE LAW
(Appellee's Brief, pp. 52-57)

Appellee's discussion of the extra-territorial point is very limited, apparently because it has no effective answer grounded in either law or fact.

Its principal reliance is upon decisions upholding state regulation of trucks on state highways (*South Carolina Highway Dept. v. Barnwell Bros.*, supra, 303 U.S. 177; *Maurer v. Hamilton*, 309 U.S. 598; *Sproles v. Binford*, 286 U.S. 374); and it asserts, though without factual support, that the regulations considered in those cases "probably" imposed far greater extra-territorial burdens upon interstate commerce than the Train-Limit Law. In our discussion of these cases in our Opening Brief (Vol. I, at pp. 147-154, 169-171), we pointed out that no questions of extra-territorial effect were involved. This Court remarked, however, in a footnote to the *Barnwell* opinion

(303 U.S., at p. 185), that "state regulations affecting interstate commerce, whose purpose or *effect* is . . . to *burden those out of the state*, without any corresponding advantage to those within, have been thought to impinge upon the constitutional prohibition (the Commerce Clause) even though Congress has not acted." (Emphasis supplied.) *Hall v. DeCuir*, 95 U.S. 485; *Bowman v. C. & N. W. Ry. Co.*, 125 U.S. 465; and *Baldwin v. Seelig*, 294 U.S. 511, cases upon which we rely in our extra-territorial argument (our brief, Vol. I, pp. 160-166), were cited with apparent approval.

The *Barnwell* opinion indicates also, and the *Maurer* opinion confirms, that there is a substantial distinction, in the mind of the Court, between state regulation of interstate railroads, operating upon their own rights of way, and similar regulation of the use of the state-owned highways. "*Unlike the railroads*, local highways are built, owned and maintained by the state or its municipal subdivisions. The state has a primary and immediate concern in their safe and economical administration" (*Barnwell* opinion, 303 U.S., p. 187). The regulatory problems involved in the regulation of motor vehicle traffic bear *little resemblance* to those of other systems of transportation; "our most extensive experience had been in the national regulation of rail carriers, operating over roads and with rolling stock privately owned and controlled, with standards of roadbed, operation, and equipment substantially uniform throughout the country, and with the movement of traffic on each road subject to a single unified control. *Regulation of vehicular traffic over the highways of the United States involves a far more varied and complex*

undertaking." (*Maurer* opinion, 309 U.S. 598, 609; emphasis supplied.)

While states may act *within* their respective jurisdictions, according to the special requirements of local conditions, by the same token "one state cannot establish standards which would derogate from the equal power of other states to make regulations of their own." (*Sproles* opinion, 286 U.S., p. 390). The Arizona law has exactly these effects: admittedly, it cannot be observed within Arizona, in its application to interstate trains in continuous movement, without also controlling train lengths in California and New Mexico, and thus derogating from the equal power of those states to make corresponding regulations of their own.

Cases cited by appellee relating to railroad operations include: *N. Y. H. & H. R. Co. v. New York*, 165 U.S. 628; *Atlantic Coast Line R. Co. v. Georgia*, 234 U.S. 280; the *Arkansas Full Crew Cases*, 219 U.S. 453, 283 U.S. 249; and *Terminal Railroad Assn. v. Brotherhood*, 318 U.S. 1. In each of these, other than the *Terminal Railroad Case*, certain changes in railroad crews or equipment were apparently required at state lines; but none involved a regulation which by inevitable effect controlled interstate commerce far beyond the boundary. There was no actual claim of substantial extra-territorial effect, but only that interstate operations would be "inconvenienced" *at the boundaries*. Here it is conceded that the law directly controls the operations for considerable distances beyond the boundaries, and the changes compelled are not and cannot be effected at the state line.

In the *Terminal Railroad Case* the only extra-territorial effect resulted from a requirement for the use of cabooses in interyard or transfer movements, including those crossing the Mississippi between St. Louis and East St. Louis. The actual extra-territorial effect thus caused would be comparatively slight, and could well be termed inconsequential. There is a vast difference between hauling a caboose attached to a cut of cars, for a few hundred yards from the state boundary to the first point where it may be detached, and the compelled operation of short trains for substantial distances beyond the boundary.

Moreover, the *Terminal Railroad Case* should be read in the light of *South Covington R. Co. v. Covington*, 235 U.S. 537, cited in footnote 16, 318 U.S., p. 9. In the *Covington Case*, the extra-territorial effect of a local regulation was clearly involved and, in fact, was a primary reason for holding it invalid.

The law is plainly a regulation aimed at interstate commerce, one of whose principal effects is to impose burdens upon and obstructions to commerce, as carried on *outside of Arizona*. This Court's decisions establish that a law which inevitably imposes such extra-territorial burdens and obstructions is invalid under the Commerce Clause, whether or not it be called a "local" regulation.

3. "THE OCCUPIED FIELD"
(Appellee's Brief, pp. 57-78)

Appellee's argument upon the above topic has been generally anticipated and largely covered in the section of our Opening Brief devoted to this issue (Vol. I, pp. 209-254).

Appellee attempts to establish a lack of conflict between Sections 1 and 9 of the Federal Safety Appliance Act and Section 25 of the Interstate Commerce Act, on the one hand, and the Train Limit Law on the other, by asserting (its brief, pp. 61-64) that the only purpose or effect of the federal statutes is to prescribe the brake equipment and other appliances, required for the control and stopping of trains, to be used on the cars and trains of interstate railroads; and infers that these statutes are not concerned with the effectiveness of these appliances in actually controlling trains, but only with the application of a sufficient number and proportion, in working order. Appellee then says (its brief, p. 66) that the Train Limit Law is not concerned with ("does not regulate") mechanical equipment, but occupies only the field of "the number of cars which may be run in a train."

This argument fails to give any weight to the long-standing construction of the Safety Appliance Act. In *Virginian Railway Co. v. U. S.* (C.C.A. 4), 223 Fed. 748 (approved by this Court through subsequent citation: *New York Central R. Co. v. United States*, 265 U.S. 41, 46), the railroad was convicted of violating the Act by having operated trains fully equipped with all of the power-brakes and appliances required by law and the order of the Interstate Commerce Commission, admittedly in good working order: because these trains were so *long* and so *heavy* that, "in the circumstances of their operation" (i. e., in consideration of the grades, etc. encountered) they could not be adequately controlled by the engineers in charge, by use of those brakes. It was shown in the case that *shorter* trains, equipped with the same

brakes, and indeed composed of the same cars, could be and were properly controlled in their operation over the same lines. Thus the Safety Appliance Act was construed as requiring not merely the presence of air brakes on the cars, but also that they be *adequate* to control trains *safely*, and as *limiting* their *lengths* to that number of cars which, in all the circumstances of operation, could be *safely* controlled thereby.

The Safety Appliance Act as thus construed is clearly a "train-limit" law; but (as contrasted with the Arizona law) is reasonable and logical because the limit may vary according to circumstances, and is to be determined by a *trial court* by an *analysis of the facts* when and if, as in the *Virginian Case*, a railroad is prosecuted for operating a train claimed to be too long for safe control.

The Safety Appliance Act has been supplemented since 1920, and especially since 1937, by the Safety Section (now Section 25) of the Interstate Commerce Act, which gives the Commission the power and duty (among others) to investigate and determine the effectiveness of appliances used for controlling and stopping railroad trains. Under this section the Commission has quite recently (July 29 and October 19, 1944) issued and amended its order (presently tentative, but expected shortly to be made final) prescribing specifications for brakes on freight cars, and in particular that such brakes shall be operative on ("based upon") *trains of 150 cars* (see pp. 7 and 9 of the Appendix to Vol. I of our brief).

The principal justification attempted for the Arizona law is that because of slack action freight trains of more

than 70 cars cannot be safely handled and controlled in motion or stopped, with the present type of air brakes, even though these have been greatly improved.[1]

This was the burden of the oral testimony of appellee's witnesses, and is the conclusion which it seeks to draw from the lengthy excerpts from the air-brake instruction books (Exhibits 152, 319; R. 3445-3640), quoted in its argument upon the safety issue (its brief, pp. 91-93).

The effect of the law is thus to impose an arbitrary limit, assertedly required because longer trains cannot be safely controlled, and made to apply to all trains regardless of conditions; this although the federal statutes and orders contemplate that trains may be operated up to any length at which the air brakes will function to control the train adequately, due consideration being given to the relevant circumstances. Thus, Arizona has substituted its legislative fiat, not based upon a showing of the actual limit at which the air brakes properly function (but instead upon the siding capacities prevailing in 1912 on the appellant's main line), in place of the limit which might be found proper by a federal court or jury, in the

[1]It is true that appellee assigns (its brief, pp. 65, 73, 74, 106-111, 146) other alleged dangers of long-train operation as reasons for the law: e. g., the supposed difficulty of passing signals and observing defects; the alleged loss of efficiency due to fear; and the increased responsibility of members of the crew. Appellee fails, however, to refer to any accident or casualty in Arizona or Nevada, or elsewhere upon appellant's lines, occurring on a long train, and shown to be due to any of these causes, or as to which it was or could reasonably be claimed by any witness that the accident would not have happened on a short train, or, if happening, would have been less severe. The trial court found (R. 4023-4032) that these alleged hazards, as well as those supposed to arise from the asserted greater difficulty of controlling long trains, are largely imaginary.

light of the proof adduced in a prosecution under the Safety Appliance Act for operating a train which allegedly could not be safely controlled.

Clearly this constitutes a direct conflict between the federal and state statutes, forcefully exemplified by the Arizona long-train operations of 1940. Appellant operated 302 long freight trains and 62 long passenger trains in the state during March and April of that year. There is no testimony that any difficulty was met in handling, controlling, or stopping any of these trains. There is positive testimony from engineers who handled or rode upon some of these trains that there were no such difficulties (R. 2435, 2815). The fact that no casualties of any kind occurred on any of these long trains while in motion indicates that there was no lack of proper control. Every one of these trains was therefore lawful under the federal acts. Equally, every one of them was unlawful and forbidden by the state act. The conflict therefore was and is direct and complete.

Although this particular example of conflict is cited in our Opening Brief (Vol. I, p. 240), appellee offers no comment in its reply. There is no effective answer.

Appellee also argues (its brief, pp. 74-76) that absence of conflict between the state and federal laws is shown by the asserted lack of power in the Commission to issue an order limiting train lengths. Whether or not the Commission has such power is immaterial to the present issue. The Safety Appliance Act, as construed in the *Virginian Case*, supra, 223 Fed. 748, itself prohibits the operation of any train which, even though equipped throughout with

functioning brakes, is so long that it cannot be adequately controlled. No order of the Commission was required in 1912, or would now be required, to support a prosecution for operating a train which because of length could not be controlled. The Arizona law is nothing less than a direct attempt to modify or supplement the federal statutes, which as construed act upon the same subject matter —the length and consist of interstate trains—and for the same purpose—safety—and impose limitations which conflict and are inconsistent with the arbitrary limitation imposed by the state.

4. THE UNREASONABLENESS OF THE LAW AS A PURPORTED SAFETY MEASURE

(Appellee's brief, pp. 78-93)

In this portion of its brief, appellee argues the proposition that the validity of the law rests solely upon the determination whether, upon the whole record, it is possible to say that the law is without rational basis in safety, asserting that it has a rational basis and is therefore valid.

This entire argument depends upon the premise that the nature of the subject-matter regulated can be wholly disregarded; or, alternatively, that the subject-matter is of local concern and involves no national interest. We have shown that each of these premises is untenable.

Appellee's initial argument (its brief, pp. 80-84) is that the extent of the *burden* on interstate commerce need not be considered by the Court in determining the law's reasonableness under either the Commerce or the Due-Process Clauses. So far as concerns the Commerce Clause, this

argument is predicated upon appellee's view of the significance to be given certain expressions quoted from *South Carolina Highway Dept. v. Barnwell Bros.*, supra, (303 U.S., pp. 189-190). As already pointed out, in stating that it is a legislative and not a judicial function to determine whether the burdens imposed upon interstate commerce by state regulation are too great and should therefore be curtailed, the Court was careful to confine its reference to state regulations "otherwise permissible". It did not say that the courts might not consider the burdens imposed by state regulations operating in the exclusive national field, or which, though nominally of local concern, are in point of fact aimed at interstate commerce, or seek to subordinate the efficiency and convenience of interstate traffic to local requirements, or otherwise impose unnecessarily harsh restrictions. Since any regulation which directly burdens or impedes interstate commerce or substantially impairs the usefulness of the carriers' facilities employed in such commerce is invalid, it is clearly a judicial function to determine the nature and extent of the burden imposed and whether it falls within these descriptions. Such is precisely what this Court has declared that it must do, and has done, in cases arising both before and since the *Barnwell Case:* e. g., *Milk Control Board v. Eisenberg,* 306 U.S. 346, 352; *Parker v. Brown,* 317 U.S. 341, 362; *Terminal R. Assn. v. Brotherhood,* 318 U.S. 1, 8-9.

Appellee asserts (its brief, p. 80) that it differs greatly with appellant concerning the conclusion to be drawn from the evidence as to the extent of the burden shown, including the cost of compliance and the interference with opera-

tions. It also differs in this respect from both of the courts below. The trial court specifically found that in 1938 the direct money cost of compliance with the law was $394,900, of which $94,600 was incurred extra-territorially (R. 3968). The state supreme court apparently accepted this finding: for in its opinion (R. 4062), it stated that appellant is compelled "to expend great sums of money in order to comply with the restriction." That there is delay, congestion, and interference, and thus a substantial physical obstruction to the free movement of the interstate traffic carried in the affected territory, is also fully established, and would indeed be obvious: for the compelled operation of 28% more trains than necessary to carry the traffic inevitably multiplies the interferences due to meets and passes; while the necessary reconsisting of trains at and beyond the border cannot but result in serious delays.

In its argument respecting the consideration to be given to the burden due to the obstruction and cost of compliance, appellee relies upon *Erie R. R. Co. v. Board of Commissioners*, 254 U.S. 294, as later modified, so appellee says, by *Lehigh Valley R. Co. v. Board of Commissioners*, 278 U.S. 24. It disregards more recent decisions: *Missouri-Pacific R. R. Co. v. Norwood*, 283 U.S. 249, 255; *A. T. & S. F. Ry. Co. v. Railroad Commission*, 283 U.S. 380, 395, 396, in which, with the citation of earlier cases upon which we rely, this Court has declared that the cost of complying with state laws enacted to promote safety is an element properly to be taken into account in determining whether such laws are arbitrary and repugnant to the Due Process Clause.

The comment in the *Lehigh Valley Case*, apparently limiting the effect of the earlier *Erie R. R. Case*, should not be interpreted as setting forth the *only* circumstances in which cost of compliance may be considered, but rather as describing one method of proving the unreasonableness of a regulation involving heavy cost. If the object may be achieved by other means but at much less expense, then a regulation compelling heavy expenditures is demonstrably unreasonable. But this is not to say, and we do not understand that the Court has said, that a regulation imposing relatively heavy expense and burden, for the sake of a comparatively minor safety advantage (or, as in this case, without such advantage but with actual detrimental effects), cannot be held unreasonable even though there is no alternative cheaper means of obtaining the desired result.

Appellee concludes upon this point by asserting (its brief, p. 83) that the object of the law is to protect against the dangers incident to the increase in train length, and that no other method has been shown which will accomplish this object. This assertion is without factual support and indeed wholly erroneous. Assuming, however, for argument's sake, in spite of the evidence to the contrary, that the object of the law is to increase railroad safety, as against supposed dangers from long-train operation: it is shown that other methods are available which do not involve the enormous dislocation of and burden upon through interstate transportation attendant upon the law, and which will accomplish, and in fact elsewhere in the United States have accomplished, all the claimed objects of the law. The substantial reductions (nearly 70%) in

the frequency of accidents and casualties to railroad employees, whether all classes be considered or only the more restricted groups claimed to be the principal beneficiaries of the law, which have attended the growth and development of the long-train operating practice, and the many improvements in the cars, locomotives, and fixed structures, and particularly in the brakes, couplers, signals and other mechanical devices and appliances especially connected with safety, eloquently attest the availability and effectiveness of these other methods; particularly when it is realized that the improvement in Arizona has been substantially less than nationally, or in the adjacent state of Nevada where substantially similar conditions, other than those created by or incident to the enforcement of the law, have existed through this same period (i. e., since about 1923).

If it can be said that the object of the law is to reduce the number and frequency of "slack-action" casualties, without considering others (and this appears to be appellee's argument, although obviously other casualties cannot be disregarded, because their frequency is directly affected by the law), the record still shows that this objective can be and has been attained by other means not involving the cost and burden imposed by the law. For in Nevada appellant, by the use of improved equipment and other facilities and the adoption of modern operating methods, has reduced the frequency of slack-action casualties, in their relation to traffic handled, by more than 57%, comparing the earlier period of predominant short-train operation (1923-1928), with the latest period for which statistics were available (1935-1940):

whereas in Arizona, although conditions were substantially the same and the same improved equipment and appliances were in use, but modern operating methods could not be developed because of the law, the corresponding reduction in the frequency of these casualties has been but 47.7%. In Nevada, during the most recent 12-year period (1929-1940), with about five per cent more traffic volume than Arizona, there were on the average only 5.08 such casualties per year; in Arizona the average was 5.17 per year. It is apparent that without the law somewhat better results have been obtained, even considering only this class of casualties, than by observance of the law in Arizona. This, however, is without regard to other classes of casualties, although the number and frequency of these is greatly affected and, as the trial court has found (R. 4021-4022), substantially *increased* by the law, because of the greater exposure of men, and the greater opportunity for accidents, created by the compelled operation of additional and unnecessary trains.

The operating methods used elsewhere, in territory not affected by the law, have accomplished more fully and more cheaply the object of reducing the number and frequency of railroad casualties, even including the particular type claimed to be the special object of the law; so that even by appellee's test, the law is wholly unreasonable under the Due-Process Clause.

II.

THE FACTUAL ISSUES

1. THE SIGNIFICANCE OF THE TRIAL COURT'S FINDINGS AND THE STATE SUPREME COURT'S REFERENCE THERETO

(Appellee's Brief, pp. 11-13, 149-151)

Appellee's discussion of "the Trial Court's Findings and Judgment" (appellee's brief, pp. 11-13), and of the state supreme court's reference (R. 4067-4068) thereto in its opinion (appellee's brief, pp. 149-151) covers two phases of the same topic. Its position is rather equivocal, in that it appears to contend that the state supreme court, in reversing the trial court, at most set aside only those portions of the findings which are of "ultimate" facts; but it fails to specify which portions are, in its view, "ultimate", and which are "evidentiary", and, as it says, therefore "improper" (though *not* reversed).

When appellee took its appeal to the state supreme court, it did not assert that any of the findings were erroneous because "evidentiary" rather than "ultimate"; but specifically because each of the findings complained of was, as it said in its assignments, "based upon incompetent, irrelevant, immaterial, and inadmissible evidence, improperly admitted and considered by the trial court, contrary to and not supported by the evidence, and upon an immaterial issue." Thus appellee conceded that the findings, if supported by legal evidence and upon a proper issue, were not otherwise objectionable because of so-called "evidentiary" content. Many findings which contain "evidentiary" material (as we understand appellee's use of the term) were not objected to: e. g., Findings III(a), III(b) (1), III(b) (2) (except in part), III(b) (3),

III(b) (4), IV(a), IV(b), VI(a) (except in part), VI(b) (except in part), VI(c) (except in part), VII(a) (1), VII(a) (2), VII(a) (3) (except in part), VII(a) (4) (except in part), XI(a), XI(b), XI(c), XI(d) (except in part), XII(a), XII(b), and XII(c) (1) (R. 3890, 3891, 3893, 3895, 3896, 3897, 3898, 3902, 3904, 3907, 3909, 3911, 3912, 3913, 3969, 3970, 3971, 3974, 3976, 4010).

As stated in our Opening Brief (Vol. I, pp. 12-14, 315-322), we believe that the expression of the state supreme court (R. 4067-4068), holding the findings and judgment of the trial court to be in error, cannot be construed as a blanket reversal of the trial court's detailed findings of fact. Certainly there was not, even upon appellee's theory, a disapproval of any findings other than those termed "ultimate" by appellee. In so far as the findings state the specific facts shown by the evidence, they are therefore unimpaired, and so may be accepted as a complete and adequate analysis of the testimony.

We do not subscribe to appellee's apparent view that even the so-called "ultimate" findings were intended to be reversed by the state supreme court. All of the findings are supported by the principle, embodied alike in the Arizona Rules of Practice (Sec. 21-1028, *Arizona Annotated Code,* 1939), and the federal rules (Rule 52(a)), that findings of fact shall not be set aside unless clearly erroneous, due regard being given to the opportunity of the trial court to judge the credibility of witnesses. The state supreme court pointedly failed to indicate any intention to depart from that rule. This Court has accorded great weight to such findings, especially when not modified or reversed in terms by the inter-

mediate court: *Butte & Superior Copper Co. v. Clark-Montana Realty Co.*, 249 U.S. 12, 30; *District of Columbia v. Pace*, 320 U.S. 698; and compare *Commissioner v. Scottish-American Inv. Co.*, No. 52, etc., Oct. Term, 1944 (Dec. 4, 1944).

Appellee also suggests (its brief, pp. 12-13, 151) that even if the findings were not set aside this Court is not bound by them but will examine the whole record upon the pertinent issues, citing *South Carolina Highway Dept. v. Barnwell Bros.*, 303 U.S. 177; *Clark v. Gray*, 306 U.S. 583. Neither of these decisions indicates that this Court will make an exception, in a case such as this, to the established principle of accepting the trial court's findings when supported by substantial evidence. In other similar cases, decided both before and since the *Barnwell Case*, this Court has held that such findings will not be disturbed: *Borden's Farm Products Co. v. Ten Eyck*, 297 U.S. 251, 261; *Atlantic, etc. Tea Co. v. Grosjean*, 301 U.S. 412, 420; *Alabama Power Co. v. Ickes*, 302 U.S. 464, 477; *Milk Wagon Drivers Union v. Meadowmoor Dairies*, 312 U.S. 287, 293; except that this Court, in the performance of its constitutional duty, will examine the record when it is properly asserted that a private litigant has been deprived of constitutional rights by reason of findings made by a state court claimed to be unsupported by and contrary to the evidence: the point presented by appellant's assignments Nos. 7 and 8 (our brief, Vol. I, pp. 322-330). Appellee apparently agrees (its brief, p. 151) that if the lower court's opinion, in spite of the apparently controlling reasons for a contrary view set forth in our brief (Vol. I, pp. 315-322), is to be interpreted

as a reversal of the trial court's findings of fact (not of law), appellant is entitled to a review of the evidence by this Court: compare its citation of *Truax v. Corrigan*, 257 U.S. 312, and *Norfolk and Western R. Co. v. Conley*, 236 U.S. 605. But neither these cases, nor any other decisions of this Court, conflict with the principle that findings of the trial court, if supported by substantial evidence, will be accepted as conclusive. These cases simply recognize an exception to that rule, when a *private litigant* claims a deprivation of federal right *by a state* because of "insubstantial findings screening reality" made by a state court. The state—the appellee here—cannot invoke that exception. It is available only to appellant; and it is invoked by appellant only if, and to the extent that, the state supreme court's opinion may be construed as a "finding of fact" differing from and contrary to the trial court's findings of fact, and therefore, as we insist, contrary to and unsupported by the testimony of record. Otherwise, and at all events from the standpoint of the state, the trial court's findings are complete, conclusive, and not now open to question.

Appellant therefore does not, as appellee asserts, complain that the state court failed to discuss the evidence or point out specifically the error as to each finding of fact. On the contrary, as appears very clearly from our Opening Brief (Vol. I, pp. 13, 329), we believe that the state court's opinion plainly shows that it did not consider the findings of fact to be in any respect an erroneous reflection of the facts developed by the evidence; that on the contrary, and in line with its own long-standing rule and the usual practice of appellate courts generally,

it accepted the factual findings since no error was clearly shown. It simply concluded, *as a matter of law and in spite of the facts,* that the challenged statute, which it held to have been enacted for the purpose of safety, was fortified by a presumption of reasonableness so strong as to render unnecessary any consideration of the facts as found.

Since it is not disputed, but on the contrary is clearly shown, that each of the trial court's findings is supported by substantial evidence and in practically every instance by evidence which is wholly unchallenged, they should and we are confident that they will afford the factual basis for the consideration and judgment of this Court.

2. "LOCAL CONDITIONS"
(Appellee's Brief, pp. 7-8, 39-40)

Commencing at page 7 of its brief, under the heading "Local Conditions", appellee attempts by reference to the record to support the argument that appellant's lines in Arizona are subject to local conditions affecting the operation of its trains, which differ from those obtaining in other states. Somewhat the same argument is also made at pages 39 and 40, where it is asserted that the "safety of long-train operation" (apparently believed to be the subject-matter of the law) depends to a considerable extent upon local conditions, "curves, grades, hogbacks, dips, sandstorms, and the like."

The facts, as found by the trial court (R. 3891-3897, 3902-3915, 3945-3946), and not challenged in or disputed by the state supreme court, show that appellant's lines in Arizona are not subject to any peculiar local conditions

affecting train operations, or any that differ substantially from those on the railroads in the other western states, except that the conditions in Arizona are in many respects more favorable to long-train operation.

While there is nothing in the record to show that the principal main lines of railroad in Kansas are "comparatively curveless", as appellee suggests, they cannot in this respect be much more favorable, if at all, than appellant's Arizona lines. The finding of the trial court is to the effect that in Arizona "curvatures are light, and curves are comparatively infrequent." 84% of the mileage on the principal main line in Arizona is straight track and, of the 16% which is curved, all but about 1% consists of curves of less than 6° (R. 3894-3895). On the alternate main line through Phoenix, 91% of the mileage consists of straight track. On the alternate main line through Douglas to El Paso, 82.5% is straight track (R. 3895). By contrast, only 75.5% of the Nevada main-line mileage is straight track, 24.5% being curved (R. 3897).

Moreover, all of these curves, where they occur in grade territory, are "compensated", so that they offer no more resistance to the movement of trains ascending the grades than results from the grade alone upon adjacent stretches of straight track. But such curvature, far from being a handicap to long-train operation, is actually a help; when trains pass around curves, the members of the crew in the engine and caboose can more readily obtain a complete view of the moving train, and on descending grades the resistance to wheel movement helps in controlling the speed.

The helper districts in Arizona, where additional engines must be used to move trains, are neither lengthy nor characterized by heavy grades. The maximum ruling grade upon any of the Arizona main lines is 1.4%, or slightly less than the maximum (1.5%) on the main line in Nevada. The clearness of the atmosphere, the general lack of foliage along the tracks, the absence of fog and smoke, and the normally mild winter weather, all make for relatively favorable conditions in Arizona. These conditions likewise prevail in Nevada (except that the winters there are more severe) and, as the Court will notice judicially, in those portions of New Mexico, western Texas, and southern California adjacent to Arizona.

The record shows, and the trial court found (R. 3915, 3937-3938, 3942), that long-train operation is being successfully conducted as a common, standard, daily practice, not only in the states adjacent to Arizona and in other western states, but throughout the United States generally, over railroads where the grades are more severe and the climatic and other conditions more arduous than any encountered upon appellant's Arizona lines. Ruling grades in California, upon certain of the main lines over which long trains are continually operated, are from 2% to 2.5%; the curvatures are at least as severe as any in Arizona (R. 2194-2197). Ruling grades on main lines in Arkansas (R. 2874), Montana (R. 2894), New Mexico (R. 2986), Pennsylvania and New York (R. 2862, 2933), Massachusetts (R. 2942), and West Virginia (R. 875), as to which specific testimony of long-train operation appears in the record, are about as heavy as in Arizona, and in many cases somewhat heavier. These grades evidently do not seriously impede long-train operation.

The extent of the grade territory in Arizona is not described by appellee, obviously because it is of such small importance. There are only 41.2 miles (32.2 opposed to eastward, and 9.0 opposed to westward traffic) upon the principal main line where the ruling grade of 1.4% applies. Elsewhere the heaviest ruling grade is 1.1%, and even this district is only 12 miles long. There are other short grades of approximately 1%; but by far the greater part of the lines, including all of the alternate main lines via Phoenix and Douglas, are in level territory, or with ruling grades not exceeding 0.6% in the case of the Phoenix line, and 0.8% in the case of the Douglas line (Finding III(b) (2), R. 3893-3895).

Appellee also speaks of "elevations" crossed by the Arizona lines; but the record (Ex. 155, 156; R. 3029, 3030) shows that the maximum elevation upon appellant's Arizona lines is approximately 4700 feet: much less than the maximum elevation upon the line in New Mexico east of El Paso (6600 feet), or in California (7000 feet), or Nevada (6300 feet). The greater portion of the Arizona line is below 3000 feet elevation. The line lies, for the most part, in comparatively level, desert territory where operating conditions are favorable. The other railroad lines which cross the continent through the states north of Arizona, upon which long-train operation is the customary practice, attain much higher elevations and are in generally less favorable territory.

Appellee also says (brief, pp. 7, 39) that Arizona is subject to sandstorms and strong wind conditions, asserted not to be present, at least to the same degree, in Nevada. The record does not show that sandstorms are

unusually frequent in Arizona, or that when they do occur they offer substantial hindrance to train operation, any more than in Nevada and other nearby states. Sandstorms and high winds are at least equally frequent in the adjacent desert portions of southern California and New Mexico, as well as in Nevada. The same traffic which, under the law, must be handled in short trains across Arizona, is handled in long trains, despite these sandstorms and high winds, in the adjoining districts in California and New Mexico.

It is true, and properly a matter of judicial notice, that Arizona's population is not as great as in many other states, although greater than in Nevada; but it is not shown of record, and is certainly not a matter of judicial notice, that Arizona's highways in the neighborhood of its larger cities (particularly Tucson and Phoenix, through which appellant's main lines pass) are any less heavily traveled than in many other states, or that the density of the traffic thereon is any greater or less than on the main highways crossing Nevada. There are several interstate highways crossing each state, which in normal times carry a large volume of through interstate automobile traffic, as well as considerable local traffic. The density of the traffic upon these highways is not controlled by and to some extent is independent of the density of the local population.

The local conditions in Arizona, so far as concerns appellant's train operations, are essentially similar to those encountered on the main lines of railroads throughout the United States. To the extent that there are differences they favor Arizona rather than otherwise.

Appellee refers (brief, pp. 39, 75, 102) to an accident occurring at Manor, Pennsylvania, on March 27, 1936 (R. 2213, 3329), as an example of an accident caused by a "local condition". In that accident a car in a train "buckled" and fell across an adjacent track; and the wreckage was struck by a passenger train moving on that track, resulting in 14 casualties. Accidents in which cars are buckled or otherwise thrown aside so as to foul adjacent tracks are not peculiar to long trains, as appellee seeks to infer, but also occur, and with at least equal frequency, on short trains (Ex. 312, R. 2266-2267). Moreover, this particular type of accident is exceedingly unlikely on appellant's lines in Arizona under either long- or short-train operations. Only 65.6 miles of the 808 miles of appellant's main lines in Arizona are double track; and of this total, the 39.7 miles between Tucson and Mescal consists of alternate, non-adjacent tracks, which are separated from each other considerable distances. Thus the extent of adjacent double track main line is but 25.9 miles, or about 3.2% of the total main line mileage.

Appellee's attempted emphasis upon the effect of local conditions upon the safety of operation demonstrates very forcefully the essential unreasonableness of the Train Limit Law. The law takes no account of any variation in conditions, either as between different sections of the line, or as between different periods of railroad development. It imposes a single fixed and arbitrary limit throughout the state, automatically violated if a longer train crosses the state boundary, or operates anywhere within the state. Changes in the conditions affecting train operations do not occur merely because the state

line is crossed. As appellee suggests (its brief, p. 39), a limit which might have some appearance of reasonableness in a difficult mountainous district could not be justified for application to through interstate trains operating under favorable conditions characteristic of appellant's Arizona lines. For similar reasons, this law, presumably addressed to conditions prevailing in 1912, is utterly unreasonable today because it fails to recognize the revolutionary changes in operating methods taking place since, as the result of improvements in locomotives, cars, and fixed properties, and the general progressive evolution of the railroad industry.

3. "BURDEN ON INTERSTATE COMMERCE"
(Appellee's Brief, pp. 8-10, 42-52)

At pages 8-10 of its brief, appellee summarizes its factual argument relative to the burden upon interstate commerce imposed by the law; this argument is elaborated at pages 42-52.

We emphasize again that, in attempting to show that enforced compliance does not impose substantial financial burdens, appellee disagrees with not only the trial court's finding (Finding X(d), R. 3968), but also the state supreme court's inferential adoption and approval thereof (R. 4062-4063). Upon this question there are thus affirmative "concurrent findings of the courts below" (*Just v. Chambers*, 312 U.S. 383, 385; *Texas & New Orleans R. Co. v. Railway Clerks*, 281 U.S. 548, 558, and cases cited); so that appellee's attempt to raise the point again in this Court is foreclosed.

(a) The Comparisons of Train-Length and Efficiency Trends (Appellee's Brief, pp. 42-47).

Appellee argues (brief, pp. 8-9, 42-46) that there is no evidentiary value to our showing of operating and transportation expenses for the years 1922-1939, wherein the trends are contrasted with those upon the Class I railroads of the United States as a group, upon various representative major systems separately, and upon appellant's system, and its lines in Nevada; because 1922, 1923, and 1924 were included in the base period 1922-1925, against which the improvements (decreases) in unit expenses in later years were computed. Its particular criticism is that the appellant's Arizona lines were greatly changed on November 1, 1924, by the acquisition of the El Paso & Southwestern and Arizona Eastern properties, so that the inclusion of the operating results for these lines in the Arizona totals after that date, but not before, produces an incomplete showing.

The comparisons in this series of exhibits are of *trends* of *unit* costs: i. e., *average* operating and transportation expenses per thousand revenue ton-miles; so that the criticism would be tenable only if the acquired lines were actually dissimilar, having operating and traffic conditions so widely different as to produce substantial disparities in unit costs. The fact is quite otherwise. These other lines are all in Arizona, and generally in the same districts, serving in fact many of the same localities, and subject to the same conditions of climate and terrain, and particularly to the train-limit restrictions. Operating conditions, from the standpoint of grades, curvatures, elevations, helper districts, etc., are somewhat

more favorable. On the former EP&SW line (now the alternate main line through Douglas), the ruling grade was and is 0.8%, and there are no helper districts (R. 3894, 3896). On the Arizona Eastern (now a part of the alternate line through Phoenix) the maximum grade is 1%, and the grades in general do not exceed 0.6% (R. 3894). Curvature was and is comparatively light. In general, the conditions on these lines resemble those prevailing on the former (and present) Southern Pacific lines west of Mescal, and particularly west of Tucson, and thus did not include even the slightly more adverse conditions on a part of the line east of Mescal.

Comparisons of operating results, in terms of unit costs, on the Southern Pacific in Arizona before and after the acquisition, show that appellee's criticism is without substance. The following is taken from Exhibit 160 (R. 3034):

Years	Revenue ton miles (in freight and mixed trains)	Freight Operating Expenses	Freight Transportation Expenses	Averages for 1000 Revenue Ton-Miles: Freight Operating Expenses	Averages for 1000 Revenue Ton-Miles: Freight Transportation Expenses
1925-1928	6,292,063,760	46,337,346	20,606,596	$7.38	$3.28
1922-1924	2,994,341,655	21,996,747	9,162,381	7.34	3.06
Per cent increase 1925-1928 over 1922-1924				0.54	7.19

Appellee's willingness to be bound by trend showings based upon results during the years 1925-1928 (see pp. 44-46 of its brief) is explained by the fact that commencing in 1923, and as soon as 1928, many railroads had substantially accomplished the inauguration of their long-train programs and achieved the attendant operating economies. For instance, as to those roads selected by appellee, we have:

	Ex. No.		1922	1924	1926	1928
S. P., Nevada	150	Average cars per train	48.9	54.4	66.1	68.5
	161	Transportation expense per 1000 revenue ton miles	$3.45	$3.07	$2.53	$2.61
C. B. & Q.	103	Average cars per train	41.5	44.5	48.5	50.9
	102	Transportation expense per 1000 revenue ton miles	$3.96	$3.48	$3.17	$3.02
Erie	56	Average cars per train	49.8	55.0	57.4	68.0
	54	Transportation expense per 1000 revenue ton miles	$4.68	$3.70	$3.71	$3.59

While the comparisons of operating results in Arizona with other parts of appellant's system, and with other lines, are perhaps not *ideal*, reason does not permit us to close our eyes to developments elsewhere, and decline to seek to determine what might happen in Arizona if the restraint of the law were removed. When the same results are noted in separate instances, but in the presence of the same common factor, those results should logically be ascribed to that factor. The following tabulation affords an example of the operation of that principle; and far from indicating, as appellee contends, that improvements in efficiency and unit costs are unaffected by increases in train length, it shows precisely how that factor has operated:

TABLE A

Exhibit Nos.		Railroad Company	Train Length—Cars					Average Freight Transportation Expenses Per 1000 Revenue Ton Miles				
			1922	1930-1932		1939	Percent Increase 1939 over 1922	1922-1925	1930-1932		1936-1939	Percent Decrease 1936-9 under 1922-5
28	29	Illinois Central	42.7	44.6	40.0	46.1	8.0	3.26	3.31	3.16	3.14	3.5
130	131	Santa Fe	41.5	51.3	44.4	45.9	10.6	4.00	3.20	3.24	3.48	13.0
102	103	Burlington	41.5	51.5	43.2	46.3	11.6	3.63	3.00	3.18	2.86	21.2
11	12	New York Central	49.0	57.4	53.6	55.2	12.7	4.31	4.00	3.71	3.41	20.9
94	95	Milwaukee	37.8	46.7	41.6	45.8	21.2	4.16	3.65	3.59	3.39	18.5
59	60	St. Louis Southwestern	36.9	45.4	39.5	45.1	22.2	4.19	3.79	3.95	3.20	23.6
51	52	Rock Island	32.4	41.8	37.8	39.9	23.1	5.03	3.90	3.86	3.43	31.8
48	49	Northern Pacific	39.5	46.9	42.1	49.9	26.3	3.94	3.77	4.24	3.30	16.2
20	22	Class I—U. S.	38.4	48.9	44.8	49.1	27.9	4.16	3.52	3.48	3.18	23.6
24	25	Missouri Pacific	35.2	47.9	41.9	46.6	32.4	4.35	3.22	3.52	3.04	30.1
78	79	U [illegible] Pacific	28.1	53.2	50.2	50.5	32.5	3.90	3.23	3.43	2.99	23.3
54	56	Erie	49.8	71.9	67.4	67.4	35.3	3.93	3.52	3.26	3.32	15.5
46	47	Great Northern	41.0	53.4	42.4	56.0	36.6	3.78	2.85	3.35	2.64	30.2
63	64	Chicago Northwestern	33.4	42.6	39.0	47.5	42.2	5.18	4.52	4.97	4.13	20.3
120	121	Chesapeake and Ohio	51.9	66.2	73.6	79.5	53.2	2.06	1.43	1.21	1.29	37.4
67	68	Pennsylvania	40.8	58.0	55.4	63.5	55.6	4.35	3.63	3.22	3.12	28.3
86	87	Boston and Maine	31.3	49.7	48.2	51.1	63.3	7.64	5.79	5.52	5.06	33.8
		(For Comparison)										
151	162	Southern Pacific	43.4	52.5	49.5	54.6	25.8	5.03	4.40	4.34	3.95	21.5
150	161	Southern Pacific—Nevada	48.9	77.2	81.0	78.5	30.4	3.12	2.59	2.26	2.36	24.4
149	160	Southern Pacific—Arizona	55.8	56.4	56.8	54.8	1.3 Dec.	3.22	3.11	3.40	3.00	6.8

This tabulation summarizes and briefs the train-length and expense exhibits, and compares appellant's Arizona lines with other lines and railroads, the several roads being shown in ascending order of percentage increases in train length, 1939 over 1922. Average train lengths increased substantially during the period between 1922 and the years 1930-1932, and during that period the cost indices showed marked improvement; while since 1930-1932 train lengths have shown considerably less fluctuation, and the same indices have shown correspondingly less improvement.

The tabulated figures very definitely establish, *first*, that freight transportation expenses vary inversely with train lengths, and, *second*, that reductions in freight transportation expenses, and increases in efficiency, as measured by performance, have occurred on other railroads, outside of Arizona, coincident with and as a result of increases in train lengths, but such improvements have not occurred in Arizona.

At page 46 of its brief appellee presents excerpts from another series of exhibits, showing the efficiency index "gross ton miles per freight train hour" for Arizona, in contrast with four other western railroads. As with the cost exhibits, appellee's selection is favorable to its position because its base year is 1930, when the long-train program was well established on the other roads, but of course not in Arizona, although operations there could and did receive the benefit of practically all the other improvements in facilities and practices applied during those years. The following is a summary of *all* of this

group of exhibits, which compares the trend of the Arizona performance (in gross ton miles per train hour) with the same 16 other railroads shown above, the Class I roads of the United States as a group, the appellant's system, and its lines in Nevada:

TABLE B

Exhibits	Railroad Company	Train Lengths—Cars				Gross Ton Miles Per Freight Train Hour			
		1924	1930-1932	1939	% Increase 1924-1939	1924	1930-1932	1939	% Increase 1924-1939
130, 131	Santa Fe	46.6	51.3-44.4	45.9	—	22,887	31,115-29,492	35,471	55
28, 29	Illinois Central	44.7	44.6-40.0	46.1	3	20,319	24,963-24,411	29,934	47
102, 103	Burlington	44.5	51.5-43.2	46.3	4	20,239	26,140-24,048	32,145	59

(*) (Main Line only—All freight trains.)

This summary differs slightly from the preceding, for 1924 is the base year, 1922 statistics not being available for the Southern Pacific divisions necessarily used; and the Tucson and Salt Lake divisions are used instead of the states of Arizona and Nevada. The Tucson Division lies almost wholly within Arizona and includes a large percentage of the Arizona mileage. Its operations are completely governed by the law. The Salt Lake Division includes practically all of appellant's lines in Nevada, and extends to Ogden, Utah. Statistics are for *main line* operations only, on the three Southern Pacific showings; but there can be no criticism on this score, because the exclusion of branch line operations for the Tucson Division (Arizona) showing produces a result slightly more favorable to appellee's contention.

Here again the dominant, controlling factor is revealed to be train length. Increasing efficiency goes hand in hand with increasing train length. The periods of long-train development as to certain lines are pronounced, and so are the corresponding improvements in efficiency. The showing is consistent, cohesive, persuasive, and unimpeachable that increasing train lengths are largely responsible for increasing efficiency on other lines, but the law places a permanent barrier against ever achieving comparable improvements in efficiency in Arizona.

The acquisition of the EP&SW and Arizona Eastern in November, 1924, becomes wholly immaterial when *Tucson Division* statistics are used, because the division accounts for 1924 were "restated" when the 1925 figures were compiled, so as to cover the same lines as in 1925.

and only these 1924 "restated" figures are used in the summary.

Appellee's brief (pp. 46, 47) presents the following tabulation and observation:

Railroad	"Gross ton mile per freight train hour 1930	1939	% Increase
Great Northern	28021	35462	26.5
Northern Pacific	24848	32408	30.4
Union Pacific	33267	43006	29.3
Santa Fe System	31115	35471	14.0
S. P.—Arizona	35087	45026	28.3

"The increase in gross ton miles per freight train hours—the yardstick of efficiency—is seen to be comparable to that on other western roads."

Appellee's purpose is to show that appellant in Arizona can register as good a performance as other western railroads not affected by the law, and thus to prove indirectly that the law is not a deterrent, efficiency-wise. This analysis has its place in the consideration of this case, but appellee's conclusion is completely erroneous. The reason for the parallelism between the Arizona lines and the other railroads is that these roads, having effectuated their long-train programs prior to 1930, were influenced by forces also active in Arizona, and the results were similar. The average cars per train for these lines, excerpted from preceding tabulations, were as follows:

	Train Lengths—Cars 1930	1939
Great Northern	53.4	56.0
Northern Pacific	46.9	49.9
Union Pacific	53.2	50.0
Santa Fe System	51.3	45.9
S. P.—Arizona	56.4	54.8

As pointed out heretofore, the Arizona lines do respond to and are affected by other economic influences and stimuli, which also make themselves felt in the other parts of the nation's railroad system.

Appellee's meager showing only emphasizes the situation presented in full by the two summaries above set forth, based upon *all* of the expense and efficiency exhibits which compare the Arizona lines with other lines and railroads. Appellee's own reasoning likewise negatives its contention that conditions in Arizona are so different, or on the lines acquired in 1924 (the EP&SW and Arizona Eastern) were so different, as to render comparisons with other railroads of no value, or support the view that the law itself responds to some distinctive "local condition". An opposite conclusion must be drawn: specifically, that controlling conditions on the Arizona lines, and on other lines, are so much alike that all lines in the country, both in Arizona and in the other states, respond to the same stimuli, and are truly comparable as to those situations which are pertinent and worthy of serious consideration. Any differences which may exist between Arizona and other lines are trivial and inconsequential, and asserted by appellee only for the sake of argument: for there are no special "local conditions" (apart from the challenged law) which distinguish railroad operations in Arizona from those in other states, for any purpose of this case.

(b) The Redispatching Studies (Appellee's Brief, pp. 47-52).

At pages 47-52 of its brief, appellee criticizes the redispatching studies presented by appellant, and accepted

(as noted) by both the courts below as showing the recurring annual out-of-pocket expense of compliance with the law. Appellee asserts that whatever savings are shown by the redispatching study could have been realized regardless of the law, by merely substituting larger power (400 or AC-type engines) for the smaller engines actually used on the short trains run. Appellee is correct, *but only in part;* for it does not develop all that its argument implies.

At this point a brief review of appellant's "burden" showing is desirable. *First,* by comparison of cost and efficiency indices, appellant has shown that the Arizona lines lag far behind rail lines elsewhere in the country in reductions in cost and increases in efficiency. These benefits are still attainable in Arizona by removal of the law's restrictions. *Second,* by an entirely independent avenue, appellant made an accurate determination of the savings which could have been realized in the years 1938 and 1940. This was the result of the redispatching studies, which developed how many less trains, train miles, and locomotive miles would be required to move the same business, and applied known cost figures to the operational savings thus determined. By these two separate approaches—independent, yet each confirming the other—appellant has presented a balanced and integrated showing of burden which is conclusive and inescapable.

Appellee, at pages 47-48, attacks one detail of the redispatching study: the substitution of larger power on the redispatched (long) trains, for the smaller power actually used on the short trains. The essential place that larger power has in the long-train program was

developed by appellant's witness, Dr. Parmelee (R. 189-190):

> "Railroad executives of Class I railways in the spring of 1923 formulated and inaugurated a continuing program designed to rehabilitate and modernize the entire rail plant. *This involved* not only the physical fitness of the plant but also *an increase in the unit output of rail facilities.* The primary objective of the program was to provide equipment and facilities capable of handling mass transportation with the smallest possible number of units, that is, cars and trains. *To that end railroads installed new locomotives and cars of modern design and greater unit hauling and carrying capacity.* They retired obsolete equipment units from service. They laid millions of tons of heavier rail. They renewed and strengthened roadbeds. They reduced curves and grades. They rebuilt or replaced bridges, trestles and culverts. They greatly extended signalling systems and safety devices. *In every way they remodelled the rail plant to permit, where conditions were favorable, use of trains of greater carrying capacity and moving at a greater average speed between terminals.* During the first year of the improvement program, 1923, more than $1,000,000,000 of gross expenditure was made on capital account. During the 17 years ending with 1939 the total was approximately $9,000,000,000." (Emphasis supplied.)

The place that this larger power would have in long-train operation in Arizona is stated in Finding IX(b) (R. 3949):

> ". . . In order to conduct long freight-train operations in the affected territory with greater efficiency and economy, and with due regard for schedule re-

quirements, and to realize thereby a larger degree of use and usefulness of its entire railroad plant in said territory, defendant plans and intends to provide and assign to such freight-train operation an adequate number of locomotives having sufficient tractive power more readily to handle long freight trains in both directions in said territory. Such locomotives, when so assigned, will replace certain of the other locomotives now in use in said territory. Of all of the types of locomotives owned and operated by defendant, the Articulated-Consolidation type is most suitable to such long-train operation. Locomotives of class 8 of the Articulated-Consolidation type, for brevity known as AC-8 locomotives, have been in service on various portions of defendant's lines since 1939. . . . In order to handle, in long-train operation, the same volume of freight traffic actually handled in the affected territory in 1938, defendant will be required to assign some thirty AC-8 locomotives to said service . . ."

Appellee points to certain data on Exhibit 198 (R. 3115), and then proceeds to draw wholly unwarranted conclusions, primarily based upon its understanding of appellant's statement that Exhibit 198 is "representative" of the 900 work sheets which together contain the details of the 1938 redispatching study. Appellee's observations in this respect are a mixture of misunderstanding and unwarranted assumption. Exhibit 198 is only a sample, *representing the form* of the work sheets, and shows how the arithmetic was developed on each of the 900, so as to obtain the daily totals of locomotive miles, train miles, cars, and wages for actual and redispatched operations. It indicates the methods by which were solved the

other 899 problems of making long trains out of shor
However, it covers *only eastbound* trains moving o
June 18, 1938, over the district from Tucson to Lordsbur
and so does *not* reflect actual conditions on the othe
districts involved (Yuma-Gila, Gila-Tucson, and Lord
burg-El Paso), or present any of the details appearin
on the 600 or more work sheets covering those district

No railroad with due regard for efficiency and economi
would consider using AC-8 locomotives on short trains i
the districts west of Tucson or east of Lordsburg; no
was such use contemplated in the redispatching study
An AC-8 locomotive, without helper, could handle th
short train Y-311 efficiently over the 1.4% ruling grade
between Tucson and Lordsburg, but it would be a gros
waste of power to use it on that train, under the 70-ca
restriction, over the 1.02% ruling grades between Yum
and Tucson, or the 1.0% ruling grades between Lordsbur
and El Paso (Ex. 155, R. 3029).

Appellee argues at length (its brief, p. 48) that if AC-
locomotives had been used on the actual trains show
on Exhibit 198, substantial savings in wages for th
engine crews, and in locomotive fuel, maintenance, repairs
and other expenses would have been realized, as well a
the elimination of delays necessary to cutting in and cut
ting out helpers and certain delays at water stops, and
contends that the entire saving claimed by appellan
could have been made simply by the use of these larger
locomotives upon the short trains actually operated in
conformity with the law.

An analysis of appellee's claims with regard to wages
alone demonstrates that they are quite unfounded. From

Exhibits 198 and 209 (R. 3193) the results of its plan may be compared with the results of the redispatching study, as follows:

	Actual	Redispatch	Appellee's Plan
Wages of Train Enginemen 9 x $29.22	$237.49	$206.05	$262.98
Wages of Double Header Enginemen	26.22		26.22
Wages of Helper Enginemen 4 x $15.01	187.58	133.05	60.04
Wages of Train Crews	401.67	312.67	401.67
Wages of Flagmen	27.29	6.57	—
Deadheading	29.86	—	29.86
	$910.11	$658.34	$780.75
Saving		251.77	129.36

Thus appellee's plan would be, *as to wages only*, about half as effective in the Tucson-Lordsburg district where helpers are used.

Appellee concedes that the use of larger locomotives would save delays because of fewer stops for water and to cut helpers in and out, and would also save locomotive fuel, maintenance, repairs, and other expenses, but insists that none of these savings may be credited to long-train operation. It cannot avoid the fact, however, that the wage expense is by far the largest direct expense associated with the train operation; and that the operation of fewer trains means a corresponding reduction in this item of expense. It likewise cannot avoid the fact that the substitution of larger locomotives, if trains are limited by law so that the same number must be run, will result in increased wage expense for engine crews, because their wages are based upon the size of the locomotives operated (Exhibits 198, 209); but if fewer trains are operated and fewer locomotives run, this expense is cut down even though the locomotives are somewhat larger.

In fact, as demonstrated by Exhibit 198, a comparatively small wage saving might be realized by substituting larger power for the smaller now used *in helper territory*, where such substitution would reduce total locomotive mileage; and exactly the same character of saving, but in much greater measure, could be achieved by reducing the locomotive mileage in *all* of the affected territory, through the operation of fewer and longer trains. In *non-helper territory*, there would be no saving in wages of engine crews, if short-train operation were continued but with larger power, because no engine mileage would be saved. There would be no saving in wages of train crews, because no train mileage would be eliminated; and there would be absolute losses in locomotive-repair and fuel-consumption expense, because of the inefficiency of operating the large engines at a fraction of their capacity.

At pages 51-55 of its brief, appellee attacks our fuel saving figures, and particularly the estimated 10 per cent saving which was applied against June and August, 1938, fuel consumption between Yuma and Lordsburg to produce a part of the $400,000 per year cost of compliance (see pp. 121-122 of Vol. II of our opening brief).

There is no inference or speculation involved in the fact that long-train operation reduces the number of trains operated and increases the ton-mile production per locomotive. Experience elsewhere in the United States, on appellant's lines in Nevada, and upon the system, indicates the approximate measure by which fuel consumption is reduced when locomotive output is increased. It is impossible to conclude that similar additional fuel economies could not also be achieved in Arizona.

Appellant objects, however, that the showing of savings in fuel expense is to some extent based upon comparisons which relate to the period prior to 1930, and claims that because of the change in the Tucson Division limits in that year, prior experience is of no value. But practical common sense and judgment cannot be circumscribed by such narrow criticism.

Between 1924 and 1930 there were substantial increases in train lengths, and in tonnages handled by locomotives, on the Salt Lake Division, accompanied by marked reductions in average fuel consumption per unit handled. Over the same period there were slight but noticeable reductions in average train lengths, and in tonnage per locomotive, on the Tucson Division. The decrease in average fuel consumption was very much less than on the Salt Lake Division, which result can only be due to appellant's inability to increase the output per locomotive on the Tucson Division. Efforts to increase the train loading on the Salt Lake Division continued after 1930 and up to the present, with corresponding decreases in fuel consumption. The Tucson Division operation in 1930 and thereafter was still restricted by the Train Limit Law; and its improvement in fuel consumption per unit handled was less than on the Salt Lake Division, in this second period (1930-1939), as well. The technical improvements in locomotive construction in the period 1924-1939, as well as other improved methods of railroad operation, resulted in reductions of average fuel consumption on both divisions; but there still remains to be realized, on the Tucson Division, fuel economy comparable to that already achieved, on the Salt Lake Division, as a result of the increases in train length and locomotive loading.

The percentage of the improvement in fuel economy thus available was quite accurately determined, by comparing the Tucson Division performance in each of the two periods with the corresponding performance on the Salt Lake Division. This method eliminates any change in Tucson Division performances incident to the change of division limits in 1930. It also, incidentally, makes use of the Tucson Division figures as *restated* for 1924, thus eliminating any disturbing effect caused by the acquisition of the El Paso and Southwestern and Arizona Eastern properties.

The change in division limits in 1930, which added to the division approximately 160 miles of railroad between Tucson and Lordsburg, cannot change the fact that in Arizona there had been no increase in train length, and no resulting reduction in average fuel consumption, in the six years immediately preceding. That change does not cancel out the fact that there had been a considerable increase in train length and locomotive loading, and a considerable decrease in fuel consumption, on the Salt Lake Division over the same period. Appellee in Arizona has never had an opportunity to increase its train lengths and locomotive loadings; and these improvements in efficiency, with resulting decreases in fuel consumption, are still to be realized. The possible fuel saving has been conservatively estimated to be at least 10 per cent of the fuel consumed under the short-train restriction.

Appellee asserts that the paired track arrangement with the Western Pacific in Nevada, begun in 1925, is one reason for casting out this comparison, because the reduction in train stops results in fuel economy not attainable

in Arizona. If the law were to be set aside, a large percentage of train stops would be eliminated in Arizona also, due to the smaller number of trains operated, so that corresponding fuel economy would be attainable (Finding X(b), R. 3953-3962).

Appellee points to inequalities assertedly appearing in fuel consumption rates when set beside average train lengths on the Salt Lake Division, claiming that there is no consistency in the showing. A single year's results may be unsatisfactory for a variety of reasons—weather, to mention only one—and appellant has consistently followed the practice of averaging two or more years for comparative purposes in order to eliminate, so far as possible, such periodic inequalities. However, appellee cannot successfully maintain that there has not been a definite long-time trend downward in the rate of fuel consumption on the Salt Lake Division, side by side with increasing train length.

Appellee ascribes a part of the Salt Lake Division fuel economy to abandonment of 151.85 miles of branch line between 1936 and 1939. There were also branch line abandonments in Arizona, during the period of the fuel studies (Exhibit 171, R. 3045); but it cannot seriously be contended that the amount of fuel used on branch lines, later abandoned, would materially affect the *rate* of fuel consumption.

We call attention to Exhibit 249 (R. 3258) showing that the difference between percentages of decrease on the Tucson and Salt Lake divisions is 13.44. To be conservative, appellant used 10%, recognizing that the information developed had been affected by a variety of factors;

among which, however, train length had played the dominant role. Appellant did not rely upon the Salt Lake Division showing alone for establishment of a fuel economy percentage; for the system's fuel economy during the same years had exceeded that on the Tucson Division by 9.76%.

Finally, as a test of appellee's sincerity in contending that improved economy does not follow from adoption of long-train operation, consideration should be given to the following paragraph (p. 51 of its brief):

> "Also it will be noted that the average tractive power on the Salt Lake Division was increased from 55162 tons in 1936 to 62423 in 1939, an increase of 7261 tons.[1] The use of these heavier locomotives, such as the 4100 or A.C. type, was a material aid in the decrease in fuel per 100 gross ton miles—first by eliminating the necessity of many helper engines, and, second, by reason of the larger water capacity of their tender they can run further without the necessity of stopping for water."

From 1936 to 1939, the average freight cars per train on the Salt Lake Division increased from 72.9 to 79.8, all the efficiency factors showed improvement, and this was all apparently due (as appellee concedes) to the assignment of heavier power, and the resulting further expansion of the long-train program (R. 3038). There is no possible reason for believing that the same results would not follow in Arizona.

---

[1]The *figures* in this sentence are correctly quoted from line 5 of Ex. 164, R. 3038; but the unit should be *pounds*, not *tons* as stated by appellee. The largest locomotive operated by appellant (the AC-9 class: Ex. 5, R. 2855) has a tractive power of about 62 *tons* (124,300 pounds).

4. THE TRAIN LIMIT LAW HAS NO RATIONAL BASIS AS A SAFETY MEASURE

(Appellee's Brief, pp. 10-11, 93-148)

Appellee's "safety" discussion extends from pages 93 to 147 of its brief, being summarized at pp. 10-11, and again at pp. 147-148. It consists principally of an attempted analysis of certain portions of appellant's testimony, with some references to appellee's own showing, and a great deal of comment which is either contrary to the evidence or has no relation at all to the record.

Appellee's treatment of the safety issues is noteworthy because *first*, it disregards, so far as possible, all types of accidents and casualties except the so-called "slack-action" group: i.e., those ascribed to "sudden stop, start, lurch, or jerk of the train or car"; *second*, it attempts to minimize even slack-action casualties, unless occurring upon "long" trains; and *third*, it contains almost no references to the detailed safety findings of the trial court (Findings XI, XII, XIII; R. 3969-4032).

Apparently it is appellee's position that the law, as a claimed safety measure, is concerned with casualties of only one type ("slack-action"), and even with those only when occurring on "long" trains; and that the trial court's safety findings, though not in terms reversed or set aside by the state supreme court, should now be disregarded.

The claimed safety purpose of the law cannot be so narrowly confined. As a purported safety statute it has no standing if it is merely a "slack-action" prevention law, and at the same time actually increases other hazards of railroad operation. Appellee, at the outset of its dis-

cussion, declares that the purpose and effect of the law are "to protect against the dangers incident to the increase of the number of cars in trains operated." But it is not claimed that the law prevents, or even measurably reduces, the *frequency* of *any* class of accidents or casualties; or that, *all* hazards considered, its observance results in greater safety of railroad operation; nor does appellee now deny or challenge the conclusion stated by the trial court, and independently presented by other parties now appearing in this case (i.e., the United States, and the Association of American Railroads, as amici curiae) as well as appellant, that the restricted operation under the law is *more* hazardous, all casualties considered, than if the same traffic were handled in an unrestricted—i.e., "long-train"—operation. On the facts that argument could not be maintained; and for this reason apparently, appellee stakes its whole case upon slack-action and attempts to dismiss from consideration as many of the other classes of hazards and casualties as possible, asserting that they are not affected by train length, or otherwise are immaterial.

As anticipated, appellee emphasizes its theory that from the standpoint of safety the essential question is whether accidents are more frequent and serious on long than on short trains. We have already pointed out (our opening brief, Vol. I, pp. 203-204, 312), that the issue cannot be thus restricted. As the trial court said (R. 4052):

> "Essentially the question is not whether a given number of long trains may be operated with fewer casualties than an equal number of short trains, but rather whether the long-train method of moving the entire volume of traffic results in fewer casualties,

of all classes, than the movement of the traffic in a larger number of trains of restricted length."

The testimony establishes and, as we emphasize, appellee offers no serious challenge, that that method of operation which permits the traffic to be handled with as few train units as consistent with economy and efficiency, and therefore exposes as few employees as possible, creates far less hazard and causes many fewer casualties than does the restricted operation; or, as the trial court said (R. 4052-4053), when the "overall result in casualties of the entire operation" is considered it is clear "that the law not only does not increase safety of train operations in Arizona, but that as a matter of cold fact it makes these short train operations more dangerous"; hence, the "law not only bears no reasonable relation to safety, but to the contrary does, and if enforced will continue to impair and lessen substantially the safety of (appellant's) train operations in Arizona and the adjacent affected territory."

(a) "Slack-Action Accidents and Injuries" (Appellee's Brief, pp. 93-99).

Even as a purported slack-action prevention measure, the law has no real merit or true relation to safety; for in this field it takes into account only one of the numerous factors which control the occurrence and severity of the slack-action shocks experienced in train operation and wholly disregards the others, although these are in most cases of much greater consequence.

Appellee would have the Court believe that the length of the train, and that factor alone, determines whether a slack-action shock will be sufficiently severe to cause dam-

age or injury. The evidence, however, shows, and the trial court found, in a finding (No. XI(d), R. 3971-3972) not heretofore or presently challenged by appellee in these particulars, that the occurrence and severity of slack action depend also, and in much greater degree, on: (1) the *speed* of the train at the time; (2) whether it is *accelerating* from a start, or *slowing down*, or proceeding at *normal speed;* (3) the *grade* upon which it is moving; (4) whether it is going *with* or *against* the grade; (5) whether the cars in the train are *loaded* or *empty;* and (6) if partly loaded and partly empty, the *placement* of the loads and empties with relation to each other.

The trial court also found (R. 3973) that the extent and amount of slack action in a freight train are to a large degree within the control of the engineer, through the use of air brakes and the engine power; and that it was not true, as appellee had apparently contended (and now contends: its brief, pp. 93-96) that the amount and severity of slack action occurring in a train depend solely upon the number of cars. That contention, said the trial court, fails to take into account any of the other factors affecting slack-action shocks and the severity thereof; particularly, "grades, speed of trains, consist of trains, whether the cars therein are loaded or empty, and if loaded, the weight of the loads, and the control exercised and exercisable by the engineer" (R. 3973).

Appellee quotes (its brief, pp. 93-96) from the air brake instruction books, issued by appellant and the Santa Fe to engine service employees, asserting (p. 96) that by these instructions definite and distinct recognition is given to the danger from slack action in train operations, and

that this danger increases with train length; that the longer the train the greater the care required, "because the greater the difficulty in controlling the slack"; that the law is based upon the very proposition stated by the railroads themselves, that as the length of the train increases the care required to control the slack increases, and therefore the danger from slack action; but as appellee alleges (its brief, p. 100), the law "says that with over 70 cars in the train the care required becomes too great for safe operation."

This argument has no substantial foundation. These instruction books tell the employees that greater *care* is required in handling longer trains with heavier locomotives, and instruct the engineers how to exercise that care and employ the air brakes and the engine power to obtain safe control. The instruction books likewise recognize, although appellee apparently does not, that effective control of the train, including the slack and the slack action, can be obtained by the engineer, through the use of the brakes and the engine power, if the instructions are fully followed; that the *weight* of the train and the *grades* over which it travels, are factors determining the extent and severity of the slack action.

Neither of these books declares, either in terms or by reasonable inference, that there is any greater *difficulty* in handling of a long train, provided adequate *care* is exercised. Appellee's suggestion to this effect is not supported by the testimony of its own witnesses. None of the engineers called by appellee asserted that he had ever handled a train, either long or short, that he could not control. Engineer Kennedy admitted that he had had no

difficulty in controlling the long trains operated by him over the grade territory in Arizona during April, 1940; that he had accomplished this handling without any trouble because he had intended to do so (R. 2434-2435). Engineer Cooper, who is employed by the Santa Fe and has seniority permitting him to run in freight service, according to choice, in either Arizona (short train territory) or California (long train territory), voluntarily elected the latter, apparently because he preferred the job (R. 2438-2440). Engineer Stevenson, employed by the Southern Pacific, has the same election as between Arizona and New Mexico, but for many years has by preference operated in the latter territory (R. 2488-2489). Appellant's engineer witnesses (Messrs. Fifield and Menzies), who had long experience in train handling and the observation and supervision of other engineers, showed by their testimony that appellant's engineers generally have no difficulty in handling freight and passenger trains of all lengths, including those much longer than 70 or 14 cars, and that long trains are not more difficult to handle and control than short trains; in fact, engineers who as a regular practice handle long trains will frequently take more care than usual when occasionally called upon to handle short trains (R. 2785-2806, 2814-2817).

A complete answer to appellee's suggestion is found in the actual operations of April, 1940, when 302 long freight trains were operated on appellant's lines in Arizona, and wholly without any difficulty of handling so far as the record shows. If the engineers on any of these trains had experienced any difficulty or lack of control, appellee would have made the most of it in evidence. As

to certain of these trains the testimony affirmatively shows, by the statements of the very men who handled or rode upon them, that no such difficulties were experienced (R. 2435, 2815). No reportable accident or casualty attributed to either slack action or any other cause, occurred upon any of these long trains while in motion.

Appellee argues (pp. 97-99) that the trial court erred in finding (R. 3991) that slack-action casualties are of infrequent occurrence, and (R. 3993) a minor factor in determining whether the law is reasonable. During the 18 years 1923-1940, inclusive, there were 103 of these casualties in Arizona and 118 in Nevada (Exhibits 274, 275, 280, R. 3351, 3364, 3375). Of these, 101 occurred on short trains in Arizona, and 24 on short trains in Nevada; so that combining the two states there were 125 short train slack-action casualties. There were 96 of these casualties on long trains; 2 in Arizona and 94 in Nevada. During the last 12 years of this period, when long-train operation predominated in Nevada, there were 61 such casualties in that state and 62 in Arizona; an average of about five per year in each state. The "frequency" in Nevada was 3.77 per hundred million car-miles, or about one such casualty for every 26,525,000 car-miles operated. This rate is slightly less than the corresponding frequency rate in Arizona for the same period: 4.01 per hundred million car-miles, or about one for each 25,000,000 operated. Either "frequency" is so low as to warrant completely the observation that these casualties are indeed *infrequent*.

It is also clear that observance of the law in Arizona has not prevented or even reduced the frequency of these casualties, while unrestricted operation in Nevada, under

similar conditions, has not increased their frequency. In fact, the Nevada improvement over the 18-year period (57.5%, in the car-mile rates) is greater than in Arizona (47.7%); and this improvement comparison is particularly pertinent because in the earlier years, 1923-1926, short-train operation predominated in Nevada, whereas since 1929 long-train operation has greatly predominated.

Appellee attempts to build up the relative importance of these casualties by asserting (its brief, pp. 97-98) that casualties to employees occurring on passenger trains, in yard operations, on standing freight trains, or in other circumstances where train length has (according to appellee) no influence, should be excluded; that only those accidents and casualties which occur on trains while in motion should be taken into account. The influence of the law in causing additional trains to be run, and thus creating additional exposure to hazard, is not confined to those accidents occurring on moving trains. Accidents while trains are standing, or which result from pinched fingers, sand in eyes, and the like, are definitely related to the number of men exposed and thus to the number of trains run. Accidents to employees in yards or on passenger trains are likewise due to exposure, which again is directly proportionate to the number of men employed and thus to the number of trains run. Moreover, an increase in the number of freight trains operated increases the hazard to passenger trains arising from train interferences or collisions. Thus, it is entirely proper to relate the slack-action accidents, not merely to those occurring on freight trains while in motion, but to all of the various accidents to which employees are exposed and to which *more* em-

ployees must be exposed if the law is obeyed. While it is true that slack action can occur only when the train is in motion, it is not true that accidents on moving trains are the only ones whose frequency is influenced by the law.

(b) Train Length Is Not the Sole or Controlling Factor in Slack-Action Accidents (Appellee's Brief, pp. 99-102).

At pages 99-100, appellee repeats its argument that the difficulty of controlling the slack and the severity of the slack-action shock increases as the train length increases; thus again disregarding all the other factors which influence the degree of control and determine the severity of the shock when slack action takes place. It is particularly *not* true that the *difficulty* of train handling and train control, with special reference to slack action, increases with train length. While greater *care* is required with larger and heavier trains, complete control can be and is obtained when ordinary care is used (R. 2435-2436, 2490, 2502, 2787, 2801, 2817).

Appellee argues, however, that in Nevada of the 48 slack-action accidents occurring during the 12-year period 1929-1940, all but one were on long trains and that exception was on a 69-car train; while in Arizona during the same period, out of 55 slack-action accidents, 42 were on trains of 65 or more cars (one on a long train) and only 13 on trains of less than 65 cars. Appellee thus confesses the complete unreasonableness of the law. By selecting 70 cars as the supposed safe operating maximum, the law has committed appellee to that figure. The supposed safe limit is not 65 or 60 cars, or something less; and to argue

that a train of that length is safe, but a 70-car train is not (the practical and logical deduction from appellee's discussion), is to admit that the law has no merit, even with relation to its supposed purpose of preventing slack-action casualties.

There is a complete explanation for the fact that these accidents occurred principally on trains of more than 65 cars. Since 1929 long-train operation has prevailed in Nevada; which means that comparatively few short trains have been operated, and those largely on branch lines or for short distances on main lines. In Arizona during the same period, while the law was generally observed, appellant endeavored to operate as near that limit as possible, and most of its through trains came within the 61-70-car bracket. Exhibit 214 (R. 3198) shows that in June and August, 1938 (the two typical months analyzed in the redispatching study) 85% of the trains actually operated were within the 61-70-car bracket, and only about 2% had less than 51 cars. Thus as in Nevada there was less opportunity for accidents on short trains, because being used largely for local or branch line service, or short main line runs, there was much less exposure.

The argument is presented (appellee's brief, pp. 100-102) and apparently greatly relied upon, that the severity of the injuries sustained in slack-action accidents is directly related to train length. To support this argument appellee presents a purported analysis of the slack-action casualties occurring in both Arizona and Nevada during the 12 years 1929-1940, contrasting a computed "average disability" in days from such casualties on long trains with a corresponding average for the casualties on short trains.

This comparison is misleading because it fails to take into account, *first,* various other controlling factors already mentioned, beside train length, which determine the extent and severity of the slack-action shock (and thus, to some degree, of the injury sustained); *second,* the variations in the individuals concerned, which play their part in determining the length of the disability of each; and *third,* the impossibility of deriving any true "rule of relative severity" from the comparatively small number of casualties reviewed.

This is particularly illustrated by the variation in the length of disability when two or more men are injured in the same accident, or when the same man is injured in different accidents. For example, in the accident shown in line 255, sheet 6, Exhibit 274 (R. 3356), a conductor and a brakeman were both injured because of a sudden stop of a 65-car train at Harqua, Arizona. The conductor's disability was only ten days, but the brakeman's was 74. Again, in the accident shown in line 352, sheet 8, of the same exhibit (R. 3358), due to the sudden stop of a 67-car train at Wymola, Arizona, three men were injured, the conductor suffering 41 days' disability, while the two brakemen were off duty, one for six and the other for five days. In the accident shown in line 287, sheet 7, Exhibit 274 (R. 3357), a brakeman on a 68-car train suffered a permanent disability, while in the accident shown in line 289 of the same exhibit, occurring less than three weeks later on a 70-car train, the brakeman suffered only eight days' disability. The two accidents were apparently quite similar. In the accident shown in line 210, sheet 5, Exhibit 275 (R. 3368), at Moor, Nevada, on a 100-car

train, the conductor suffered 306 days of disability while the brakeman was disabled for only 32 days. The same two men were injured in the accident shown in line 224, sheet 6, of the same exhibit (R. 3369), occurring at Avenel, Nevada, on a train of 111 cars; but upon this occasion the conductor was disabled for 20 days and the brakeman for 26. In the accident occurring at Hazen, Nevada, on March 1, 1935 (line 235, sheet 6, Exhibit 275, R. 3369) two men were injured by the sudden stop of an 82-car train, one suffering 44 days' and the other 7 days' disability; and in an exactly similar accident taking place a few months later at Carlin, Nevada (line 237 on the same page), a brakeman on a train of 131 cars suffered only 12 days' disability.

Appellee makes much of the accident occurring on November 19, 1938, at Reno, Nevada, in which five men were injured on an 85-car train, suffering disabilities ranging from 51 days up to 286 days; but the impossibility of deriving any rule from train length is illustrated by the exactly similar accident occurring at Reno on October 4, 1936 (line 245, sheet 7, Exhibit 275, R. 3369A), when the conductor on an 85-car train suffered a disability of only ten days.

The facts, as properly found by the trial court (R. 3973) are:

> "It is not true, as apparently contended by plaintiff, that the amount and severity of slack-action occurring in a freight train depends solely upon the number of cars in a train * * *.
>
> "It is likewise not true that the Train-Limit Law, by restricting the lengths of freight trains, either

eliminates or substantially reduces the number or severity of the casualties attributable to slack-action shocks in cabooses or other cars at or near the rear end of trains. The evidence indicates that in the operation of long trains, there have been many instances of severe jerks and jolts occurring at the rear end of the train because of slack-action, and that injuries have been suffered by brakemen and conductors as a result thereof. The record contains many similar instances occurring in connection with the operation of short trains. It is also shown that emergency stops of long trains have taken place, without causing any severe slack-action shocks to the caboose or injuries to the occupants thereof. Emergency stops of short trains have occurred, accompanied by severe slack-action shocks to the caboose and injury to the occupants thereof. The evidence shows that these different results, as herein indicated, on long and short trains arise because of the presence or absence, in the particular operation of the factors directly contributing to and controlling the severity of the slack-action."

The averages shown by appellee (its brief, pp. 101-102) are misleading in a statistical sense. In obtaining the figures for the averages of the long-train disabilities, appellee has included disabilities ranging from four days (the minimum reportable) up to a maximum of 663. Similarly, in obtaining the short-train average the minimum is four days and the maximum 180. While it is possible to compute a mathematical average of figures so widely apart as these, the result does not present an accurate picture. For example, one might compute an average of the height of the buildings in a particular block in which one was 40

stories high and all the rest three, but that average would hardly present an accurate picture of the block. The mere average of the wealth of 15 men, one of whom has a million dollars and the other fourteen five thousand apiece, does not present a true story of their composite prosperity. An average, to be fully representative, must be predicated upon individual figures which are not extremely far from the mean.

There is still another and more serious defect in appellee's computation. It has included in the long-train accidents a number which in reality are not of that character because of the circumstances of their occurrence. Thus, for example, it has included the accident at Moor, Nevada, shown in line 233, sheet 6, Exhibit 275 (R. 3369) in which a conductor suffered disability of 663 days because of an undesired emergency due to the failure of the train line in the 66th car from the head end of the train. While this was a train of 100 cars, the effect was the same as if the failure had taken place on the 36th car of a 70-car train; for there were but 34 cars between the point of the failure and the caboose in which the conductor was injured. In the *Nevada Train Limit Case* (*Southern Pacific Company v. Mashburn*, 18 Fed. Supp. 393), the court found,[1] with respect to those slack-action accidents caused by a break-in-two or other failure in the middle of the train, that:

> "The number of cars between the caboose and the point where the train separates and not the total number of cars in the train is the factor to be considered

[1]The findings of the Court in the *Nevada Case* are reproduced in the record of the hearing before the House Committee on Interstate and Foreign Commerce, 75th Congress, Third Session, on S-69, at pages 475-521. The quotation is from page 511.

together with other slack-action producing factors in determining the severity of the slack-action shock, if any, to the rear end or at any point behind the break. The number of cars ahead of the break has nothing to do with the shock experienced at the caboose or at any point behind the break.

"Casualties which the evidence shows were due to slack action from this cause would not be related to the number of car units operating in the train on which the accident occurred."

In other words, this accident is to be classed as a short-train accident, for the effect was the same as if there had been an emergency stop of a 34-car train. The accident on August 29, 1932, at Moor, Nevada (line 210, sheet 5, Exhibit 275, R. 3368), also included by appellee, in which the conductor suffered 306 days' disability and the brakeman 32 days, is of the same character, having been caused by a burst air hose on the 31st car of a 100-car train; so that there could not have been a "run-in" of slack of more than 69 cars between the point of the break and the caboose. If only these *two* accidents (and there are at least *four* others of the same kind) are transferred to the "short-train" side of appellee's comparison, where they properly belong, the average disability from short-train accidents becomes 38 days, and from long-train accidents 34 days; and it again appears, as the trial court properly found (R. 3973-3991), that the law does not, by restricting the length of freight trains, either eliminate or substantially reduce the number *or severity* of the casualties attributable to slack-action shocks in cabooses or other cars at or near the rear end of trains, and is not reason-

ably effective in the prevention or minimization of slack-action accidents and incident casualties.

(c) There Is No Actual and Substantial Hazard to the Public From Slack-Action on Freight Trains on Appellant's Lines in Arizona (Appellee's Brief, pp. 102-105).

At pages 102-105 of its brief appellee argues that there is a danger to the public from slack action, asserted to have a direct relation to the number of cars in a train. The alleged danger is that arising from the buckling of cars in freight trains when moving in multiple-track territory, or in yards where passenger trains are passed; and appellee again stresses the accident occurring on the Pennsylvania Railroad near Manor, Pa., on March 27, 1936 (Item 45, Exhibit 270, R. 3329).

If there is any such hazard—and even nationally it appears to be very slight, appellee having been able to cite only three such accidents during the entire period covered by the record (1923-1939), in only one of which slack action appears to have been a factor—clearly the Arizona law is not directed towards its elimination, at least so far as appellant's lines are concerned. Upon the more than 808 miles of appellant's main line in Arizona, there are but 29.5 miles of "adjacent" double track, the balance of the double track being non-adjacent. There is no record of any accident or hazard of accident from this cause in Arizona, either disclosed by the exhibits or otherwise referred to in the testimony.

Moreover, the hazard of collision on double track because of wreckage from an adjoining track being struck is not peculiar to long-train operation. Exhibit 312 (R. 2265-

2267) contains reports of the Safety Bureau of the Interstate Commerce Commission covering five such accidents, all involving short trains, in which wreckage from one track fouled an adjacent track and was there struck by another train.

From this standpoint the law clearly has no rational safety basis, particularly as applied to appellant's Arizona operations.

(d) The Law Increases Rather Than Reduces the Hazards Due to Defects in or Failures of Freight-Car Equipment (Appellee's Brief, pp. 106-108).

At pages 106-108 appellee argues that the law reduces the hazards incident to failure of freight car equipment, because it reduces the "strains on the weak parts," said to increase in quantity and quality as cars are added. This argument is based wholly upon theory and not on fact; for appellee errs in stating that there is no evidence from which a comparison of accidents on short and long trains from defects or failures of equipment, per train operated, can be made. Appellee has overlooked Exhibits 286, 287, 288, 389, and 397 (R. 3383-3385, 3565, 3578), which compare the derailments due to defects in or failures of freight car equipment, including particularly those due to weaknesses in the draft gears, draw bars and other portions subjected to strain, as they have occurred in Nevada, Arizona and New Mexico, and demonstrate that appellee's argument has no foundation. If appellee were correct, these derailments and the resulting casualties should have been much more frequent in Nevada, and somewhat more frequent in New Mexico, than in Arizona,

simply because of the long-train operation in the first two states. The fact is that in Nevada, in 18 years, there were 70 such derailments whereas there were 106 in Arizona, the rates per million train miles (i.e., on a "train-operated" basis) having been 2.02 for Nevada and 2.51 for Arizona, and per hundred-million car miles, 2.93 for Nevada and 4.64 for Arizona. Moreover, of the 70 Nevada derailments only 35 were on long trains. Thus out of the total of 176 derailments in both states, 141 (106 in Arizona, 35 in Nevada) were on short trains.

In New Mexico, during the 11-year period 1930-1940, there were 29 derailments of this type, 23 on short trains. During the same period there were in Arizona 42 such derailments, all on short trains; in Nevada 31, of which 11 were on short trains. It will be recalled that from 1926 on there has been a substantial long-train operation in Nevada, and since 1929 long-train operation has predominated.

Bearing in mind that the *same* types of equipment are operated in all three states under the *same* operating rules and under operating conditions which, except for the law, are at least as favorable in Arizona, it is obvious that the law does not reduce any hazard associated with the alleged strain upon weak parts of freight car equipment, but on the contrary greatly increases the opportunity for this as for most, if not all, other types of accidents. The reason is that the law, by arbitrarily increasing the number of trains, greatly increases the amount of switching involved in making up and breaking up trains, and the number of starts and stops involved in running between terminals, because of the disproportionate increase in the

meets and passes required. Weaknesses leading to failures are largely developed in switching, starting, and stopping; and the results are evident in the larger number of derailments due to these failures in Arizona.

(e) The Alleged Difficulty of Seeing or Understanding Signals on Long Trains Does Not Result in Any Measurable Hazard (Appellee's Brief, pp. 108-109).

At pages 108-109 of its brief appellee asserts that as the length of the train increases it becomes more difficult for the employees on the train to communicate with each other by signals, and infers that this gives rise to additional hazard. This contention, like many others made by appellee, is completely disposed of by an express finding of the trial court (Finding XIII(b), R. 4023-4025). The testimony of appellee's own witnesses shows that when a train is in motion there is only one signal that need be given, and that is the stop signal. If for any reason that signal is not seen by the engineer the conductor's valve in the caboose may be used to stop the train. This valve applies the brakes throughout the train, but they apply first in the caboose and then in succession forward to the engine. There can be no severe slack-action shock in the caboose in these circumstances. There is no evidence that any reportable long-train casualty has occurred in Nevada, or Arizona, or New Mexico, or on the Los Angeles Division in California, during the period covered by the testimony, due to the use of the conductor's valve; nor has any reportable casualty occurred in any of this territory while the train was in motion, asserted to have been due to failure to observe or interpret signals properly, where the

train length was claimed to have had any effect. There was one accident, without casualties, occurring from failure to see or understand a signal; but it involved the movement of a helper engine, with two cars and a caboose, the remainder of the train being at a standstill at the time. A supposed hazard which has not resulted in any casualty over a long period of years and extensive operation can hardly be said to have real existence.

Obviously there is no hazard from inability to see or understand signals while the train is standing; if signals are given and not understood, they can be repeated, or one of the men at the caboose can go forward until the signal can be seen.

Experience thus shows that the law is wholly unnecessary as a safeguard against the alleged hazards created by the supposed difficulty of seeing or interpreting signals on long trains.

(f) **The Alleged Hazard From Failure to Detect Defects on Cars of Long Trains Is Likewise Unsubstantial (Appellee's Brief, pp. 109-111).**

At pages 109-111 appellee argues that long-train operation is more hazardous, because of the supposed inability of members of the train crew to observe and detect defects in the cars of the train while in motion, and thus to prevent derailments or other accidents.

This contention is likewise covered by an express finding (Finding XIII(d), R. 4026-4029). The argument has no foundation, so far as concerns operations in Arizona and the adjacent territory, especially when Arizona operations are contrasted with those in neighboring states. If appellee's argument were sound, and there really were

greater difficulties in making inspection and observation upon long trains, there would follow a much greater frequency of derailments due to defects in or failures of freight car equipment, in long-train as compared to short-train operations; for the inspections at stops and the observance of the trains while in motion are for the primary purpose of detecting these failures before the accident occurs. However, these accidents have been more frequent in the short-train operation in Arizona than in the partial long-train operation in New Mexico, and much more frequent than in the long-train operation in Nevada. In both actual number and car-mile frequency, there were about 50% more derailments due to these causes in Arizona than in Nevada during the six years ending in 1940, and the Arizona rates were much higher throughout the 18 years 1923-1940 (Exhibit 288, R. 3385). The survey of long- and short-train operations between Lordsburg and El Paso (i.e., in New Mexico) during the first six months of 1940 (Exhibit 397, R. 3578) shows that in that territory inspection was just as effective on long as on short trains. The fact that derailments have occurred in Arizona, in greater number and with greater frequency on short trains, than in long-train operation in Nevada and New Mexico, indicates that there is no greater difficulty of effective observation on long trains, and that the alleged increased hazard of which appellee speaks is purely imaginary. No long-train accident of this kind was referred to by any witness, as to which a claim was or could have been made by the witness that it would have been prevented or lessened by inspection or observation if the train had been short.

(g) The Alleged "Fear of Long Trains" Is Unfounded (Appellee's Brief, p. 111).

At page 111, appellee argues that fear of injury is increased with increases in train lengths, thus reducing the efficiency of trainmen. This argument, like the preceding, is also covered by an express finding (Finding XIII(c), R. 4025-4026).

Since the evidence shows that the law does not eliminate accidents of any kind, least of all slack-action accidents, it is hard to see how the operation of short trains exclusively could eliminate any fear in the minds of the trainmen riding in the cabooses of such trains. If such fear results in inefficiency, it is apparently greater in short-train than in long-train territory; for there were 106 derailments due to defects in or failure of freight car equipment in Arizona, in 18 years, all on short trains, as compared to 70 in Nevada during the same years, only 35 of which were on long trains. Since it may fairly be argued that many of these derailments might have been prevented if the trainmen had detected the defects or failures in time, the greater number in Arizona can be properly ascribed to inefficiency of the crews, because all other conditions were either substantially the same or more favorable in Arizona.

The trial court found (R. 4206) that this alleged fear of long trains is unsubstantial and without foundation. Appellee's witnesses who testified along these lines were conductors who by preference work between El Paso and Lordsburg, where long-train operations are frequent, although they have seniority to hold equivalent positions in short-train territory west of Lordsburg. If fear of long

trains were of real consequence, it would be difficult to understand their long years of continuance in long-train territory.

Appellee's argument is based principally upon its analysis of the Arizona and Nevada slack-action casualties and resulting disabilities, already discussed. It is difficult to believe that a type of casualty which occurs as infrequently as do those from slack action in Nevada (in the six years 1935-1940, on the average slightly more than four times per year: once for every 31,850,000 car miles operated) produces any real apprehension leading to inefficiency, especially since the employees know that train limitation does not remove this class of accidents, but instead increases the frequency and severity of all other hazards and casualties.

(h) By Increasing the Number of Trains and the Number of Employees Required, the Law Increases the Hazard of Accidents Due to Employee Negligence (Appellee's Brief, pp. 112-114).

Appellee next addresses its argument to the proposition that "long trains will not reduce the casualties due to negligence of employees." The topic suggested by this contention is likewise covered by a specific finding of the trial court (Finding XII(v), R. 4021-4022), stating that the operation of additional and unnecessary trains to handle the same volume of traffic which might be handled in longer and fewer trains, because it requires more employees and also more train orders and messages, increases the hazard of accidents resulting from misunderstanding or forgetfulness, or other kinds of negligence of employees.

It is obvious from ordinary experience that if more operations are required, and more men are employed to perform them, there are more opportunities for individual negligence or forgetfulness, and thus more accidents due to such negligence.

Appellee attempts, however, to support its argument by comparing the number of accidents on all Class I railroads caused by negligence of employees, which were investigated by the Bureau of Safety, with average train lengths during the same series of years, and then by a series of single-year comparisons attempts to show that in years when train lengths were greater there were also more of these accidents. The comparison is incomplete and meaningless; but even taken at face value it leads to no such deduction as appellee attempts. For example, in 1928, when the average train length was 48.1 cars, there were 23 such accidents investigated; but in 1932, when train lengths had declined to 44.8 cars, there were 24. In 1930, when the average train length was 48.9, there were 34 such accidents, but in 1939, when the average train length was 49.1 cars, there were 33. In 1932, when the average train length was the shortest (44.8 cars) of any of the years shown, the number of such accidents was 24, but with an increase in average train length to 46.2 cars in 1934, the number of accidents decreased to 23. There was also an increase in train length between 1936 and 1938 (46.4 to 47.7), and again the number of such accidents went down (32 to 28).

At pages 113 and 114 of its brief, as part of this argument appellee asserts that since the average train lengths for Class I railroads were 20 to 25 cars less than the 70

permitted by the law, there must have been at least ten short trains run for every long train. This is pure assumption, and in any event immaterial. The exposure of men and trains to accident and casualty does not depend upon mere numbers of trains operated, but upon the number of train miles made by those trains. Short trains may be relatively much more numerous, but if each runs only a few miles, it produces a comparatively slight exposure. Long trains are, however, seldom used in local or turn-around service or on branch lines, or for similar short runs. They are principally used in the longer through runs from terminal to terminal. Consequently the proportion of the train miles made by long trains, and thus of exposure incident to their operation, is much greater than the one-to-ten relationship assumed by appellee. While the record does not indicate what that relationship may be, it was testified on behalf of the railroads, in the proceedings before the House Committee on Interstate Commerce, 75th Congress, in connection with S. 69, that about 43% of the total freight car miles operated in 1936 were in trains of more than 70 cars (p. 851 of the Report of the Committee Hearings). Since long trains were only 18% of the trains involved in the 349 accidents to freight trains caused by negligence of employees, investigated by the Bureau of Safety during the period 1928-1939, it would appear that from this standpoint as well as all others, long-train operation is relatively safer.

(i) **The Law Greatly Increases the Hazard of Grade-Crossing Accidents (Appellee's Brief, pp. 114-118).**

At pages 114-118 of its brief, appellee argues at length that the law does not increase, but on the contrary reduces

the hazard of grade crossing accidents, asserting that the evidence supports this contention.

Appellee's initial argument is that train lengths have little effect upon the opportunity for accidents, because, so it says, with a larger number of shorter trains the addition of the engines and cabooses will cause only a slight increase in the total length of time that the grade crossings are occupied, which will be offset by the faster speed of the short trains. Like much of appellee's other argument, this is pure theory which has no factual foundation. There are, as appellee says, two principal types of grade crossing accidents: those in which the engine strikes the automobile or other vehicle, and those in which the vehicle strikes the side of the train. The latter type constituted about 34.6% of the total grade crossing accidents occurring during the years 1935-1939. Whichever type be considered, however, the danger is bound to be greater if more trains are operated. Assuming the volume of the automobile traffic over a particular crossing to be constant, the hazard of automobiles being struck by trains, or of automobiles striking trains on that crossing increases directly with the number of trains operated over it. This is the essential conclusion to be drawn from the fact that, in the United States at large, the frequency of grade-crossing casualties is almost the same year after year, as measured against train miles operated. An increase in the number of trains, and thus in the number of train miles, produces a proportionate increase in the number of casualties at the rate of about 6.45 per million train miles. The experience has been too consistent and too complete to permit any other conclusion.

The Interstate Commerce Commission recognizes that the volume of rail traffic, measured in train miles, is one of the essential bases to be employed in calculating the frequency of grade-crossing accidents (R. 1966, 2168), having said that it is necessary to know the volume of the rail, as well as the highway, traffic passing over grade crossings. Naturally, if the highway traffic increases in volume the likelihood of accidents at that crossing increases; but if the automobile traffic remains constant, and the number of trains over the crossing increases, the likelihood of accident likewise increases.

It is particularly pertinent to note that while the rate per million train miles of grade crossing casualties throughout the years since 1923 has remained practically constant, average train lengths have increased substantially, as also the number of long trains operated. This shows that the grade crossing casualty *rates* are independent of train length. While the *rate* does not rise with an increase in trains operated, the *aggregate number* of casualties increases in direct proportion. Arizona, by compelling an artificial increase of about 28% in the total number of trains operated, has created the opportunity for and the probability of a 28% increase in the *number* of grade crossing casualties, even though the *rate* per train mile is not affected.

Appellee places great emphasis upon the exhibits (Nos. 293, R. 3422; 334, R. 3461; and 335, R. 3462) showing the grade crossing casualties per 10,000 automobiles registered, in Arizona, Nevada, and New Mexico. These exhibits obviously have no relation to the question of the effect of the law upon this type of accident. The law

neither increases nor reduces the number of automobiles registered, and so does not affect the number of automobiles using grade crossings in Arizona. But, as appellee recognizes, the use of the grade crossings *by automobiles* is only one of the two factors which cooperate to produce grade-crossing accidents. The law does directly affect the other factor—the frequency of use of those crossings *by trains*—and by artificially increasing the number of trains, increases the hazard in direct ratio.

Appellee's argument (its brief, p. 118) that the more frequent operation of trains over grade crossings is beneficial because of producing "a greater awareness" of danger on the part of automobile drivers hardly merits reply: the sum total of ordinary experience points to an exactly opposite conclusion. It is common knowledge that wig-wags, flashing signals, and other devices designed to warn the motorist of the presence of railroad grade crossings are placed, *not* at crossings where train movements are relatively infrequent, but upon those where such movements are most frequent and the dangers therefore acknowledged to be greatest. At the little used crossing the ordinary fixed wooden crossing sign is usually deemed sufficient. The number of trains or of movements over the crossing is invariably the factor which determines the degree of warning protection to be provided; and the number of trains is the controllable factor of crossing hazard which the law unnecessarily and avoidably increases.

5. APPELLANT'S SAFETY EVIDENCE
(Appellee's Brief, pp. 121-143)

(a) "The National Evidence" (Appellee's Brief, pp. 121-135).

Under the above sub-title appellee argues that our showing, based upon accidents and casualties of railroads of the United States generally, has no evidentiary value and fails to support any findings or conclusions with respect to safety of train operations insofar as any issue in this case is concerned. Appellee includes in this argument certain criticisms also of the Arizona-Nevada comparisons (see, for example, pp. 126, 131-135), although these are also made the subject of additional comment (at pp. 135-138) under a separate subheading.

Appellee first asserts (p. 122) that the conceded "very substantial decrease" in accident and casualty rates over the period 1923-1939 is not in any way due or related to the length of trains operated; by which it presumably means to contend that there is nothing to show that this improvement was due to the adoption and development of the long-train operating practice and the resulting widespread operation of long trains. It is certainly the fact, which appellee cannot challenge, that during this period there was a substantial increase in average train lengths and a continued expansion of the long-train operating practice, except in Arizona; and that in Arizona the improvement in casualty frequency was considerably less than the national improvement, no matter what basis of measurement be taken. All of the other factors mentioned by appellee, to which it attributes the improvement in casualties, had full opportunity to operate in Arizona; that is to say, the improvements in equipment (e.g., the

elimination of weak graduating springs in air brake triple valves, and of arch-bar trucks), road bed, block signals, and operating methods; the grade-crossing eliminations, etc. The record shows, and appellee accepted largely without challenge the finding, that these same improvements all occurred in Arizona (Finding VI, R. 3902-3908). The only fair conclusion is that the compelled short-train operation, the only differentiating factor, has prevented the safety improvements achieved elsewhere. This is confirmed by the results in Nevada, where conditions are practically identical with those in Arizona, except for the more severe winters, and the improvement in casualty frequency is substantially as great as nationally, and much greater than in Arizona.

Appellee argues, however, that the exhibits presenting the national showing (Nos. 262-271, R. 3300-3366) are of no value because they include the combined operations of both long and short trains, there being no separation between purely long-train and purely short-train operations. This is appellee's stock argument, by which it undertakes to shape and restate the issues to suit its own purposes, and has already been discussed in both our opening brief (Vol. I, p. 203), and this reply (ante, p. 62).

The merits of the law as a safety measure can be measured properly only by contrasting the complete operation which it compels with the complete operation which would be conducted if it were not in effect: i.e., by comparing the Arizona short-train operation with a standard long-train operation which includes the use of trains of all lengths, in accordance with the traffic demands and as may

be consistent with speed, economy, and safety. No purpose is served by comparing the operation of one or a number of long trains, with an equal number of short trains, because that comparison would not reflect an actual condition, or contrast equivalent performances or exposures.

At page 123 of its brief appellee undertakes to summarize appellant's argument based upon the casualty comparisons. All of the factors contributing to greater safety of railroad operation have been available in Arizona, to the same extent as in other states and upon other railroads; but the reduction in the number and frequency of accidents and casualties in Arizona has been much less than elsewhere. The only real differentiating factor is the Arizona law, which has not permitted the development of the safer long-train operating practice. Our contention is, therefore, not only that the operation of long trains outside of Arizona, in conjunction with all of the other improvements in equipment and methods, has caused the improvement in casualty frequencies; but also, as appellee fails to note, that the continuance of the Arizona restriction has prevented a similar improvement in Arizona, in spite of the use there of the same improved equipment and the presence of other favorable conditions.

Appellee asserts (its brief, pp. 123-128) that the exhibits showing the national casualty results are not properly comparable to those covering Arizona, and draws attention particularly to Exhibits 262 and 276 (R. 3300, 3371). In the tabulation at pages 191 and 192 of Volume II of our opening brief, we contrasted the national improvement with the Nevada and Arizona improvements in casualty rates to various classes of employees and from

various classes of accidents; and in using these two exhibits, which present the number and rates of casualties to all classes of employees on duty in all classes of service, we used the improvements in the rate per million locomotive miles for Nevada and Arizona, contrasting them with the improvements in the car-mile and train-mile casualty rates nationally. The casualty rate per million locomotive miles is also available nationally. On this basis the casualty rate to all classes of employees on duty in the five years 1935-1939, was *66.74% less* than in 1923-1928. The corresponding improvement on the train-mile basis was 66.99%. These improvements compare with the Arizona improvement, contrasting the six years 1935-1940 with the six years 1923-1928, of 38.7%. These exhibits also show that the use of the locomotive-mile basis presents no substantial variation in trend from the train-mile basis. Appellee's objection is obviously untenable.

Appellee also argues (its brief, pp. 124-127) that the Arizona figures are meaningless because the first period, 1923-1928, includes the years 1923 and 1924, and that the El Paso and Southwestern and Arizona Eastern lines were acquired on November 1, 1924, resulting in an increase in the Arizona operated mileage. It then says that if the casualty rates were substantially higher on the acquired territory than on the original territory, the rates on the combined operation would be higher than on the original operation. Mere acquisition of mileage will not change casualty rates calculated upon the basis of traffic moved (car miles), or train units employed (train miles); nor will it produce any substantial disturbance unless the acquired mileage is quite different in its characteristics

from the mileage owned prior to the acquisition. There was no substantial change in casualty rates as a result of the acquisition, as may be seen by comparing the Arizona rates for the year 1923 with those for 1925, the first full year following the acquisition. The 1925 rates were somewhat higher than for 1924, but slightly lower than for 1923 (Exhibits 276-280, R. 3371-3375); and after 1925 there was generally a moderate downward trend. Thus it is apparent that the acquisition had no disturbing effect. This result is quite natural, for these lines were in the same general territory, encountering the same operating conditions, and subject to the same restrictions as the lines to which they were added.

At pages 127 and 128 of its brief appellee argues, as a further reason for disregarding the national comparisons, that work-train miles are included in the basis against which the rates are computed upon the national exhibits, but not upon the Arizona and Nevada showings. This criticism is wholly beside the point, because all of these showings are for the purpose of determining the *trend*, by years and groups of years throughout the period studied; and since the same basis of total performance is used each year for the national showing, the trend is accurately indicated. The national accident totals include accidents and casualties on work trains, because the Interstate Commerce Commission statistics are prepared in that way. The train miles and car miles accumulated upon the work trains upon which these accidents took place are therefore properly used in calculating the frequency. Since work trains are always short trains, the showing properly reflects whatever increased safety may have been due to

that factor. In the Nevada-Arizona exhibits a segregation of the work-train accidents and work-train car miles and train miles was possible and was therefore made. Since, however, the essential purpose of the exhibits is to show trends, and the same basis is used throughout these exhibits, appellee's criticism is clearly without foundation. These statistics are of the same type and source which this Court has called "incontrovertible" (*Railroad Retirement Board v. Alton R. Co.*, 295 U.S. 330, 364).

At pages 128-131 of its brief appellee presents a list of the detail of the casualties to road freight conductors, brakemen and flagmen on duty, occurring during the year 1937 in Arizona and Nevada. It will be noted that this list is confined to accidents to this restricted class of individuals, and does not include accidents to other classes of employees on duty, occurring in road freight train operation, or any accidents occurring in any other classes of service. The showing, therefore, while correct so far as it goes, is incomplete as an attempted comparison between Arizona and Nevada from the standpoint of relative safety of railroad operations.

Following this listing appellee emphasizes that there were two accidents in Arizona due to sand or particles in the employees' eyes, compared to none in Nevada. This limited comparison does not establish, as appellee contends, that there is any peculiar local condition in Arizona, such as sand storms, not encountered in Nevada. It is noteworthy that there has been no casualty of this kind reported in Arizona since 1938. These casualties are very unimportant, and certainly do not indicate by their presence or absence any real difference in operating condi-

tions. They are significant only because, by their greater frequency in Arizona, they show the effect of the added exposure due to the unnecessary employment of men on account of the law.

Appellee also compares the casualties occurring in the operation of hand brakes, and asserts that this is due to a difference in operations in the two states. Appellee is mistaken in its statement of the purposes for which hand brakes are used; they are used not only to insure that a detached car remains in place after being spotted on a siding for loading or unloading, but also to control and stop cars in switching movements ("flying switches" or "drops"), or to "tie down" a train when stopped on the main line, if the engine is detached to do other work. The only difference in operating conditions which might lead to a greater use of hand brakes, and thus a greater number of hand brake accidents in Arizona, is directly attributable to the law. Because of its effects, trains must be remade, and more trains operated, so that there is more switching in making up and breaking up trains, and more use of the hand brakes. The difference in the volume of local traffic, to which appellee refers, has but little effect upon their use. It is so small in either state, by comparison with the total amount of the traffic, as to be relatively unimportant. It should also be noted that these hand-brake casualties occur either at low speeds or while trains are standing; and as the trial court found (R. 1009), nearly all of these standing accidents occur on short trains and are increased by the number of trains operated. So far as concerns the brake appliances and the cars themselves, and their use, these are the same in both

states, and there is no difference in the conditions under which they are used.

Appellee also refers (its brief, p. 133) to the casualties caused by stepping on or stumbling over rocks in the road bed, or by being thrown by jerk or jar in switching movements. These stumbling accidents occur mostly at meeting points, where brakemen must run ahead of or after their trains, in order to open or after closing switches. The greater number of trains operated in Arizona, in proportion to traffic handled, greatly increases the number of meets and passes, and thus the opportunity for these accidents. Thus the difference in operating conditions alleged by appellee is really due to the law itself.

Appellee refers (its brief, p. 133) to certain other classes of casualties asserted to have no relation to the length of the train. It appears to claim, in this connection, that there is some burden upon appellant to show that these accidents would have been prevented or minimized if long trains had been operated in place of short trains. These accidents are important in the consideration of the case because they are the result of the exposure of men to the hazards incident to railroad operation. While possibly not directly related to the length of the trains upon which they occur, they are related to the limitation because that factor compels more trains to be operated and thus more men to be exposed.

At best, appellee's argument only shows that the restriction has no effect at all to reduce or minimize these and the other classes of accidents and casualties. Even if this were true, appellee's cause would not be aided. A costly and obstructive restriction, which actually accom-

plishes no improvement in safety, is just as unreasonable as one which increases the hazards. However, as demonstrated by the entire showing, the law is not only of no positive benefit, but instead substantially *increases* hazards and resulting casualties.

At page 134 appellee asserts that in 1937 there were nine "slack-action" casualties (in seven accidents) in Arizona, and only four in Nevada; and that this sustains its contention that conditions (such as dips, hog-backs, grades, and curves) which produced slack-action are more prevalent in Arizona. Actually there were 11 casualties due to "sudden stops, etc.," in Arizona in 1937, appellee having omitted the casualties shown in lines 449 and 470 on sheet 11 of Exhibit 274 (R. 3361), although these are mentioned in the list at pages 129 and 130 of its brief. Consideration of the individual Arizona accidents shows that none of them was due to the effect of any of the conditions mentioned by appellee. The two accidents at Yuma occurred within yard limits, on level track, and were due to undesired emergency applications while the trains were either stopping or starting. The accident at Jaynes occurred just outside the Tucson yard limits, where the track is straight and grade about 0.8%. This accident was also due to an undesired emergency, thus resembling the Yuma accidents. A fourth accident occurred at Bowie when the train was making the station stop. A fifth took place at Picacho where the track is straight and practically level for many miles. A sixth accident occurred at Tucson, within yard limits, and was due to a break-in-two while the train was being backed at a speed of about eight miles per hour. At Tucson the grade is less than

one percent, and there is no curvature which would have affected the movement. A seventh occurred at Benson, when the train broke in two because of a defective draw-bar. The two accidents omitted by appellee occurred, one at Calumet, near Douglas, and was caused by a sudden stop during a switching move; the other at Coolidge, when the caboose, previously detached from the train, made a hard coupling with standing cars, and the injured brakeman was thrown to the ground. This was also during a switching move. At this point the track is straight and level."

If the presence of hog-backs, dips, grades, etc., were frequently productive of this type of accident, one would expect that in the years preceding and following 1937 there would be similar accidents at the same points and with about the same frequency. Actually in 1936 there were only three "sudden-stop" accidents and casualties and in 1938 only two; and all of these, except one occurring in 1936, took place at points other than those where the eleven casualties occurred in 1937. That one exception was at Tucson (line 433, R. 3360) when the slack ran out as a westbound train arriving at Tucson was coming to a stop.

Appellee also presents at this point (its brief, p. 134) a comparison of disability resulting from the long and short train slack-action casualties in the two states in 1937, and attempts to derive from these thirteen casualties which it mentions a rule as to the relative severity of the shock and the resulting injury, with relation to train length. We have already commented upon this type of comparison. The number of casualties used as the basis is so limited as to be clearly inadequate to support ap-

pellee's theory. In fact, by the selection of casualties in other years an entirely different picture could be presented. In 1926 (Exhibit 274, pp. 3-4, R. 3353-3354), there were in Arizona 11 slack-action casualties, all on short trains, one of which was fatal, while in another the injured employee died. In 1927 there were five slack-action casualties and one of these was fatal (R. 3354-3355). In 1929 there were six such casualties (R. 3356-3357), one a permanent disability. Appellee's argument demonstrates nothing except its own care in making its selections.

The tabulation presented by appellee (its brief, p. 135) fails entirely to support its argument. It is merely a set of selected comparisons, which, so far as concerns average train lengths, are on the single-year basis, although where casualties are concerned groups of years have been taken. Appellee appears to recognize that there has been a general downward trend in the casualty rates, but attempts to show that it has no relation to the growth of long-train operation, because in some selected year a downward trend in average train length was nevertheless accompanied by a continuing decline in the casualty rates. It is quite true that by careful selection such variations in trends can be discovered; but the general downward trend over the 18 years covered by appellant's exhibits is not at all disturbed by these highly selective comparisons. That trend is particularly portrayed, for Arizona and Nevada, in the table printed at page 174 of Volume II of appellant's opening brief; and the percentage trends are shown at pages 191 and 192 of that brief, in a tabulation which covers Class I railroads as well.

It will be observed that in the tabulations at page 174 we have taken into account average train lengths over a group of years, corresponding to the groups of years for which casualty frequencies are shown. If appellee had followed this same method, it would have shown that while the rates of improvement vary, dependent upon the type of casualty studied and the periods selected, nevertheless casualty rates tend to improve materially with increases in train lengths, especially if such increases are substantial; while if train lengths are not increased the casualty improvement is less, and if train lengths decline the improvement comes to a standstill. Exhibit 264 (R. 3302) and 282 (R. 3377) furnish good examples of these results.

(b) The Arizona-Nevada Comparisons (Appellee's Brief, pp. 135-138).

At pages 135-138 of its brief appellee renews its criticism of the Arizona-Nevada casualty comparisons (Exhibits 274-294, R. 3310-3421; 389, R. 3565; 391, R. 3567; and 392, R. 3568). Nearly all of appellee's criticisms have already been discussed, such as the inclusion in the showing of the Arizona operations prior to the acquisition of the El Paso and Southwestern and Arizona Eastern, the supposedly heavier local traffc in Arizona, and the greater number of casualties in that state due to sand or particles in the eye.

At page 137 of its brief appellee presents another selective single-year comparison of average train lengths and slack-action casualty rates, the latter being on the train-mile basis. This tabulation is meaningless because, first

of all, it does not include all of the years, but only alternate years, and excludes entirely the years prior to 1926 which preceded the development of long-train operation, both nationally and in Nevada. Furthermore, as a single-year comparison it is obviously defective so far as concerns slack-action casualties, because of the infrequency of this type of casualties and the consequent disturbing effect of only one or two such casualties in a particular year. What appellee has done is to select the years which are most favorable to Arizona and omit the other years. For example, in 1931, which appellee omits from the table, there was only one slack-action casualty in Nevada but 10 in Arizona; in 1937, also omitted, there were four slack-action casualties in Nevada but 11 in Arizona. In 1923-1925, years of predominant *short*-train operation in Nevada, there were 34 slack-action casualties. There is no need, however, for the Court to be misled by the parfial picture presented by appellee. The full showing with respect to slack action appears on Exhibit 266 (R. 3304), which presents the national picture for each of the 17 years 1923-1939, and by presenting both train-mile and car-mile totals affords a basis from which may be computed, year by year, the average length of all the trains operated in the services in which these casualties occurred; and for Arizona and Nevada on Exhibit 280 (R. 3375), which presents a corresponding showing, but includes also the year 1940.

Appellee renews its argument that the operating conditions, as shown by the profile maps covering the Arizona and Nevada lines, are substantially more severe in Arizona. At the risk of repetition we point out again that

the differences between the two states are very slight and in most respects actually favor the Arizona operations. The maximum ruling grades in the latter state are slightly less than in Nevada. While the maximum curvature on the Arizona main lines is 10°, there are comparatively few such curves, and these not only do not handicap the operation of long trains but actually assist. In general, the grade conditions in both states are very favorable because the lines lie for the most part in level, desert territory where there are no obstructions to efficient long-train operation. It would be difficult, and indeed appellee has not suggested that it is possible, to find two territories more nearly alike, for the purposes of this case, than appellant's Nevada and Arizona lines. Three trial courts have agreed that there is a close similarity (the federal courts for Arizona in the *First Arizona Train Limit Case*, 2 Fed. Supp. 855, and Nevada in the *Nevada Train Limit Case*, 18 Fed. Supp. 393; and the trial court in the present case). The trial court's findings (Findings III(c), R. 3896-3897; IV(c), R. 3900; and VII(a)(5), R. 3914-3915, in particular) fully cover this point: and since they apparrently are not classed by appellee as "ultimate" findings, they are not, even in its view, disturbed by the decision of the state supreme court.

(c) Los Angeles Division Casualty Statistics (Appellee's Brief, pp. 138-140).

At pages 138-140 appellee comments upon the casualty statistics for appellant's Los Angeles Division. Its first objection is that it can find no testimony of record as to the percentage of long and short trains operated there.

The trial court's finding respecting the percentage of long trains on certain main lines of that Division during four typical months of 1939 is predicated upon Exhibits 154 (R. 3028) and 185 (R. 3077). The latter shows (lines 34-38) that on certain lines forming a part of the Los Angeles Division the indicated numbers of long and short trains were operated. By a simple mathematical computation the percentage of long trains to the total can be derived. Appellee simply failed to examine the record before it drafted its argument.

The objection is made that the train count is incorrect, because a train is classified as "long" if at any time during its operation it had more than 70 cars. In making the count reproduced on Exhibit 185, appellant used the test which the law itself provides.

While it is true that on the Los Angeles Division the casualty rates to employees, to occupants of motor vehicles, and to non-trespassers generally show some small increase in the five-year period 1936-1940, as compared to the six-year period 1930-1935, the variations are not so substantial as to warrant any particular conclusion. The total number of casualties in any one year, in any one classification, is so small that the occurrence of two or three more casualties per year in the earlier six-year period, or of two or three less in the later five-year period, would have altered the picture completely. Exhibit 386 does show, however, that the greatest hazard to the public from train operation is at grade crossings: of the total of 252 casualties to non-trespassers in the 11 years, 236 were to occupants of motor vehicles. The number of these casualties increased substantially with the increase in the

number of train miles operated in the later five-year period, 1936-1940; thus showing again that an increase in the number of trains operated will be accompanied by a substantial increase in the number of grade crossing accidents, even though other factors remained unchanged.

(d) New Mexico Casualty Statistics (Appellee's Brief, pp. 140-142).

At pages 140-142 appellee presents its criticisms of the Arizona-New Mexico casualty comparisons. This argument is somewhat peculiar, because appellee itself first undertook to make a showing for appellant's New Mexico lines (its Exhibits 338, 340, 349, 362, 364 and 368; R. 3465, 3501, 3518, 3527). Appellant simply met this testimony by taking the casualty showing *appearing upon appellee's exhibits*, and presenting it together with a showing for Nevada and Arizona, so as to give a complete picture for all three states for similar classes of accidents and casualties (appellant's Exhibits 387-389, R. 3548-3565). Appellee is therefore in no position to argue a lack of similarity as between New Mexico and Arizona. However, there is an adequate showing to support these comparisons. Exhibits 165 (R. 3039), 186 (R. 3042), and 218 (R. 3206) cover the traffic and operating conditions, in addition to which there is oral testimony showing that the same traffic, both eastward and westward, which moves across Arizona, also moves across New Mexico.

So far as concerns appellee's attempted analysis of Exhibit 387 (R. 3549-3557), it is sufficient to point out again, as with the corresponding exhibit covering the Los Angeles Division (No. 386, R. 3533), that the number of accidents or casualties in any year is so small as not to warrant any

dogmatic conclusion, in the light of the comparatively slight variations in train length shown for the state. The addition of two or three casualties in any one of the groups or years would have modified the showing materially, and permitted a deduction completely contrary to that now attempted by appellee.

The striking feature of appellee's argument is, however, that it seeks to emphaize, as usual, only the slack-action accidents, and in this instance only those occurring on trains of 65 cars or more. This argument again confesses the complete unreasonableness of the law, even as a slack-action prevention measure. The law has set 70 and not 65 cars as the presumed safe limit, and this argument demonstrates that that limit has no true relation to safety from even this particular type of accident.

(c) Santa Fe and Chesapeake & Ohio Casualty Statistics (Appellee's Brief, pp. 142-143).

At pages 142-143, appellee discusses the Santa Fe and Chesapeake and Ohio casualty showings covered by separate sub-paragraphs in the trial court's findings (paragraphs (k) and (l) of Finding XII, R. 4004-4008). The relevant facts are carefully set forth in the findings, but largely overlooked in appellee's discussion. Contrary to appellee's assertion, Exhibit 126 (R. 2986), which summarizes operating conditions on the Santa Fe main lines, shows that operating conditions in the territory between Needles, California and Gallup, New Mexico (where the Arizona restriction is completely effective), are generally as favorable as between Gallup and Clovis, New Mexico. Between Needles and Belen the operation is entirely double

track; whereas the operation is all single track between Belen, New Mexico and Clovis. Appellee has asserted (its brief, p. 138) that the double-track operation in Nevada makes for a more favorable condition in that state; and to whatever extent this is true, it is also true of the Santa Fe operation in Arizona and New Mexico west of Belen.

The traffic carried is predominantly through or overhead traffic, and in fact largely the same traffic, carried across New Mexico either before or after it crosses Arizona (R. 1856-1857, 1876, 1882). The comparison is between the Arizona operation under the 70-car restriction, and an operation in part affected by that restriction, although not entirely controlled (between Gallup and Belen), and in part a standard long-train operation (between Belen and Clovis). The number and frequency of the casualties to all train service employees, and particularly trainmen (as a separate group from enginemen), are much less in the New Mexico districts than in Arizona, although because of the absence of the restriction the average train length is much greater.

There is no record foundation for appellee's assertion that any of these accidents were caused by the so-called "purely local conditions" to which it refers; nor is there, in particular, any possible or plausible foundation for its contention that the Arizona casualties from setting or releasing brakes, or picking up or setting out local traffic, are more numerous than in New Mexico. If, however, this is true, it is solely because the Arizona restriction compels more trains to be operated and more men to be employed, and thus increases the exposure.

The Santa Fe Arizona-New Mexico casualty comparisons are convincing evidence that the 70-car restriction bears no relation to safety whatever, but on the contrary increases the hazards substantially.

Appellee attacks the Chesapeake & Ohio comparisons because, *first*, the traffic of this railroad consists largely of coal; *second*, it has accomplished a considerable amount of grade and curve elimination which, according to appellee, has greatly improved safety conditions; and *third*, the showing relates to all classes of service, both freight and passenger. The first objection is wholly without merit. Coal is a heavy-loading commodity, the gross weight of a car with its contents amounting to about 75 tons; so that a train of 160 cars, the normal operation on most districts of the Chesapeake & Ohio main line, has a total gross weight of about 12,000 tons (R. 881-884, 915). If there were any merit to appellee's contention that longer and heavier trains are more difficult to control, with consequent greater hazards, casualty results on the C&O would be more unfavorable than elsewhere, particularly in Arizona, where a maximum train of 70 cars of the usual weight handled does not exceed 4500 tons; and the average is much less. Thus the difference pointed out by appellee, if it means anything, indicates more arduous conditions on the C&O, in spite of which that carrier has achieved a remarkable safety record.

The evidence, while indicating that the Chesapeake & Ohio has made extensive improvements, does not show that these have been any greater in character or degree than upon appellant's lines in Arizona. Finding VI(a) (R. 3902-3904) describes the details of these improve-

ments, and in these respects has not been challenged by appellee.

Appellee's final criticism is completely untenable. There is both a national and an Arizona-Nevada showing of casualties to all classes of employees on duty in train and train-service accidents; the national showing (Exhibit 262, R. 3300) includes both the car-mile frequency (the basis employed in the C&O showing: Exhibit 122, R. 2982), and as well the train-mile and locomotive-mile rates. The Arizona-Nevada comparison (Exhibit 276, R. 3371) shows rates and improvement trends in casualties to all classes of employees, based upon locomotive-mile rates; and while the basis is slightly different, there is no lack of a proper comparison since the purpose of these exhibits is primarily to show *trends* in accident *frequencies* rather than merely total *numbers* of accidents or casualties, year by year. The trend of the accident rates on the Chesapeake & Ohio, whether all employees or only train and engine-service employees be considered, shows a substantial decline over the period studied (1924-1938), approximately the same as the national trend, and considerably more than in either Nevada or Arizona. It cannot be doubted that this favorable result is due in large part, if not entirely, to the adoption and use of the long-train practice by the Chesapeake & Ohio, which is, as stated, one of the outstanding "long-train" railroads of the country.

6. ALLEGED PASSENGER TRAIN HAZARDS
(Appellee's Brief, pp. 144-147)

In this portion of its discussion appellee again presents arguments for which virtually no evidence is cited, and

which are in fact not supported by the record. There is a complete showing of passenger train casualties to employees in Nevada and Arizona for the period 1923-1939 (Exhibits 291, 292; R. 3409-3421). Appellee's own Exhibits 362 and 368 (R. 3501-3506, 3527) purport to be a complete showing of passenger train accidents in New Mexico for the period 1930-1940; and its Exhibits 363 (R. 3507-3517) and 370 (R. 3529) purport to show similar casualties on the Los Angeles Division during the same period. There is no showing of any slack-action casualty in Nevada, Arizona, or New Mexico, occurring on a passenger train of more than 14 cars, or in fact any casualty of any kind involving a long train, as to which it could be reasonably argued that train length had anything to do with the accident. On the Los Angeles Division four casualties are shown, occurring on trains of 16 and 17 cars, in which the injured persons were claimed to have been thrown off balance by emergency stops; but these four are matched by many others, occurring upon trains of as few as nine cars, where exactly the same causes are assigned. None of these casualties involved any serious or lengthy disabilities.

Appellee refers to the greater weight of passenger cars, and the greater number of persons exposed to hazards of slack action on passenger trains. If the greater weight or the greater exposure resulted in any real and substantial hazard, it should be capable of expression in a casualty rate based upon passenger miles or train miles. Actually the hazard from this cause (slack action) is so slight that no such casualty rate was attempted to be computed by either appellee or appellant. The fact is that there is no

substantial hazard; nor is there any such hazard peculiar to long trains, which does not also exist upon trains much shorter than the Arizona maximum.

There is particularly no support for appellee's contention that passengers are subjected to hazards of slack action while walking through moving trains en route to diners or at stations where platforms are too short to accommodate a long train. Appellee fails to refer to any accident of this character occurring upon a passenger train where the train length had any influence, or contributed in any way.

There is likewise no record support for the contention that passengers on long trains must be detrained at places where the footing is unsafe, or that that condition would not equally exist with short trains. It is obvious that in southern Arizona snowfall, or snow on the ground, such as appellee mentions, are very unlikely ever to interfere with passengers detraining from or boarding appellant's passenger trains, whether or not long trains are operated. The suggestion that passengers walking through moving trains may be knocked down, because of slack action, more frequently on long than on short trains, is wholly imaginary.

The argument on page 146 of appellee's brief, relating to the results of increased weight of the train by reason of the addition of cars, is equally without support in the evidence. There is no showing that a train of more than 14 passenger cars cannot be stopped in emergency just as readily as a shorter train. The addition of cars to the train may add to its gross tonnage, but the braking power is also proportionately increased (R. 2475).

It is idle to argue that an increase in passenger-train length increases the probability of highway grade crossing accidents. The increase in number of passenger trains run by reason of the limitation actually multiplies the grade crossing hazard and the resulting casualties. In a grade crossing collision involving a passenger train the number of cars behind the locomotive obviously cuts no figure; the damage is done when the engine collides with the automobile, and the weight of the additional cars adds little to the destructive striking force of the engine itself.

The ultimate test of increased hazard in long passenger train operation is to be found in actual experience. The Arizona-Nevada comparisons (Exhibit 293, R. 3413) show clearly that appellee's argument has no basis. Even taking into account the many casualties involved in the malicious derailment of the Streamliner at Harney, Nevada, in August, 1939, the casualty rates in Arizona are nearly twice the Nevada rates, the same relationship prevailing whether the frequencies are computed on the basis of passengers carried, passenger miles made, or passenger train-miles operated.

The argument that employees have less time to look after the safety of passengers on long than on short trains, and that safety is therefore impaired, is likewise answered by the statistics showing actual results. Long passenger train operation is the customary and usual practice all over the United States except in Arizona; and insofar as concerns the ability of employees to attend to passengers and to their other duties, the conditions are no different than in Arizona. If safety were impaired

for this reason in long passenger train operation, the results would quickly appear in the casualty statistics.

Furthermore, the addition of cars to passenger trains does not always result in more passengers, as appellee asserts. In many cases express or baggage cars are added which, though increasing the train length, do not increase the number of passengers. Other types such as dining cars, lounge cars, club cars, and railroad business cars, when added to passenger trains likewise do not add to the number of passengers carried. When sleeping cars are added, additional employees are also added (Pullman conductors and porters), whose duty it is to look after the care and comfort of the passengers.

Appellee's argument is thus unsound in both fact and theory.

7. "SUMMARY OF SAFETY ARGUMENT"
(Appellee's Brief, pp. 147-148)

Under the above heading appellee presents a summary of its safety argument which repeats in a few short paragraphs some of the points argued in its previous discussion.

A conspicuous feature of appellee's safety argument is its omission of all reference to the safety results of appellant's long-train operations in Arizona during March and April, 1940. At the risk of repetition, inasmuch as this experience was discussed in our opening brief (e.g., at pp. 205 and 240 of Vol. I; p. 189 of Vol. II) and was made the subject of a special finding by the trial court (Finding XII(t), R. 4018-4019), we point out again that appellee can apparently find no means of criticizing the

facts or challenging the conclusion. During this period 62 long passenger trains were operated, producing 15,587 train-miles and 243,749 car-miles. There were no accidents or casualties on any of these 62 trains. The only accidents or casualties in appellant's passenger train operations in Arizona during March and April, 1940, were on trains operated in full conformity with the law.

There were likewise operated 302 long freight trains, producing 37,257 train-miles and 3,180,278 car-miles; but during the period of their operation (April 3-30, 1940), while there were *six* accidents upon or in connection with the operation of short trains, there was only *one* upon a long train—and that accident took place when a brakeman fell, upon alighting from a caboose which at the time was detached from the standing train, and being handled alone by the engine.

Appellant has not claimed and does not claim that this experience conclusively shows that long-train operation in Arizona would or will be free of accidents or casualties; but clearly it does show that long-train operation is practicable, and certainly no more dangerous than the restricted operation, and thus confirms the conclusion stated by the Commission in its opinion relative to Service Order 85 (*Ex parte 156*, 256 I.C.C., at p. 536):

> "The fact that freight trains in excess of 70 cars or passenger trains in excess of 14 cars are operated in other states is convincing evidence of its safety, except where unusual operating conditions exist."

A fair analysis of the testimony of record, as presented by the safety findings of the trial court (Findings

Nos. XI, XII, and XIII, R. 3969-4032) leads definitely to the conclusion that the law "bears no reasonable relation to safety, but to the contrary . . . impairs and lessens substantially the safety of appellant's train operations in Arizona and the adjacent affected territory" (Finding No. XII(v), R. 4022); and that the "legislative choice" here under review is entirely without any possible rational basis.

CONCLUSION

Appellee, in its brief, adopts the extreme position that a state statute regulating interstate commerce, if claimed to have been enacted under the police power for the purpose of safety, cannot be held invalid, no matter what its actual effect upon commerce, unless it is possible upon the whole record for the court to say that it has no rational basis as a police power ("safety") measure.

We submit that appellee's position is untenable. Under controlling decisions of this Court, a state statute defended as an exercise of the police power will be held invalid if it falls within any of the following classifications:

(1) If it regulates a subject-matter plainly of national concern, where a uniform system of regulation is essential if any be required;

(2) If, in the guise of promoting a claimed local interest or meeting a claimed local demand, it substantially and materially burdens, obstructs, and interferes with the free flow of interstate commerce;

(3) If it directly infringes upon or conflicts with federal legislation having the same or similar purposes; or

(4) If it bears no reasonable relation to a legitimate police power purpose.

The issue under any one of these tests is not dependent upon the determination under any other, as appellee appears to contend. Each in itself presents a separate and sufficient ground of invalidity.

The Arizona Train Limit Law, however, is invalid upon each and all of these grounds. It invades the *exclusive national field* by regulating a subject-matter (the lengths of interstate trains) of the highest national concern, where a uniform system is plainly essential. It imposes *material and substantial obstructions, burdens, and interferences* upon the free flow of commerce and thus impairs the national interest, and all without any plausible or reasonable excuse from the safety standpoint. It *infringes upon*, conflicts with, and unlawfully attempts to supplement *the federal safety statutes* which have the same purposes claimed for the state law and act upon the same ultimate subject-matter. *It bears no reasonable or any relation to safety* because it compels a method of operation under which the hazards, and the resulting accidents and casualties, are greatly increased rather than reduced.

All of the controlling facts of the case are before this Court in the trial court's findings; and the legal principles to be applied are clear. The judgment of the state supreme court should be reversed, with instructions to enter judg-

ment holding the law invalid under the Constitution of the United States.

Respectfully submitted,

The effect of the state law on interstate commerce 8

The facts respecting safety 10

The trial court's findings and judgment 11

The appeal to the State Supreme Court 13

IV.

Summary of argument 14

1. The Train Limit Law does not invade an exclusive national field of legislation 14
2. Extra-territorial effect and burden on interstate commerce are one and the same thing 15
3. The Train Limit Law does not invade a field already occupied by Congress by Sections 1 and 9 of the Safety Appliance Act or by Section 25, Part I of the Interstate Commerce Act 16
4. The determination of the validity of the Train Limit Law rests solely upon the determination of whether upon the whole record it is possible to say that the law is without rational basis in safety. The Train Limit Law has a rational basis in safety 18
5. The decision of the State Supreme Court, in reversing the trial court, did not deny to appellant any federal right to which, on the evidence, appellant is entitled 19

PAGE

Argument 20

1. The Train Limit Law does not invade an exclusive national field of legislation 20

Appellant's burden evidence 42

2. Extra-territorial effect and burden on interstate commerce are one and the same thing 52

3. The Train Limit Law does not invade the field already occupied by Congress by Sections 1 and 9 of the Safety Appliance Act or by Section 25, Part I, of the Interstate Commerce Act 57

A. The fields occupied by the federal statutes are different from that occupied by the Arizona law 58

(1) The field occupied by the Safety Appliance Act 58

(2) The field occupied by Section 25 of Part I of the Interstate Commerce Act 62

(3) The field occupied by the Arizona law 66

B. No intention can be attributed to Congress in enacting the federal statutes to occupy the field of regulating train lengths 66

C. There is no conflict between the federal statutes and the Arizona law 69

D. Assuming arguendo that Section 25 of Part I of the Interstate Commerce Act contemplates authority in the Commission to regulate train lengths, occupancy of this field has not occurred 77

4. The Arizona law is not unconstitutional because of claimed burden upon or interference with, interstate commerce, or because of alleged unreasonableness as a safety regulation 78

A. The extent of the burden on interstate commerce, if any, by reason of the Train Limit Law may not be

PAGE

considered by the court in determining the reasonableness of the law 80

(a) Under the Commerce Clause 81

(b) Under the Fourteenth Amendment 82

(c) Under the Commerce Clause and the Fourteenth Amendment 84

B. The Arizona Train Limit Law has a rational relation to safety 93

(a) Slack action accidents and injuries related to train lengths 93

(b) Slack action accidents are directly related to the number of cars in a train 99

(c) The severity of injuries resulting from slack action have a direct relation to the number of cars in a train 100

(d) The danger to the public from slack action has a direct relation to the number of cars in a train 102

(e) Strains on weak parts increase in quantity and quality as each car is added (accidents due to failure of equipment) 106

(f) Increase in difficulty of communications between employees as the length of the train increases 108

(g) The ability to observe defects in the train decreases as the length of the train increases 109

(h) Fear of injury reduces the efficiency of trainmen 111

(i) Long trains will not reduce the casualties due to negligence of employees 112

(j) Grade crossing accidents 114

(k) Interstate Commerce Commission Service Order No. 85 119

PAGE

C. The appellant's safety evidence 121
(a) The national evidence 121
(b) The Arizona-Nevada comparison 135
(c) Los Angeles division casualty statistics 138
(d) New Mexico casualty statistics 140
(e) Santa Fe casualty statistics 142
(f) Chesapeake & Ohio casualty statistics 143

D. Hazards of passenger train operation 144
(a) Slack action increases as the length of the train increases 144
(b) Lack of necessary station facilities for handling passenger trains without public discomfort, inconvenience and risk of injury 145
(c) The increased weight of the train—which increases with each car added—increases the hazard of passenger train operation 146
(d) The time which employees have to give to the care and attention of the train decreases as the length of the train increases 146

E. Summary of safety argument 147

5. The decision of the State Supreme Court, in reversing the trial court, did not deny to appellant any federal right to which, on the evidence, appellant is entitled 149

Conclusion 152

IN THE

Supreme Court of the United States

OCTOBER TERM, 1944.

No. 56

SOUTHERN PACIFIC COMPANY, a corporation,

Appellant,

vs.

STATE OF ARIZONA, ex rel. JOE CONWAY, Attorney General of the State of Arizona,

Appellee.

BRIEF FOR APPELLEE.

I.

OPINIONS BELOW.

The opinion of the Supreme Court of Arizona [R. 4055-4068] is reported in 145 Pac. (2d) 540; the separate dissenting opinion of Honorable Henry D. Ross, a judge of that court [R. 4068-4071], is reported in 145 Pac. (2d) 536. The official (Arizona State) report is not yet in print.

The Memorandum Opinion of the trial court (the Superior Court of Arizona, in and for the County of Pima) is reproduced in the printed record [R. 4042-4054], but is not officially reported.

II.

JURISDICTION.

Issues under the Constitution and laws of the United States (viz., the Commerce Clause, and the Due-Process Clause of the 14th Amendment; and the Safety Appliance and Interstate Commerce Acts) were duly presented to the Superior Court of Arizona, in a suit brought in that court by the State of Arizona (the present appellee), for the recovery of penalties for alleged violations of the Arizona Train Limit Law, the statute hereinafter quoted in full. That court ruled in favor of appellant upon such issues, holding that the Train Limit Law is invalid because in violation of said constitutional provisions and statutes, and rendered its judgment for appellant accordingly, February 11, 1942 [R. 4039-4041].

Upon appeal by the State to the Supreme Court of Arizona (the highest court of that state), the judgment of the Superior Court was reversed, the State Supreme Court (one judge dissenting) holding, on December 23, 1943, that the challenged statute is valid under the Federal Constitution and laws. Final judgment upon the mandate [R. 4072-4073] of the State Supreme Court was thereupon entered February 5, 1944 [R. 4073-4074]. The present appeal from said judgment was duly presented and allowed March 7, 1944 [R. 4081-4082]. Jurisdiction of this Court is invoked under Section 237(a) of the Judicial Code (28 U. S. C. 344(a)).

The order of this Court noting probable jurisdiction herein was entered May 1, 1944 [R. 4088].

III.

STATEMENT OF THE CASE.

1. The State Statute.

The Arizona Train Limit Law* was enacted by the Arizona Legislature in 1912, and approved by a vote of the electors of the State at a referendum election on November 5, 1912.

The Train Limit Law reads as follows:

"An Act limiting the numbers of cars in a train.

"Section 1. It shall be unlawful for any person, firm, association, company or corporation, operating any railroad in the State of Arizona, to run, or permit to be run, over his, their, or its line of road, or any portion thereof, any train consisting of more than seventy freight, or other cars, exclusive of caboose.

"Section 2. It shall be unlawful for any person, firm, association, company or corporation, operating any railroad in the State of Arizona, to run, or permit to be run, over his, their or its line of road, or any portion thereof, any passenger train consisting of more than fourteen cars.

"Section 3. Any person, firm, association, company, or corporation, operating any railroad in the State of Arizona, who shall willfully violate any of the provisions of this act, shall be liable to the State of Arizona for a penalty of not less than one hundred dollars, nor more than one thousand dollars, for each offense; and such penalty shall be recovered, and

*Hereafter referred to throughout this brief for convenience, as the "Train Limit Law".

suits therefor brought by the attorney general, or under his direction, in the name of the State of Arizona, in any county through which such railroad may be run or operated, provided, however, that this act shall not apply in cases of engine failures between terminals.

"Section 4. All acts and parts of acts in conflict with the provisions of this act are hereby repealed."

2. The Present Suit.

The present suit was begun by a complaint filed by the Attorney General of the State of Arizona [R. 1-4] in the Superior Court of Arizona, in and for the County of Pima, in which complaint the State was named as plaintiff and the Appellant as defendant. The complaint alleged that in Pima County, Arizona, on March 2, 1940, Appellant operated a long* passenger train, and a long freight train on April 4, 1940, in violation of the Train Limit Law, and prayed judgment for the statutory penalties.

On May 9, 1940, Appellant filed its answer [R. 5-32], in which, after admitting the operation of the two trains named in the complaint, it alleged that each of said trains consisted in large part of cars moving in interstate commerce and carrying interstate traffic, and denied that either of said operations was willful violation of the law.

For a further separate and affirmative defense to the complaint, Appellant alleged that the law was and is void, invalid and unconstitutional, because in violation of the

*Throughout this brief trains of more than 70 cars exclusive of caboose, and passenger trains of more than 14 cars (the limits fixed by the Train Limit Law) are called "long" trains; trains conforming to these limits are called short trains.

Commerce Clause (Article I, Section 8, par. 3) of the Constitution of the United States, the Due-Process Clause of Section 1 of the 14th Amendment to the Constitution of the United States, and the corresponding Due-Process Clause set forth in Article II, Section 4, of the Constitution of Arizona, in that: (a) the law undertakes to regulate a subject-matter of national concern which, if required to be regulated at all, is subject to regulation only by Congress pursuant to the powers granted by the Commerce Clause; (b) the necessary effect of the law is to regulate Appellant's train operations extra-territorially, that is to say, beyond the boundaries of Arizona; (c) the law directly and substantially interferes with, delays, and regulates Appellant's interstate train operations in Arizona and the adjacent states; (d) the law imposes direct and substantial burdens upon the Appellant's interstate train operations; (e) the law, to the extent that it has, or is intended or claimed to have, the effect of limiting the number of cars in a train to that number which can be safely and effectively controlled or stopped by the use of air brakes and other appurtenances now in use on such trains, is in conflict with and an infringement upon existing Federal legislation having the same or similar purposes, enacted by Congress pursuant to its powers under the Commerce Clause; (f) the law deprives Appellant of its property unreasonably and arbitrarily in violation of the due-process clauses of the State and Federal Constitutions above referred to, for the reason, among others, that it bears no reasonable relation to health or safety, and does not eliminate or reduce any present hazard, but on the contrary creates certain hazards which would not otherwise exist, and increases other hazards of railroad operation in numerous respects.

At the time the complaint was filed, an order was entered by the Superior Court staying all other prosecutions under the law, pending final determination of the present suit [R. 5].

The trial of the cause commenced on November 19, 1940, and, with numerous recesses, continued to and including May 1, 1941. Evidence consisting of oral testimony and of exhibits was presented by both the Appellant and the Appellee.

Many of the ultimate facts in the case are in dispute. The evidence offered by Appellant largely consisted of statistical exhibits and explanatory testimony. Although the data underlying these exhibits were mostly reports made by the carriers to the I. C. C. and the exhibits generally are not challenged as being incorrect reproductions or summaries of such government reports (except where they incompletely or inaccurately summarize or catalogue certain accident reports), certain of the inferences and ultimate facts drawn therefrom by the Appellant are challenged here. Oral testimony in addition to that aforementioned was offered by Appellant and also Appellee. This testimony for the most part dealt with certain phases of railroad operation, including such subjects as operation of brakes, slack and slack action, accidents and the duties and experiences of employees. There is disagreement between the parties as to what ultimate facts are proved by much of the evidence.

In the ensuing statement we summarize certain of the ultimate facts, upon which our contentions are based and which we think will be found upon review of the record by this Court.

Local Conditions

Appellant's lines in Arizona are subject to local conditions affecting the operation of its trains which are different from the conditions obtaining in many other states. While there are stretches of tangent (straight) track, there are many sectors where curves are frequent and severe. [Exhibits 309, 310; R. 2209, 2210]. The railroad also crosses a number of elevations, some being parts of mountain ranges. There are five "helper districts" on Appellant's lines in Arizona, i. e., localities where the grades are so steep that the locomotive or locomotives pulling a train must be "helped" by use of an additional locomotive in such district. [Ex. 175, R. 1284]. The operation is mainly single-track operation, although there are sections of double track eastward from Yuma, and from Tucson. Duplication of east-west lines over much of the territory make possible the use of "alternate" routes whereby, for example, the preponderance of west bound traffic may be routed over the so called E. P. & S. W. route from El Paso via Douglas to Mescal and Picacho via Phoenix to Yuma, and east bound traffic may be routed from Yuma via Gila Bend, and Lordsburg to El Paso. In comparison, curves and grades in Nevada are not nearly as severe, and the operation is essentially double tracked. [Ex's. 306, 307, 308, 175; R. 2187, 1284]. Arizona is subject to sand storms and strong wind conditions not present at least to the same degree, in Nevada. It will be judicially noticed that the population of Arizona is not as great, and the number of highways are not so numerous or as densely traveled, as in many other states, although the population, and density of highways and traffic thereon is not as great in Nevada as in Arizona.

These local conditions are not encountered at all in many places in the United States, as in the flat western country or water level routes, and in territory where the traffic is essentially transfer and terminal business. The location and characteristics of highways of commerce are bound to differ in different states or areas, and each such state or area produces varying kinds and degrees of hazard. It has long been recognized that the control and regulation of such highways, including railroad operations and rights of way, are matters of local concern which the states may regulate in the absence of congressional occupation. *Atlantic C. L. R. Co. v. Georgia*, 234 U. S. 280.

The Effect of the State Law on Interstate Commerce.

The evidence presented followed two principal channels, the first going to the question of the burden imposed on interstate commerce by the Train Limit Law, and the second going to the question of the protection of the safety of the public and the employees resulting from the Train Limit Law.

In relation to the first question the Appellant introduced oral testimony and exhibits showing for the period 1922 to 1939 (1) the improvements in equipment, appliances, tracks and the operating plants as a whole of all Class I railroads, the Pacific Lines of the Southern Pacific, the Southern Pacific Lines in Nevada and the Southern Pacific Lines in Arizona; [Ex's. 2 to 7 incl.; R. 2852 to 2857 incl.; Ex's. 157-8-9; R. 3031-3] (2) the operating and transportation expenses of these roads by years over the period 1922 to 1939; [Ex's. 20, 151, 160, 161; R. 2868, 3027, 3034, 3035] and (3) by comparing the average of these expenses for the four year period 1936-1939 with the average for the four year period 1922-1925, the percentage of improvement 1936-1939 over 1922-1925. In

the Arizona exhibits for the years 1922, 1923 and the first 10 months of 1924 of the first four year period, only the operations on the Southern Pacific before consolidated with the E. P. & S. W. and the Arizona Eastern were included [Ex. 149, R. 3025]. By the consolidation approximately 200 miles of main line trackage and approximately 500 miles of branch line trackage were added to Appellant's lines in Arizona [Ex. 305, R. 3430], the added territory presenting more difficult operating conditions and increasing expenses on the lines in the state as a whole. Comparing 1936-1939 with the first four years following consolidation the percentage of improvement in Arizona compares favorably with that on other railroads.

Evidence was also introduced showing the operating averages on Class I railroads, the Pacific Lines of the Southern Pacific, the Salt Lake Division and the Tucson Division. [Ex's. 22, 162, 163, 164; R. 2870, 3036-3038]. Here again, when the periods used for comparison are *since* the territory in Arizona was constituted as it is now constituted, the improvement in efficiency in Arizona compares favorably with the other railroads.

Appellant also presented a redispatch or assumed operation of the trains actually operated in certain periods in 1938 and 1940, to represent how trains would have been operated had the Train Limit Law not been in effect [Ex. 198; R. 3115]. From this redispatch or assumed operation and a comparison of fuel used on the Salt Lake and the Tucson Division the Appellant then presented evidence to show the savings by long train operations in expense, in the number of trains operated, and in interference with and delays to interstate commerce [Ex's. 226, 249, 250; R. 3215, 3258-3262]. The exhibits, in truth, show these savings were all, or substantially all, due to the use of

equipment, such as 4100 class engines, in the redispatch or assumed operation, not used in the actual, and by the failure to take into consideration the change during the period in the territory included in the Tucson Division, and the joint-track operation agreement on the Salt Lake Division.

The Facts Respecting Safety.

This evidence fails to show the presence of any substantial burdens upon, or interference with, interstate commerce resulting from the enforcement of the Arizona law. Other facts and aspects of this question will be stated in the course of our argument.

The evidence going to the second question—the protection of the safety of the public and employees resulting from the Train Limit Law shows:

The Train Limit Law protects the public and employees from the hazards of slack action on long trains. The air-brake instruction books of the Appellant and of the Santa Fe recognize the dangers from slack action in train operations and that these dangers increase as the number of cars in a train increase [Ex's. 152, 319, 327, 328; R. 1099, 2289, 3445, 3454]. This is also shown on the exhibits showing casualties on Class I railroads, on Appellant's lines in Nevada, and on Appellant's lines in Arizona. During the 12 year period 1929-1940, 39.6% of the accidents and 45.7% of the casualties, train and train service accidents, in Nevada, were in slack action accidents, and 51.6% of the accidents and 57.5% of the casualties on trains *in motion* were from slack action. In Arizona during the same period 40% of the accidents and 44% of the casualties on trains in motion were from slack action. All but one of the accidents in Nevada were on long trains.

the one short train having 69 cars. In the two states, 46.6% of these accidents were on long trains and 87% on trains of over 65 cars. [Ex's. 274, 275; R. 3351, 3364].

The severity of the injuries resulting from slack action also increases with the number of cars in a train. In slack action accidents in Nevada during the above 12 years, on long trains two men were permanently injured and 58 were disabled for an aggregate of 2830 days, an average disability of 48.8 days, while on short trains one man was disabled for 20 days. For Arizona and Nevada combined, on long trains 3 men were permanently disabled and 59 were disabled with an average disability of 49.3 days, while on short trains one man was permanently disabled (on a 68 car train) and 60 men were disabled for 1393 days with an average disability of 23.2 days. [Ex's. 274, 275; R. 3351, 3364].

A danger to the public was shown due to slack action in long trains buckling and throwing cars out of the train and onto parallel tracks in front of passenger trains. In the 12 year period 1928-1939 three such accidents resulting in 4 deaths and 42 injured were investigated by the Interstate Commerce Commission. [Ex. 270; R. 3310].

Long trains were shown to create a hazard by reason of the inability to pass signals, or to observe defects in the train while in motion, the increased difficulty in inspecting the train while standing, and the fear and strain on the trainmen which reduces their efficiency.

The Trial Court's Findings and Judgment

After the taking of evidence was closed in the trial court and the case was submitted, the Appellant and the Appellee each filed briefs and presented to the trial court suggested Findings of Fact, Conclusions of Law and a form of Judg-

ment. The Findings of Fact and Conclusions of Law presented by Appellant were accepted and adopted by the trial Court without a single change therein so far as we are aware. The Findings of Fact cover *147 pages* of the printed record herein [R. 3887-4034, inclusive]. At least 90% of the trial court's findings relate to evidentiary, not ultimate, facts. Such ultimate facts as are found are distributed throughout these 147 pages, except for those contained in Findings Nos. XVI to XIX [R. 4032-34] referred to by Appellant as "possibly" being findings to the effect that the State law is invalid (Appellant's brief, Vol. I, p. 321). As Appellant states in its brief (Vol. I, p. 11), the Appellee presented assignments of error to the State Supreme Court asserting that the trial court had erred in making specified findings of fact, including the greater part of those adopted by the trial court. In reversing the trial court, the Supreme Court in its opinion stated [R. 4067-8]:

> "The opinion, condensed as it is in the foregoing pages, expresses our reason for holding that the findings and judgment of the trial court to the effect that the Train Limit Law is unconstitutional were in error."

It is Appellee's position that this holding constituted a reversal and setting aside of the ultimate facts contained in the findings of the trial court upon which its decision in favor of constitutionality was based. In view of the improper content of the great mass of the findings, we believe the Supreme Court's disposition of this matter was proper and sufficient.

However, even if the trial court's findings of fact were not set aside by the Supreme Court's decision, it is clear

that this Court is not bound by them, and will examine the whole record upon the pertinent issues. *South Carolina Hy. Dept. v. Barnwell Bros.*, 303 U. S. 177; *Clark v. Gray*, 306 U. S. 583.

On February 11, 1942, the trial court, adopting the findings, conclusions of law and form of judgment proposed by Appellant, filed its findings of fact, conclusions of law, and judgment [R. 3887-4045]. The judgment adjudged the Train Limit Law invalid on all grounds stated in Appellant's answer.

The Appeal to the State Supreme Court

On April 9, 1942, the Appellant filed notice of appeal [R. 4054] to the Supreme Court of Arizona from the judgment of the Superior Court dated February 11, 1942.

The appeal was submitted to the State Supreme Court on briefs and oral argument. The decision of the Supreme Court of Arizona, concurred in by two judges (the third Judge dissenting) was announced on December 23, 1943, and reversed the judgment of the Superior Court [R. 4055-4068]. A motion for rehearing duly filed by Appellant on January 7, 1944, was denied by the court on January 13, 1944; on the same date the dissenting opinion [R. 4068-4071] was filed. The court thereupon issued its mandate [R. 4072-4073] dated January 14, 1944, ordering the judgment to be reversed. In obedience to said mandate, the trial court, on February 5, 1944, entered judgment [R. 4073-4074] declaring the law constitutional, and assessing against Appellant a penalty of $250.00 for each of the two violations alleged in the complaint.

The appeal to this Court is from the above opinion and decision of the Supreme Court of Arizona.

IV.

SUMMARY OF ARGUMENT.

1. The Train Limit Law Does Not Invade an Exclusive National Field of Legislation.

In determining the constitutionality of the Train Limit Law it is necessary for this Court "to ascertain upon the whole record whether it is possible to say" that the law "is without rational basis" in safety, *South Carolina Hy. Dept. v. Barnwell Bros.*, 303 U. S. 177; *Clark v. Paul Gray*, 306 U. S. 583; *New York, N. H. & H. R. Co. v. New York*, 165 U. S. 628; *Smith v. Alabama*, 124 U. S. 465; *Atlantic Coast Line v. Georgia*, 234 U. S. 280; *Minnesota Rate Cases*, 230 U. S. 352. A state statute enacted in the exercise of the state's police power is in the permissible or concurrent field, and not in the exclusive national field, of legislation under the Commerce Clause. *South Carolina Hy. Dept. v. Barnwell Bros.*, 303 U. S. 177; *Clark v. Paul Gray*, 306 U. S. 583; *Minnesota Rate Cases*, 230 U. S. 352; *Gibbons v. Ogden*, 9 Wheat 1; *Missouri K. T. & R. v. Haber*, 169 U. S. 613; *New York, N. H. & H. R. Co. v. New York*, 165 U. S. 628; *Smith v. Alabama*, 124 U. S. 465; *Nashville etc. R. Co. v. Alabama*, 128 U. S. 96; *Atlantic C. L. R. Co. v. Georgia*, 234 U. S. 280; *Terminal R. Assn. v. Brotherhood of R. Trainmen*, 318 U. S. 1.

The determination as to whether the burden imposed on interstate commerce by a state statute enacted in the exercise of the state's police power is too great in relation to

the national interest in interstate commerce is a legislative, and not a judicial, function. *South Carolina Hy. Dept. v. Barnwell Bros.*, 303 U. S. 177; *Clark v. Paul Gray*, 306 U. S. 583; *Minnesota Rate Cases*, 230 U. S. 352; *Gibbons v. Ogden*, 9 Wheat 1; *Missouri K. T. & R. v. Haber*, 169 U. S. 613; *New York, N. H. & H. R. Co. v. New York*, 165 U. S. 628; *Smith v. Alabama*, 124 U. S. 465; *Nashville etc. R. Co. v. Alabama*, 128 U. S. 96; *Atlantic C. L. R. Co. v. Georgia*, 234 U. S. 280; *Terminal R. Assn. v. Brotherhood of R. Trainmen*, 318 U. S. 1.

Protection of the public and of employees against those hazards which are related to the length of a train is a matter of local concern. *Bradley v. Ohio*, 289 U. S. 92; *Nashville etc. R. Co. v. Alabama*, 128 U. S. 96; *Smith v. Alabama*, 124 U. S. 465; *Atlantic C. L. R. Co. v. Georgia*, 234 U. S. 280.

No sufficient reason appears why the regulation of train lengths should be limited to national regulation.

2. Extra-territorial Effect and Burden on Interstate Commerce are one and the same thing.

The extra-territorial effect on interstate commerce is but one phase of the burden on interstate commerce which may result from state police power regulations. Where a state police measure affects interstate commerce, such effect must in every case, to some extent at least, be extra-territorial. The determination as to whether the burden imposed on interstate commerce by such a state statute is too great is, nevertheless, a legislative, and not a judicial,

function. *Terminal R. Ass'n. v. Brotherhood of R. Trainmen*, 318 U. S. 1; *New York, N. H. & H. R. Co. v. New York*, 165 U. S. 628; *Atlantic Coast Line v. Georgia*, 234 U. S. 280; *Chicago, R. I. & P. R. Co. v. Arkansas*, 219 U. S. 453; *Missouri P. R. Co. v. Norwood*, 283 U. S. 249; *South Carolina Hy. Dept. v. Barnwell Bros.*, 303 U. S. 177; *Mauer v. Hamilton*, 309 U. S. 598; *Sproles v. Binford*, 286 U. S. 284.

The extra-territorial effect of the Arizona Law does not render the law unconstitutional.

3. The Train Limit Law Does Not Invade a Field Already Occupied by Congress by Sections 1 and 9 of the Safety Appliance Act or by Section 25, Part I of the Interstate Commerce Act.

The fields occupied by the Federal Statutes (sections 1 and 9 of the Safety Appliance Act and section 25, Part I of the Interstate Commerce Act are different from that occupied by the Train Limit Law.

Sections 1 and 9 of the Safety Appliance Act and section 25, Part I of the Interstate Commerce Act deal only with the mechanical appliances to be used in railroad operations, and in no way enter the field of regulating the length of trains. *Johnson v. Southern Pacific Company*, 196 U. S. 1; *United States v. California*, 297 U. S. 175; *Napier v. Atlantic Coast Lines*, 272 U. S. 605; *Missouri Pac. R. Co. v. Norwood*, 283 U. S. 249; *Power Brake Investigation Case*, 91 I. C. C. 481.

The Train Limit Law deals only with the number of cars which may be operated in a train and in no way enters the field of regulating the mechanical appliances which may be used in railroad operations. No intention can be attributed to Congress in enacting the Federal statutes to occupy the field of regulating train lengths. *Savage v. Jones*, 225 U. S. 501; *Kelly v. Washington*, 302 U. S. 1; *Atlantic Coast Line R. Co. v. Georgia*, 234 U. S. 280; *Peoria Ry. Co. v. United States*, 263 U. S. 528; *International R. Co. v. Railroad Comm. of Texas*, 281 S. W. 1084 (aff. 275 U. S. 503); *Terminal R. Assn. v. Brotherhood of R. Trainmen*, 318 U. S. 1.

There is no conflict between the Federal statutes and the Arizona Law. *Parker v. Brown*, 317 U. S. 341, 359; *Cloverleaf Butter Co. v. Patterson*, 315 U. S. 148; *Missouri etc. Co. v. Haber*, 169 U. S. 613; *Kelly v. Washington*, 302 U. S. 1; *New York C. R. Co. v. United States*, 265 U. S. 41; *United States v. Grand Rapids & I. Ry. v. United States*, 244 Fed. 609.

4. The Determination of the Validity of the Train Limit Law Rests Solely Upon the Determination of Whether Upon the Whole Record it is Possible to Say That the Law is Without Rational Basis in Safety. The Train Limit Law Has a Rational Basis in Safety.

The extent of the burden, if any, imposed on interstate commerce may not be considered by the Court in determining the reasonableness of a state law enacted in the exercise of the police power. Under the Commerce Clause the determination as to whether the burden imposed upon interstate commerce by a state police statute is too great is always a legislative function (see cases cited under I. above). Under the Fourteenth Amendment it becomes a matter of judicial determination only when a method of regulation is shown which will accomplish the identical object or purpose of the law in question at less cost. *Erie R. R. Co. v. Board of Comm.*, 254 U. S. 294; *Lehigh Valley R. Co. v. Board of Comm.*, 278 U. S. 24; *South Carolina Hy. Dept. v. Barnwell Bros., supra*; *Nashville, C. & St. L. R. Co. v. White*, 276 U. S. 456; *Missouri P. R. Co. v. Omaha*, 235 U. S. 131; *Chicago & A. R. Co. v. Tranbarger*, 238 U. S. 67.

Under both the Commerce Clause and the Fourteenth Amendment the judicial function stops with inquiry whether the state has acted within its province, and whether the means of regulation chosen are reasonably adapted to the ends sought. *South Carolina Hy. Dept. v. Barnwell Bros., supra.* Here the first inquiry has been resolved in favor of the state regulation by decisions of this Court. *Smith v. Alabama*, 124 U. S. 465; *Nashville C. & St. L. R. Co. v. Alabama*, 128 U. S. 96; *New York, N. H. & H. R. Co. v. New York*, 165 U. S. 628; *Atlantic*

C. L. R. Co. v. Georgia, 234 U. S. 280; *Chicago, R. I & P. R. Co. v. Arkansas*, 219 U. S. 453; *Terminal R. Assn. v. Brotherhood of R. Trainmen*, 318 U. S. 1. In resolving the second inquiry the Court looks to the record, not to see whether the findings below are supported by the evidence, but to ascertain from the whole record whether it is possible to say that the legislative choice is without rational basis. *South Carolina Hy. Dept. v. Barnwell Bros., supra*; *Clark v. Paul Gray*, 306 U. S. 583; *Erie R. R. Co. v. Williams*, 233 U. S. 685; *Stephenson v. Binford*, 287 U. S. 251; *Nashville etc. Co. v. White*, 278 U. S. 456. The Train Limit Law has a rational basis in the protection of the public and employees from accidents and injuries due to the increase in the number of cars in a train, and is valid.

5. The Decision of the State Supreme Court, in Reversing the Trial Court, Did Not Deny to Appellant Any Federal Right to Which, on the Evidence, Appellant Is Entitled.

Findings of fact should find only ultimate facts. *Wilson v. Merchants' L. & T. Co.*, 113 U. S. 121. The decision and opinion of the State Supreme Court reversing the trial court is a reversal of the trial court's finding upon the ultimate fact (it is impossible to say that the law has no rational basis in safety). The ultimate fact to be determined is so interwoven with the question of law as to be in substance a decision of the latter.

The state rules and decisions upon the effects to be given to findings have no application in a case arising under the Constitution of the United States. *Truax v. Corrigan*, 257 U. S. 312, 324; *Norfolk & W. R. Co. v. Conley*, 236 U. S. 605, 609.

ARGUMENT.

1. The Train Limit Law Does Not Invade an Exclusive National Field of Legislation [Reply to Assignment of Error No. 1].

The Appellant's position upon this proposition is stated in its brief (Vol. I, pp. 82-83) as follows:

> "We emphasize that, in considering this point, it is unnecessary for this Court to take into account whether the challenged law is really, or merely ostensibly, a safety statute; or whether it is unreasonable, arbitrary or otherwise in violation of the Due-Process Clause of the XIV Amendment. It is likewise unnecessary to consider whether the law imposes financial burdens upon, or interferes physically with, interstate commerce. The mere fact of entry into a forbidden field, reserved to the federal power, where national regulation is indispensable if any is to be attempted, is sufficient to invalidate the action of the State, irrespective of the actual effects upon interstate commerce."

This contention assumes that the state law—here the Train Limit Law—has a real relation to the safety and the protection of the life and limbs of those people who are within the borders of the state and is in a field not occupied by Congress. It further assumes that the right of a state to exercise the police power reserved to it under the Constitution where it affects interstate commerce, but in a field not occupied by the Federal government, is made to depend upon a *judicial* determination as to whether or not the subject of the state legislation is of such a nature that, if regulated at all, it should be by national and not by state legislation—a matter of policy and for Congress, the legislative branch of government. And in making this

judicial determination the Court, under Appellant's contention, is prohibited from any consideration as to whether or not the state statute has for its purpose the safety and protection of the lives of its people. The validity of state legislation, *admittedly* having for its purpose the protection of the life, health and safety of its inhabitants, and otherwise valid as an exercise of the police power reserved to the states, is, by Appellant's contention, made subject to the opinion of the Court as to whether such protection should be by Federal or state legislation.

This is not the law, and is, we believe, contrary to a long line of decisions of this Court.

We recognize that a state may not, under the guise of the police power or otherwise, *directly* regulate interstate commerce. But this does not prohibit the enactment of legislation by a state under its police power although such legislation indirectly affects interstate commerce. A statute having a real relation to the safety and protection of the people of the state, and otherwise valid under the police power of the state, is not invalid because it indirectly burdens interstate commerce, the Federal government not having occupied the field. In this we are supported by a long line of decisions of this Court.

In the state court, as here, the Appellant quoted at length from, and placed great reliance on, the decision of this Court in the *Minnesota Rate Cases*, 230 U. S. 352. We will consider this case first.

In its quotation from the decision in the *Minnesota Rate Cases* in its brief herein (Vol. I, p. 98) the Appellant placed particular emphasis upon the following statement therein:

> "The grant in the Constitution of its own force, that is, without action by Congress, established the

essential immunity of interstate commercial intercourse from the *direct* control of the states with respect to those subjects embraced within the grant which are of such a nature as to demand that, if regulated at all, their regulation should be prescribed by a single authority. It has repeatedly been declared by this court that as to those subjects which require a general system or uniformity of regulation, the power of Congress is exclusive. In other matters, admitting of diversity of treatment according to the special requirements of local conditions; the states may act within their respective jurisdictions until Congress sees fit to act; and, when Congress does act, the exercise of its authority overrides all conflicting state legislation." (Citing cases.) (Emphasis ours.)

This statement in the *Minnesota Rate Cases* does not in truth support the Appellant's contention. By this statement the Court limits the class of legislation which is within the "exclusive field" to that which *directly* controls interstate commerce. That this is true is clearly shown by the statement which immediately follows that quoted above:

"The principle which determines this classification underlies the doctrine that the states cannot, under any guise, impose direct burdens upon interstate commerce. For this is but to hold that the states are not permitted *directly* to regulate or restrain that which, from its nature, should be under the control of a one authority, and be free from restriction, save as it is governed in the manner that the national legislature constitutionally ordains." (Emphasis ours.)

230 U. S. at 400.

The following examples are then given by the Court of legislation prohibited to the states (that is, within the exclusive power of Congress):

The states cannot: tax interstate commerce; "prohibit interstate trade in legitimate articles of commerce"; "discriminate against the products of other states"; "exclude from the limits of the state corporations or others engaged in interstate commerce," or "fetter by conditions this right to carry it on"; "prescribe rates to be charged for transportation from one state to another"; or "subject the operations of carriers in the course of such transportation to requirements that are unreasonable or pass beyond the bounds of suitable local protection."

Each example given by the Court is one of *direct* regulation. And the last example, statutes regulating the operations of carriers in interstate transportation, places in the "exclusive field" only such of those statutes "as are unreasonable or pass beyond the bounds of suitable local protection." It follows that those statutes of this character that are reasonable and within the bounds of suitable local protection are not in the exclusive but in the permissible field. And such is the holding of the Court in that part of the opinion immediately following (230 U. S. at 402):

> "But within these limitations there necessarily remains to the states until Congress acts, a wide range for permissible exercise of power appropriate to their territorial jurisdiction although interstate commerce may be affected. It extends to those matters of a local nature as to which it is impossible to derive from the constitutional grant an intention that they should go uncontrolled pending Federal intervention."

The Court then pointed out that there are subjects which, since the foundation of government, the states have regulated, because of the necessity that they should not remain unregulated, until Congress supersedes (230 U. S. 402):

> "Further, it is competent for a state to govern its internal commerce, to provide local improvements, to create and regulate local facilities, *to adopt protective measures of a reasonable character in the interest of the health, safety, morals and welfare of its people, although interstate commerce may incidentally or indirectly be involved.* * * * In such case, Congress must be the judge of the necessity of Federal action. Its paramount authority always enables it to intervene at its discretion for the complete and effective government of that which has been committed to its care, and, for this purpose and to this extent, in response to a conviction of national need, to displace local laws by substituting laws of its own. The successful working of our constitutional system has thus been made possible." (Emphasis ours.)

Illustrations given of the exercise of the powers by the state within this permissible field are: the enactment of pilotage laws; the improvement of harbors, bays and streams, and the construction of dams and bridges across navigable streams; quarantine regulations; state inspection laws; statutes for the protection of game and the food supply; statutes providing for misfeasance, nonfeasance, injuries and death received by employees in interstate commerce; statutes creating and enforcing liens against property used in interstate commerce; and "legislation of the states, safeguarding life and property and promoting comfort and convenience within its jurisdiction, may extend incidentally to the operations of the carrier in the conduct

of interstate business, provided it does not subject that business to unreasonable demands, and is not opposed to Federal legislation." Many cases are cited by the Court in support of these propositions.

This Court has consistently held that state legislation enacted under the police power reserved to the states and in a field not occupied by Congress comes within the permissible field under the commerce clause, and, if otherwise valid, it is valid under the commerce clause until superseded by legislation enacted by Congress under its paramount power.

Applying the language of the *Minnesota Rate Cases*, is there any "exercise of power" more "appropriate to the territorial jurisdiction" of a state than the exercise of the power to protect the lives, limbs, health and property of those within its territorial limits—the exercise of its police power? If there are any powers "as to which it is impossible to derive from the constitutional grant an intention that they should go uncontrolled pending Federal intervention," isn't the power to protect the lives, limbs, health and property of its inhabitants one of such powers? If there are certain subjects which, irrespective of their obvious and direct relation to interstate commerce, nevertheless, with the acquiescence of Congress, have been controlled by state legislation "because of the necessity that they should not remain unregulated," isn't the protection of the life, limb, health and property of the state's inhabitants one of such subjects?

> "It is competent for a state * * * to adopt protective measures of a reasonable character in the interest of the health, safety, morals and welfare of its people, although interstate commerce may incidentally or indirectly be involved."

This principle of law is stated by Mr. Justice Johnson in *Gibbons v. Ogden*, 9 Wheat. 1, 235, and quoted with approval in *Missouri K. & T. R. Co. v. Haber*, 169 U. S. 613, 627, as follows:

> "The same bale of goods, the same cask of provisions, or the same ship, that may be the subject of commercial regulation, may also be the vehicle of disease, and the health laws that require them to be stopped and ventilated are no more intended as regulations on commerce than the laws which permit their importation are intended to innoculate the community with disease. Their different purposes marks the distinction between the powers brought into action, and, while frankly exercised, they can produce no serious collision."

It has been repeatedly held by this Court that the protection of life, health, safety and property is a local problem and primarily the function of the states.

> "Protection against accidents, as against crime, presents ordinarily a local problem. Regulation to insure safety is an exercise of the police power. It is primarily a state function, whether the *locus* be private property or the public highways. Congress has not dealt with the subject. Hence, even where the motor cars are used exclusively in interstate commerce, a state may freely exact registration of the vehicle and an operator's license. * * *".
>
> *Bradley v. Ohio*, 289 U. S. 92, at 95.

> "It is conceded that the power of Congress to regulate interstate commerce is plenary; that as incident to it, Congress may legislate as to the qualifications, duties, and liabilities of employes and others on railway trains engaged in that commerce; and that such

legislation will supersede any state action on the subject. *But until such legislation is had, it is clearly within the competency of the states to provide against accidents on trains whilst within their limits. Indeed, it is a principle fully recognized by decisions of State and Federal Courts, that wherever there is any business in which, either from the products created or the instrumentalities used, there is danger to life or property, it is not only within the power of the states, but it is among their plain duties, to make provision against accidents likely to follow in such business, so that the dangers attending it may be guarded against so far as is practicable.*" (Emphasis ours.)

Nashville etc. R. Co. v. Alabama, 128 U. S. 96, 99, 100.

"The rules prescribed for their (railroads) construction and for their management and operation, designed to protect persons and property, otherwise endangered by their use, *are strictly within the limits of the local law.*" (Emphasis ours.)

Smith v. Alabama, 124 U. S. 465, 482.

Quoted with approval in *Atlantic C. L. R. Co. v. Georgia*, 234 U. S. 280, 292.

"In each of these cases regulation involves a burden on interstate commerce. But so long as the state action does not discriminate, the burden is one which the Constitution *permits because* it is an inseparable incident of the exercise of a legislative authority, which under the Constitution has been left to the states." (Emphasis ours.)

South Carolina Hy. Dept. v. Barnwell Bros., 303 U. S. 177, 189.

The cases of *Buck v. Kuykendall*, 267 U. S. 307, and *Bush v. Malloy*, 267 U. S. 317, are cited by Appellant (Brief, Vol. I, pp. 95-6) as supporting Appellant's contention. In truth, the statutes involved in those cases had no purpose in safety, presented no question as to the exercise of the police power of the states, but were examples of attempted *direct* regulation of interstate commerce by the state. This was expressly pointed out by this Court in *Bradley v. Ohio, supra* (289 U. S. at 95):

> "In those cases safety was doubtless promoted when the certificate was denied, because intensification of traffic was thereby prevented. * * * But there promotion of safety was merely an incident of the denial. Its purpose was to prevent competition deemed undesirable. The test employed was the adequacy of existing transportation facilities; and since the transportation in question was interstate, denial of the certificate invaded the province of Congress. In the case at bar, *the purpose of the denial was to promote safety*, and the test employed was congestion of the highway. The effect of the denial upon interstate commerce *was merely an incident*." (Emphasis ours.)

The Appellee's contention has been sustained by this Court in a number of decisions sustaining the constitutionality of state laws affecting railroad transportation enacted in the exercise of the state's police power.

In *New York, N. H. & H. R. Co. v. New York*, 165 U. S. 628, the constitutionality of a New York statute regulating the heating of passenger cars operated within the state was in question in so far as it applied to inter-

state operations. In sustaining the constitutionality of the statute this Court said (165 U. S. at 634):

> "While the laws of the state must yield to acts of congress passed in execution of the powers conferred upon it by the Constitution * * *, the mere grant to Congress of the power to regulate commerce with foreign nations and among the states *did not, of itself and without legislation by Congress*, impair the authority of the states to esablish such reasonable regulations as were appropriate for the protection of the health, the lives, and the safety of their people." (Emphasis ours.)

This Court there stated the law to be exactly as we here contend. And in *Nashville etc. R. Co. v. Alabama*, 128 U. S. 96, 99, 100, this Court said:

> "It is conceded that the power of Congress to regulate interstate commerce is plenary; that as incident to it, Congress may legislate as to the qualifications, duties and liabilities of employees and others on railway trains engaged in that commerce; and that such legislation will supersede any state action on the subject. *But until such legislation is had, it is clearly within the competency of the states to provide against accidents on trains whilst within their limits. Indeed, it is a principle fully recognized by decisions of State and Federal Courts, that wherever there is any business in which, either from the products created or the instrumentalities used, there is danger to life or property, it is not only within the power of the States, but it is among their plain duties to make provision against accidents likely to follow in such business, so that the danger attending it may be guarded against so far as is practicable.*" (Emphasis ours.)

And see:

Hennington v. Georgia, 163 U. S. 299;

Chicago, R. I. & P. R. Co. v. Arkansas, 219 U. S. 453;

St. Louis, I. M. & S. R. Co. v. Arkansas, 240 U. S. 518;

Missouri P. R. Co. v. Norwood, 283 U. S. 249;

Missouri, K. & T. R. Co. v. Haber, 169 U. S. 613;

Smith v. Alabama, 124 U. S. 465;

Atlantic C. L. R. Co. v. Georgia, 234 U. S. 280;

Terminal R. Ass'n v. Bro. of R. Trainmen, 318 U. S. 1.

As this Court in these and many other cases has recognized, this right on the part of the states, in a field not occupied by Congress, to protect the life, health and safety of its people, is in no way inconsistent with the purpose of the commerce clause to place in Congress the supreme control over interstate commerce and to prevent the states from creating barriers to interstate commerce, since the paramount authority of Congress "always enables it to intervene at its discretion." (*Minnesota Rate Cases, supra.*) On the contrary, it is in keeping with the purpose of the commerce clause to give to Congress the supreme control over interstate commerce, and to place in Congress, and not the court, the power and authority to "determine whether the burdens imposed on it (interstate commerce) by state regulation, otherwise permissible, are too great" and by legislation curtail the state's regulatory power, and this whether these burdens arise by reason of the lack of uniformity of regulation; that is, the lack of a national system of regulation.

"Congress, in the exercise of its plenary power to regulate interstate commerce, may determine whether the burdens imposed on it by state regulation, otherwise permissible, are too great, and may, by legislation designed to secure uniformity or in other respects to protect the national interest in the commerce, curtail to some extent the state's regulatory power. But that is a legislative, not a judicial, function, to be performed in the light of the congressional judgment of what is appropriate regulation of interstate commerce, *and the extent to which, in that field, state power and local interests should be required to yield to the national authority and interest.* * * * In resolving the second, *court do not* sit as Legislatures, either state or national. *They cannot* act as Congress does when, after weighing all the conflicting interests, state and national, it *determines when and how much the state regulatory power shall yield to the larger interests of a national commerce.*" (Emphasis ours.)

South Carolina Hy. Dept. v. Barnwell Bros., 303 U. S. 177, 190.

"But these considerations are for the practical judgment of Congress in determining the extent of the regulation necessary under existing conditions of transportation to conserve and promote the interest of interstate commerce. * * * It is the function of this court to interpret and apply the law already enacted, but not, under the guise of construction, to provide *a more comprehensive scheme of regulation than Congress has decided upon.* Nor, in the absence of Federal action, may we deny effect of the laws of the state enacted within the field which it is entitled to occupy until its authority is limited through the exertion by Congress of its paramount constitutional power." (Emphasis ours.)

Minnesota Rate Cases, 230 U. S. at 432.

This proposition—that the commerce clause has placed in *Congress* the power and authority to determine whether the burdens imposed on interstate commerce by state regulation, otherwise permissible are too great—*does not*, as Appellant argues (App. Br., Vol. I, p. 115), lose sight of realities. No real problem is presented as to how Congress may enter the field and thus exclude the states. It is neither necessary, as Appellant suggests, that Congress pass a resolution declaring no regulation is necessary nor that Congress pass affirmative legislation fixing a limit on the number of cars that may be operated in a train.

A few examples will illustrate how Congress has performed this function. Congress excluded the states from the field of quarantine regulations affecting interstate commerce by delegating to the Secretary of Agriculture the power to determine when quarantines were necessary and to declare such quarantines. But until Congress thus occupied the field the validity of state regulations was uniformly sustained notwithstanding the burdens imposed upon interstate commerce.

Oregon-Washington R. & N. Co. v. Washington, 270 U. S. 87.

The Boiler Inspection Act delegates to the Interstate Commerce Commission authority to prescribe the use of safety equipment upon locomotive and all parts and appurtenances thereof. This statute constitutes an occupation of the entire field of such equipment whether or not the Commission has acted respecting a given device, and the states are ousted from regulating such devices. *Napier v. Atlantic Coast Line*, 272 U. S. 605, 613. But prior to the time when the Commission was given jurisdiction over

locomotive appurtenances, state regulations requiring such appurtenances were sustained, notwithstanding they may have burdened interstate commerce. *Atlantic Coast Line R. Co. v. Georgia*, 234 U. S. 280.

The protection of the safety and health of those within the boundaries of a state is always a matter of *local concern*, and a proper subject for the exercise of the state's police power. When regulatory measures affect interstate commerce, it becomes a question of policy for Congress, the legislative body entrusted by the Commerce Clause with the paramount power over such commerce, to determine whether the regulation shall be local or national.

To exclude the state and state regulation here Congress need only delegate to the Interstate Commerce Commission (or some other appropriate Federal department) the exclusive power and authority to investigate the number of cars which may be operated in a train with safety, and, when such investigation shows a limitation to be necessary and proper in the interest of safety, to fix a limit on the number of cars to be operated in a train. It then becomes a subject of exclusive national regulation, and there will be no limitation unless the Interstate Commerce Commission after investigation should find it necessary. The state regulation becomes void and of no effect but a Federal agency has been provided with experience in the field and with authority to investigate and control the matter where control is found necessary. This, we believe, is the intent of the Commerce Clause. As stated in the *Minnesota Rate Cases*, *supra*, the Constitution never intended that matters of a local nature (and certainly the protection of citizens of a state is a matter of local concern) should go uncontrolled pending Federal intervention.

California v. Thompson, 313 U. S. 109, and *Parker v. Brown*, 317 U. S. 341, cited by the Appellant, are in accord with this contention or proposition. The determination of the question as to whether or not the subject of regulation is one which if regulated at all it should be by national legislation and not by state, the "balancing of local and national interest", in final analysis is in every instance based upon the extent of the burden imposed on commerce by the state regulation. Of necessity in determining that the regulation should be by national authority, the question reduces to the effect of local regulation on national commerce. That is, is the burden imposed by the state regulation too great? The argument of the Appellant and of the Solicitor General herein reduces down to the proposition that the constitutionality under the Commerce Clause of a state statute, *admittedly a police regulation*, is to be determined by a consideration of the extent of the burden imposed on interstate commerce by the state statute, by "balancing the local and national interest"—in other words, by determining whether in the light of the national interest the burden imposed upon interstate commerce is too great—and that such is the holding of this Court in *California v. Thompson*, *supra*, and in *Parker v. Brown*, *supra*. The Appellee contends that whether the burden on interstate commerce by reason of the statute *is too great* is a legislative, and not a judicial, question, and that *California v. Thompson* and *Parker v. Brown*, are in accord with Appellee's contention.

In *California v. Thompson*, the Court cited with approval, among others, *South Carolina Hy. Dept. v. Barnwell Bros.*, 303 U. S. 177, 185-191; *Smith v. Alabama*, 124 U. S. 465; *Nashville, C. & St. L. R. Co. v. Alabama*,

128 U. S. 96; *Chicago, R. I. & P. R. Co. v. Arkansas*, 219 U. S. 453; *Missouri Pac. R. Co. v. Norwood*, 283 U. S. 249; *New York, N. H. & H. R. Co. v. New York*, 165 U. S. 628, and the *Minnesota Rate Cases*, 230 U. S. 352, 398-412. *Parker v. Brown, supra*, cited with approval, among others, *South Carolina Hy. Dept. v. Barnwell Bros., supra; California v. Thompson, supra*, and *Minnesota Rate Cases, supra.*

As we have heretofore pointed out, the Court in those cited cases, and in conformity with a long line of cases, has held that the Constitution placed in Congress the power and authority to "*determine* whether the burdens imposed on it (interstate commerce) by state regulation * * * *are too great.*" (Emphasis ours.) *South Carolina Hy. Dept. v. Barnwell Bros., supra:*

> "But that is a *legislative*, not a judicial, function, to be performed in the light of Congressional judgment of what is appropriate regulation of interstate commerce, and the extent to which, in that field, state power and local interest should be required to yield to the national authority and interest. * * * In resolving the second, courts *do not* sit as Legislatures, either state or national. *They cannot* act as Congress does when, after weighing all the conflicting interests, state and national, *it determines when and how much the state regulatory power shall yield to the larger interests of a national commerce.*"
>
> *South Carolina Hy. Dept. v. Barnwell Bros., supra.*

In effect the Appellant argues that this Court, by its decisions in *California v. Thompson* and *Parker v. Brown*, has transferred or taken to itself the power and authority which in the *Barnwell* and other cases it held was

legislative, and by the Constitution placed in Congress. We do not so read the *Thompson* and *Parker* decisions. We understand these cases to hold, in accordance with the *Barnwell* and other cases cited, that where a statute has a rational basis in safety *the extent* of the burden it imposes on interstate commerce—whether it is *too great* in relation to the national interest—is a *legislative* question.

As we have said, the national interest in interstate commerce is not, as Appellant seems to infer, left unprotected by this construction or interpretation. The simple remedy lies with Congress which "in the exercise of its plenary power to regulate interstate commerce, may determine * * * what is appropriate regulation of interstate commerce, *and the extent* to which, in that field, state power and local interests *should be required to yield to national authority and interest.*" (Emphasis ours.) *South Carolina Hy. Dept. v. Barnwell Bros.*, 303 U. S. 177, 189-190. To exclude the state legislation Congress need only authorize the Interstate Commerce Commission to investigate, and where found necessary fix the number of cars to be operated in a train. The state law becomes invalid but in its place a Federal Agency is provided with authority to investigate and, if and when found necessary, fix a limit on the number of cars to be operated in a train. If no limit is necessary, none will be fixed.

> "* * * there is a simple remedy; and it cannot be assumed that it will not be readily applied if there be real occasion for it. That remedy does not rest in a denial to the state, in the absence of conflicting Federal action, of its power to protect life and property within its borders, but it does lie in the exercise of the paramount authority of Congress in its control of interstate commerce, to establish such

regulations as in its judgment, may be deemed appropriate and sufficient. Congress, when it pleases, may give the rule and make the standard to be observed on the interstate highway."

Atlantic C. L. R. Co. v. Georgia, 234 U. S. 280, 292;

Oregon-Washington R. & N. Co. v. Washington, 270 U. S. 87;

Napier v. Atlantic C. L. R. Co., 272 U. S. 605, 607.

Kansas Southern Ry. v. Kaw Valley District, 233 U. S. 75, and *Seaboard Air Line Ry. v. Blackwell*, 244 U. S. 310, do not support the Appellant's contention. In the *Kansas Southern Ry.* case, purporting to act under a state statute, the drainage district ordered the railroad to raise to a specified height its bridges across the Kansas river, a navigable stream. The State Supreme Court, recognizing that the bridges could not be raised without the consent of the Secretary of War, and seeking to do indirectly what could not be done directly, ordered the railroad to clear the channel to the specified height. This would have required the removal of the bridges and would have prohibited and entirely destroyed interstate commerce. It was "not pretended that local welfare needs the removal of the defendant's bridges at the expense of the dominant requirements of commerce with other states, but merely that it would be helped by raising them." 233 U. S. at 79. The state statute was not in fact a police measure.

In *Seaboard Air Line Ry. v. Blackwell*, the state statute which required trains approaching crossings to reduce speed so as to be able to stop if necessary to avoid an accident was held invalid, not by balancing local and national interest, but because to *indiscriminately* require

trains to slow up at *all* crossings, whether or not the crossing presented a hazard greater than the ordinary crossing hazard, "would be practically destructive of the successful operation of interstate passenger trains" and therefore "might not only be a direct burden on interstate commerce." 244 U. S. at 315. There is a clear distinction between a police measure which as an incidental effect *regulates* interstate commerce, and a measure the effect of which is to *prohibit* or *destroy* interstate commerce. The latter *directly* regulates interstate commerce. *Seaboard Air Line Ry. v. Blackwell, supra*, is such a case. And see: *Hannibal & St. J. R. Co. v. Husen*, 95 U. S. 465; *Scholienberger v. Pennsylvania*, 171 U. S. 1; *West v. Kansas Natural Gas Co.*, 221 U. S. 229.

Nor do the numerous other cases cited by Appellant and by the Solicitor General support the Appellant's contention on this proposition. Upon examination it will be found that the basis of the decision upon the validity of the state statute involved was either that *the field was already occupied* by Congress, or that *the state statute was direct regulation and not a police measure.*

Oregon-Washington R. & N. Co. v. Washington, 270 U. S. 87, is typical of the first class of decisions. In that case this Court held the state quarantine statute invalid, not because it invaded the "exclusive" national field, but because Congress, by giving to the Secretary of Agriculture the power to establish quarantines whenever and wherever he found necessary, had occupied the field of quarantines (see 270 U. S. at 99).

Lempke v. Farmers Grain Co., 258 U. S. 50, is typical of the second class of decisions. In the *Lempke* case the state statute was adjudged invalid because this Court held

that, in providing a system which enabled state officials to fix the profits which could be made in dealing with subjects in interstate commerce, the statute directly regulated interstate commerce; and that the police provisions of the state were so "essential and vital" to the general plan of the statute that the statute was inseparable and invalid *in toto*. (258 U. S. at 59, 60.).

The whole argument of Appellant that the Train Limit Law invades the "exclusive national" field is that the burden imposed on interstate commerce by the law *is too great* to permit of local regulation—a legislative question. No *other* argument is made by Appellant and there is no evidence in the record to support the contention that the subject matter of the Train Limit Law is one of national, and not local, concern. The record in fact refutes the Appellant's contention that the subject is of national and not of local concern. The safety of long train operation depends to considerable extent on local conditions, curves, grades, hogbacks, dips, sand storms and the like. It is improbable that the same limit would be made for *flat*, comparatively curveless trackage such as in Kansas, as would be applied where there are hogbacks, dips, curves and grades. Nor is it probable that a limit for Kansas or Arizona would be applicable to terminal operations such as in the Chicago territory.

If the Interstate Commerce Commission had the power and authority to fix train lengths, it would of necessity investigate local conditions. Its determination of the number of cars to be operated in a train would depend to a large extent on local conditions. The accident on the Pennsylvania near Manor, Penn. [Ex. 311, R. 2213], where three were killed and eleven injured when the run-in of slack on a long train, passing through a dip, buckled and threw a

car out of the train in front of a passenger train, was due to a local condition—a dip or sag. The local character of the subject matter under this law is far greater than in the statutes sustained in the *Georgia Headlight* case and in *California v. Thompson, supra.* In the *Georgia Headlight* case, a Federal statute could have taken care of the subject (as it later did) without thought to local conditions. There could be no local condition which would affect the headlight. Likewise, in *California v. Thompson*, a national statute could regulate ticket brokers without consideration of local matters. Federal legislation, however, as to the number of cars in a train would not, in all probability, be uniform throughout the United States but would vary depending on local conditions.

Protection against accidents is a *local* matter or problem. This has been the consistent holding of this Court.

Bradley v. Ohio, 289 U. S. 92, 95;

Smith v. Alabama, 124 U. S. 465, 481, 482;

Atlantic C. L. R. Co. v. Georgia, 234 U. S. 280, 292.

New York, N. H. & H. R. Co. v. New York, 165 U. S. 628, 631.

Protective legislation is in the permissible field under the commerce clause. The burden on interstate commerce involved in such legislation "is one which the Constitution permits because it is the inseparable incident of the exercise of legislative authority, which, under the Constitution, has been left to the states." (303 U. S. at 189.) Congress may determine whether the burdens imposed by the state legislation are too great, and, to protect the national interest in commerce, curtail the state's power. "But that is a legislative not a judicial function, to be

performed, in the light of the Congressional judgment of what is appropriate regulation of interstate commerce, and the extent to which, in that field, state power and local interest should be required to yield to the national authority and interest. * * * courts do not sit as Legislatures, state or national. They cannot act as Congress does when, after weighing all the conflicting interests, state and national, it determines when and how much the state regulatory power shall yield to the larger interests of a national commerce." (303 U. S. at 190.)

"* * * there is a simple remedy; and it cannot be assumed that it will not be readily applied if there be real occasion for it. That remedy does not rest in a denial to the state, in the absence of conflicting Federal action, of its power to protect life and property within its borders, but it does lie in the exercise of the paramount authority of Congress in its control of interstate commerce to establish such regulations as in its judgment may be deemed appropriate and sufficient." (234 U. S. at 292.)

We respectfully submit that, as this Court has stated in *New York, N. H. & H. R. Co. v. New York, supra*, (165 U. S. at 631) the mere grant to Congress of the power to regulate interstate commerce "did not of itself and without legislation by Congress, impair the authority of the states to establish such reasonable regulations as were appropriate for the protection of the health, the lives, and the safety of their people," and that the Arizona Train Limit Law cannot be adjudged unconstitutional unless it is determined that this law is not a safety measure, or that it invades a field already occupied by Congress, or that it violates the 14th Amendment to the Constitution of the United States.

Appellant's Burden Evidence.

In our discussion of this proposition we have not discussed the evidence presented by the Appellant for the purpose of showing the extent of the burden imposed on interstate commerce by the Train Limit Law. As our argument discloses, we do not believe that the extent of the burden is a matter to be considered by the Court in determining the constitutionality of the law. This should not be taken to mean, however, that we concede that the law imposes such burdens as Appellant concludes from the evidence or as the trial court found—or that it imposes any substantial burden. We, in fact, deny that the law imposes any substantial burden on interstate commerce. While we will not go into the burden evidence to any great extent, believing that whether the burden is too great is a legislative, and not judicial, question, we will point out a few parts of the evidence to illustrate why we believe the conclusions of the Appellant and of the trial court, with respect to the extent of the burden, are erroneous.

Exhibits were placed in evidence by the Appellant showing the operating and transportation expenses by years 1922 to 1939, inclusive, for (a) all Class I railroads, (b) some 16 railroads, each separately, and (c) separately, Southern Pacific Company, Pacific Lines, Southern Pacific Company lines in Arizona and S. P. lines in Nevada. The purpose was to show a comparison of trends in the percentage of decrease or improvement in these expenses. From this Appellant argues and the trial court found that the Appellant was unable to achieve the same decrease or percentage of improvement in the territory affected by the Train Limit Law as was achieved in other territory, and this because of the train limit law. The exhibits present no basis for such conclusion.

It is necessary to show one factor only (and there are others) entering into the comparison to show its fallacy. The comparison of percentage of improvement made by Appellant and accepted by the trial court includes the years 1922, 1923 and 1924 in the first four year period. Any comparison with the Southern Pacific Company lines in Arizona which includes the years 1922, 1923 and 1924 is impossible because of the consolidation of the E. P. & S. W. and the Arizona Eastern with the Southern Pacific Company *in November, 1924* [Ex. 149, R. 3025.]. The Southern Pacific Lines in Arizona before consolidation consisted of 399.95 miles of main line trackage and 144.93 miles of branch line trackage, or a total of 544.88 miles of trackage, and after consolidation it consisted of 574.81 miles of main line trackage and 647.98 miles of branch line trackage, or a total of 1222.79 miles of trackage. [Ex. 305, R. 3430.]. The line before consolidation was an entirely different railroad from that after consolidation and could not be taken as a basis for determining the percentage of improvement *on the latter*. If there were no other reason the large amount of branch line added is sufficient to make these expenses in 1922, 1923 and 1924 impossible as a basis for determining the percentage of improvement. By the consolidation 503.05 miles of branch line were added to the 144.93 operated prior. The *higher cost of branch line operations* would *increase* these expenses *after the consolidation* and distort any percentage of improvement based upon the years 1922, 1923 and 1924. Yet these three years constitute practically 75% of the first four year period (1922-1925) *used by the Appellant and the trial court* in determining the percentage of improvement on the *present* Southern Pacific lines in Arizona.

	% Increase Cars Per Train 1939 over 1924	Operating Expense 1925-8	Operating Expense 1936-9	Operating Expense % Decrease	Transportation Expense 1925-8	Transportation Expense 1936-9	Transportation Expense % Decrease

On the page opposite this, using *the first four years following consolidation* (1925-1928) as the first period, we show for the several railroads the percentage of improvement and the percentage of increase in cars per train. We submit that it requires supreme imagination to conclude from the percentages shown *that the Train Limit Law has prevented* the Appellant in the least iota from achieving the same improvement that has been achieved in territory where there is no train limit law. For example consider:

	% increase in cars	% decrease Trans. expense
S.P. Ariz.	....	8.7
S.P. Nev.	44	10.9
C.B. & Q.	4	10.3
Erie	23	10.8

The decrease in operating expense was 2.2% greater in Nevada than in Arizona with a 44% increase in cars per train in Nevada and no increase in Arizona. But with a 40% *greater* increase in cars per train in Nevada than on the C. B. & Q. the decrease in operating expense was only 6% greater. This showing presents no possible basis for holding that the Train Limit Law has prevented the Appellant from achieving the same percentage of improvement achieved in territory where train lengths are not limited. Many factors enter into the improvement in these unit costs. *Increased traffic* will reduce the unit operating cost [R. 202, 203]. Likewise grade and curve elimination will reduce fuel costs and increase speed. Abandonment of costly branch line operations, as has occurred in many sections of the country where trucks have

taken over short hauls, reduces unit costs. These and other factors other than train lengths have brought about the improvement. It will be noticed that the improvement has been greater on *eastern* roads than on western, probably due to a greater increase in traffic on eastern roads. Arizona will be found to compare very favorably with the other *western* roads.

Road	% improvement oper. expense	% improvement trans. expense
Great Northern	16.3	15.8
Northern Pacific	6.9	7.0
Union Pacific	18.8	7.7
Santa Fe System	2.2	.....
S. P. Arizona	18.8	8.5

Mr. Wright of the New York Central testified in substance that gross ton miles per freight train hour is the yardstick for determining efficiency in operations [R. 262, 263]. For the same western railroads the percentage of increase in gross ton miles per freight train hours, 1939 over 1930 (as to this item, no year earlier than 1930 is shown for Arizona in any exhibit) is:

Railroad	Gross ton mile per freight train hour 1930	1939	% increase
Great Northern	28021	35462	26.5
Northern Pacific	24848	32408	30.4
Union Pacific	33267	43006	29.3
Santa Fe System	31115	35471	14.0
S. P.-Arizona	35087	45026	28.3

[Exs. 47, 49, 79, 131, 163; R. 2898, 2900, 2931, 2993, 3037.]

The increase in gross ton miles per freight train hours —the yardstick of efficiency—is seen to be comparable to that on other western roads.

The Appellant contends and the trial court found that Appellant would save approximately $400,000 a year if long trains were operated in Arizona. The contention and finding are based almost entirely, if not entirely, upon the assumed operation or redispatch presented by Appellant. Nine hundred sheets covering the different operations during the period were introduced. Exhibit 198 is a typical sheet [R. 3115]. From this it is seen:

4100 type locomotives were used in the assumed operation while *none* of this type locomotive were used in the *actual*. The tonnages of the trains actually operated were as follows [R. 2225]:

(Tonnage given is in M's or 1000 pounds)

Train	Out of Terminal	Into Terminal
Y310	6356 M's	6406 M's
Y311	5850 "	5850
CY412	5840 "	5135
C413	6150 "	6150
C414	6550 "	6550
CY414	5200 "	5535
C415	6630 "	6630
Y312	6058 "	6058
Y313	6114 "	6114

The tonnage rating of a 4100 type locomotive, Tucson to Lordsburg, is 6220 M's [R. 2220]. In the *assumed operation* a 4100 type locomotive handled train Y312 with

6150 M's from *Tucson to Lordsburg without a helper*. The tonnage of *six* of the nine *actual* trains shown in exhibit 198 was *6150* M's or less, and all six could have been handled by a 4100 type locomotive in actual operations without helpers. They are trains ~~Y311, Y312~~, Y313, ~~CY412, C413~~ and CY414. *All six* used 5000 type engines and *all* required helpers. *Had* 4100 type locomotives been used, *no* helper would have been needed. Thus by merely changing the type of engine used *all these helpers* used in the actual operations would be eliminated. The other three trains in the actual operations were double headers, using 5000 type locomotives. By using 4100 type locomotives helpers would be required for only a short period. (Benson to Dragoon, 21.4 miles; San Simon to Steins, 14.7 miles. Compare engine ratings, page 15, Tucson Division, time table, exhibit 175 [R. 1284].) The savings as to *all nine* of the trains was due to the use of 4100 or A.C. type locomotives in the *assumed* and *not in the actual*. Eleven helper engines *were used* in the actual operations. Not over four would have been necessary had the 4100 or A.C. type locomotive been used on the trains.

In addition to the savings in wages of enginemen and the saving on fuel, there would have been savings in repairs and maintenance of the unnecessary helper engines; savings in time due to the heavier engine handling the train with greater speed. Also the larger tender on the 4100 type engine enables it to go farther before taking water and so have few delays. Time would be gained by not having to couple helpers in and out. These things show that the purported cost of compliance of $400,000 per year is not due to the Train Limit Law but is due to

the change in power, to the use of 4100 or A.C. type engines in the assumed operation and not in the actual.

Again, Appellant's claimed fuel savings (accepted by the trial court in its findings) is based primarily upon Exhibit 249 [R. 3258]. The exhibit purports to show the fuel consumption and percentage of decrease in pounds of fuel per 1000 gross ton miles on the Southern Pacific lines, Tucson Division in Arizona, Salt Lake Division in Nevada, and the Pacific Lines, 1924 to 1939, inclusive. The percentage decrease for the period is shown on page 1 of the exhibit as follows:

Tucson Division	Pacific Lines	Salt Lake Division
12.62%	22.38%	26.06%

That these percentages are fallacious and without any logical basis whatsoever must immediately appear upon examination of sheet 2 of the exhibit [R. 3259]. From this it will be seen that on the Tucson Division in 1924 the fuel used per 1000 gross ton miles was 101 pounds, while in 1939 it was 108 pounds. Thus the exhibit shows an *increase* over the period, *not* a decrease. The reason for this is that from 1924 to 1930 the Tucson Division covered only the territory between Yuma, Arizona, and Tucson, Arizona. In 1930 the Division was extended east to Lordsburg, New Mexico. Since 1930 the Tucson Division has included the territory from Yuma to Lordsburg [R. 1212]. In 1929 on the Tucson Division the fuel per 1000 gross ton miles was 98 pounds. With the extension of the division to Lordsburg, New Mexico, the fuel per 1000 gross ton miles used on the division became 117 pounds—an increase of 19 pounds per 1000 gross ton miles. One outstanding reason for this is the grades and

curves on the territory between Tucson and Lordsburg, shown on the profile maps [Exs. 309, 310, R. 2210]. Also the branch line operation from Bowie, Arizona, to Globe and Miami, Arizona, which came into the division with the extension to Lordsburg [Ex. 154, R. 3028].

The percentages shown by Appellant on sheet 1 of Exhibit 249 were accomplished by determining the percentage of decrease on each division 1928-1929 over 1924-1925 and 1938-1939 over 1930-1931. These two percentages were *added together* and the total taken as representing the percentage of improvement over the entire period. With respect to the Tucson Division the percentages added were for *two different and distinct territories*—for the first period the territory Yuma to Tucson and for the second period the territory Yuma to Lordsburg. This could not possibly show the improvement on the *Yuma-Lordsburg* territory for the entire period.

Also, in the first period the percentage on the Salt Lake Division is colored by reason of the joint track agreement entered into August 1, 1924, between the Southern Pacific and the Western Pacific [R. 2155]. By this agreement a considerable mileage of single track operations, with the necessary stopping for meets and passes, were eliminated in Nevada. The effect of this is seen in the decrease in pounds of fuel per gross ton miles in the years 1925 (7 pounds) and 1926 (9 pounds) [R. 3261]. The total decrease 1927-1939, inclusive, was 11 pounds per 1000 gross ton miles as compared to the 16 pounds decrease in the two years 1925 and 1926. During the 12-year period 1927 to 1939 the decrease in pounds per 1000 gross ton miles in no sense corresponded with the increase in cars per train. If anything, the contrary appears. In 1927

the cars per train was 65.8 and the use of fuel was 81 pounds per 1000 gross ton miles [R. 3261]. In 1932 the cars per train had increased to 73.4 but the fuel *had also increased* to 85 pounds per 1000 gross ton miles. In 1934 with 79.7 cars per train the fuel used was 80 pounds per gross ton mile. But in 1937 with 73.8 cars per train, a *decrease* of 5.9 cars per train, the fuel remained at 80 pounds per 1000 gross ton mile. In 1938 and 1939 with cars per train 78.6 and 81.2, respectively, the fuel used was 75 and 73 pounds per 1000 gross ton miles respectively. However, in other exhibits will be found other factors which brought about the decreases in these two years. For example, from Exhibit 164, item 1 [R. 3038], it will be seen that the miles of line operated in freight service on the Salt Lake Division in 1936 was 1230.17 miles, while in 1938 it was 1091.09 and 1939 it was 1078.32—a total reduction of 151.85. Unquestionably this reduction in mileage was by reason of the abandonment of *unprofitable branch line mileage*. The abandonment of such mileage would have a material effect in decreasing pounds of fuel per 1000 gross ton miles.

Also it will be noted that the average tractive power on the Salt Lake Division was increased from 55162 tons in 1936 to 62423 in 1939, an increase of 7261 tons. The use of these heavier locomotives, such as the 4100 or A.C. type, was material aid in the decrease in fuel per 1000 gross ton miles—first by eliminating the necessity of many helper engines, and, second, by reason of the larger water capacity of their tender they can run further without the necessity of stopping for water.

We submit that the evidence presented by Appellant presents no logical basis whatsoever for the conclusions

and findings as to savings in fuel as shown on Exhibit 250 [R. 3262]. The percentage of decrease (10%) in fuel in the redispatch used in this exhibit, derived from Exhibit 249, is utterly without logical basis.

We have presented these examples of what we believe are erroneous conclusions and findings drawn from the evidence with respect to the purported burden on interstate commerce resulting from the Train Limit Law (and we could give many others) in order, as we have said, that we may not be understood to concede the burdens claimed by the Appellant, or that any substantial burden results from the Train Limit Law. However, as we have argued, we believe the question of the extent of the burden—whether it is too great—is for Congress and not for the Court.

2. Extra-territorial Effect and Burden on Interstate Commerce Are One and the Same Thing. (Reply to Assignment of Error No. 2.)

The Appellant contends that the Arizona Train Limit Law is invalid because its necessary effect is to regulate and control the length and consist of interstate trains extra-territorially, that is, beyond the boundaries of the State of Arizona.

While appearing to present a new and distinct question, the legal question presented under this assignment of error is, in fact, identical with or included in the question presented under Assignment of Error No. 1. To state that a necessary effect of the statute is to regulate extra-territorially is only to contend, by different language, that the statute imposed a *direct* burden on interstate commerce. It would seem that wherever a burden is imposed on interstate commerce it affects that commerce as a whole, and

there is always an extra-territorial effect. But as we have shown by our argument under Assignment of Error No. 1, the burden imposed by a state statute enacted under the police power reserved to the states and in a field not occupied by Congress, if otherwise valid, is valid under the Commerce Clause because "the burden is one which the Constitution permits because it is an inseparable incident of the exercise of a legislative authority which, under the Constitution, has been left to the states." (303 U. S. at p. 190.) (*South Carolina Hy. Dept. v. Barnwell Bros., supra.*) The protection of the national interest in the commerce is in Congress, which may determine whether the burden imposed by a state statute is too great and "by legislation designed to secure uniformity * * * curtail to some extent the state's regulatory power." This Court has in numerous decisions held contrary to Appellant's contention.

State statutes regulating the operation of motor vehicles are typical. In *South Carolina Hy. Dept. v. Barnwell Bros., supra*, a statute prohibiting the use on the highways of South Carolina of motor trucks exceeding 90 inches in width or 20,000 pounds in weight with load, was in question; in *Mauer v. Hamilton*, 309 U. S. 598, a Pennsylvania statute prohibited the operation on the state highway of any vehicle carrying any other vehicle above the cab of the carrier vehicle or over the head of the operator of the carrier vehicle; and in *Sproles v. Binford*, 286 U. S. 374, the state statute limited the net load of trucks operating over the highway. In these and similar cases the same contention as to extra-territorial effect was made as the Appellant presents here. It is probable that the requirements of those laws as to the width, the length, the

weight, the number of trailers, or as to vehicles over the cab of the carrier-vehicle impose a far greater extra-territorial regulation and burden on interstate commerce than the Arizona Train Limit Law because with different laws in various states the carrier is required to have his equipment constructed to meet the *most restrictive* law or change equipment at each state line. But this Court has consistently held that the burden imposed by such statutes is indirect and is incidental to the exercise of the state's police power.

Likewise the same argument has been made in numerous cases before this Court involving the question of the validity of state laws regulating railroad transportation, and the decisions of the Court refute Appellant's argument here. In *New York, N. H. & H. R. Co. v. New York, supra*, the statute regulated the method of heating passenger cars; in *Atlantic Coast Lines R. Co. v. Georgia*, 234 U. S. 280, the state statute required the use of electric headlights; in *Chicago, R. I. & P. R. Co. v. Arkansas*, 219 U. S. 453, and in *Missouri P. R. Co. v. Norwood*, 283 U. S. 249, the operation of a train with less than a designated number in the crew was prohibited; and in *Terminal R. Assn. v. Bro. of R. Trainmen*, 318 U. S. 1, the operation of trains without a caboose was prohibited. In these and similar cases the same contention as Appellant here makes was made as to the extra-territorial effect of the law and this Court held *against* the contention.

In *New York, N. H. & H. R. Co. v. New York*, 165 U. S. 628 (commonly known as the New York car-heating case), the extra-territorial effect of the New York car-heating statute was argued to the Court:

> "Counsel for the railroad suggests that a conflict between state regulations in respect of the heating of

passenger cars used in interstate commerce would make safe and rapid transportation impossible; that to stop an express train on its way from New York to Boston at the Connecticut line in order that passengers may leave the cars heated as required by New York, and get into other cars heated in a different mode in conformity with the laws of Connecticut, and then at the Massachusetts line to get into cars heated by still another mode as required by the laws of that Commonwealth, would be a hardship on travel that could not be endured." (165 U. S. at 632.)

The Court answered by saying:

"These possible inconveniences cannot affect the question of power in each State to make such reasonable regulations for the safety of passengers on interstate trains as in its judgment, all things considered, is appropriate and effective. Inconveniences of this character cannot be avoided so long as each State has plenary authority within its territorial limits to provide for the safety of the public, according to its own views of necessity and public policy, *and so long as Congress deems it wise not to establish regulations on the subject that would displace any inconsistent regulations of the States covering the same ground.*" (Emphasis ours.) (165 U. S. at 632-633.)

In *Atlantic Coast Line v. Georgia*, 234 U. S. 280, the same argument was advanced in objection to a state statute which required an electric headlight of a certain type on each locomotive, including locomotives engaged in interstate commerce.

"It is argued that if Georgia may prescribe an electric headlight, other States through which the road runs may require headlights of a different sort; that,

for example, some may demand the use of acetylene and that others may require oil; and that, if state requirements conflict, it will be necessary to carry additional apparatus and to make various adjustments at state lines which would delay and inconvenience interstate traffic." (234 U. S. at 290.)

Completely answering this the Court said:

"If there is a conflict in such local regulations, by which interstate commerce may be inconvenienced—if there appears to be need of standardization of safety appliances and of providing rules of operation which will govern the entire interstate road irrespective of state boundaries—there is a simple remedy; and it cannot be assumed that it will not be readily applied if there be real occasion for it. That remedy does not rest in a denial to the State, in the absence of conflicting Federal action of its power to protect life and property within its borders, but it does lie in the exercise of the paramount authority of Congress in its control of interstate commerce to establish such regulations as in its judgment may be deemed appropriate and sufficient. *Congress, when it pleases, may give the rule and make the standard to be observed on the interstate highway.*" (Emphasis ours.) (234 U. S. at 292.)

The recent opinion in *Terminal R. Assn. v. Bro. of R. Trainmen, supra*, is typical of these decisions and would seem to be conclusive against Appellant's contention (318 U. S. 8, 9):

"* * * Appellant contends, and we assume however, that there do not exist, and that it is not reasonably practicable to install, facilities for taking on and dropping off cabooses at the points where the

trains cross the state line; and that the practical consequence of the order is that if cabooses are to be used in Illinois on runs of the second sort they must also be used at least as far as the nearest switching point in Missouri.

"As to both classes of runs; the effect of the order is in some measure to retard and increase the cost of movements in interstate commerce. This is not to say, however, that the order is necessarily invalid. In the absence of controlling federal legislation this Court has sustained a wide variety of state regulations of railroad trains moving in interstate commerce having such effect. * * *

"If lack of facilities at the state line requires as a practical matter that in order to provide cabooses in Illinois appellant must also provide them for some distance in Missouri, that fact does not preclude Illinois from regulating the operation to the limits of its territory. * * *"

3. **The Train Limit Law Does Not Invade the Field Already Occupied by Congress by Sections 1 and 9 of the Safety Appliance Act or by Section 25, Part I, of the Interstate Commerce Act.** (Reply to Assignment of Error No. 5.)

It is, of course, recognized that a state law which invades a field already occupied by Congress is void and of no effect.

The Appellant under Assignment of Error No. 5 contends that the Train Limit Law invades a field already occupied by Sections 1 and 9 of the Safety Appliance Act (45 U. S. C. 1 and 9) and by Section 25, Part I, of the Interstate Commerce Act (49 U. S. C. 25). This contention is without merit for a number of reasons.

A. The Fields Occupied by the Federal Statutes Are Different From That Occupied by the Arizona Law.

(1) THE FIELD OCCUPIED BY THE SAFETY APPLIANCE ACT.

The Safety Appliance Act (45 U. S. C. 1-16), as the name implies, deals with the subject of mechanical appliances which are required in the operation of locomotives, cars and trains by railroads engaged in interstate commerce. Section 1 requires the use of (a) power driving-wheel brakes on locomotives and appliances on locomotives for operating the train-brake system, and (b) power brakes on cars in a train. Section 9 provides for the minimum number and "association" of cars in a train which shall be equipped with power brakes. Other sections of the Act prescribe the use of automatic couplers (sec. 2); grab irons (sec. 4); standard drawbars (sec. 5); and sill steps, hand brakes, ladders, running boards and hand holds, as designated by the Interstate Commerce Commission (secs. 11-12).[1]

The preamble of Section 1,[2] referred to in *Johnson v. Southern Pac. Co.*, 196 U. S. 1, 15, as declaring the intention of Congress, reads:

> "An act to promote the safety of employees and travelers upon railroads *by compelling common carriers engaged in interstate commerce to equip* their

---

[1] Comparable statutes not a part of the Safety Appliance Act include the Safety Ash Pan Act (45 U. S. C. 17-22); the Boiler Inspection Act (45 U. S. C. 22-34); and the provisions of Sec. 25 of Part I of the Interstate Commerce Act (49 U. S. C. 25), relating to signal systems, train control devices, etc. which are considered under our next heading.

[2] (Act of Mar. 2, 1893, c. 196, 27 Stat. 531).

cars with automatic couplers and continuous brakes and their locomotives with driving-wheel brakes, and for other purposes." (Emphasis supplied.)

In *United States v. State of California*, 297 U. S. 175, 185, this Court stated:

"* * * The Federal Safety Appliance Act is remedial, to protect employees and the public from injury *because of defective railway appliances*, Swinson v. Chicago, St. Paul, M. & O. Ry. Co., 294 U. S. 529; Fairport, P. & E. R. Co. v. Meredith, 292 U. S. 589, 594; Johnson v. Southern Pacific Co., 196 U. S. 1, 17, and to safeguard interstate commerce itself from obstruction and injury *due to defective appliances* upon locomotives and cars used on the highways of interstate commerce. * * *." (Emphasis supplied.)

Thus it clearly appears that the purpose of the Act is the promotion of safety by the compulsory use of specified mechanical devices. The field occupied is that of *regulating designated equipment* of locomotives, cars and trains, specifically, as to Sections 1 and 9, the power brake mechanism. *Cf. Napier v. Atlantic Coast Line R. Co.*, 272 U. S. 605, 607.

This construction of the Safety Appliance Act is confirmed by its legislative history. The bill from which the Act of March 2, 1893 was derived was H. R. 9350, introduced in the 52nd Congress, 1st Session. The report of the House Committee on Interstate and Foreign Commerce on this bill[1] traces the history of the movement to

[1] House Report No. 1678; 52nd Cong. 1st Sess.

relieve the perils due to the use of hand brakes and non-uniform and unsafe couplers. After stating the nature and frequency of the accidents to which railway employees were exposed the report continues (p. 3):

"REMEDY SUGGESTED.

"It is the judgment of this committee that all cars and locomotives should be equipped with automatic couplers, obviating the necessity of men going between the cars, and continuous train brakes that can be operated from the locomotive and dispense with the use of men on the tops of the cars; that the locomotive should be provided with power driving wheels rendering them easy of control."

The Senate Committee's report on the bill is to the same effect.[2]

The language of Sec. 1 which is relied on by Appellant came into the bill by Senate amendment. In explaining the amendment to the Senate, Senator Cullom, who was in charge of the bill, stated (24 Cong. Rec. 1273):

"I will state that the first section of the amendment reported by the Committee as a substitute for the House bill simply provides that after the first of January, 1895, it shall be unlawful for a common carrier engaged in interstate commerce by railroad to use on its lines locomotive engines in moving interstate traffic not equipped with power driving-wheel brakes and appliances for operating the trains, etc., the section requiring only a sufficient number of cars to be so equipped as will enable the engineer to control the train.

[2]Senate Report No. 1049, 52nd Cong. 1st Sess.

"There is nothing in the section that has any reference to the Interstate Commerce Commission or to any board outside in determining anything about it. The naked proposition is that it shall be unlawful after a given date to run locomotives not equipped with power brakes, or to run any train in interstate traffic which has not a sufficient number of cars in it so equipped with power brakes that the engineer can control it."

The amendment of March 2, 1903 (32 Stat. 943) was designed "to make more clear and effective" the provisions of the 1893 Act.[1] One of its purposes was to "make certain that which was uncertain" in the requirements of section 1 relating to the use and amount of power or train brakes. *United States v. Baltimore and O. R. Co.*, 176 Fed. 114, 116. It accomplished this purpose by including in the Act what is now section 9, providing, among other things, that when any train is operated with power or train brakes not less than 50 percent of the cars in such train shall have their brakes used and operated by the engineer (authority being given the Interstate Commerce Commission to increase the minimum percentage). The amendment thus was a restatement of the amount or proportion of power brakes required to be used.

Section 1 is now to be read and construed with the modifying and explanatory act of 1903. *United States v. Pere Marquette R. Co.*, 211 Fed. 220, 223. When so construed it is clear that the subject of the provisions of the Act here under discussion is the regulation and use of the brake appliances.

---

[1] House Report No. 15144, 57th Cong. 1st Sess.

(2) THE FIELD OCCUPIED BY SECTION 25 OF PART I OF THE INTERSTATE COMMERCE ACT.

Sub-section (b) of section 25 (49 U. S. C. 25(b)) reads:

> "* * * the commission may, after investigation, if found necessary in the public interest, order any carrier * * * to install the block signal system; interlocking, automatic train stop, train control, and/or cab-signal devices and/or other similar appliances, methods, and systems intended to promote the safety of railroad operation, which comply with specifications and requirements prescribed by the commission, * * *."

The preamble of the Act of August 26, 1937 (c. 818, 50 Stat. 835) amending Sec. 25 to its present content, reads:

> "AN ACT TO require common carriers by railroad to install and maintain certain appliances, methods, and systems intended to promote the safety of employees and travelers on railroads, and for other purposes."

As in the case of the Safety Appliance Act, the field carved out by the provisions of this section is specific. It is the requirement and maintenance of the mechanical equipment thus designated. As Appellant concedes (Br. Vol. I, p. 221), under settled rules of statutory construction, the words "other similar appliances, methods, and systems" refer to devices of the same general nature as those specifically named. *Cf. Missouri Pac. R. Co. v. Norwood*, 283 U. S. 249; 257.

The legislative history of Sec. 25 supports this construction. The section as first enacted (Sec. 441 of the Transportation Act, 1920; 41 Stat. 498) dealt with the requirement of "automatic train-stop or train-control devices or other safety devices". The committee reports upon the measure show that what Congress had in mind was a provision which would hasten the use of these mechanical devices which had been under experimentation for many years. Thus the report of the House Committee on H. R. 10453 state:[1]

"AUTOMATIC TRAIN CONTROL.

"Section 439 gives the commission after investigation authority to order any carrier by railroad to install automatic train-stop or train-control devices, which comply with specifications and requirements prescribed by the commission. Automatic train-control devices have passed the experimental stage and in the interest of the public as well as the safety of employees, your committee believes that some action should be taken by Congress which would hasten the installation of such safety devices. * * *"

The Conference Report on H. R. 10453[2] which reported out the section in the form in which it became law stated, in the explanation of the Managers on behalf of the House, that the conference bill contained the House provision respecting the requirement of train-stop or control devices, adding a similar power in the commission as to "other safety devices".

---

[1]House Report No. 456, 66th Cong. 1st Sess., p. 22.

[2]House Report No. 650, 66th Cong. 2nd Sess., p. 70.

There had been in effect since 1906 a statute (45 U.S.C. 35) which empowered the Commission to investigate and report upon the use and necessity for block signal systems and appliances for the automatic control of railway trains, and since 1908 an additional statute (45 U. S. C. 36) which authorized the Commission to investigate, test experimentally, and report upon the use and need of "any appliances or systems intended to promote the safety of railway operation which may be furnished in completed shape to such commission for such investigation and test * * *."

It was after years of such investigation and experience that the section under consideration was adopted, and it is in this setting that the statute is to be understood and construed.[1]

Section 25 was amended to its present content by the Act of August 26, 1937 (50 Stat. 835). This amendment extended the authority of the Commission to include block signal systems, interlocking devices and cab-signal systems. Again the committee reports on the amendment speak only of mechanical devices and systems as the subject of the legislation.[2]

Reference to the full text of the section demonstrates that it is intended to occupy only the field of requiring and regulating the specified mechanical devices. Sub-

And see also 1 *Sharfman, The Interstate Commerce Commission*, p.275ff., for an explanation of the circumstances surrounding the enactment of the section.

[2]Senate Report No. 245, 75th Cong. 1st Sess.; House Report No. 456, 75th Cong. 1st Sess.

secs. (c), (d) and (e) implement sub-sec. (a). Sub-sec. (c) requires each railroad to file with the commission its rules for the installation, inspection, maintenance and repair of the systems, devices and appliances covered by this section. Sub-sec. (d) authorizes the commission to inspect and test them; and Sub-sec. (e), stating the requirement of obedience to commission orders, provides that it shall be unlawful for any carrier to use such sysetems, etc. unless such *apparatus* is in proper condition and safe to operate.

There is no evidence that the Interstate Commerce Commission understands that this section affords it jurisdiction to do more than to regulate the designated appliances. Its conception of the powers conferred upon it is stated in the *Power Brake Investigation Case*, 91 I. C. C. 481, (quoted at pp. 221-2, Vol. I, of Appellant's brief) as follows:

> "This is a proceeding instituted by us on our own motion under Section 26 [now Section 25] of the Interstate Commerce Act, which authorizes us, after investigation, to *order the installation of automatic train-stop or train-control devices, or other safety devices*, which comply with specifications and requirements prescribed by us, * * *." (Emphasis ours.)

Nowhere in that report, or in the subsequent reports in that proceeding (see Appendix to Appellant's Brief, Vol. I) is there any finding, order, or requirement made respecting the regulation of train lengths. We understand that the Commission has never entered any order limiting the number of cars in a train, or made any investigation or recommendation concerning the latter subject.

(3) THE FIELD OCCUPIED BY THE ARIZONA LAW.

This field is, of course, the number of cars which may be run in a train. It does not regulate the mechanical equipment or appurtenances upon cars, locomotives or trains. Its purpose is to protect against hazards due to the number of cars in, or the length of, trains. These hazards include, among others, those due to "slack" and slack "action", including those wherein the functioning of the brakes is not a factor; dangers wherein employees are prevented from properly giving or receiving signals or communications or from observing defects in the train; hazards caused by loss of efficiency of employees due to fear of danger and to increased responsibility and difficulty in the performance of duty.

B. No Intention Can Be Attributed to Congress in Enacting the Federal Statutes to Occupy the Field of Regulating Train Lengths.

It is true that the purpose of both the federal and state statutes here under considerations is to promote safety. Assuming for the moment the field of safety to be one generic field of regulation, it is of course recognized that Congress may limit its occupation to only a part of such field, and thus leave the remainder open for action by a state. *Savage v. Jones*, 225 U. S. 501, 533; *Kelly v. Washington*, 302 U. S. 1, 10. Under this rule, it is clear that Congress, in selecting the field of safety appliances and equipment as the object of regulation, has occupied only the portion of the general field of safety regulation thus selected.

The specific nature of the requirement of these federal laws emphasizes the intent to confine their application to

the subjects designated. *Atlantic Coast Line v. Georgia*, 234 U. S. 280. And the very detail in which the subjects of the federal regulation have been specified precludes the statutes extention to other subjects by implication. *Cf. Peoria Ry. Co. v. United States*, 263 U. S. 528, 534. We suggest that *Atlantic Coast Line v. Georgia* applies with special force here. Even though the device required by the Georgia law, the electric headlight, was a mechanical appliance, this Court held that Congress by enacting the Safety Appliance Act had not intended or decided to legislate with respect to headlights, and that the state was free to legislate on the subject. And see also *International etc. R. Co. v. Railroad Comm. of Texas*, 281 S. W. 1084 (affirmed 275 U. S. 503) where, prior to the amendment of present Sec. 25 of Part I of the Interstate Commerce Act to cover interlocking devices, it was held that the right of a state to require such devices had not been ousted by this section. *A fortiori* where, as in our case, the matters dealt with by the state and federal statutes are so different in nature, the intention of Congress to leave the former free of regulation appears clear. In this connection, it may be noted that in *Terminal R. Assn. v. Brotherhood of R. Trainmen*, 318 U. S. 1, 4, this Court expressed its understanding that neither the Safety Appliance Act nor the Interstate Commerce Act by themselves and unimplemented by Commission action lay down any requirement respecting the use of cabooses on the runs in question, saying that at least in the absence of Comission action these Acts do not themselves preclude the state order. It was added that the court found it unnecessary to decide what might be the extent of the Commission's power under such Acts. In our case, as in this one, the

Commission has not made any order on the subject covered by the state statute.

From the analysis made above it is quite clear that the federal and state statutes occupy different fields. They accomplish their regulation by wholly different means, and operate on entirely different objects. The situation here is the reverse of that presented in the *Napier* case where the Court, in holding that federal and state statutes occupied the same field, observed that:

> "The federal and the state statutes are directed to the same subject—the equipment of locomotives. They operate upon the same object." (272 U. S. at p. 612.)

In view of the differences thus shown, we submit that the federal statutes do not occupy the field covered by the Arizona law, and that no intention can be attributed to Congress to exclude or displace the state act. This is particularly plain when the federal statutes are construed in accord with the recognized rule that the intention of Congress to exclude or supersede state legislation—particularly where the state measure has been enacted to preserve public safety—must be definitely expressed and clearly manifested, and is not to be lightly inferred.

Mauer v. Hamilton, 309 U. S. 598, 614;

H. P. Welch Co. v. New Hampshire, 306 U. S. 79, 85, and cases there cited;

Missouri Pac. R. Co. v. Norwood, 283 U. S. 249, 257;

Cf. Cloverleaf Butter Co. v. Patterson, 315 U. S. 148, 156.

C. There Is No Conflict Between the Federal Statutes and the Arizona Law.

The test of whether there is conflict between federal and state statutes is an important aid in resolving the point under consideration. Unless such conflict is shown, the sovereign power of the state to enact legislation under its reserved police power will be sustained. *Parker v. Brown*, 317 U. S. 341, 359. *Cf. Cloverleaf Butter Co. v. Patterson, supra.* The yardstick to be used in determining the question of such conflict is stated by this Court as follows:

> "May not the statutory provisions stand without obstructing or embarrassing the execution of the act of Congress? This question must, of course, be determined with reference to the settled rule that, a statute enacted in execution of a reserved power of the state is not to be regarded as inconsistent with an act of Congress passed in the execution of a clear power under the Constitution, unless *the repugnance or conflict is so direct and positive that the two acts cannot be reconciled or stand together.*" (Emphasis ours.)
>
> *Missouri etc. R. Co. v. Haber*, 169 U. S. 613, 623.

> "The principle is thoroughly established that the exercise *by the state of its police power, which would be valid if not superseded by federal action, is superseded only where the repugnance or conflict is so 'direct and positive' that the two acts cannot be 'reconciled or consistently stand together.'* (Emphasis ours.)
>
> *Kelly v. Washington*, 302 U. S. 1, 10.

In applying this yardstick in the instant case, a consideration of the history of these several statutes would seem to be sufficient to show the fallacy of the Appellant's contention.

Section 1 of the Safety Appliance Act was enacted by Congress in 1893, Section 9 in 1903, and Section 25, Part I, of the Interstate Commerce Act in 1920. The Train Limit Law was enacted by a vote of the people of Arizona in 1912.

Continuously since the enactment of the Train Limit Law in 1912, the Arizona Train Limit Law and Sections 1 and 9 have stood together in full force and effect. Continuously since 1912, Sections 1 and 9 of the Safety Appliance Act have been fully and completely enforced in Arizona. Brake appliances and changes in brake appliances have been approved by the Interstate Commerce Commission and increases in the percentage of cars in a train required to be operated by power brakes have been ordered by the commission. Continuously since 1912, the railroads have complied in Arizona, just as elsewhere, with the provisions and requirements of said Sections 1 and 9. At no time has the Train Limit Law in any manner or to any extent obstructed or embarrassed the enforcement or execution of said Sections 1 and 9. Not the slightest difference has resulted by reason of the Train Limit Law in the execution and enforcement of Sections 1 and 9 in Arizona from their enforcement and execution in other states.

Likewise, Section 25, Part I, of the Interstate Commerce Act, since its enactment in 1920, and the Train Limit Law have stood together. Section 25 of the Interstate Commerce Act has been fully and completely en-

forced in Arizona, just as elsewhere, and complied with by the railroads. At no time has the Train Limit Law obstructed or embarrassed the enforcement or execution of said Section 25.

The fact that the Train Limit Law has operated side by side with Sections 1 and 9 of the Safety Appliance Act for approximately thirty years, and side by side with Section 25, Part I, of the Interstate Commerce Act for approximately twenty years without in the least iota obstructing or embarrassing the enforcement or execution of these federal statutes, or either of them, constitutes conclusive evidence, we believe, under the decisions of this Court cited *supra*, that the Train Limit Law does not invade a field already occupied by these federal statutes.

There is, of course, a plain reason why these statutes operate without conflict. The Safety Appliance Act and requirements issued under Section 25 regulate the brake equipment to be used on a train, not the number of cars therein. The Arizona law regulates the number of cars without reference to brake equipment. Thus the Federal statutes require adequate power brakes (*i. e.*, power brakes on a specified proportion of the cars in a train) without regard to the length of the train. This requirement is the *same* whether *5 or 100* cars be operated in a train. Indeed, a carrier may have as many cars in a train as it pleases, be it 5 or 500, so long as the brake equipment meets the federal standards.

Appellant's contention (brief, Vol. I, p. 215 *et seq.*) that Section 1 of the Safety Appliance Act should be construed to regulate the length of trains is without substance. This contention is based upon the language of the section that

no train shall be run "that has not a sufficient number of cars in it so equipped with power or train brakes that the engineer * * * can control its speed without requiring brakemen to use the common hand brake for that purpose.

This provision should be construed in the light of its purpose. It was enacted to obviate the dangers involved in the use of hand brakes. *New York Central R. Co. v. United States*, 265 U. S. 41, 44-5; *United States v. Grand Rapids & I. Ry.*, 244 Fed. 609, 612; *Virginian Ry. Co. v. United States*, 223 Fed. 748, 751. This purpose was accomplished *by requiring the substitution of an improved and safe mechanical device* (power brakes) for an unsafe or defective one (hand brakes). *United States v. State of California*, 297 U. S. 175, 185. The regulation does not go to the number of cars that might be run in a train, but goes only to the number which shall be equipped with power brakes, *i. e.*, a number sufficient to make the use of hand brakes unnecessary.

It is undoubtedly true, as Appellant states, that there must be some limit to the effectiveness of any air brake. And when that limit is passed the power brake provision of the Safety Appliance Act may tend to regulate the number of cars which may be operated. But if such is the effect of this provision, it certainly does not show the "positive or direct" conflict or repugnance which is required to supersede the state police measure. *Kelly v. Washington*, quoted *supra*. Indeed, there is no conflict at all, because the practical limit of the effectiveness of air brakes may operate as a natural law without disturbing the enforcement of the state law, and *vice versa*. At most this effect is but the indirect and incidental result of the

regulation of the braking equipment required by the federal law. The carrier may have as many cars in the train as it pleases, so long as the brake equipment meets the requirement of this section.

This, we submit, is the holding of the courts in *Virginian Ry. Co. v. U. S.*, 223 Fed. 748; *New York C. R. Co. v. U. S.*, 265 U. S. 41; *U. S. v. Great Northern R. Co.*, 229 Fed. 927; *U. S. v. Grand R. & I. R. Co.*, 244 Fed. 609; and *Pennsylvania Co. v. U. S.*, 241 Fed. 824.

The Appellant, in an endeavor to create conflict between the state and federal statutes, argues that the purpose and effect of the Train Limit Law is to regulate with respect to the brakes used in train operations, and that Appellee has admitted or recognized this by the introduction of evidence with respect to air brakes and their operation. (Br., Vol. I, p. 233, *et seq.*) This argument is ingenious but fallacious.

This argument assumes that the hazards resulting from slack action, and particularly from slack action resulting from the use of air brakes, is the only hazard protected against by the Train Limit Law. In our argument upon the Safety Evidence, beginning at page 93 of this brief (to which we refer to save repetition), we show that in addition to the hazard due to slack action the Train Limit Law protects against hazards in no way related to slack action or to the brake equipment on a train. We also show with respect to slack action that serious slack action accidents occur at times when the brakes are not being operated and therefore without any relation or connection to the brakes. Where a train is operated in territory where there are hog-backs and dips, the head-end of the train may be on an upgrade which retards its speed while the rear-end

is on a downgrade, causing the slack to run-in. Or the speed of the head-end of a train may be reduced by the resistance of a curve and the run-in of the slack from the rear-end cause an accident without the brakes being touched. Example of these two types of accidents are found in item 45, Record, page 3329, and item 36, Record, page 3328. A more complete discussion of these and similar accidents appears beginning at page 102 of this brief, to which we refer to save repetition.

The Appellant overlooks the purpose of Appellee's evidence respecting air brakes. Appellant contended below, and is contending here (Br., Vol. I, p. 270 *et seq.*), that the Train Limit Law is invalid because of changes in conditions since its enactment. It was to meet this contention and show that the hazard resulting from slack action in long trains has not been removed by improvement in air brakes, that the evidence as to air brakes and their operation was presented by the Appellee. It requires only a reading of the Train Limit Law to see that it in no way regulates or has relation to air brakes or other appliances. It limits the length of freight trains to 70 cars and passenger trains to 14 cars, *regardless of the type or character of brakes used, or their efficiency or inefficiency*. Certainly there is no regulation of brake equipment or other appliance there.

That the Safety Appliance Act and Sec. 25 of the Interstate Commerce Act do not conflict with the state law may be further demonstrated by the fact that the former neither provide for, or by implication reach, the kind of regulation contemplated by the latter or the results accomplished by it. Assume the Interstate Commerce Commission in an investigation should find and determine that

freight trains with more than 70 cars and passenger trains with more than 14 cars cannot be operated safely. Where in the Safety Appliance Act or in Sec. 25 of the Interstate Commerce Act is there any power or authority given to the Commission *to order that no trains be operated with the number of cars in excess of the limit fixed by the Commission?* Or suppose a Commission investigation shows a territory or stretch of track with a sag or dip; that the brakes are never required, nor could they be used, in operating over this territory; that there is usually slack action in trains passing across this dip due to the slack running in from the rear as the speed of the head-end of the train is slowed down coming up out of the dip; that accidents with many casualties are *frequent* on *long* trains but rarely, if ever, occur on *short* trains [compare item 45, R. 3329—the I. C. C. report of this accident on the Pennsylvania R. R. at Manor, Pa., is a part of Ex. 311]. Since the brakes are not used in operating over the territory, the accidents were not due in any respect to the brake equipment—nor to any other appliance. It would seem that the only logical finding that the Commission could make would be that the accidents were caused by the severity of the slack action due to the length of the train. An order requiring certain brake equipment would not remedy the situation because the brakes were not involved in the accident. The only order which would prevent the accidents and resulting casualties would be an order limiting the length of trains operated over the territory. *But where would the Commission find the power or authority to enter such an order?* Certainly not under the Safety Appliance Act or Sec. 25 of the Interstate Commerce Act because they grant to the Commission *only power and authority to order the use of specified standards*

of brakes or other appliances. The situations may be multiplied wherein factors not involving the brake mechanism or any mechanical appliance may require regulation of train lengths in the interest of safety. No power or authority is given the Commission in these situations or any other to limit the number of cars that may be operated in a train.

In summary, the Arizona Train Limit Law, which Appellant contends invades a field already occupied by Congress by reason of the aforesaid federal statutes, deals *only* with the *number* of cars permitted in trains operated in the State of Arizona. It in no way deals with, relates to or is concerned with the brake equipment, signal system, train control, or any other appliance used in the operation of the trains. The Arizona law is violated only when a train is operated within the state with more cars than the law permits. There can be no possible repugnance or conflict between the Arizona Train Limit Law and the federal statutes named because the Train Limit Law can in no possible way obstruct or embarrass the enforcement or execution of those statutes, or any of them, and because the state statute and the federal statutes deal with entirely different and unconnected subjects. State regulation of the number of cars in a train does not and cannot, in any possible way, affect or conflict with the federal regulation of the brake equipment, signal system, train control or other appliances used.

D. Assuming Arguendo That Section 25 of Part I of the Interstate Commerce Act Contemplates Authority in the Commission to Regulate Train Lengths, Occupancy of This Field Has Not Occurred.

Where Congress delegates to an administrative agency authority to regulate in a given field, two questions arise in determining whether state authority is thereby ousted: (1) whether the agency has acted in pursuance of such authority, and (2) whether Congress intended the legislation to occupy the field unimplemented by Commission action. This rule, among others, governs the applicability of Sec. 25 of Part I of the Interstate Commerce Act in the instant case.

It will be conceded, we take it, that the Commission has made no order limiting train lengths under this section.

As to the intention of Congress to occupy the field in the absence of administrative action, we believe (again assuming administrative authority to have been conferred) the situation here to be like that in *H. P. Welch Co. v. New Hampshire*, 306 U. S. 79. There this Court decided that Congress did not intend the state safety measure to be nullified before the federal agency had prescribed regulations on the matter. As one of the factors making clear the intention of Congress, the Court pointed out that the federal statute (Sec. 204(a) of the Motor Carrier Act), although imposing upon the Commission the duty to "regulate", *merely authorized* it to establish reasonable requirements with respect to the matter dealt with by the state law, *viz.*, maximum hours of service of drivers of motor vehicles. (306 U. S. at p. 84.)

In our case, all Section 25(b) does is to authorize the Commission to order the use of the designated devices—

and this only after investigation discloses the necessity therefore. The section does not go as far as the Motor Carrier Act, for it does not impose a "duty" to "regulate", as does the latter Act.[1] Moreover, the authority of the Commission to regulate train lengths (assumed *arguendo*) would have to be based upon a construction of the statutory language which, to say the least, is far-fetched and not readily ascertained from the language itself. Thus, where regulation is so plainly dependent upon prior investigation and the exercise of administrative discretion as a condition precedent to its imposition, and also upon a strained construction of the statutory language, we submit that it cannot be said that Congress had manifested its clear intention to displace the Arizona law by the mere enactment of the enabling legislation set forth in Sec. 25.

4. The Arizona Law Is Not Unconstitutional Because of Claimed Burden Upon, or Interference With, Interstate Commerce, or Because of Alleged Unreasonableness as a Safety Regulation.

Assignments of Error 3, 4 and 6 charge, in substance, that the Supreme Court of the State of Arizona erred in failing to hold the Train Limit Law

(3 and 4) unconstitutional and in violation of the Commerce Clause because its necessary and inevitable effect is to interfere with, delay, obstruct and regulate, directly, substantially and reasonably the operation and movement of interstate trains and to impose direct, substantial and

---

[1] It will be observed that in the *Welch Co.* case such duty to regulate was not considered to be of controlling significance in view of the permissive nature of the authority to act.

unreasonable financial burdens upon the interstate commerce carried on by Appellant.

(6) in violation of the Commerce Clause and the Due Process Clause of the Fourteenth Amendment because it operates arbitrarily and unreasonably to deprive Appellant of its property without due process of law and bears no reasonable relation to health or safety.

We are considering these assignments together because in the final analysis each presents the identically same questions.

These assignments of error present two propositions, namely:

1. The extent of the burden imposed by the Train Limit Law is so great that, notwithstanding it has a rational relation to safety, it imposes an unreasonable burden on interstate commerce in violation of the Commerce Clause and of the Fourteenth Amendment to the Constitution.

2. The Train Limit Law has no rational relation to safety.

The Appellee contends:

1. The *extent* of the burden on interstate commerce, if any, by reason of the Train Limit Law may not be considered by the Court in determining the reasonableness of the law.

2. The Train Limit Law has a rational relation to and basis in safety and is therefore a proper exercise of the state's police power and is constitutional.

A. The Extent of the Burden on Interstate Commerce, if Any, by Reason of the Train Limit Law May Not Be Considered by the Court in Determining the Reasonableness of the Law.

In considering this proposition *it must be assumed* that the Train Limit Law has a rational relation to safety. If the law has no rational relation to safety, the burden on interstate commerce resulting by reason of the law is, as we have conceded in our discussion of Assignment of Error I, *direct* and the law is unconstitutional because it is a *direct* regulation of interstate commerce. Where the state regulation is *direct* the extent of the burden, whether it is great or small, has no bearing upon the question of the constitutionality of the law. The law is unconstitutional *regardless* of the extent of the burden on interstate commerce.

A substantial part of the evidence presented by the Appellant in the trial court was presented for the purpose of showing the burden imposed upon interstate commerce by the Train Limit Law. As we have heretofore pointed out (p. 42, *supra*), we differ greatly with Appellant concerning the conclusions to be drawn from the evidence as to the extent of the burden shown, the cost of compliance, the interference with operations and the like. However, we present no argument or discussion, other than heretofore presented, on this question for the reason that we believe that, under the decisions of this Court, while the evidence was admissible to show *a burden* on interstate commerce resulted from the operation of the law, the extent of the burden is *not* a question or element to be considered by the Court in determining the constitutionality of the Train Limit Law.

(a) Under the Commerce Clause.

The question as to whether *under the Commerce Clause*, in determining the validity of a state statute enacted under the state's police power, the consideration of the extent of the burden imposed on interstate commerce—whether it *is too great* with relation to the national interest in commerce—is a legislative or judicial function has been fully discussed in our argument concerning the so-called "exclusive national field" of regulation of interstate commerce. The Appellant's contention here that the extent of the burden may be considered by the Court, in determining the "reasonableness" of the state law under the Commerce Clause, is merely a repetition, dressed in different clothes, of Appellant's argument as to the "exclusive national field" of regulation of interstate commerce. The reasonableness, in this respect, of a state police statute *under the Commerce Clause* can only be measured by its effect on interstate commerce—whether the burden imposed on interstate commerce is *too great*. The determination of that question is, as we have pointed out, a legislative, and not a judicial, function.

(b) Under the Fourteenth Amendment.

In considering the constitutionality of state police statute under the Fourteenth Amendment, the cost of compliance or the extent of the burden resulting from the state regulation *becomes a matter of judicial consideration only* when a method of regulation is shown, other than that adopted by the law in question, which will accomplish the identical object or purpose of the law in question. This applies to both the Commerce Clause and the Fourteenth Amendment.

In *Erie R. R. Co. v. B'r'd of Comm.*, 254 U. S. 394, 410, in sustaining the constitutionality of a state law requiring a separation of grades where a railroad crossed a highway, this Court said:

> "Being places to which the public is invited, and that it necessarily frequents, the state, in the care of which this interest is, and from which, ultimately, the railroads derive their right to occupy the land, has a constitutional right to insist that they shall not be made dangerous to the public, *whatever may be the cost to the parties introducing the danger.* That is one of the most obvious cases of the police power, or to put the same proposition in another form, the authority of the railroads to project their moving masses across thoroughfares must be taken to be subject to the implied limitation that it may be cut down whenever and so far as the safety of the public requires. It is said that if the same requirement were made for the other grade crossings of the road it would soon be bankrupt. That the states might be so foolish as to kill a goose that lays golden eggs for them, has no bearing on their constitutional rights. If it reasonably can be said that safety requires the change, it is for them to say whether they will insist upon it, and neither prospective bankruptcy nor engagement in interstate commerce can take away this fundamental right of the sovereign of the soil." (Emphasis ours.)

In *Lehigh V. R. Co. v. B'r'd of Comm.*, 278 U. S. 24, 34, the italicized part of the above quotation was modified by the following statement:

> "This is not to be construed as meaning that danger to the public will justify great expenditures, unrea-

sonable burdening the railroad, *when less expenditure can reasonably accomplish the object of the improvements and avoid the danger.*" (Emphasis ours.)

In *South Carolina Hy. Dept. v. Barnwell, Bros., supra,* the Court said (303 U. S. at 190):

"In the absence of such legislation (Congressional legislation) the judicial function under the Commerce Clause * * * as well as the Fourteenth Amendment, stops with the inquiry whether the state legislature in adopting regulations such as the present *has acted within its province, and whether the means of regulation chosen are reasonably adapted to the end sought* * * *." (Parenthesis and emphasis ours.)

In other words, the holding of the Court in the *Erie R. R. Co.* case, that cost of compliance may not be considered by the Court in determining the constitutionality of state police power regulation, was modified *only* with respect to situations where it was shown that the object of the state regulation in question could be accomplished at less expense *by other methods* of regulation.

And see:

Nashville C. & St. L. R. Co. v. White, 278 U. S. 456;

Missouri P. R. Co. v. Omaha, 235 U. S. 121;

C. & R. Co. v. Tranbarger, 238 U. S. 67.

No such situation is shown in the record herein. The object of the Train Limit Law is to protect against the dangers which are incident to the increase in the length of a train. No method, other than that adopted by the Train Limit Law, has been shown which will accomplish this object, and the exception or modification stated in the *Lehigh V. R. Co.* case has no application here.

(c) Under the Commerce Clause and the Fourteenth Amendment.

When the constitutionality of a state statute enacted under the state's police power is in question, in the absence of Congressional legislation on the subject, "the judicial function under the commerce clause * * * as well as the Fourteenth Amendment, stops with the inquiry whether the state legislature in adopting regulations such as the present has acted within its province, and whether the means of regulation chosen are reasonably adapted to the end sought." (303 U. S. at 190.)

That the Legislature and the people of the State of Arizona acted within their province in adopting the Train Limit Law has been established by the decisions of this Court. Paraphrasing the language of Mr. Chief Justice Stone in *South Carolina Hy. Dept. v. Barnwell Bros.*, 303 U. S. at 190. Here the first inquiry has already been resolved by the decisions of this Court that a state may impose nondiscriminatory restrictions with respect to the operation of railroads engaged in interstate commerce as a safety measure. Among the cases which have so resolved are the following:

Smith v. Alabama, 124 U. S. 465;

Nashville C. & St. L. R. Co. v. Alabama, 128 U. S. 96;

New York, N. H. & H. R. Co. v. New York, 165 U. S. 628;

Chicago, R. I. & P. R. Co. v. Arkansas, 219 U. S. 453;

St. Louis M. & S. R. Co. v. Arkansas, 240 U. S. 518;

Hennington v. Georgia, 163 U. S. 299;
Missouri P. R. Co. v. Norwood, 283 U. S. 249;
Erie R. R. Co. v. B'd of Comm., 254 U. S. 394;
Lehigh V. R. Co. v. B'd of Comm., 278 U. S. 24;
Missouri K. & T. R. Co. v. Haber, 169 U. S. 613;
Atlantic C. L. R. Co. v. Georgia, 234 U. S. 280;
Terminal R. Ass'n. v. Bro. of R. T., 318 U. S. 1.

In resolving the second inquiry "courts do not sit as Legislatures, either state or national. They cannot act as Congress does when, after weighing all the conflicting interests, state and national, it determines when and how much the state regulatory power shall yield to the larger interests of a national commerce. * * * a court is not called upon as are state Legislatures, to determine what, in its judgment, is the most suitable restriction to be applied of those that are possible, or to choose that one which in its opinion is best adapted to all the diverse interests affected. (Citing cases.) When the action of a Legislature is within the scope of its power, fairly debatable questions as to its reasonableness, wisdom and propriety are not for the determination of the courts, but for the legislative body on which rests the duty and responsibility of decision. (Citing many cases.) * * * This is equally the case when the legislative power is one which may legitimately place an incidental burden on interstate commerce. It is not any the less a legislative power committed to the states because it affects interstate commerce, and courts are not any the more entitled, because interstate commerce is affected, to substitute their own for the legislative judgment. (Citing many cases.)" (303 U. S. at 190, 191.)

The Solicitor General suggests that the test as to whether or not the state police statute is reasonably adapted to the end sought is not the same under the Commerce Clause as under the Fourteenth Amendment. We have found no decision by this Court which supports this suggestion, except in the situation referred to in *Lehigh Valley R. Co. v. Bd. of Comm., supra.* On the contrary, in those cases where the validity of a state police statute has been brought in question under both the Commerce Clause and the Fourteenth Amendment, as in *South Carolina Hy. Dept. v. Barnwell Bros., supra, one and the same test* has been applied under the Commerce Clause and under the Fourteenth Amendment in determining whether the statute was "reasonably adapted to the end sought."

The test or yardstick to be used by the Court has been variously stated in the decisions of the Court.

> "Being a legislative judgment it is presumed to be supported by facts known to the legislature unless facts judicially known or proved precluded that possibility. Hence, in reviewing the present determination, we examine the record *not to see whether the findings of the court below are supported by the evidence, but to ascertain upon the whole record whether it is possible to say that the legislative choice is without rational basis.*" (Emphasis ours.)
>
> *South Carolina Hy. Dept. v. Barnwell Bros.*, 303 U. S. at 191.

> "Hence, in passing on the validity of the present classification, it is not the province of a court to hear and examine evidence for the purpose of deciding

again a question which the legislature has already decided. *Its function is only to determine whether it is possible to say that the legislative decision is without rational basis.*" (Emphasis ours.)

Clark v. Paul Gray, 306 U. S. 583, 594.

"The legislature is, in the first instance the judge of what is necessary for the public welfare, and a judicial review of its judgment is limited. *The earnest conflict of serious opinion* does not suffice to bring it within the range of judicial cognizance." (Emphasis ours.)

Erie R. Co. v. Williams, 233 U. S. 685, 699.

"* * * The extent to which, as means, they conduce to that end, the degree of their efficiency, the closeness of their relation to the end sought to be attained, are matters addressed to the judgment of the legislature, and not to that of the courts. *It is enough if it can be seen that in any degree, or under any reasonably conceivable circumstances, there is an actual relation between the means and the end.*" (Emphasis ours.)

Stephenson v. Binford, 287 U. S. 251, 272.

And see:

Nashville etc. R. Co. v. White, 278 U. S. 456;

McLean v. Arkansas, 211 U. S. 539;

Tanner v. Little, 240 U. S. 369;

Chicago, Burlington & Quincy Railroad Co. v. McGuire, 219 U. S. 549;

Arizona Copper Co. v. Hammer, 250 U. S. 400;

Erie R. Co. v. Williams, 233 U. S. 685;

Standard Oil Co. v. Marysville, 279 U. S. 582;
Stephenson v. Binford, 287 U. S. 521;
Gant v. Oklahoma City, 289 U. S. 98;
Bayside Fish Flour Co. v. Gentry, 297 U. S. 422.

In all these cases where the constitutionality of a state *police measure* was in question under both the Commerce Clause and the Fourteenth Amendment *one and the same test* was applied in determining whether the state statute was reasonably adapted to the end sought. We have found no case to the contrary. And we can see no logical reason why, in determining whether a state police measure is reasonably adapted to the ends sought, one test should be used under one constitutional provision and another test be used under another constitutional provision. It is difficult to understand how a state statute could be held reasonably adapted to the purpose of safety under the Commerce Clause and the same statute held not reasonably adapted to that purpose under the Fourteenth Amendment —or vice versa.

Under both the Commerce Clause and the Fourteenth Amendment to the Constitution the question as to whether or not the burdens upon interstate commerce resulting from state police power regulation are too great is legislative and for Congress, which may protect the national interest by legislation curtailing the state's power.

We believe under the decisions of this Court hereinbefore cited, the determination of the validity of the Train Limit Law rests *entirely* upon correctness of the contention that the law has a rational basis in safety. If the contention that the law has a rational basis in safety is supported by the record, the law is valid. If this conten

tion is not supported by the record, then the law is a direct regulation of interstate commerce and invalid.

Before presenting our discussion of the record, and replying to argument presented beginning page 270, Volume I, of Appellant's brief, we refer to certain further legal principles, often stated by this Court, to be applied when determining whether or not state regulation of interstate commerce is valid as a proper exercise of the state's police power.

It is not essential to the validity of a state statute enacted under the police power that the purpose of the statute be stated. The necessary effect of the statute and not its stated purpose determines its validity.

> "The question whether a state law deprives a party of rights secured by the Federal Constitution depends not upon how it is characterized, but upon its practical operation and effect.
>
> *Mountain Timber Co. v. Washington*, 243 U. S. 219, 237.

And see:

Standard Oil Co. v. Graves, 249 U. S. 389;

Ludwig v. Western Union Co., 216 U. S. 146, 162.

It is presumed that the legislature intended to act within the scope of its lawful authority.

Ex parte Young, 209 U. S. 123, 165-166;

Erie R. Co. v. Williams, 233 U. S. 685, 699;

Mountain Timber Co. v. Washington, 243 U. S. 219, 237-238;

United States v. Butler, 297 U. S. 1, 67.

While a law valid when enacted may become invalid by reason of changed conditions.

United States v. Carolene Products Co., 304 U. S. 144, 153,

every legislative enactment is presumed to be valid and constitutional, and the burden of proof is on those who seek to overthrow it. One who relies on changed conditions to invalidate a statute has the burden of proving that by reason of the changed conditions it is now possible to say, upon the whole record, "that the legislative choice is without rational basis."

South Carolina Hy. Dept. v. Barnwell Bros., 303 U. S. 177, 192;

Ex parte Young, supra;

Erie R. Co. v. Williams, supra;

Mountain Timber Co. v. Washington, supra.

The legislative judgment is presumed to be supported by facts known to it unless facts judicially known or proved preclude that possibility.

Clark v. Paul Gray, 306 U. S. 583, 594;

South Carolina Hy. Dept. v. Barnwell Bros., supra.

The appellant urges that in determining the validity of the Train Limit Law the Court may give consideration to the "common belief" that the law is unreasonable, and that this "common belief" is shown by the refusal of Congress and all but four states to enact a train limit law, and by the Interstate Commerce Commission Order No. 85, suspending all train limit laws during the war.

The refusal of a state legislature to enact such law is no indication of a "common belief" the law is unreason-

able. State legislatures determine state policy based upon *conditions within the state.* The most that can be said concerning the refusal of a state legislature to enact such a law is that the legislature considered it unnecessary in *that particular state.* And the measure may have prevailed in the lower house of the legislature and have been defeated by one vote in the senate, in which event the "common belief" would seem to be that the law was reasonable and desirable, although not enacted. As Appellant states (Appellant's Br., Vol. I, p. 299), employees through their organizations have appeared in support of proposed measures. But likewise representatives of the management have appeared in opposition. Legislative action or inaction is no indication of "common belief." As this Court said in *Adkins v. Children's Hospital*, 261 U. S. 525, 559-560:

> "We are asked, upon the one hand, to consider the fact that several states have adopted similar statutes, and we are invited, upon the other hand, to give weight to the fact that three times as many states, presumably as well informed and as anxious to promote the health and morals of the people, have refrained from enacting such legislation. We have also been furnished with a large number of printed opinions approving the policy of the minimum wage, and our own reading has disclosed a large number to the contrary. These are all proper enough for the consideration of the law-making bodies, since their tendency is to establish the desirability or undesirability of the legislation; *but they reflect no legitimate light upon the question of its validity, and that is what we are called upon to decide. The elucidation of that question cannot be aided by counting heads.*" (Emphasis ours.)

Likewise, the most that can be said concerning the refusal of Congress to pass a train limit law is that it considered a *national law* limiting the number of cars in a train was unnecessary. It is no indication of a "common belief" that *local or state regulation* was unnecessary or unreasonable.

Neither has the Interstate Commerce Commission by Service Order No. 85 indicated a belief on the part of the commission that state train limit laws are unnecessary or unreasonable. Service Order No. 85 in part provides [Par. 95,2, App. p. 2]:

> "This order, being based upon conditions of war emergency, shall not constitute a precedent for peacetime operations."

This indicates a belief that, while train limit laws should give way to the war emergency, they are a reasonable and proper regulation in peacetime operations.

"Belief" imports knowledge or information, at least to a degree sufficient to cause or form an opinion. It imports thought and consideration with respect to the matter in question. Very few people other than those connected with the operation of trains, give a thought to the manner in which trains are operated or whether one type of operation is more dangerous than another. They have no knowledge or information concerning the effect of train lengths on train operations, and therefore give no thought to and have no beliefs concerning the reasonableness of laws limiting train lengths. Of those connected with train operations, the *greater* number (the employees) believe the Train Limit Law is reasonable, proper and necessary. "Common belief", if there is such in relation to the Train Limit Law, *is in favor of the law.*

B. The Arizona Train Limit Law Has a Rational Relation to Safety.

The purpose and effect of the Arizona Train Limit Law is to protect against the dangers incident to the increase in the number of cars in trains operated. These dangers are real, and the Train Limit has a real basis in safety and is a proper exercise of the state's police power.

(a) Slack Action Accidents and Injuries Related to Train Lengths.

One of the dangers to both railroad employees and the public in train operations is slack action. Slack is the "play" or movement between cars. Slack action is the accumulated effect of that movement throughout the train in train operation. The total slack between two cars averages approximately seven and one-half inches. Slack is necessary because a rigid train could not turn curves, go over hills or through dips, and because locomotives could not start a rigid train of considerable length. Each additional car in a train increases the slack in the train by approximately seven and one-half inches.

The air-brake instructions printed and published by the Appellant and those printed and published by the Atchison, Topeka & Santa Fe are in evidence. Excerpts from these instructions are printed in the record [R. 3445-3461]. These instructions definitely recognize the danger in train operations from slack action and definitely recognize that those dangers *increase as the number of cars in a train increases*. We quote from these (emphasis ours):

> "Smooth train handling depends on the *ability to control the slack* and how to prevent it from running in or out harshly. Where so controlled, no draft gear in fair to good condition will be damaged. *Slack*

action cannot be prevented, but by acquiring knowledge of the various causes for it, and exercising forethought in the use of steam, train brakes, independent engine brake and sand it can be controlled, even to the extent of avoiding further injury to damaged draft gear. The heavier the engine and *the longer the train the greater is the care required.*

"When slack runs in or out one part of the train gradually attains a lower speed than the other and the shock is the result of draft gears having suddenly to make the speed uniform on the instant slack is all in or out. How heavy the shock will be depends mainly on *the difference in speed that must instantly be made uniform and on the weight that must suddenly be altered in speed.*" [Ex. 319, S. P. Air Brake Book, pp. 8-9; R. 3454. Ex. 152, Santa Fe Green Book, pp. 32-33; R. 3452.]

"At how low speeds brakes can be released without liability of damages depends on how heavily they are applied, the amount of main reservoir pressure, *the length of train*, whether slack is in or out, lightly or heavily, and on whether track conditions (sags, humps and curves) favor releasing. Engineers must exercise judgment in this, but taking all chances on the side of stopping." [Ex. 152, Green Book, p. 35; R. 1099.]

"Shocks are caused by the *difference in holding power* and speed throughout the train and to *consequent running of* the slack. The *longer the train* the greater may these differences become." [R. 3447. Ex. 152, Santa Fe Green Book, p. 17; R. 1099.]

"It follows from the foregoing that the nearer brakes are applied to full service application the more

promptly will they commence to release. Also that as a light reduction results in less excess, it is more liable to be followed by brakes failing to release. Where made from standard pressure it is also likely to be followed by overcharging in the attempt to insure release. *This becomes more pronounced the longer the train.* Therefore, it is undesirable as a general rule to attempt a release following a light reduction from standard pressure." [Ex. 152, Santa Fe Green Book, p. 28; R. 3447.]

"The difference in grade over which the train may be passing when the brakes are applied—for example, one portion of the train may be on an ascending grade, when the grade would assist the brake in stopping the cars; and another portion of the train may be on a descending grade, in which case the grade would oppose the effort of the brake to stop the cars. Such a condition requires care and judgment on the part of the engineman as regards the time and manner of operating the brake to prevent as far as possible severe shocks and strains due to the action of the slack in the train." [Ex. 152, Santa Fe Green Book, p. 16; R. 3446.]

"Shocks are caused by the difference in holding power and speed throughout the train and to consequent running of the slack. The *longer the train* the greater may these differences become. If the brakes are applied while the slack is stretched it will run toward the engine and the lower the speed and the heavier the application, the greater will be the shock, while if the brakes are released on a moving train the slack will run out unless some means is at hand for preventing it (see 'ET Equipment' and 'K Triple Valve') and will result in pulling strains on the draft

gear which will be aggravated by low speed and heavy brake pipe reduction. Parts of the train being on different *grades at the same time*, and car loading are among the causes for one portion of the train slowing down more rapidly than another. These are conditions that have to be met, and enginemen and trainmen are expected to understand them and exercise such judgment as will prevent damaging shocks." [Ex. 152, Santa Fe Green Book, p. 16; R. 3446.]

While these instructions refer to damage to equipment, certainly a shock sufficient to damage equipment would be dangerous to persons riding thereon—and very apt to "damage" such persons.

"Smooth train handling depends upon the ability to control the slack * * *. The heavier the engine and *the longer the train* the greater is the care required." "Shocks are caused by the difference in holding power and speed throughout the train and to consequent running of the slack. The *longer the train* the greater may these differences become." These statements definitely and distinctly recognize the danger from slack action in train operations and that this danger increases with the increase in the length of the train. The longer the train, the greater may be the differences in holding power and speed throughout the train, and the consequent running of slack, *and the greater the shock*. The longer the train the greater the care required because the greater the difficulty in controlling the slack—and so the greater the danger. These railroads in their instructions to their employees are calling attention to and warning the employees with respect to the very dangers against which the purpose of the Train Limit Law is to protect.

While it may be true that only 6% of *all* casualties to *all* employees on duty in *all* classes of service are due to slack action, it must be remembered that: 1. *All casualties*, of course, includes sand in the eye, pinched finger, accidents while the train is standing, and the like. 2. *All classes of service* includes *passenger* trains, yard operations and the like. Of course, it is clear from the record that by far the greater number of these accidents occur in road freight train operations. And, finally, all employees *excludes* accidents to the *public* caused by slack action. When these factors are considered the percentage shown has little significance.

The existence of these dangers from slack action is definitely and conclusively shown by the evidence. The trial court found that slack action accidents are "of comparatively infrequent occurrence" and a minor factor in determining the validity of the Train Limit Law. The fallacy of this is seen from the following facts taken from exhibits placed in evidence by the Appellant.

Exhibits 274 and 275 [R. 3351 and 3364] give the details of *all* casualties to *all* classes of *employees* on duty sustained in train and train service accidents, road freight train operations reportable to the Interstate Commerce Commission, years 1923 to 1939, inclusive, in the states of Arizona and Nevada, respectively.

For Nevada this detail for the twelve years shown, 1929 to 1940, inclusive, appears in the Record at pages 3367 to 3370, inclusive. From this detail it will be seen that during this period there were in Nevada 121 train and train service accidents to such employees with 134 casualties. Forty-eight, or 39.6%, of the 121 accidents were *slack action* accidents, and 61, or 45.7%, of the 134 casual-

ties occurred *in slack action accidents*. That is, approximately *two out of every five* accidents during the period were *slack action accidents*. Twenty-seven of the 121 accidents occurred while the trains were standing and one was sand or a particle in the eye. These 28 accidents could have no possible relation to the length of the train. Slack action can occur only when a train is in motion, and should be considered only in relation to accidents which occur while a train is in motion. Eliminating the standing and sand in the eye accident, there were in Nevada during this period, 93 train and train service accidents, to employees on duty, on trains *in motion*, with 106 casualties. Forty-eight, or 51.6%, of such accidents, and 61, or 57.5%, of the casualties *on trains in motion* were from *slack action*. In other words, the train and train service accidents *on trains in motion* to employees on duty resulting from slack action were greater than *from all other causes combined*. It can hardly be said, then, that slack action accidents are "of comparatively infrequent occurrence" or are "a minor factor."

In Arizona during the same period [R. 3350 to 3363, incl.] there was a total of 281 train and train service accidents to employees on duty, with 290 casualties. Of this total, 103 of the accidents were on standing trains and 15 were sand or a particle in the eye. On trains *in motion* there were 163 train and train service accidents to employees on duty, with 172 casualties. Of these 55, or 33.7%, of the accidents and 62, or 36%, of the casualties were from *slack action*.

In the two states there was a total of 256 train and train service accidents on *trains in motion*, employees on duty, and a total of 278 casualties. One hundred and three, or 40%, of these accidents, and 123, or 44%, of

the casualties were the result of slack action. Certainly then such accidents constitute more than a minor factor in considering safety.

These exhibits show conclusively that the frequency of slack action accidents and the severity of resulting injuries are directly related to the number of cars in a train.

(b) Slack Action Accidents Are Directly Related to the Number of Cars in a Train.

In our discussion of slack action accidents we are not to be understood as contending that such accidents do not occur on trains with less than 70 cars. They can, and sometimes do, occur on trains of 40, 30, 20 or even less, cars. But slack action accidents on these short trains are unusual. The amount of the slack in these trains is such that it can usually be controlled or, even if not controlled, there is not enough slack in the train to cause a shock sufficient to bring about an accident. But as cars are added, adding slack to the train, *both* the *difficulty in controlling* the slack and the *severity of the shock* resulting from slack action increase. As we have pointed out heretofore, both the Appellant, Southern Pacific Company, and Atchison, Topeka and Santa Fe Railroad Company in their air brake instruction books warn employees that as the length of the train increases *greater care* is required to handle the slack. In other words, as the length of the train increases, the difficulty in handling slack increases—and so the probability of and danger from slack action increases. The Train Limit Law in its relation to slack action is based upon this very proposition (stated by the railroads themselves) that as the length of the train increases the care required to control the slack increases (and therefore the

danger from slack action) but says that with over seventy cars in the train the care required becomes too great for safe operation. It is based upon the railroads' own statement of a fact. The soundness of it is borne out by the following facts taken from exhibits 274 and 275 [R. 3356-3363, 3367-3370, all inclusive] and for the same period just considered.

In Nevada for the period 1929-1940, inclusive, there were 48 slack action accidents. Forty-seven were on trains of over 70 cars. *Only one* was on a train of 70 cars or under, a 69-car train.

In Arizona, where the 70 car limit applied, during the same period there were 55 slack action accidents. One was on a train of over 70 cars. Forty-two were on trains of 65 cars or over. Only 13 were on trains of less than 65 cars.

In the two states combined there were 103 slack action accidents. Forty-eight were on trains of over 70 cars. Ninety, or 87% were on trains of 65 cars or more. There can hardly be any doubt from these figures that as the length of a train increases, the care required, and the difficulty, in handling slack becomes so great that a real hazard from slack action accidents arises and a rational reason exists for limiting the number of cars in a train.

(c) The Severity of Injuries Resulting From Slack Action Have a Direct Relation to the Number of Cars in a Train.

These same exhibits show a further sound and rational basis for the train limit law—the increased severity of the injuries received from slack action accidents as the number of cars in the train increases.

In Nevada during this period there were, as we have stated, 48 slack action accidents with 61 casualties. Forty-seven of the accidents and 60 of the casualties were on trains of *over* 70 cars. One was on a train of 69 cars. Two of the 60 men injured on the trains over 70 cars were *permanently* injured. The other 58 had a total disability of 2830 days, or an average disability of 48.8 days. The one man injured on the 69 car train was disabled for 20 days.

In Arizona there were 55 slack action accidents with 62 casualties. One accident and two casualties were on a train of over 70 cars, one man being *permanently* disabled and the other disabled for 80 days. In the other 54 accidents (42 being on trains of 65 or more cars) 60 men were injured, one *permanently* (on a 68 car train), the other 59 having a total disability of 1373 days, or an average disability of 23.3 days.

For both states combined there were:

On trains of *over* 70 cars:

48 slack action accidents

62 casualties with 3 *permanently* disabled and the other 59 having an aggregate disability of 2910 days, and an average of 49.3 days.

On trains of 70 cars or less:

55 slack action accidents (42 on trains of 65 cars or more)

61 casualties with one permanently disabled (on a 68 car train) and the other 60 having an aggregate disability of 1393 days and an average of 23.2 days.

Three were *permanently* injured on *long* trains against *one* on trains of 70 cars or less (and the one was on a 68 car train).

Where the disability was not permanent, the period of disability of those injured on *long trains* was more than twice that of those injured on trains of 70 cars or less. Certainly this shows that the probability of permanent or serious injury is greater on trains of over 70 cars. Surely this is a rational basis for limit the length of a train to 70 cars.

(d) THE DANGER TO THE PUBLIC FROM SLACK ACTION HAS A DIRECT RELATION TO THE NUMBER OF CARS IN A TRAIN.

We have heretofore discussed only the danger from slack action to railroad employees on duty. Slack action on long trains also presents a real danger to the traveling public, especially in parallel track territory or in yards where passenger trains are passed. As the length of the train increases, the amount of slack, with the weight of the train, develops slack action of sufficient force to *buckle* a car, throwing it out of the train onto and fouling parallel track. If a passenger train is approaching on the parallel track a wreck with death and injury to passengers and employees results. The Interstate Commerce Commission, report of an accident on the Pennsylvania Railroad on March 27, 1936, near Manor, Pa. [Ex. 311; R. 3329, item 45, Ex. 270] describes such an accident.

As the 101 car freight train westbound was approaching Manor a refrigerator car was buckled out of the middle of the train, due to severe slack action, fouling the adjacent track directly in front of an approaching eastbound passenger train, wrecking the passenger train. *Three* persons were *killed* and *eleven* were *injured*.

Considerable force is required to buckle a car and throw it out of a train. This type of accident demonstrates the tremendous force and shock developed by the slack and weight of a long train.

"Shocks are caused by the difference in holding power and speed throughout the train and to the consequent running of slack. The *longer the train* the greater may these differences become." (Emphasis ours.) [R. 3446, Santa Fe Green Book.]

"The critical time in regard to train damage from brake applications is while slack is running in or out, as trains are not pulled in two, or *buckled* from steady pulling or pushing strains * * *." (Emphasis ours.) [R. 2287; S. P. Air Brake Instructions, page 12, Ex. 319.]

"When slack runs in or out one part of the train gradually attains a lower speed than the other and the shock is the result of draft gears having suddenly to make the speed uniform on the instant slack is all in or out. *How heavy the shock will be* depends mainly on the difference in *speed* that must instantly be made uniform and on the *weight* that must suddenly be altered in speed." (Emphasis ours.) [R. 3454, S. P. Air Brake Instructions.]

The danger from cars being thrown on parallel tracks due to slack action buckling cars in long trains in recognized by the Director of Safety of the Interstate Commerce Commission in his report of an accident on the Western Maryland Railway at Oldtown, Maryland, February 9, 1937, where it is stated [Ex. 311, R. 2213, page 15 of report]:

"The break-in-two and consequent buckling of *long trains*, such as twice occurred in this train, is a

hazard which *calls for remedial action* on any line, but the hazard to life and property is *greatly increased* when such defective cars are hauled on double or multiple-track lines with trains travelling on adjacent parallel tracks." (Emphasis ours.)

In this accident the slack action was the result of a break-in-two due to a low coupler. But we submit that the severity of the slack action, sufficient to buckle a car, was due to the length of the train. (162 cars.)

That this danger from cars buckled and thrown out of a train due to slack action is one incident and peculiar to long trains is shown as a fact by Exhibit 270 [R 3310] introduced in evidence by the Appellant.

Exhibit 270 is a tabulation of data shown in summaries of the accident investigation reports of the Interstate Commerce Commission, years 1928 to 1939, inclusive, in so far as the reports relate to accidents involving freight trains, including mixed trains handling freight cars. During the 12 year period a total of 561 such accidents are shown as investigated by the I. C. C. The 33 accidents shown in Class III and 95 of the 100 accidents shown in Class IV, or a total of 128 accidents, have no relation whatever to train lengths.

For example, the accidents shown in Class III were due to collapsed bridges, broken rails, defective switches, poor track and the like. Ninety-five of the 100 accidents shown in Class IV were caused by wash-outs, rocks or other objects on the track, switches or tracks being tampered with, land slides and the like. In these accidents there can be no possible relation between the cause of the accident and the length of the train involved. In five

of the accidents in Class IV (items 36, 45, 47, 72 and 75) the cause or contributing cause was the slack action in the train. Four were on trains of over 70 cars.

In 349 of the accidents (Class I) negligence of employees is shown as the cause of the accident. (In passing we note that *only one* of these latter occurred in Arizona where the Train Limit Law was in effect—item 142 R. 3321, "Failure to operate under proper control within yard limits." A. T. & S. F. R. Co., Kingman, Arizona, November, 1936, R. 3333, Investigation Report No. 2117. More will be said about this later in our brief. Eighty-four of the total of 561 accidents were due to causes other than negligence of employees—collapsed bridges, defective tracks, washouts and the like. Of these 84 accidents, 25 were caused by the failure of arch bar trucks, a type of truck not now permitted in interchange [Ex. 304, p. 22, rule 3). They were due entirely to the type of truck used and had no relation to train length. Of the remaining 59 accidents, 3 were caused by cars *buckled and thrown out of the train fouling adjacent tracks in front of approaching passenger trains* killing 4 and injuring 42. These three accidents are shown on the exhibit as follows:

Record p.	I.C.C. Rep. No.	Killed	Injured
3326	1575	1	25
3329	2055	3	11
3330	2316	–	6

The second of these accidents is one at Manor, Pa., referred to heretofore. *All 3 of these accidents were on trains with over 70 cars. No such accident is shown on a train of 70 cars or less.*

A rational basis in safety in the enactment of the Arizona Train Limit Law is shown by the record in the protection of both the public and the employees from the dangers incident to slack action.

(e) Strains on Weak Parts Increase in Quantity and Quality as Each Car Is Added (Accidents Due to Failure of Equipment).

The average weight of an empty freight car is 27 tons and of a loaded freight car 45 tons [Ex. 2, R. 2852]. Every car added to a train adds from 27 to 45 tons to the pull on the draft gear, drawbars, couplings, knuckles, etc., of the cars ahead. If ten cars are added, the added weight to be pulled is from 270 to 450 tons. This pull is exerted whenever the slack is stretched as by the engine in starting or pulling up a grade, or the rear cars pulling back on up grade. The force and quantity of the pull increases as the length of the train increases, because the greater the length of the train the more weight and slack, and the greater the speed that the engine and head cars may attain before the rear cars begin to move.

In starting a long heavy train the slack is first bunched, then each car is started as the slack is pulled out. The longer the train the *greater the speed* the head end will attain before the rear cars begin to move.

> "How heavy the shock will be depends mainly on the difference in speed that must instantly be made uniform and on the weight that must suddenly be altered in speed." [Santa Fe Green Book, Ex. 152; R. 3452.]

Likewise, with each car added there is an additional 27 to 45 tons to *run in* on the cars ahead when the slack

runs in, as on a down grade, in stopping, backing up or in any operation where the slack is bunched. This added weight and strain may be enough to break or injure draft gear, drawbars, couplings, etc., or where already defective, to cause it to break and cause an accident.

There is *no* evidence in the record from which a comparison of accidents on short and long trains from defects or failure of equipment, per train operated, can be made. There are exhibits showing accidents due to such defects or failure during certain periods. Exhibit 270 shows that of the 79 accidents from this cause involving 90 trains investigated by the I.C.C. during the 12 year period 39 of the trains were over 70 cars and 51 were 70 cars or less. But it does not show, nor does the record anywhere show, the total number of short trains or the total number of long trains operated.

Exhibit 270 covers the period 1928 to 1939, inclusive. Exhibit 22 [R. 2870] shows the average cars per *freight* train for Class I railroads during this period as follows:

Year	1928	1930	1932	1934	1936	1938	1939
Av. cars	48.1	48.9	44.8	46.2	46.4	47.7	49.1

It will be seen from this that the average cars per freight train operated on all Class I railroads during the period was from 20.1 to 25.2 *below* the limit under the Train Limit Law. To accomplish these averages it would seem probable that *at least 10 short trains* were operated to one long train. Certainly this must be true when it is considered that in Arizona, *where practically every train operated was a short train*, the *lowest* average cars per train for the same years was 52.04 (1928) [Ex. 149, R. 3025], *3.01 more cars per train* than the *highest* average cars per train on Class I railroads for the years shown.

With at least 10 short trains operated to every one long train, this type of accident on short trains per train operated then would be small compared to long trains, and the percentages shown at the bottom of page 3311 of the Record are meaningless.

There *is*, however, evidence in the record from which a comparison can be made of the *severity* of this type of accident and the resulting casualties, on *long* and *short* trains.

Exhibit 270 [R. 3311] shows that of the 90 trains involved in this type of accident 51 or 56.7% were short trains and 39 or 43.3% were long trains. There was a total of *426* casualties in the 79 accidents. *Three hundred and eighteen* of these casualties were in accidents in which the *39 long trains* were involved, or an average of *8.2 casualty per train. One hundred and eight* of the casualties were in the accidents in which the *51 short trains* were involved, or *2.1* casualty *per train*. In other words, *the casualties per train* where trains of *over 70 cars* were involved was nearly *four times* that *per train* where trains of *70 cars or less* were involved. This again shows trains of over 70 cars present a greater hazard and a rational basis for the enactment of the Arizona Train Limit Law.

(f) Increase in Difficulty of Communications Between Employees as the Length of the Train Increases.

Communications between employees on different parts of a freight train is by hand signals during the day and by use of lights at night. It is obvious as the distance between the employees increases the more difficult it will be to see and interpret these signals. Exhibit 118 [R. 2978] is a picture of a train with 150 cars operated on the Chesapeake & Ohio Railroad. It is improbable that the

men on the engine of that train can even see a man on the caboose, let alone see and interpert signals.

When a train is in motion men are on top of the train only in case of emergency, and signals ordinarily would be passed direct from the rear to the head. The dangers to men on top of a train in motion are well known, and were recognized in the adoption by Congress of the air-brake provision of the Safety Appliance Act.

Virginian R.R. Co. v. U. S., 223 U. S. 748.

An instance where the ability to give a "stop" signal is important is where a hot box is noted by the trainmen in the caboose [see rule 16, p. 28; Ex. 319; R. 2287]. An instance where the ability to give a "reduce speed" signal is important is where an engineman fails to observe a slow board and is moving at a dangerous speed. In either of these instances, if the length of the train is such that a hand signal cannot be seen, the conductor must either send a man over the top of the train, if time permits, or stop the train by the use of the conductor's valve in the caboose. Either method adopted would create a danger.

(g) The Ability to Observe Defects in the Train Decreases as the Length of the Train Increases.

While a train is in motion it is the duty of the trainmen to watch and observe the train, from the caboose and the runway of the engine, for the purpose of detecting any defects that might arise—such as hot boxes, broken wheels and the like—in order that the train may be stopped in time to prevent an accident. The serious consequences of a failure to detect a defect in a train is seen in the report

of the accident on the Rock Island at La Salle, Illinois, March 6, 1936 [Ex. 311; R. 2213]. There, for something over a mile, the crew failed to detect a *derailed* truck, which finally resulted in the car under which the derailed truck was located, and several other cars, derailing and fouling the adjacent track, wrecking a train moving on that track. Four were injured. In that case the failure to detect the defect—the derailed truck—was due to smoke following along the train after coming through a tunnel. But the length of the train can also prevent the crew from observing such a defect. With cars averaging 45 feet in length, each car would add 45 feet to the length of the train. The more cars there are in a train, the farther the trainmen will be from any defect which may develop in the middle of the train. It is just plain common sense that the further one is away from an object the more difficult it is to see and detect such object.

On pages 3324 and 3325 of the Record appears a tabulation of data from summaries of Interstate Commerce Commission investigation reports of freight train accidents caused by defective equipment, years 1928 to 1939. There are a total of 79 accidents. Twenty-five of those listed under "Trucks" on page 3324 are shown as caused by broken arch bars. These accidents were due entirely to the type of truck used—a type *no longer permitted* in interchange—and can have no relation to train lengths. The remaining 59 accidents involved 60 trains with a total of 344 casualties. Thirty-three of the trains were *over* 70 cars and in these there were *244 casualties*. These accidents were, for the most part, caused by broken wheels, broken journals, defective couplings, and the like.

It is only reasonable to expect that had some of those long trains been shorter the trainmen might have discovered the defect in time to stop the train and prevent the accidents—and preventing many casualties.

(h). Fear of Injury Reduces the Efficiency of Trainmen.

Witnesses for the Appellee testified to the fear of injury which increases with the increase in train lengths [R. 2546, 2563]. That this fear is not fanciful is seen from the facts, hereinbefore pointed out, that in Arizona and Nevada for the 12 year period 1929 to 1940, inclusive, there were 48 slack action accidents on trains of *over 70 cars* with *62 casualties, 3 permanently injured* and the other 59 with an *aggregate disability of 2910 days*, while on the trains of 70 cars or less there were 55 slack accidents with *61 casualties, one permanently disabled (on a train of 68 cars) and an aggregate disability of 1393 days for the other 60.* In other words, *on long* trains *3* were *permanently* disabled to *one* on the short trains, and the average disability of those not permanently disabled was *more than twice* as great on *long* trains as on short trains.

And we call attention to the report of the investigation by the Interstate Commerce Commission of the accident on Appellant's lines at Reno, Nevada, November 19, 1938 [Ex. 304], where *five men* were sent to the hospital by an accident due to slack action on an 85 car train, and to the accident on Appellant's lines in Yuma, Arizona, October 21, 1937 [item 466, R. p. 3361], where one man was *permanently* injured and another disabled for 80 days when the slack ran in on a train with 122 cars. Men working under conditions which cause strain and fear of injury cannot be as efficient as men working where such conditions do not exist.

(i) Long Trains Will Not Reduce the Casualties Due to Negligence of Employees.

The Appellant argued below that accidents caused by negligence of employees have a relation to train lengths because shorter trains require more employees and present more opportunities for accidents from this cause. The record does not bear out the contention that more accidents result from this cause with shorter trains.

The cars per freight train as shown by Exhibit 22, and the number of accidents *investigated* by the Bureau of Safety caused by the negligence of employees, all Class I railroads, years 1928, 1930, 1932, 1934, 1936, 1938, 1939, are as follows [Ex. 22 and 270; R. 2870, 3310]:

	1928	1930	1932	1934	1936	1938	1939
Cars per Train	48.1	48.9	44.8	46.2	46.4	47.7	49.1
Accidents	23	34	24	23	32	28	33

It will be seen that there was an *increase* in cars per train, 1930 over 1928, of .8 cars and *also an increase of eleven accidents caused by negligence of employees;* for 1932 over 1930 a *decrease* of 4.1 cars per train and a *decrease* of *ten* accidents caused by negligence of employees; for 1936 over 1934 an *increase* of .2 cars per train and an *increase* of nine such accidents; for 1938 over 1936 an *increase* of 1.3 cars per train and a *decrease* of four such accidents; and for 1939 over 1938 an *increase* of 1.4 cars per train and an *increase* of 5 such accidents.

Somewhat similar results will be found if accidents caused by negligence of employees shown on Exhibit 270 [R. 3310] and the man-hours shown on Exhibit 262 [R. 3300] for the different years are compared. For ex-

ample, in 1928 the man-hours worked were 4,200,547,000 and the accidents from this cause investigated by the Bureau numbered 23, or 5.47 accidents per billion man-hours; in 1929 the man-hours worked were 4,234,000 and the accidents from this cause investigated were 58, or 13.69 accidents per billion man-hours; and in 1937 the man-hours worked were 2,646,909,000 and the accidents from this cause investigated were 41, or 15.5 accidents per billion man-hours. In other words, with approximately the same man-hours worked in 1928 and 1939, the accidents from this cause investigated in 1929 were more than twice as great per billion man-hours as those in 1928; and in 1937 with approximately one-third less man-hours worked the accidents from this cause investigated were nearly three times as great as in 1928 and greater than in 1929. This certainly refutes the contention of Appellant that short trains, by increasing the number of employees and the man-hours worked, increase the number of accidents caused by negligence of employees and thus increase hazards.

The Appellant has pointed out that 349 accidents are shown as caused by negligence of employees, with 499 freight trains involved, and that 409, or 82%, were short trains, and 90, or 18%, long trains. Appellant then argues that this shows long train operations to be safer. The argument is erroneous because, first, as we have pointed out above, when the accidents are considered by years it is apparent that there is no relation between this type of accident and the length of trains operated or man-hours worked; and, second, as we have heretofore pointed out, the average cars per freight train operated during this period was from 20.1 to 25.04 cars per train *less* than the 70 cars permitted under the Train Limit Law (see p. 107,

of this brief) and thus *at least 10 short trains* must have been operated to one long train. With 10 short trains operated to one long train, this showing of only 4 short trains involved in these accidents to one long train is certainly *favorable* to short train operation. There is nothing to show the train miles, car miles or man-hours accumulated in short and long train operations respectively during the period; and so no accurate basis for comparing this type of accident in the two operations.

And we point out that only *one* of these 349 accidents and *none* of 112 accidents of the same type involving passenger trains [R. 3336] occurred in Arizona, where the number of cars in a train is limited. All the other 460 such accidents occurred in territory where, Appellant contends, long train operation is the normal practice. Certainly this does not show that the limitation on the number of cars per train brings about more accidents due to negligence of employees. In fact, it shows just the contrary.

The *one* accident in Arizona due to negligence of employees during the 12 year period involved two trains of from 61 to 70 cars. The cause of the accident is shown as "Failure to operate under proper control within yard limits" [Item 142, R. 3321; I.C.C. Inv. No. 2117, R. 3333].

(j) Grade Crossing Accidents.

The appellant contends that the Train Limit Law increases the hazard of grade crossing accidents because short trains will require more trains and increase the opportunity for such accidents. The evidence does not support this contention, in fact is to the contrary.

The two principle factors in relation to the question of opportunity for grade crossing accidents are the time

the crossing is occupied by trains and the number of automobiles using the crossing.

The length of the trains operated will have little effect upon the opportunity for accidents. There are just so many cars to be moved across a given crossing and, if the speed of the trains are the same, those cars will occupy the crossing for exactly the same period of time regardless of whether they are in a long train or a short train. With short trains there may be a few more engines and cabooses. But the additional time these engines and cabooses would occupy the crossing will, in all probability, be more than offset by the faster speed of the short trains.

Crossing accidents generally are of two types: those where the train and the automobile run into each other, and those where the automobile runs into the side of the train.

The first type of accident is usually the result of the driver of the automobile trying to beat the train over the crossing. There is a greater danger of this type of accident in long train than in short train operations. In many of these situations the engineer may become aware of the danger and slow down or stop the train. Because of the weight of the train it is more difficult and takes longer to slow down or stop a long train. There is then in long train operations less chance on the part of the engineer to prevent the accident. Also the engineer is fully aware that the large amount of slack in a long train may damage the train and injure employees if the brakes are applied with the slack stretched [R. 3454, 5 P. Co. Air-brake instructions], and will hesitate and delay longer before applying the brakes.

The second type of these accidents are more apt to occur at night and the length of the train can be an im-

portant factor. With the middle of a long train occupying the crossing the lights of the engine and the caboose will be so far away on either side of the crossing as to be impossible to be seen by an approaching automobile. These lights are so far away that they are not observed by the driver of the automobile and he comes up to the crossing without warning that it is occupied by the train. With short trains the probabilities are greater that the engine or caboose lights will be seen by and will warn the driver of the automobile and prevent an accident.

From the exhibits introduced in evidence it will also be seen that short trains do *not* increase grade crossing accidents.

Exhibit 268 [R. 3306] shows the casualties, and the casualty rate per million train miles and per 10,000 automobiles registered, grade crossing accidents in which automobiles were involved, all steam railroads in the United States, 1923 to 1938, inclusive. The exhibit shows that casualties declined in absolute number and in proportion to the number of automobiles registered, during the period 1923-1939.

The only evidence in the record as to a casualty rate in grade crossing accidents, other than the rate per 10,000 automobiles registered, is the per million train mile basis shown in this Exhibit 268. This certainly does not sustain a finding that grade crossing accidents increase in proportion with the number of trains using the crossing. On the contrary, it shows that the casualty rate per train mile has remained relatively constant. If we were to consider only the length of trains operated over the period we would find [Exhibit 22, R. 2870] that the average cars per train increased from 1923 to 1930, then decreased until 1934,

when they again began to increase. And we would also find [Exhibit 268, R. 3306] that the grade crossing casualty rate per million train miles varied somewhat the same.

By Exhibit 293 [R. 3422] appellant showed by years for the period 1923-1938, inclusive, the number of grade crossing accidents and casualties on the Southern Pacific Company lines and on all railroads in Arizona, and the casualty rate per 10,000 automobiles registered for Arizona and for the entire United States. The comparison of the rate per 10,000 automobiles registered, Arizona with the United States as a whole, will be found favorable to the appellee. While the average rate for the entire period is not shown, by totaling the casualties in Arizona and the automobiles registered, it will be found to be 2.39 in Arizona as against 2.77 per 10,000 registered automobiles for the entire United States.

Exhibits 200 [R. 3149] and 201 [R. 3150] show the number of grade crossings on appellant's lines in Arizona and in Nevada, respectively, in each of the years 1930 to 1939 inclusive. The exhibits show that for each of the years there were more than *three times* as many grade crossings on appellant's lines in Arizona than on appellant's lines in Nevada. For example, in the year 1939 in Arizona there were 654, while in Nevada there were 211.

Exhibit 334 [R. 3461] gives a comparison of grade crossing accidents per 10,000 automobiles registered involving automobiles 1929-1939, inclusive, states of Arizona, Nevada and New Mexico. Exhibit 335 [R. 3462] is a similar comparison of all grade crossing accidents for these states in those years. The basis used in these ex-

hibits is the identical basis used by the appellant in Exhibits 268 and 293. The data was taken from tables in the reports of the Interstate Commerce Commission, showing that the Commission considers such basis as a proper yardstick for measuring this type of accident.

Exhibit 334 [R. 3461] shows the casualty rate per 10,000 registered automobile grade crossing accidents involving automobiles as follows: Arizona 1.13, New Mexico 1.22, Nevada 1.29.

And Exhibit 335 [R. 3462—all grade crossing accidents: Arizona 1.23, New Mexico 1.35, Nevada 1.6.

And this notwithstanding that, on appellant's lines, there were *three times* as many grade crossings in Arizona as in Nevada.

It appears from the trial court's finding that the trial court assumed as a fact that an increase in the number of trains operated over a grade crossing necessarily increases the hazard and the probability of an accident at such crossing. There is absolutely no basis for such an assumption and we deny that such is the fact. On the contrary, a more frequent operation of trains over a grade crossing creates a greater awareness on the part of drivers of motor vehicles that trains may be passing over such crossing, a greater alertness in approaching such crossing, greater caution and care. It is at crossings over which trains pass only infrequently that the greatest hazards exist by reason of the fact that the driver of the motor vehicle, forgetting, because of the infrequency of the trains, that trains pass over the crossing, becomes careless in approaching the crossing.

(k) Interstate Commerce Commission Service Order No 85.

At several places in its brief the Appellant has referred to Service Order No. 85 issued by the Interstate Commerce Commission effective September 15, 1942. This order is set out at page 1 of the Appendix to this brief. The Commission states that the order was issued under the authority of sub-sections (10)-(17) of section 1 of the Interstate Commerce Act (49 U.S.C. 1 (10)-(17)).

Neither the validity of Service Order No. 85 nor the authority of the Interstate Commerce Commission under sub-sections (10)-(17), section 1 of the Interstate Commerce Act are before this Court in this appeal. The authority of the Interstate Commerce Commission under these provisions of the Interstate Commerce Act was not brought in question in the trial court. Consequently no opportunity has been given to the Appellee to make a record upon which the Appellee's contention on this question could be presented. The judgment was filed in the trial court February 11, 1942 [R. 4039]. Service Order No. 85 was not issued until approximately seven months thereafter. While some argument with respect to the validity of Service Order No. 85 was presented in the briefs in the State Supreme Court, upon oral argument before the court it was recognized that, upon the record before the Court and in the absence of the Interstate Commerce Commission as a party, the question could not be considered or determined. The majority opinion in the State Supreme Court gives no consideration to these provisions of the Interstate Commerce Act nor to Service Order No. 85. The dissenting opinion of Judge Ross refers to the decision of the Interstate Commerce Commission in *Ex Parte*

No. 156 issued November 8, 1943, approximately seven months after the argument in the State Supreme Court. (The case was argued in the state court April 12-13, 1943.) No assignment of error herein brings in question the validity of Service Order No. 85 nor the authority of the Interstate Commerce Commission under sub-sections (10)-(17), section 1 of the Interstate Commerce Act.

This statement is made so that the limited purposes for which reference is made to Service Order No. 58 may be clearly understood, and not in reply to any contentions by the Appellant in its brief. The Appellant, in fact, has presented no argument with respect to either the validity of Service Order No. 85 nor the authority of the Interstate Commerce Commission under sub-sections (10)-(17), section 1 of the Interstate Commerce Act, and seemingly agrees that those questions are not presented in this appeal.

The references in Appellant's brief to Service Order No. 85 are in connection with the contention that this order indicates a belief on the part of the Interstate Commerce Commission, and is a declaration by that Commission, that state train limit laws are unnecessary, and unreasonably burden interstate commerce. We do not believe the order supports this interpretation. The order in part provides:

> "This order, being based upon conditions of war emergency, shall not constitute a precedent for peacetime operations."

The Commission very carefully and specifically points out that the suspension of the train limit laws is based "upon conditions of war emergency". During the war they are to give way to this greatest of public concern, the war emergency. And the Commission then carefully and specifically provides that the order "shall not consti-

tute a precedent for peacetime operations". This, we submit, indicates a belief on the part of the Commission that these train limit laws are proper and reasonable in normal peacetime operations and are only suspended because winning the war is a matter of greater public welfare.

In this connection it will be noted that mere temporary suspension of the operation of a state statute by the intervention of federal authority will not permanently oust the state of its right of regulation, and such regulation may be resumed by the state without reenactment of its statute when the effective period of the federal regulation has ended.

Missouri Pac. R. Co. v. Boone, 270 U. S. 466, 468.

C. The Appellant's Safety Evidence.

(a) The National Evidence.

The Appellant's safety evidence consisted almost entirely of exhibits based upon accidents and casualties reported by the various Class I railroads to the Interstate Commerce Commission. These begin with Exhibit 262 [R. 3300] and for the most part cover the period 1923 to 1940, inclusive. Accidents and casualties on Class I railroads are classified under these exhibits (the so-called "national exhibits) as accidents and casualties, (1) to *all classes of employees* in *all classes of service* [Ex. 262, R. 3300]; (2) to *road trainmen and enginemen on duty* in all classes of service [Ex. 263, R. 3301]; (3) to road *freight* trainmen and enginemen on duty [Ex. 264, R. 3302]; (4) to road *freight conductors, brakemen and flagmen* on duty [Ex. 265, R. 3303]; (5) to road freight conductors, brakemen and flagmen on duty *caused by slack action*

[Ex. 266, R. 3304]; (6) to passengers [Ex. 267, R. 3305]; (7) at crossings [Ex. 268, R. 3306]; (8) classified as to cause [Ex. 269, R. 3307]; and (9), investigated by the Interstate Commerce Commission [Exs. 270, 271, R. 3310, 3336]. These exhibits have *no* evidentiary value whatsoever upon the question before the Court. It is true that they show a very substantial decrease in accidents and casualties over the period both as to train miles and car miles operated. But it is nowhere shown that this improvement is in any way due or related to the length of trains operated. On the contrary the record shows a number of other causes, in no way related to the number of cars in a train, which have brought about the improvement with respect to accidents and casualties. We call attention to some of these. In the early part of the period covered by the exhibits there were numerous accidents caused by undesired emergency application of the air-brakes due to the triple valves sticking. In the middle 20's the graduating spring in the triple valve was made heavier. This practically eliminated these accidents. In the early part of the period many accidents were caused by the failure of arch bar trucks [Ex. 270, R. 3310]. Arch bar trucks have been eliminated by the Rules of Interchange since January 1, 1941 [R. 3185]. During the period equipment has been strengthened, rails made heavier and ballast improved [R. 194, 195]; block signals have been improved; grades and curves have been eliminated and many grade crossings have been eliminated by a separation of grades. *These are the causes* for the improvement in casualties and they have no relation to the length of a train. It is pure speculation to say from this evidence what, if any, effect train lengths had or did not have on the "improvement" in casualties.

The exhibits include the *combined operations* of both short and long trains. There is *no* separation whatsoever of long and short train operations. It is therefore *impossible to compare* the casualties, or the rate of improvement therein, between short and long trains. So far as the evidence shows, 90% of the improvement in casualties may have been on *short* trains and *only 10%* on long trains.

The Appellant contends, however, that by a comparison with exhibits covering operations in Arizona, these exhibits do show that increased train lengths contributed to the improvement in casualties; that all the other factors affecting the improvements in casualties and accidents were present in Arizona, and if a greater improvement is shown on the national exhibits, the cause must be the operation of long trains outside of Arizona. But this contention is erroneous because:

First, the national casualties exhibits are not comparable with the casualties exhibits as to Arizona. This is readily apparent from a consideration of the comparison Appellant seeks to make at pages 191 and 192, Volume II, of its Brief: For the purpose of comparing the improvement percentages of casualty rates as to Class I railroads the five-year period 1935-1939 is compared with the six-year period 1923-1928 and as to Nevada and Arizona the six-year period 1935-1940 is compared with the six-year period 1923-1928.

The first comparison is with respect to casualties to All Classes of Employees on Duty, All Classes of Service [Exs. 262, 276, R. 3300, 3371]. For Class I railroads the percentage of improvement shown in the comparison is on a *car mile and train mile basis*. For Arizona and Nevada it is on a *locomotive mile basis*. The basis for

percentage of improvement used as to Class I railroads is not comparable to that used as to Arizona and Nevada and the comparison is meaningless. Exhibit 262 shows the percentage of improvement as to Class I railroads based upon *locomotive miles* was 66.74%. Why this was not used by Appellant we do not know.

There is another very important reason why this comparison is valueless. The first period, 1923-1928, includes the years 1923 and 1924. In November, 1924, the E. P. & S. W. and the Arizona Eastern railroads were consolidated with the Appellant, Southern Pacific Company [Ex. 141, Note (a), R. 3017]. Before consolidation Appellant operated in Arizona 399.95 miles of main line trackage and 144.93 miles of branch line trackage, or a total of 544.88 miles of trackage. After consolidation it operated in Arizona *574.81* miles of main line trackage and 647.98 miles of branch line trackage, or a total of 1222.79 miles of trackage [Ex. 305, R. 3430]. The first period used in Appellant's comparison includes *almost two years* in which operations were on *only the 544.88 miles* of trackage operated before consolidation. But Appellant attempts to compare the casualties in the later period, 1935-1940, on *1222.79 miles of track operated* with the casualties on *544.88 miles* of track operated in the earlier period to determine the percentage of improvement on the 1222.79 miles of track now operated. It is like comparing present operations in Arizona with the combined Arizona-Nevada operations to determine the percentage of improvement in Arizona. It can't be done. But the Court will find that the Appellant included 1923-1924 as a part of the earlier period in making its comparisons, not only as to Exhibits 262 and 270 but *as to all exhibits.*

The effect of including 1923 and 1924 is shown by excluding in the Arizona-Nevada exhibit these years from the earlier period and determining the percentage of improvement. The figures for the period 1925-1928 are:

Total locomotive miles		Total Casualties		Casualties per million loco. miles	
Nevada	Arizona	Nevada	Arizona	Nevada	Arizona
18129	24019	125	327	6.89	13.61

[From Exhibit 276, R. 3371.]

For the period 1935-1940 [Ex. 276]:

21757	30970	103	273	4.73	8.81

The percentage of improvement 1935-1940 over 1925-1928 is:

Nevada 31.35% Arizona 35.26%

On Exhibit 276 with 1923 and 1924 *included* the improvement 1935-1940 over 1923-1928 is:

Nevada 46.7% Arizona 38.7%

And this last, the percentage of improvement with 1923 and 1924, included, *is used in the comparison set out in Appellant's brief.*

The Appellant argues that this increase in miles of trackage operated cannot affect the comparison made on a train or car miles basis. That this argument is erroneous must be readily apparent. If the casualty rate per car and per train mile was substantially higher on the acquired territory than on the original territory, it would cause the per car and train mile casualty rate on the combined operation *to be higher than on the original operation.* A comparison of subsequent rates with those on the

original mileage will not give the rate of improvement on the original territory nor on the consolidated territory.

For further illustration we refer to Exhibit 279 [R. 3374]. This exhibit is a comparison of casualties to road freight conductors, brakemen and flagmen on duty, Arizona and Nevada, 1923 to 1940. For comparison of improvement in casualties the total period is broken up into three 6-year periods. It shows the following percentage improvement on a train mile basis in the two states:

Period	Arizona	Nevada
1929-34 over 1923-1938—decrease	37.9%	45.6%
1935-40 over 1929-1934— "	20.0%	24.3%
1935-40 over 1923-1928— "	50.3%	58.8%

A year and ten months of the period 1923-1928 was before consolidation. If we eliminate the years 1923 and 1924, and divide the remaining 16 years into periods of six, five and five years, the percentage of improvement on a train mile basis is as follows:

Period	Arizona	Nevada
1931-35 over 1925-1930—decrease	38.8%	33.6%
1936-40 over 1931-1935— "	7.97%	15. %
1936-40 over 1925-1930— "	43.7%	43.6%

In other words, during the period since consolidation, when the territory and mileage operated in Arizona has remained substantially the same, the percentage of improvement in the two states is comparable. This shows the fallacy of including the years before consolidation. It is the same as combining two different territories to get the percentage of improvement on one.

The absurdity of such a comparison stands out in Appellant's comparison of the three-year periods 1938-40 and

1923-1925 (Appellant's Br. Vol. II, p. 178.) Over 22 months of the period 1923-1925 was before consolidation when the trackage operated was only 544.88 miles. Only 14 months was after consolidation. Yet Appellant determines the percentage of improvement on the *1222.79 miles* of track now operated by comparing the experience on *this trackage* for the period 1938-1940 with the experience on 544.88 miles for *22* months and 1222.79 miles for 14 months.

In Appellant's comparison (App. Br., Vol. II, pp. 191-192) no Arizona-Nevada exhibits are shown comparable to Class I railroads Exhibits *263* and *264*, and no Class I railroad exhibit is shown comparable to Arizona-Nevada Exhibit *277*—and there are none.

National Exhibits *265* and *266* are represented as comparable to Arizona-Nevada Exhibits *279* and *280*. There is no basis for comparison, first, because of the consolidation of the Southern Pacific Company and the E. P. & S. W. in November, 1924, referred to above and, second, because the percentage of improvement in the national exhibits is based upon car miles and train miles of *freight train and work train* operations while the Arizona-Nevada exhibits are based upon car miles and train miles of *freight train operations only*.

In columns (b) and (c), Exhibits *264*, *265* and *266* [R. 3302-4], which give the national casualties, the car miles and train miles used are those for freight trains *and work trains*. In Exhibits *276*, *277* and *279*, which present the casualties as to Arizona, the car and train miles used are those for freight trains *only*. *Work train* car miles, train miles and casualties *are not included in the Arizona exhibits*. It is impossible to know how the failure to include

work train operations in the Arizona exhibits affects the percentage of improvement in Arizona and the comparison with the national casualties. It is shown in the record that the period 1923 to 1930 was one of reconstruction following the return of the railroads to the owners following government ownership. The average expenditures for roadway and structures was for those years approximately *three times as great* as for the following years. [Ex. 15, R. 2863.] This certainly would mean the operation of *a great many more work trains in those years* than in the later years. If the casualty rate was high in work train operations, then the reduction in work train operations *would have a material effect upon the percentage of improvement in casualties* on the national exhibit but *would not be reflected in the Arizona* exhibits because work train miles *are not* included in the Arizona exhibits.

Second, the comparison fails to consider, and is impossible because of, differences in local conditions affecting the casualties, such as wind and sand, differences in traffic and the like. For example, Exhibit 279 shows 32 casualties in Arizona in the year 1937, an unusually large number in comparison with other years in this third period, and materially affecting the percentage of improvement for this period. The following detail as to the casualties to employees on duty in Arizona and Nevada for the year 1937 is taken from Exhibit 274 [R. 3361] and Exhibit 275 [R. 3369A]:

ARIZONA.

Item No.	Description of Accident.
(441)	Thrown against cupola steps when train was stopping.
(442)	Slipped off edge of car roof to ground.

(443) Slipped and fell on frosty car roof while releasing hand brake.

(444) Thrown against rear door of caboose by undesired emergency application of brakes.

(445) Particle of sand in eye.

(446) Caught finger between piece of freight and door frame.

(447) Fell on slippery load of piling.

(448) Back of hand struck by brake club while releasing hand brake.

(449) Thrown against end ladder by sudden stop during switching move.

(450) Lost balance and fell to ground releasing hand brake.

(452) Stepped on small rock and sprained ankle.

(453) Fell from moving train.

(454) Fell from steps of caboose when slack ran out.

(456) Fell from top of car in moving train.

(457) Thrown against inside frame of cupola by undesired emergency.

(458) Fell from top of moving train.

(459) Stepped on rock and sprained ankle detraining from caboose.

(460) Slipped on small rock and fell, spraining arm and shoulder, when boarding caboose.

(461) Fell from car to ground when brake wheel unexpectedly released due to defect.

(463) Stepped off end of car and fell to ground.

(464) Finger caught between brake club and truck frame while wiring up brake beam.

(465) Foot struck by rebounding running board.

(466) Thrown in caboose on account of undesired emergency as train was being brought to a stop.

(467) Lost balance and fell from top of a water car to ground.

(468) Stumbled and fell on highway crossing detraining from caboose.

(469) Struck by flying brake club while releasing hand brake.

(470) Thrown to ground from caboose when it made hard coupling with standing cars.

(471) Foreign object in eye.

(472) Trainmen thrown in caboose by sudden stop caused by train parting due to defective draw bar.

(473) Thrown from side of car when train backing up broke-in-two.

NEVADA.

Item No.	Description of Accident.
(247)	Fell against cupola steps when jerk occurred as train was stopping.
(248)	Slipped on side ladder of car and fell to ground.
(249)	Finger broken when hand came in contact with coupler while separating air hose.
(250)	Fell from gangway of moving engine while detached from train and struck by truck structure of tender.
(251)	Sprained ankle alighting from train.
(252)	Hand caught between brake lever and stop on end of car.
(253)	Lost balance and fell against load machinery 21st car from engine when slight jerk of train occurred stopping.
(254)	Fell from car when foot slipped while preparing to set hand brake.

(255) Sudden stop due to undesired emergency.

(256) Fell to ground when hand slipped off hand rail while getting on running board of engine.

(257) Fell to ground detraining from gangway ladder of locomotive.

(258) Lost hold on side ladder of car and fell to ground.

(259) Lost balance on caboose and fell to ground when reaching down to raise lock block of coupler.

(260) Lost hold and fell to ground from caboose step when jerk of train occurred while stopping.

These casualties shown under these items segregated according to the cause shown will appear as follows:

Cause	Number of Casualties Arizona	Nevada
Slack action	9	4
Sand or particle in eye	2	0
Operating hand brake	4	1
Slipped off top of car—train standing	2	0
Fell from moving train	5	6
Pinched finger	2	2
Slipped on rock or other obstacle	4	1
Thrown by jar or jerk in switching	2	0
Rebounding running board injured trainman	1	0
Brakeman fell on slippery load of piling	1	0
	32	14

Two of the accident *in Arizona* were *sand or particle in the employee's eye*, while there were *no such accidents in Nevada*. And it will further be found upon examining

Exhibits 274 and 275 that there were *40 of this type of accidents in Arizona* during the 18 years 1923 to 1940, inclusive, and *only 2 in Nevada*, one of which occurred while *sanding out the engine*. These accidents are clearly due to local conditions—the sand and dust in the air in Arizona.

Similarly the greater number of casualties in Arizona (4 in Arizona, 1 in Nevada), which occurred *in the operation of hand brakes*, is traced to the difference in operations or operating conditions in the two states. The total number of cars of revenue freight originating and terminating in Arizona for the year 1939 was 147,408 [Ex. 167, R. 3041], while in Nevada for the same year the number of such cars was 19,559. In other words, the number of cars of revenue freight which originated or terminated in Arizona was *7.5 times that in Nevada*. This traffic requires a substantial amount of switching, placing or spotting of cars, and picking up cars. It requires trainmen to get on and off moving trains in opening and closing switches, to walk along the train in spotting and picking up cars, to open and close the couplers in setting out cars, and to set and release hand brakes in picking up and setting out cars. The Federal Safety Appliance Act *prohibits* the use of hand brakes *on moving trains*. They are used *only* to insure that the car remains in place after the car is placed or spotted and is detached from the locomotive or train. When a car is spotted the hand brakes are set and when it is picked up the hand brakes are released. This is true whether the car is moved to its place of destination in Arizona, or from its place of origin in Arizona, in a 50-train or in a train of 100 cars. In other words, the same number of hand brakes must be set and the same number of hand brakes released regardless of the number

of cars in the trains operated. With the percentage of traffic originating and terminating in Arizona 7.5 times that as in Nevada, it is not surprising that the casualties resulting from the use of hand brakes is four times that in Nevada. It is the result of the difference in traffic handled.

The same is true with respect to those accidents caused by stepping on or stumbling over a rock or other object (4 in Arizona, 1 in Nevada) and those caused by being thrown by a jerk or jar in a switching movement (2 in Arizona, 0 in Nevada). With the percentage of traffic originating and terminating in Arizona 7.5 times that in Nevada, necessarily many more men are required to be on the ground in spotting and picking up cars, many more switches must be opened and closed and many more cars must be coupled onto with the possibility of jars or jerks which will throw men on the car. But this is the result of the difference in traffic in the two states.

The casualties resulting from falling off the top of a standing car (Arizona 2, Nevada 0), falling from a moving train (Arizona 5, Nevada 6), and pinched fingers (Arizona 2, Nevada 2) really have no relation whatsoever to the length of the train. The total of these for the states is substantially the same (Arizona 9, Nevada 8).

Likewise the casualties resulting from slipping on slippery load of piling (Arizona 1, Nevada 0), and rebounding running board striking foot (Arizona 1, Nevada 0), have no relation to the number of cars in the train. Placing the load of piling, or the car with the defective running board, in an 80-car train would not have prevented the brakeman from slipping on the piling or the running board from striking the trainman. One was due to the

character of the load, the other to a defective running board.

There were seven slack action accidents with 9 casualties in Arizona, and 4 slack action accidents and 4 casualties in Nevada. This indicates and sustains the Appellee's contention that conditions (such as dips, hog-backs, grades and curves) which produce slack action are more prevalent in Arizona than Nevada. It also sustains the Appellee's contention that the probability of slack action with resulting casualties, and the severity thereof, increases as the length of the train increases.

All the trains on which slack action causing injury occurred in Nevada were *over 75* cars in length, and in Arizona the trains were 63 cars or over in length. It will also be noticed that in the two states combined there were five such accidents *on trains of over 70 cars*, with six casualties; and with respect to the six casualties, two were permanently injured, one was disabled for 137 days, and one for 80 days. Of the six casualties on long trains *two* were *permanently disabled*, and the remaining *four* were disabled for an aggregate of *249 days*. The seven injured on *short trains* were disabled for an aggregate period of *94 days*. This clearly demonstrates that the probability of slack action causing casualties arises, for the most part, and increases as the length of the trains exceed 60 cars, and that the severity of the shock and the resulting injuries increase as the length of the train increases.

Third, the exhibits themselves rebut any contention that the trend in improvement in casualties is caused or affected by train lengths. This is seen from a consideration for the different periods of the percentage of increase in cars per train [Ex. 22, R. 2870] in relation to the percentage

in decrease in casualties Class I railroads [Ex. 262, R. 3300], S. P.-Pac. Lines [Ex. 272, R. 3349], Arizona and Nevada [Ex. 276, R. 3371]:

	Class I Railroads	S. P.-Pac. Lines	Arizona	Nevada
% Increase				
Cars per train 1939 over 1934	6.3%	3.6%	4.0% decrease	9.4% decrease
% Decrease				
Casualties 1935-1939 over 1929-1934	26.08%	10.00% increase	9.00%	1.5% decrease
% Increase				
Cars per train 1934 over 1928	3.9% decrease	5.2%	5.1%	28.4%
% Decrease				
Casualties 1929-1934 over 1923-1928	55.00%	33.5%	32.7%	45.9%
% Increase				
Cars per train 1939 over 1922	27.9%	25.8%	1.7% decrease	60.39%
% Decrease				
Casualties 1935-1939 over 1923-1928	66.74%	26.86%	38.7%	46.7%

This clearly shows that there is no similarity in or relation between the trend in increase in cars per train and the decrease in casualties.

(b) The Arizona-Nevada Comparison.

What we have said concerning the national comparison applies equally to any attempted comparison between Arizona and Nevada. We particularly refer to our discussions of comparisons which *include* the operations in Arizona before consolidation of the E. P. & S. W. and Arizona Eastern with the Southern Pacific and to the discussion of local conditions.

Concerning local conditions, as pointed out, the exhibits show that there are *20* casualties in Arizona, due to sand or particle in eye, to *one* in Nevada. These casualties are due to more sand and dust in the air in Arizona than in Nevada.

There is 7.5 times as much local traffic in Arizona as in Nevada. This requires switching, men on the ground to open and close switches, setting out and picking up cars, setting and releasing of hand brakes, more stops and starts and jerks and jars. As we have shown, the accidents in Arizona related to handling *local traffic* were at least 5 in Arizona to one in Nevada. This was due entirely to the fact that local traffic in Arizona is 7.5 times that in Nevada. It has no relation to the number of cars in a train. Yet in the Appellant's comparison of casualties, except slack action casualties, these sand in the eye casualties and those due to the difference in traffic are included. Such a comparison can give no possible information in respect to the relative safety of short and long trains.

The slack action accidents clearly show a greater hazard in long train operations as we have pointed out in our discussion of slack action accidents. In addition to the evidence we have heretofore pointed out in this connection, we call attention to the average cars per train and slack action accidents per million car miles, Class I railroads, Arizona and Nevada. The years shown are those where the cars per train Class I railroads is shown on Exhibit 22 introduced by Appellant [R. 2870].

	Average Cars Per Train			Casualties, Conductors, Brakemen, Flagmen on Duty—Slack Action Per Million Train Miles		
	National	Nevada	Arizona	National	Nevada	Arizona
Exhibit No.	22	150	149	266	280	280
1926	45.2	66.11	52.3	2.88	.96	4.07
1928	48	68.54	52.04	2.48	5.79	2.46
1930	48.9	77.18	56.39	1.73	4.38	4.27
1932	44.4	81.06	56.76	1.26	3.96	3.24
1934	46.2	86.67	57.33	1.14	3.31	.56
1936	46.4	74.03	53.	1.35	3.11	1.22
1938	47.7	78.77	55.5	1.74	3.64	.87
1939	49.1	78.46	54.8	.86	1.65	1.56

We have heretofore shown that the *severity* of the casualties from slack action increases with the increase in the number of cars in a train. The foregoing shows that the number of such casualties also increases.

The profile maps of Appellant's lines through Arizona and through Nevada are in evidence [Exs. 306 to 308, R. 2186; Exs. 309, 310, R. 2240]. A consideration of these profile maps will disclose to the Court that Arizona is a territory with many hogbacks and dips and that both grade and curve conditions are substantially more severe in Arizona than in Nevada. The Court will find that in the Nevada territory the curves are for the most part gradual, seldom ranging over two degrees, and usually occur on level track or only slight grades, while in Arizona the curves are, for the most part sharper, ranging from two to ten degrees, and usually occur on a substantial grade. On Exhibit 302 [R. 2101] a photostatic copy of the profile of Appellant's line in Arizona between mile post 1006.3 and mile post 1011.1, Station Irene (a distance of less than five miles) will be found *no less than twenty* curves ranging from *six degrees to ten degrees*, all on

grades ranging from 0.5% to 1%. We also direct the Court's attention to the profile maps showing the territory in Arizona between Mobile and Yuma, between Tucson and Steins on the north line, and between Tucson and Rodeo on the south line. *On the entire lines across the State of Nevada only four curves with as much as six degrees curvature are found*—three of six degrees and one of eight degrees [Kirkbride testimony, R. 2181, 2185].

Another difference in the two territories is in the amount of double track operated. Over 71% of the line through *Nevada is double track* or double track operation while only 15% of the line through Arizona is double track or double track operation [Salt Lake Division and Tucson Division time tables, Ex. 175].

These differences make comparison of operations in the two states impossible.

Los Angeles Division Casualty Statistics.

The Appellant contended below that approximately 25.8 percent of the trains run on certain main lines of that division during four typical months of 1939, were long trains. The record nowhere shows the total number of trains operated on this division nor the relative number of short and long trains operated.

Exhibit 185 [R. 3077] shows *by states* and in specific districts but not by divisions, a summary of main line freight trains operated in January, April, July and October, 1939. If this exhibit is the basis of the Appellant's contention, it does not support the contention.

First, the trains are not shown by division. For the *State of California* the percent of long trains operated is shown as 21.74, not 25.8.

Second, the formula used in preparing the exhibit will not support the contention. *If at any time* in its movement a train had *over* 70 cars it was *taken as a long train* —if in only one mile out of a 100-mile movement it had over 70 cars, it was counted a long train. If the formula had been reversed—that is, *if at any time* in its movement a train had *less* than 70 cars it was counted as a short train, the number of long trains would probably have been greatly reduced. If in a part of its movement it had less than 70 cars and in a part over 70 cars, there was just as much reason to count it as a short train as a long train.

Further, a percentage as to *main line operations only* would have no meaning because the accidents and casualties are for *all operations* on the division, *both main and branch* line. If 25.8 percent of main line trains were long trains (and there is nothing to sustain such contention), with the many short trains in branch line operations were considered, the percentage would probably be reduced substantially. Considering the volume of local traffic and pick-up trains handled around Los Angeles, we doubt that ten percent of all trains on the Los Angeles Division are long trains.

On sheet one of Exhibit 386 [R. 3533] appears a summary of the casualties to employees on duty and non-trespassers during the eleven year period, the average cars per train each year, and the casualties per million train and car mile. The eleven year period is divided into two periods, 1930-1935 and 1936-1940.

The average cars per train for the period 1930-1935 is 52.42, and for the period 1936-1940 is 57.81, an *increase* of 5.39 cars per train 1936-1940 over 1930-1935. The casualty rate for "Occupants of Motor Vehicles" was

12.09 per million freight train miles and 23.07 per million freight car miles for the *period 1930-1935*. For the period 1936-1940 it was 15.17 per million freight train miles and 26.24 per mililon freight car miles—an *increase* of 3.08 casualties per million freight train miles and 3.17 casualties per million freight car miles. For *all* non-trespassers the *increase* was 3.07 casualties per million train miles and 2.98 casualties per million car miles. There was also an *increase* in casualties to employees of 3.49 casualties per million train miles and 3.24 casualties per million car miles. In other words, with the *increase* in the average cars per train there was also *an increase* in casualties to both the *public* and to *employees*.

We further call to this Court's attention that 70 of the 460 accidents were "slack action" accidents. Fifty of these "slack action" accidents were on *long* trains and only 20 were on *short* trains, although probably better than 80 percent of the trains operated were *short* trains.

(d) New Mexico Casualty Statistics.

The record presents no basis for a comparison of accidents and casualties in Arizona and New Mexico. There is no showing of similarity of conditions sufficient to give probative value to the evidence. There is no showing as to the miles of railroad operated, the main and branch lines, the amount of traffic originating and terminating in New Mexico, and the like. It is shown that the grade and curve conditions in New Mexico are more favorable than in Arizona and that freight trains can be operated between Lordsburg and El Paso without once touching the automatic or air brake [R. 2456]. Without these conditions being shown to be similar, the comparison is meaningless.

But we direct the Court's attention to the data as to operations of long and short trains *in the same territory* —New Mexico.

From Exhibit 387 [R. 3548] showing casualties to employees on duty and non-trespassers 1930-1940; it will be seen that for the period 1936-1940 over 1930-1935 there was an increase in average cars per train of 2.83, an *increase* in casualties to Occupants of Motor Vehicles of .36 per million freight train miles and .59 per million freight car miles, an *increase* of casualties to all non-trespassers of .26 per million freight train miles and .39 per million freight car miles, an *increase* in casualties to conductors and brakemen of .91 per million freight train miles and 1.17 casualties per million freight car miles but a *decrease* of .42 per million freight car miles and 1.43 per million freight car miles for all employees and for casualties to all persons a *decrease* of .17 per million freight train miles and 1.03 per million freight car miles. In 1940, with an *increase* of 6.85 in the average cars per train over the previous year, the casualties to all employees *increased* 8.01 casualties per million freight train miles and 11.55 casualties per million freight car miles—and to all persons 8.61 casualties per million freight train miles and 12.46 per million freight car miles.

From the exhibit (sheet 9) it will be seen that there were 139 accidents during the 11 year period. Sheet 4 of the exhibits shows that 29 of these were "slack action" accidents. Eighteen were on *long* trains and 11 were on *short* trains. Five of the *short* trains *had 70 cars*. Only 3 of the short trains were *less than 65 cars in length*. Sheet 3 shows that there was a total of 145 casualties to all

persons, 34, or 23.46%, of which were on *long* trains, although probably *not 10 percent* of all trains operated were long trains.

SANTA FE CASUALTY STATISTICS.

Exhibits 126 [R. 2986] and 300 [R. 2093] and the testimony in connection therewith show that, as to grades and curves, the conditions in Arizona and New Mexico are *not* similar. There is evidence as to the types of traffic but upon the important question of the relative bridge traffic and traffic originating and terminating in the state there is *no* evidence. Exhibit 296 [R 3425] shows the casualties in totals by years, on the territory between Clovis, New Mexico, and Gallup, New Mexico, and between Gallup and Needles, California. There were 10 killed in the New Mexico territory to 4 in the Arizona territory. Detail of the cause of these accidents is shown, probably to show they were not due to long trains. But no detail is given from which the cause of the accident or accidents causing injuries can be determined—that is, whether they are caused by purely local conditions such as wash-outs, bridges giving away or washed out, melting snow causing track to give way, and the like. No similarity in the two territories in this respect was shown. And yet any accident occurring from these causes on a train while in operation would be included in the casualty data although due solely to local conditions. Casualties in Arizona from setting or releasing brakes, and picking up, setting out and switching local track are undoubtedly greater than in New Mexico. Although not shown in the record, undoubtedly local traffic is much heavier in Arizona than in New Mexico. Consequently more accidents of this type would be expected.

There can be no comparison of casualties per train or car miles unless *all* facts and factors relating thereto are shown.

CHESAPEAKE & OHIO CASUALTY STATISTICS.

In addition to the failure to show the necessary similarity of conditions as a basis for and to give probative value to the evidence, pointed out in our above discussion of the Santa Fe evidence—and which applies equally to the Chesapeake & Ohio evidence—we point out two important *differences* shown by the evidence.

First, it is shown by the evidence that the greater part of the Chesapeake & Ohio traffic is *coal*, thus differing entirely from the traffic on Appellant's lines in Arizona.

Second, it appears from the evidence that, during the period covered by the exhibits, a great amount of *grade and curve elimination* took place on the Chesapeake & Ohio. An example of this is seen in the fill on which the train shown in Exhibit 160 [R. 3034] is standing. The elimination of grades and curves would have a substantial effect upon the reduction of accidents. No such elimination of grades and curves is shown on Appellee's lines in Arizona.

Further, the casualties and derailments shown are those which occurred in *all classes of service*—that is, in the *combined freight and passenger operations*. It cannot be used as a basis of comparison with operations on Appellant's lines in Arizona or with operations on any other railroad because *there is no similar evidence* as to operations on the Appellant's lines in Arizona nor as to any other railroad. As to all other railroads, including Appellant's lines in Arizona, *the freight and passenger casualties were segregated.*

D. Hazards of Passenger Train Operation:

(a) SLACK ACTION INCREASES AS THE LENGTH OF THE TRAIN INCREASES.

Slack action produces severe shocks and serious injuries to passengers and trainmen. The dangers from slack action, which we have discussed in detail *supra* under hazards in freight train operation, are also present in passenger train operations. While the slack on passenger trains is less per car and the brake equipment is better, these are more than offset by other factors which enter into the consideration of the dangers from slack action in passenger trains:

1. The weight of passenger cars is from 80 to 100 tons while the average weight of freight cars is from 27 tons (empty) to 45 tons (loaded) [Exhibits 2, 4]. While the slack in a passenger car is less than that of a freight car, the weight of the passenger car is twice that of a freight car. The impact will consequently be greater in the passenger train operation.

While the brake equipment on passenger trains is better than that on freight trains, the distance the passenger car travels before the impact—the amount of slack to be taken up—is less, and the time for the brakes to apply before the impact occurs is shorter.

2. The number of persons who may be injured as a result of slack action is many times greater on a passenger train than on a freight train. On freight trains only the crew and such caretakers or deadheading employees as may be riding the train—seldom exceeding 2 or 3—are exposed to the dangers of slack action. On passenger trains in addition to the train crew and pullman employees, the passengers—perhaps 200 or 300, increasing in numbers

as the length of the train increases—are liable to injuries from slack action.

3. The passengers on passenger trains are ignorant of the dangers from slack action, ignorant of the places where and the conditions under which slack action may occur, ignorant of how to protect themselves, and in the case of old people and children, physically unable to protect themselves from slack action.

4. The distance passengers are required to travel through a moving train when en route to the diner or to get off at stations where the platforms are not of sufficient length to accommodate the length of the train increases as each car is added. This causes discomfort and inconvenience to passengers and exposes the passenger to the danger of being knocked down and injured by slack action.

(b) Lack of Necessary Station Facilities for Handling Passenger Trains Without Public Discomfort, Inconvenience and Risk of Injury.

At stations where platforms are not sufficient to accommodate long passenger trains passengers are subjected to additional hazards, because (1) they must be discharged at places where the footing is unsafe; and if after night fall, in the dark; and if in inclement weather, in snow and mud; or (2) they must walk a long distance through the moving train with the possibility of being knocked down by slack action; or (3) a second stop must be made, requiring stretching and bunching of the slack, and giving an additional opportunity for injury from slack action.

(c) The Increased Weight of the Train—Which Increases With Each Car Added—Increases the Hazard of Passenger Train Operation.

Each car added to a passenger train adds from 80 to 100 tons to the train. There is then 80 to 100 tons added to pile up on the cars ahead in case of derailment, thus increasing the possibility of serious injuries to passengers. Each car added increases the number who may be injured in case of a derailment or other accident to the train.

Long trains add to the danger to the public and to employees where it is necessary to make an emergency stop, because as the length of the train increases the difficulties of stopping in case of emergency increase. There is greater probability of injuring or killing persons at highway crossings, etc., with the probable derailment of the train and injury or death to passengers and employees. The length and weight of the train must influence the engineer in exercising his judgment. Where a crossing accident appears probable, he is compelled to choose between the possibility of injury to passengers by an emergency application of the brakes, and injuries to persons approaching the crossing. As the length of the train increases, the probability of injury to passengers on the train from an emergency application of the brakes increases.

(d) The Time Which Employees Have to Give to the Care and Attention of the Train Decreases as the Length of the Train Increases.

Every car that is added to a passenger train gives added duties and responsibility to the employees which take them away from giving their care and attention to the operation of the train. Each car adds passengers whose tickets

must be taken up by the conductor. Each car adds passengers, perhaps children, women or old people, whose comforts and conveniences must be looked out for and taken care of by the trainmen. These duties require time, and such time is taken and can only be taken from the time the trainmen give to looking after the safety of the train—observing train for defects, checking signals, checking to see that engineer is observing schedule, and similar duties in protecting the safety of the train. As these duties of the trainmen to look after passengers increase, his ability to protect the *safety* of the train decreases.

E. Summary of Safety Argument.

The record presents an abundance of evidence to support the proposition that the Train Limit Law is reasonably adopted to the ends sought (303 U. S. 177, 190) and thus to sustain validity of the law as a proper exercise of the state's police power for the protection of the safety of the public and of employees. The airbrake instructions of both the Southern Pacific Company and the Santa Fe recognize the hazard due to slack action in train operations and that this hazard increases as the number of cars in a train increases; and that this is true both as to the number of casualties and the severity of the casualties.

Increased hazards are shown in train operations, due to the increase in the number of cars in a train, by reason of (1) the increase in the quantity and quality of strains on weak parts in equipment, and the consequent probability of accidents due to failure of equipment, (2) the increase in difficulty of communication between the employees, (3) the increase in the difficulty in observing de-

fects in the train while in motion, and (4) the increase in fear of injury and strain upon the trainmen which reduces their efficiency.

The appellant's contention that short trains increase the hazard of crossing accidents and accidents due to negligence of employees is shown to be without support in the evidence; in fact, it appears the contrary is true.

The appellant's "national" and Nevada evidence has little evidentiary value. On the whole the "national" evidence presents no basis for comparison with operations in Arizona. Where a fair comparison is possible it is favorable to Arizona operations. Also, the exhibits combine long and short train operations, making a comparison between the short and long trains impossible.

In Nevada appellant appears to have selected its most favorable operating territory when traffic, grades, curves, double tracking and the like are considered. But difference in these and other local conditions make any comparison with Arizona operations impossible. The evidence as to Nevada operations, however, also shows that the hazards of operation increase with the increase in number of cars in the train.

Certainly, upon the records here, it is *not* "possible to say that the legislative choice is without rational basis."

South Carolina Highway Dept. v. Barnwell Bros., 303 U.S. 177, 191.

5. The Decision of the State Supreme Court, in Reversing the Trial Court, Did Not Deny to Appellant Any Federal Right to Which, on the Evidence, Appellant Is Entitled.

The Appellant complains that the State Supreme Court in its opinion did not discuss the evidence and specifically point out the error as to each Finding of Fact.

After the taking of evidence was closed in the trial court and the case was submitted, the Appellant and the Appellee each presented to the trial court suggested Findings of Fact, Conclusions of Law and a form of judgment. The Findings of Fact and Conclusions of Law presented by Appellant were accepted and adopted by the trial court without a single change therein so far as we are aware. The Findings of Fact cover *147 pages* of the printed record herein [R. 3887-4034, incl.]

Findings of Fact should *not* state or set out the evidence, or evidentiary or subordinate facts, but should find only the ultimate facts.

Wilson v. Merchants Loan & T. Co., 113 U.S. 121.

At least 90% of the trial court's findings here are in relation to evidentiary facts. As Appellant states (App. Br. Vol. I, p. 327): "No pertinent evidence introduced by either party has been disregarded". The inclusion of this evidentiary matter in the findings of fact could not impose on the Supreme Court of Arizona or this Court the burden of reviewing all the evidence.

Upon the question as to whether or not the Train Limit Law is valid as a safety measure, the ultimate fact to be determined was whether upon the whole record "it is possible to say that the legislative choice is without rational basis".

South Carolina Hy. Dept. v. Barnwell Bros., supra.

The State Supreme Court in its opinion determined "that the *findings* and judgment of the trial court *to the effect* that the Train Limit Law is unconstitutional were in error" [R. 4067-4068]. (emphasis ours). A finding by the trial court that the Train Limit Law has no rational basis in safety is "in effect" a finding that the law is unconstitutional. If upon the whole record it is impossible to say that the Train Limit Law has a rational basis in safety, then it is a direct regulation of interstate commerce and invalid under the Commerce Clause of the Federal Constitution. The ultimate fact to be determined is whether upon the whole record it is possible to say that the Train Limit Law is without rational basis. *So Carolina Hy. Dept. v. Barnwell Bros., supra*, is so interwoven with the question of law as to be in substance a decision of the latter.

Norfolk & W. R. Co. v. Conley, 236 U.S. 605, 609;

Truax v. Corrigan, 257 U.S. 312, 324-325.

The State Supreme Court has determined that the trial court erred in its finding upon this ultimate fact.

Section 21-1028, Arizona Code, 1939, stating the effect to be given to findings of fact, and the decisions of the State Supreme Court cited at pages 316-319, Volume I of Appellant's brief have no application here. This section of the Arizona Code and the cases cited have to do with the ordinary civil action arising under the *state laws*. They have no application to the determination of a Federal question arising under the Federal Constitution. The determination of such Federal question is governed by the decisions of this Court.

> "When a state court has wrongly denied a Federal right, finding that the asserted Federal right has no basis in point of *fact*.
>
> "This court, as an incident of its power to determine whether a Federal right has been wrongly denied, may go behind the finding to see whether it is without substantial support. *If the rule were otherwise, it almost always would be within the power of a state court practically to prevent a review here.*" (Emphasis ours.)

Truax v. Corrigan, supra, 257 U.S. at page 325.

And see:

Norfolk & W. R. Co. v. Conley, supra, and cases cited Appellant's brief, Vol. I, p. 236.

And the same rule or principle applies in a state Supreme Court's review of a trial court judgment. Certainly this Court will not apply one rule or principle to the review of the state Supreme Court's decision and apply another and different rule to the review by the state Supreme Court of the trial court's decision.

Conclusion.

The record clearly shows that the Train Limit Law has a rational basis in the protection of the safety of the public and of employees, and is a proper exercise of the police power of the state. It is in the permissible or concurrent field of legislation and in a field not occupied by Congress. No Federal rights of the Appellant have been denied by the decision of the State Supreme Court. We respectfully submit that the decision of the Supreme Court of the State of Arizona should be affirmed.

Respectfully submitted,

APPENDIX.

SERVICE ORDER NO. 85.

Part 95—Car Service

Length of Trains

At a session of the Interstate Commerce Commission, Division 3, held at its office in Washington, D. C., on the 11th day of September, A. D. 1942.

The Commission having under consideration operating rules, regulations, and State laws limiting the length of railroad freight and passenger trains, the Commission is of the opinion that, due to the existing state of war, an emergency exists requiring immediate action within the meaning of section 1, paragraphs (10) to (17), inclusive, of the Interstate Commerce Act.

It appearing that certain rules, regulations, practices, and laws are now in effect and are being enforced in certain states limiting the length of railroad freight trains to not more than one-half mile and limiting the number of freight cars in a railroad freight train to 70 cars, and limiting the number of cars in a railroad passenger train to 14 or 16, and that compliance by railroads subject to the Interstate Commerce Act with such rules, regulations, practices, and laws, during the present emergency, may result in congestion of tracks and terminals, wasteful use of locomotives, and interference with the free flow of traffic necessary in the present emergency; and that railroad freight trains exceeding one-half mile in length, or exceeding 70 cars in length, and railroad passenger trains

exceeding 14 or 16 cars in length may be operated in accordance with safety standards now applicable, during the present emergency, in and through such states, and that such operation will facilitate the free flow of traffic necessary during the present emergency;

Therefore, it is ordered, that:

Sec.

95.1 Length of trains

95.2 Effective period; emergency character.

AUTHORITY: §§95.1 and 95.2 issued under 40 Stat. 101, 41 Stat. 476, 49 Stat. 543, 54 Stat. 901; 49 U.S.C. 1 (10)-(17).

§95.1 *Length of trains.* From and after September 15, 1942, carriers by railroad subject to the Interstate Commerce Act shall operate their trains, when necessary for the prompt movement of freight and the clearing or avoidance of congestion by either freight or passenger trains, without regard to any rules, regulations, practices or laws now in effect and being enforced in the various states limiting the length of freight trains to not more than one-half mile and limiting the number of cars in a railroad freight train to 70 cars or limiting the number of cars in a railroad passenger train to 14 or 16.

§95.2 *Effective period; emergency character.* This order shall remain in effect during the war in which the United States is now engaged, unless sooner terminated by subsequent order of the Commission; and that this or-

der, being based upon conditions of war emergency, shall not constitute a precedent for peacetime operations.

It is further ordered, That this order shall be served upon each common carrier by railroad subject to the Interstate Commerce Act and upon each State railroad commission, and that notice of this order be given to the general public by depositing a copy thereof in the office of the Secretary of the Commission at Washington, D. C., and by filing it with the Director of the Division of the Federal Register, The National Archives.

By the Commission, division 3.

(Seal)

W. P. BARTEL,
Secretary.

Safety Appliance Act

Section 1

It shall be unlawful for any common carrier engaged in interstate commerce by railroad to use on its line any locomotive engine in moving interstate traffic not equipped with a power driving-wheel brake and appliances for operating the train-brake system, or to run any train in such traffic after said date that has not a sufficient number of cars in it so equipped with power or train brakes that the engineer on the locomotive drawing such train can control its speed without requiring brakemen to use the common hand brake for that purpose.

Section 9

Whenever, as provided in sections 1-7 of this title, any train is operated with power or train brakes not less than 50 per centum of the cars in such train shall have their brakes used and operated by the engineer of the locomotive drawing such train; and all power-braked cars in such train which are associated together with said 50 per centum shall have their brakes so used and operated; and, to more fully carry into effect the objects of said sections, the Interstate Commerce Commission may, from time to time, after full hearing, increase the minimum percentage of cars in any train required to be operated with power or train brakes which must have their brakes used and operated as aforesaid; and failure to comply with any such requirement of the said Interstate Commerce Commission shall be subject to the like penalty as failure to comply with any requirement of this section.

INTERSTATE COMMERCE ACT

Section 25, Part I

(In part)

The Commission may, after investigation, if found necessary in the public interest, order any carrier within a time specified in the order, to install the block signal system, interlocking, automatic train stop, train control and/or cab-signal devices, and/or other similar appliances, methods, and systems intended to promote the safety of railroad operation, which comply with specifications and requirements prescribed by the Commission, upon the whole or any part of its railroad, such order to be issued and published a reasonable time (as determined by the Commission) in advance of the date for its fulfillment.

In the Supreme Court of the United States

OCTOBER TERM, 1944

No. 56

SOUTHERN PACIFIC COMPANY, APPELLANT

v.

STATE OF ARIZONA, EX REL. JOE CONWAY, ATTORNEY GENERAL OF THE STATE OF ARIZONA

APPEAL FROM THE SUPREME COURT OF THE STATE OF ARIZONA

BRIEF FOR THE UNITED STATES AS AMICUS CURIAE

OPINIONS BELOW

The opinion of the Arizona Supreme Court (R. 4055–4071) is reported in 145 Pac. (2d) 530. The unreported opinion of the Arizona Superior Court may be found in the jurisdictional statement (pp. 22–34) and at R. 4042–4054; the findings of fact and conclusions of law of that court may be found at R. 3879–4039.

QUESTIONS PRESENTED

The questions considered in this brief are:

1. Whether Congress has manifested any specific intention as to the validity of state train

length legislation, and in particular whether Section 1, paragraphs 10–17 of the Interstate Commerce Act authorizes the Interstate Commerce Commission to regulate the subject of train lengths and, if so, whether state limitations are valid during the period before the Commission acted.

2. Whether, assuming the absence of any specific federal legislation on the subject, the Arizona statute contravenes the Commerce Clause.

STATUTES INVOLVED

The statutes involved are the Arizona Train Limit Law (Arizona Code Ann. 1939, Sec. 69–119), and the policy section and Section 1 (10)–(17) of the Interstate Commerce Act (49 U. S. C., Sec. 1 (10)–(17), which are printed in the Appendix, *infra*, pp. 90–98).

STATEMENT

On April 19, 1940, the State of Arizona brought suit against the Southern Pacific Co. for statutory penalties for operating two trains, one passenger and one freight, in violation of the law providing that passenger trains shall not consist of more than fourteen cars and freight trains of more than seventeen (R. 1–4). The carrier answered, admitting the violations but contending that the statute violated the commerce clause and the due process clause of the United States Constitution (R. 5–32). The case was tried in the Arizona

Superior Court, sitting without a jury. After a long trial devoted to the constitutional issues, the trial court entered judgment for the defendant railroad. The evidence and findings are discussed in some detail at the appropriate point in the Argument (*infra*, pp. 21–44). They are accurately summarized in the following excerpts from the trial court's opinion.

The court found that (R. 4046) the

> * * * evidence clearly establishes that "long-train" operating practice is the customary and ordinary practice throughout the United States and that improvements in efficiency, economy and safety are an accomplishment and necessary result of the adoption of that practice. This type of operation is unquestionably more economical and efficient than "short-train" operations. Freight train expenses vary inversely with train length. Furthermore, long-train operations permit improved schedules and performance by elimination of short-train interference.

With respect to the effect on commerce, the court stated (R. 4048–4049):

> The record here also amply discloses that the law causes real interference with, and delay to, interstate commerce, practically to the extent that Arizona operations create a bottle-neck. Actually ninety-three percent of the freight traffic and ninety-five of the passenger business of the defendant in Arizona is interstate commerce. Fur-

thermore, the law certainly imposes a great, substantial and wholly unreasonable burden of expense upon this interstate traffic. To hold in this case that interstate commerce was only incidentally or indirectly involved would be less than realistic, for the interference and regulation is *substantial, continuous, direct and unavoidable,* as is pointed out in detail in the findings of fact. What is even more serious from the standpoint of those who seek to uphold the Act is its extra-territorial effect. The challenged law lays hands upon interstate commerce moving over defendant's lines long before it reaches the physical boundaries of Arizona, and continues directly to affect and regulate that commerce long after it has left Arizona. As a practical matter, it nearly controls the length of passenger trains from Los Angeles to El Paso, and of freight trains from Yuma to Lordsburg, the latter point being twenty-three miles East of the State line, and frequently on to El Paso, 171 miles beyond Arizona's boundary.

The court concluded not only that the Arizona statute imposed an unconstitutional burden upon interstate commerce, but also that the "subject of the length of trains in interstate traffic" falls within the field "exclusively reserved to the National Government" (R. 4047),

> * * * for the reason that the subject matter is national in its character, requir-

> ing uniformity of regulation by a single authority. If each state was at liberty to regulate the conduct of carriers while within its jurisdiction, the confusion likely to follow could not but be productive of great inconvenience and unnecessary hardship. The very purpose of the commerce clause was to insure uniformity of regulation of interstate commerce against conflicting and discriminating state legislation, such as the law in question. The absence of any act of Congress on the subject of train lengths is equal to its declaration that commerce in that matter shall be free.

The court then turned to the State's contention that the statute was a valid exercise of the police power because designed to add to the safety of railroad operations. Basing its finding on accident statistics in Arizona and other states where longer trains were operated, which showed that casualty rates were much higher in Arizona, the court stated with respect to the limitation on passenger trains (R. 4050):

> From the standpoint of the safety of persons and property, slack and slack-action casualties on passenger trains are of no significance whatever.
>
> Long-train method of operation prevails in passenger service all over the United States, except in Arizona, and the statistics demonstrate, from the safety angle, that the fourteen-car limit has no logical or reasonable basis. Furthermore, long pas-

senger-train operations in Arizona are entirely practicable and would result in greater efficiency, economy and safety.

Hence, certainly as applied to passenger-train operations, the challenged law bears no reasonable relation to its claimed object of safety, and instead of promoting that object actually increases many hazards, and creates many others which would not exist if the law were not enforced.

The same conclusion was reached as to freight trains. On this point the court said (R. 4051):

> The frequency of train and train-service accidents, which includes grade-crossing accidents, appears to be directly related to the number of train units operated and that when more train units are run than are necessary to handle a given amount of traffic, the hazard or accidents in the handling of such traffic is correspondingly increased. When one considers that in the year 1938, for instance, that 30.8% or 4,304 more freight trains were operated between Yuma and El Paso than were actually necessary if it had not been for this law, it becomes apparent why the casualty rate is higher in Arizona.
>
> * * * * * *
>
> * * * it appears very definitely that there are more accidents and they occurred more frequently in proportion to trains handled or traffic moved in short-train territory than in long-train territory.

The court then considered the relationship of the length of trains to "slack accidents" as follows (R. 4052–3):

> A certain amount of slack is absolutely necessary to train operations. It cannot be denied that the addition of each car to a train adds just that much more potential slack, which must be effectively handled by the engineer if serious accidents are to be avoided. To the credit of the locomotive engineers of the United States, be it said that they have, with the improved equipment and devices furnished them, manifested greater skill and exercised more care in handling these longer trains with their heavier locomotives to the extent that over a seventeen-year period (1923–1939) only six per cent of the over-all casualties were caused by this type of accident. It must also be remembered that there are many factors besides length of train causing slack-action casualties, such as: grades, speed of train, consist of train and whether loaded or empty. The record shows many severe casualties of this type on short trains. Limiting trains to the Arizona maxima has had no perceptible limiting effect on even that class of accidents, * * *
>
> * * * * *
>
> In determining then whether the law bears any reasonable relation to safety, only the over-all result in casualties of the entire operation should be considered and when thus weighed it is clear that the law

> not only does not increase safety of train operations in Arizona, but that as a matter of cold fact it makes these short-train operations more dangerous.

The court's final conclusion was that the Act was void as in conflict with both the commerce and the due process clauses (R. 4053–4054).

This judgment was reversed by the Arizona Supreme Court, one judge dissenting (R. 4055–4071). The latter court did not overturn any of the facts found by the trial judge, whose findings, under the state rules of civil procedure, were not to be set aside "unless clearly erroneous."[1] Indeed it did not mention the facts or the findings at any point in its opinion. Its reasoning was that the law was passed for the purpose of protecting the safety of railroad employees and the traveling public (R. 4058), that debatable questions as to the reasonableness of legislation were not for it to decide (R. 4059–4067), and that (R. 4063)

> A state is free in the exertion of its police power to enact reasonable measures in the interest of the health, safety and welfare of its people, including employees of railroads, passengers on trains, and others, even though interstate commerce may be incidentally or indirectly involved. * * *

[1] Rule 52 (a) of the Arizona Rules of Civil Procedure is identical with the same rule in the Federal Rules of Civil Procedure.

[2] The above passage is from a quotation from *M.-K.-T. R. Co.* v. *Williamson*, 36 F. Supp. 607 (W. D. Okla.).

There was no analysis of the facts to show the basis for the conclusion, unexpressed but implicit in the opinion, that the law was reasonably related to the public safety and only incidentally or indirectly affected interstate commerce. As to the claim that the Safety Appliance Act and various sections of the Interstate Commerce Act had occupied the field, the court was of the opinion that they had not until the Interstate Commerce Commission acted.

The carrier appealed from this judgment. In noting probable jurisdiction, this Court called the case to the attention of the Solicitor General.

On September 11, 1942, after the decision of the trial court but before that of the Arizona Supreme Court, the Interstate Commerce Commission issued an order suspending state train limit laws for the duration of the war. The history and pertinence of that order are discussed, *infra*, pp. 60–62, 67–89.

SUMMARY OF ARGUMENT

I

1. The Arizona law regulates the length of trains the vast majority of which are in interstate commerce. The effect of such a limitation in a single state is to require trains to be reconstituted when they enter and leave the state. Since this generally cannot be done at the state border, the law in operation controls the length

of trains without as well as within the state. If other states enacted similar laws, prescribing various maximum train limits, as has been proposed and as would be within their power if the Arizona law is valid, the lack of uniformity in itself would impede the flow of commerce throughout the nation.

2. The Arizona statute obstructs commerce inasmuch as it slows down the movement of interstate traffic. This results both from the terminal delays when trains are reconstituted, and from the additional "meets" and "passes" caused by the running of more trains on a single track line. The train limit law also prevents the Arizona railroads from engaging in the method of railroad operations which is prevalent in the United States today. The operation of freight trains of over seventy and passenger of over fourteen cars is a regular practice on the main lines of the railroads, including the Southern Pacific on its lines outside Arizona. The effect of the law is to require 30% more trains to be operated in Arizona than would otherwise be the case. This substantially increases the cost of transportation, as is shown by comparison of Arizona costs with those of comparable lines elsewhere. This is expensive not only to the carriers but to the public which ultimately bears the cost of transportation. The law also has the effect in time of heavy transportation demands, such as the present, of diminishing the total

amount of traffic which can be carried, inasmuch as more locomotives and more manpower are required to haul traffic in short trains than in long ones. Even if the operation of the state law be suspended during such periods, its effect is not undone inasmuch as the absence of adequate sidings and locomotives interferes with the conversion of the road from short to long train operations.

3. The train length limitation cannot be justified as a safety measure. Experience proves that the slack accident casualties at which it is directed are infrequent, averaging five per year in Arizona, that the law has had a negligible effect in preventing them, and that the increase in the number of trains operated increases the number of other types of accidents which vary in proportion to the number of trains run. The accident rates in Arizona under short train operations, even as to the trainmen whom the law was designed to protect, are much higher than in comparable states.

4. In determining whether a state law contravenes the commerce clause this Court has been concerned with whether the subject of regulation requires national uniformity and with the extent of the burden on commerce. In applying these tests the Court has been guided largely by the practical effect of the statute in interfering with commerce, as compared with the local benefits derived from it. Application of these principles to the Arizona Train Limit Law demonstrates that

it is invalid. A lack of uniformity in regulation of this subject in itself interferes with the flow of commerce. The movement of interstate trains is obstructed and retarded. The carriers are prevented from employing the method of transportation customarily used by railroads throughout the nation, and are compelled to adopt a means more costly to the public. The effect of the law in reducing accidents is too slight, if it exists at all, to outweigh the interference with the national commerce.

II

Congress has not manifested any specific intention one way or the other as to the validity of state train length bills. No conclusion either way can be drawn from the history of the train length bills introduced in Congress but which failed to pass. And although, in our opinion, the Interstate Commerce Commission is empowered by Section 1, paragraphs 10–17 of the Interstate Commerce Act, to regulate train lengths in certain circumstances, this case involves the period before the Commission acted. We do not believe that any inference can be drawn from the federal legislative history that Congress intended Section 1 either to deprive the states of any power over the subject of train lengths which they might otherwise have had or to expand their constitutional authority to matters which under this Court's decisions they could not otherwise reach.

ARGUMENT

Preliminary Analysis

This brief will deal only with two subjects: (1) whether Congress has manifested any specific intention as to the validity of state train length legislation, and in particular whether it has authorized the Interstate Commerce Commission to regulate the subject of train lengths in Section 1, paragraphs 10–17 of the Interstate Commerce Act, and, if so, whether state limitations are valid during the period before the Commission acted, and (2) whether, assuming the absence of any specific federal legislation or action on the subject, the Arizona statute contravenes the Commerce Clause.

The authority of the Commission over the subject is currently being challenged in *Johnston* v. *United States*,[3] now pending before a three-judge district court in Oklahoma. That case involves the Commission's 1942 order suspending train length limitations during the war, which, of course, does not apply to the 1940 operations for which appellant has been penalized here. The ultimate question with which we are concerned, however, is not the authority of the Commission, but the intention of Congress as to the validity of

[3] W. D. Okla., Civil Action 1408. Proceedings in the case have been postponed until the final determination of the instant case by this Court.

state legislation prior to the time the Commission first sought to exercise its authority. As will appear, we have concluded, in the absence of any specific manifestation as to what Congress actually intended, that the car service provisions of the Interstate Commerce Act neither added to nor subtracted from the preexisting constitutional power of the states over the subject of train lengths. Clearly those provisions did not expand the authority of the states over interstate commerce. An argument can be made that if the Interstate Commerce Act authorized the Commission to regulate train lengths, it occupied that field and thereby made it exclusively federal. But we think it unlikely that in fact Congress would have regarded those provisions as in themselves depriving the states of any power over train lengths which they possessed without action by the Commission.

If this analysis is correct, the case turns upon the validity of the state law under the commerce clause, without regard for any specific delegation to the Commission. Accordingly we shall deal with that problem in Point I, and then consider in Point II (pp. 63–89) whether Congress has manifested any specific intention with respect to the validity of state train length legislation.

I

THE ARIZONA TRAIN LIMIT LAW CONTRAVENES THE COMMERCE CLAUSE

A. THE UNDERLYING PRINCIPLES

Since *Gibbons* v. *Ogden,* 9 Wheat. 1, and *Cooley* v. *Board of Port Wardens,* 12 How. 299, it has been established that under the commerce clause some subjects of regulation are within the exclusive power of Congress, and that even in the absence of a showing of congressional intention some types of state laws are invalid. This has not meant that the states were deprived by the commerce clause of their power to enact measures affecting, or even directly regulating, interstate commerce. But at some point, when the national, as distinct from the local, interest in the subject was sufficient, when the practical burden on interstate commerce became sufficiently clear, the Court has always drawn a line beyond which the states could not go.

The test applied in drawing this line has been expressed in various ways. In the first authoritative formulation of the accepted doctrine (*Cooley* v. *Board of Port Wardens, supra*), the Court declared (p. 319):

> Now the power to regulate commerce, embraces a vast field, containing not only many, but exceedingly various subjects, quite unlike in their nature; some impera-

> tively demanding a single uniform rule, operating equally on the commerce of the United States in every port; and some, like the subject now in question, as imperatively demanding that diversity, which alone can meet the local necessities of navigation.
>
> Either absolutely to affirm, or deny that the nature of this power requires exclusive legislation by Congress, is to lose sight of the nature of the subjects of this power, and to assert concerning all of them, what is really applicable but to a part. Whatever subjects of this power are in their nature national, or admit only of one uniform system, or plan of regulation, may justly be said to be of such a nature as to require exclusive legislation by Congress.

In some opinions, the doctrine of the *Cooley* case has been thought to have been based on the legislative intention to be implied from the silence of Congress in the particular case. "The failure of Congress to regulate interstate commerce has generally been taken to signify a Congressional purpose to leave undisturbed the authority of the states to make regulations affecting the commerce in matters of peculiarly local concern, but to withhold from them authority to make regulations affecting those phases of it which, because of the need of a national uniformity, demand that their regulation, if any, be prescribed by a single authority." *Graves* v. *O'Keefe,* 306 U. S. 466,

479, n. and cases cited.[4] But whether or not the rule is predicated upon implications from the commerce clause itself or upon the presumed intention of Congress where Congress has been silent, the result is the same.

Many cases, while not abandoning the "necessity for national uniformity" test, have spoken in terms of "direct" or "indirect" burdens on interstate commerce. Although the words "direct" and "indirect" are in themselves of little assistance, the emphasis in the cases adopting this formula has been on the practical interference with commerce produced by the state law. The commerce clause was designed to reach state legislation which "practically obstructs" commerce as well as that which expresses "hostility" toward it. *Union Brokerage Co.* v. *Jensen,* 322 U. S. 202, 209. Consideration is to be given to "all the facts and circumstances, such as the nature of the regulation, its function, the character of the business involved and the actual effect on the flow of commerce * * *." *Di Santo* v. *Pennsylvania,* 273 U. S. 34, 44 (Mr. Justice Stone, dis-

[4] See Dowling, *Interstate Commerce and State Power* (1940), 27 Va. Law Rev. 1, 20; Powell, *The Validity of State Regulation under the Webb-Kenyon Law* (1917), 2 Southern Law Quarterly 112, 3 Selected Essays on Constitutional Law 880, 898 (Association of American Law Schools, 1938); Sholley, *The Negative Implications of the Commerce Clause,* 3 University of Chicago Law Review 556; 3 Selected Essays on Constitutional Law 933 (Association of American Law Schools 1938).

senting). See also *Minnesota Rate Cases*, 230 U. S. 352, 400.

Both of these principles—sometimes separately and sometimes as if they were interrelated—have found recognition in the recent cases. That the commerce clause establishes "the immunity of interstate commerce from the control of the states respecting all those subjects embraced within the grant which are of such a nature as to demand that, if regulated at all, their regulation must be prescribed by a single authority" was recognized in *Milk Control Board* v. *Eisenberg Farm Products*, 306 U. S. 346, 351, *Edwards* v. *California*, 314 U. S. 160, 176, and *Kelly* v. *Washington*, 302 U. S. 1, 14. Local regulation is to be upheld if it does not impair the "uniformity of control of the national commerce in matters of national concern" or "materially obstruct * * * the free flow of commerce which were the principal objects sought to be secured by the Commerce Clause". *California* v. *Thompson*, 313 U. S. 109, 113; *Parker* v. *Brown*, 317 U. S. 341, 363. And *Union Brokerage Co.* v. *Jensen*, 322 U. S. 202, 211, emphasizes that "the fate of state legislation" has been determined "by the weight of the circumstances and the practical and experienced judgment in applying these generalities to the particular instances".

Whether a state statute "unduly" burdens interstate commerce is to be determined by bal-

ancing "the interest of the state in the present regulation * * * against the effect of such control on the commerce in the national aspect". *Illinois Nat. Gas Co.* v. *Central Ill. Pub. Serv. Co.*, 314 U. S. 498, 506. In summary, as said by the Court in *Parker* v. *Brown, supra*, at 362:

> * * * When Congress has not exerted its power under the Commerce Clause, and state regulation of matters of local concern is so related to interstate commerce that it also operates as a regulation of that commerce, the reconciliation of the power thus granted with that reserved to the state is to be attained by the accommodation of the competing demands of the state and national interests involved.

It has been urged by appellee that these general principles are inapplicable to a law enacted in the interest of safety and health, that as to such matters the states have complete freedom irrespective of the effect upon commerce of the local regulation. Neither reason nor authority supports this contention, as we show at pp. 53–60, *infra*.

B. APPLICATION OF THESE PRINCIPLES

Application of the above principles to the instant case demonstrates, in our opinion, that the Arizona law is invalid. The length of trains in interstate commerce is a subject which in the national interest requires uniformity of regulation, as distinct from a diversity of local controls. And a state law which prevents railroads from

transporting freight and passengers in trains of the length customarily operated throughout the United States unduly interferes with and obstructs the free flow of interstate commerce. The effect of the law as a safety measure, in reducing accidents and casualties, is too slight, if existent at all, to outweigh the interference with the national commerce.

The following discussion of the facts is based in the main on the findings of fact of the trial court (R. 3887–4034). Although many of the findings referred to have been attacked by the appellee, they were not set aside by the State Supreme Court, and are, in our opinion, proved by the evidence to be correct.[5] Indeed many of the

[5] Citations (in folio numbers) to the supporting evidence are at the end of each finding.

This Court is not bound by the findings of a state court in cases involving a federal right. *United Gas Public Service Co.* v. *Texas*, 303 U. S. 123, 143; *Great Northern Ry. Co.* v. *Washington*, 300 U. S. 154, 165–166; *Norris* v. *Alabama*, 294 U. S. 587, 590; *Fiske* v. *Kansas*, 274 U. S. 380, 385–386; *Aetna Life Ins. Co.* v. *Dunken*, 266 U. S. 389, 394. Accordingly, if the decree of the Arizona Supreme Court be regarded as overturning the findings of the trial court, this Court could still look to the evidence to see if the original findings were correct. And although, by the same token, this Court would not be bound by the trial court's findings, they are entitled to the respect normally given the findings of the judge who has heard the testimony. We submit that the opinion of the trial judge (R. 4042–4054), as well as the findings, manifests the painstaking consideration he gave to his factual conclusions in contrast to the failure of the State Supreme Court to refer to the facts at all.

most important of them are either so obvious or so inherently probable as to be subject to judicial notice.

1. *The Subject of Train Lengths is one Requiring National Uniformity*

The predominantly interstate character of railroad operations in the United States is well known to the Court. Relatively few trains carry only goods or persons which remain within a single state. And the proportion of the trains and cars which cross state lines is very great. In Arizona approximately 93 percent of the freight traffic and 95 percent of the passenger were interstate in character. (R. 3897–8.)[6] Indeed, about two-thirds of the freight and almost three-fourths of the passenger traffic crosses Arizona in the course of travel between other states (R. 3898). Although Arizona may be exceptional in this respect, in view of its location and small population, unquestionably railroading is an industry organized and operated on an interstate basis to a greater extent than almost any other.

With railroad operations largely involving the running of trains across state lines, the confusing effect of permitting the various states to establish limitations on train lengths is easy to demonstrate. Trains crossing the country would have to be broken up and reconstituted as they cross the lines

[6] Whether measured by quantity or by revenue.

of states imposing different limitations. Whenever a long train was about to enter a state with a shorter maximum it would have to be broken up. When the train passed into a state with no restriction, or with a higher one, there would be a new rearrangement. The alternative would be that the carrier would be obliged to conform to the shortest limitation of any of the states through which the train passed.

These possibilities of interference with operations through diverse requirements are not merely theoretical. Although the 70-car maximum for freight trains is the one most commonly proposed, the various bills introduced in state legislatures would have established maximum freight train lengths at from 50 to 125 cars and maximum passenger train lengths at from 10 to 18 cars.[7] If these laws had passed, a freight train running from Virginia to Michigan might have proceeded through states with a 75 car maximum (Virginia), a 125 car maximum (West Virginia), a 3000 foot maximum (Ohio), and a 70 car limit (Michigan). A train from Arkansas to Wisconsin might have been subjected to a 50 car maximum (Arkansas), one-half mile (Missouri), 3000 feet (Iowa), one and one-half miles (Minnesota), and 3300 feet

[7] See table listing and summarizing the train limit bills which were introduced in state legislatures but failed of enactment between 1927 and 1937, Hearings before the House Committee on Interstate and Foreign Commerce on S. 69, *Train Lengths*, 75th Cong., 3rd Sess., p. 447.

(Wisconsin). A train running from Nebraska to California might have been subjected to a 60, 75 or 85 maximum in Nebraska, to a limit fixed by a commission in Kansas, to a 65-car limit in Colorado, to a 75-car limit in New Mexico, to a 70-car limit in Arizona, and to a 74-car limit in California. A passenger train might have been limited to 14 cars in New Jersey, 10 in Pennsylvania, and 18 in West Virginia. If we assume, as would have been the fact, that there were also many states which would have had no limitation upon train lengths interspersed along the routes, the confusion in railroad operations which would have resulted from complying with variegated state regulations is even more apparent.

The present situation is simpler than that described above inasmuch as only three of the 164 train-length bills introduced in 36 state legislatures since 1920 have become law,[8] and the en-

[8] In Nevada, Louisiana and Oklahoma; the Arizona law involved in this case was enacted in 1912. Of the remaining bills, 62 were never reported out of committee, four were withdrawn by their authors, 21 were reported unfavorably by legislative committees and nine without recommendation, 22 died on the legislative calendar after preliminary consideration, four passed one house but were not reported out of committee in the second, 29 were defeated by vote on the floor, and one was vetoed. (The above figures do not include nine bills introduced in New Mexico, which did not pass; we have been unable to discover at what stage of the legislative process they were defeated.) The California and Nevada legislatures have memorialized Congress to pass train length legislation. In Appendix D, *infra*, pp. 103–112, we have

forcement of two of these has been enjoined as unconstitutional.[9] At present 70-car laws are enforced only in Arizona and Oklahoma, with a 14-car passenger limit in Arizona. These affect the flow of through traffic to and from the Pacific Coast, as well as through Oklahoma in other directions. The present record, which is concerned,

---

listed the references to the above bills and to the legislative journals disclosing their disposition.

In his veto message of April 17, 1935 Governor Merriam of California stated (Cal. Sen. Journ., 51st sess., 1935, p. 1226):

"The chief and compelling objection to Senate Bill No. 24 is found in the fact that it seeks to establish within the borders of California by State law certain practices and regulations which can be effectively and equitably set up only by Federal statutes which shall be applicable not in one or two, but in all of the 48 States.

* * * * * *

"It is proper, however, that you should know that I have become convinced that this proposed law involves certain probable conflicts with the provisions of the Federal Constitution, indicating the likelihood of nullification of the proposed law in the event of a review by the Supreme Court of the United States."

[9] The 70-car laws in Nevada and Louisiana were held unconstitutional and never enforced. *Southern Pacific Co.* v. *Mashburn*, 18 F. Supp. 393 (D. Nev.); *Texas and New Orleans R. Co.* v. *Martin* (No. 428—Eq. E. D. La.), 1936, unreported. The Arizona law was also held unconstitutional in *Atchison, T. & S. F. Ry. Co.* v. *La Prade*, 2 F. Supp. 855 (D. Ariz.), reversed because of the substitution of a new attorney general who refused to threaten to enforce the law, in *Ex Parte La Prade*, 289 U. S. 444. As to the unsuccessful efforts of the carriers in Arizona to obtain the cooperation of the State Attorney General in bringing a test case between the time of the *La Prade* case and the present litigation, see Hearings, *supra*, note 7, pp. 429–446.

of course, only with the Arizona statute, shows that it results in freight trains being broken up and reformed at the California border and in New Mexico some distance from the Arizona line. Frequently it is not feasible to operate a new train from the New Mexico yard nearest to Arizona, with the result that the Arizona limitation governs the flow of traffic as far east as El Paso, Texas. As to passenger traffic, the Arizona law often controls the length of passenger trains all the way from Los Angeles to El Paso. (R. 4049, 3957, 3959.)

The situation in Oklahoma is more complicated, inasmuch as many railroads pass through the state in various directions.[10] The Chicago, R. I. & P. line from Chicago and Kansas City to the West runs through Oklahoma for 60 miles between Kansas and Texas, and the Santa Fe line between Chicago and California crosses Oklahoma for 117 miles between Kansas and Texas. The Kansas City Southern line from Kansas City, Missouri, to Port Arthur, Texas, crosses from Arkansas into Oklahoma and back to Arkansas again after running through Oklahoma for 143 miles. Neither Kansas nor Texas nor any

[10] The Oklahoma picture appears from any railroad map of the United States, and specifically in a map submitted to the Interstate Commerce Commission in *In the Matter of Service Order No. 85*. See the appendix to the brief submitted by the railroads to the Interstate Commerce Commission in that case.

other state through which the traffic passes (except Arizona) restricts train lengths in any way. On the contrary, proposed bills for limiting train lengths failed of passage in many of the adjoining states.[11] The effect of the Oklahoma law, however, is to require through trains to be broken up for the short distance they pass through that state, as well as for substantial distances on either side between

[11] See Appendix D, *infra*, pp. 103–112. The Kansas Public Service Commission, which was vested with power to regulate train lengths, refused to do so on the ground that—

"It is impracticable to direct that trains engaged in interstate commerce should, when arriving at the Kansas state line, divide into two or more portions, each portion to be attached to an engine and caboose and manned with sufficient employees to conduct it as a train across the state. To do so would not be in the interest of economy. * * * The operation of a greater number of trains would perforce increase the hazard to the public at large at grade crossings, and accidents of this character constitute a large per cent of the serious railroad accidents of today.

"The evidence introduced herein does not, by a preponderance thereof, show that accidents to employees, incurred by reason of operation of trains in Kansas, have unduly increased during the past few years solely because of the increase in length of trains. Neither has it been shown that accidents to passengers riding on such long trains have increased. * * *

"Practically all of the trains operated by respondents in Kansas are engaged to some extent in interstate commerce. The commission recognizes that it has no jurisdiction or authority to issue any order that would cast an undue burden upon such commerce."

The above excerpts are taken from the findings of the Commission as reported in *State ex rel. Public Service Commission* v. *Atchison, T. & S. F. Ry. Co.*, 125 Kans. 586, 588–589, 264 Pac. 1056 (1928).

the Oklahoma line and the nearest terminal in the adjacent state at which trains can be assembled.

The above illustrations of the operation of a state train length law show that lack of national uniformity in the regulation of this subject in itself impedes the flow of commerce through the nation.

If one state may regulate the train length, so may all the others, and they need not prescribe the same maximum limitation. If many endeavored to do so, the confusion resulting from the two state laws now in effect would be many times compounded.

The facts recited also show the effect of the state train length limitation upon operations in other states. To a certain extent the state with the lowest limit governs transportation operations in its part of the nation. For the longer trains must be broken up before they reach that state, thus extending the effect of the law at least to the nearest terminal points in adjoining states. And often, as the record shows, it is impracticable to reassemble trains, so that the short train operation is extended over a wider territory.

It thus appears both that the Arizona train limitation statute has its principal impact upon interstate commerce, and that its effect extends far beyond the control of operations within the regulating state. In such circumstances to permit state regulation will lead to the very kind of con-

fusion and interference which the commerce clause was designed to prevent. The advantages to the national interest of national regulation of such a subject are patent.

2. *The Burden on Interstate Commerce*

A. THE OBSTRUCTION TO TRAFFIC

Inasmuch as, where no legal restrictions prevail, through traffic is generally carried in long trains, many freight trains approaching Arizona are longer than seventy cars in length (R. 3915–6). Such trains must be broken up and reconstituted at the terminals when they enter Arizona. The train which is being reduced in length is delayed during this operation (R. 3953–7). The cars which are cut out of the train are delayed even longer, for they must be taken off the main track and stored for later movement until another train comes along or can be made up (*ibid.*). When a train leaves Arizona the converse takes place, except that often it is not feasible to consolidate eastbound trains at Lordsburg, New Mexico, with the result that the short-train operation continues to El Paso (R. 3957). Where the trains are consolidated in order to secure the advantages of long-train operation, cars are delayed until a long train can be made up (*ibid.*). The length of these delays varies from train to train and from car to car so that no definite figure can be given, but the trial court found the time to be substantial. (R. 3953–3956, 3961.)

These terminal delays are not the only time lost. The use of shorter trains results in more trains running in each direction. In single-track operation, which predominates in the West and in Arizona, when a train meets another going in the opposite direction, one must stop on a siding until the other has passed. This occurs also whenever one train must pass another bound in the same direction. The delays due to these "meets" and "passes" increase with the number of trains. Indeed the number of "meets" alone increases in proportion to the square of the number of trains in movement.[12] This, of course, serves to retard operations, the exact amount of the delay depending upon the length of time trains are required to wait on sidings in the particular case. (R. 3958.)

These effects of the Arizona law upon interstate transportation are readily apparent.[13] The record and findings reveal, however, that a train limitation such as Arizona's has an even deeper and more pervasive effect upon railroad operations.

B. THE EFFECT UPON RAILROAD METHODS OF OPERATION

Long-train operation is the standard operating technique of railroads in the United States today.

[12] Thus seven trains of a hundred cars in each direction would have 49 "meets", while 10 trains of 70 cars would have a hundred "meets".

[13] The law not only delays passenger operations in the ways indicated (Ex. 199, R. 3116–3148), but also has caused the Southern Pacific to cut out passenger cars and crowd the

This does not mean, of course, that all trains are over seventy cars in length. Judging by number, which includes local and branch line trains, most are not. But freight trains ranging from 125 to 160 cars are regularly operated, and the standard length of through freight trains on some systems is over 100 cars and on many others over 70. The operation of trains of over 70 cars in length is a regular and daily practice on the main lines of the railroads. (R. 3937–8.) On many railroads passenger trains of over 17 cars are commonly operated (R. 3938). Outside of Arizona the Southern Pacific runs a substantial proportion of long trains. In 1939 on its comparable route for through traffic through Utah and Nevada, from 66 to 85 percent of the freight trains were over 70 cars in length, and over 43 percent of the passenger trains over 14 cars (R. 3916).[14] As to the practice on other railroads, see Ex. 13, 26, 30, 43, 44, 73, 74, 75, 81, 83, 89, 91, 97, 100, 117, 138,

---

passengers into fewer cars when entering Arizona (R. 1307–1308). The Santa Fe has found it necessary to limit the consist of its passenger trains between Chicago and Los Angeles to 14 cars, which handicaps it in competing with lines not so restricted and running longer trains (R. 1049–1053).

[14] The trial court found, and this hardly can be doubted, that conditions on these two lines of the same railroad, both through sparsely-settled western country, were similar and suitable for comparison (R. 3914–5, 3896–7, 3900). Apart from features effected by the Arizona law itself, such as length of sidings and size of locomotives, operations on the two lines were conducted in the same manner.

R. 2861, 2874, 2878, 2894, 2895, 2924–2927, 2933, 2935, 2942, 2944, 2050, 2953, 2977, 3007.

The railroads have adopted the long-train method of operation because it is less costly. Because of the train limit law, the Southern Pacific was required to haul over 30 percent more trains in Arizona than would otherwise have been necessary. (R. 3919, 3963–4.) The record shows a definite relationship between operating expenses and the length of trains (R. 3924–3934).[15]

This additional cost of operation, which for the two Arizona railroads together amounts to about $1,000,000 a year,[16] is of significance not merely because of the expense to them but because of the burden on the public from whom the cost must be recouped. Such an additional cost to those engaged in interstate commerce has always been regarded as a burden upon such commerce in the constitutional sense. Cf. *Colorado v. United States*, 271 U. S. 153, 163.

The burden on commerce imposed by the state law is more than merely financial. More locomotives and more manpower are required to haul traffic in short trains than in long ones. This, together with the congestion at terminals and the delay caused by the statute, diminishes the amount

[15] See particularly Ex. 177, 178, 179, R. 3066–3071.

[16] The trial judge estimated the cost to the Southern Pacific to be approximately $400,000 per year (R. 3966). The annual cost to the Santa Fe was estimated to be $600,000 in the *La Prade* case (2 F. Supp. at 862).

of traffic which can be carried if short trains are used. In times of heavy traffic, where the carriers are strained to haul as large a load as possible, the law thus impedes the amount which can be transported.

And even if the operation of the state law can be suspended in time of emergency, as it eventually was by the Interstate Commerce Commission, the interference with traffic does not disappear, for a railroad line which has not been equipped to handle long trains cannot be easily converted from short to long train operation. As the record shows, because of the train limit law, the sidings in Arizona are long enough only to hold trains of the length which the law permits (R. 3947–8). Engines suitable for the hauling of longer trains were not in service in the state (*ibid*). Even when the statute was suspended, the carrier could operate only with the sidings and locomotives available. The short sidings alone prevent long-train operation in more than one direction at a time.[17] Unless the road is to some extent rebuilt and larger locomotives obtained during the emergency, it can operate long trains only to a limited degree.

This effect of the train limit law upon operations in times of traffic congestion is not merely

[17] During the test period of long-train operations in 1940, the carrier was able to operate long trains only in one direction at a time (R. 3947).

speculative or hypothetical, for that is exactly what has happened since December 1941. The interference with transportation caused by the law was responsible for the order of the Interstate Commerce Commission suspending it (see pp. 67–68, *infra*), but even suspension does not eliminate its harmful effects. Such a statute, which thus impedes commerce at a time when efficient operations are of the most vital importance, conflicts with the national transportation policy to develop a "national transportation system * * * adequate to meet the needs of the commerce of the United States * * * and of the national defense." Interstate Commerce Act, preceding Sec. 1, 54 Stat. 899.

3. *The Effect of the Law as a Safety Measure*

We assume that there can be little doubt that a state statute interfering with interstate commerce in the ways described above would be invalid if it did not purport to be a safety measure.

With respect to the safety character of the law the trial court, after taking extensive testimony, found not only that the Arizona law had no reasonable relation to safety but that it made train operations more dangerous (R. 4050–3, 4021–2). The opinion of the State Supreme Court (R. 4055–68) contains no discussion of the facts upon which the trial court relied, but seems to hold—at most—that the state law has a rational relation-

ship to safety and that if this is so the exercise of legislative judgment must be upheld.

Where the question is whether the national interest in commerce is unduly burdened by a state statute, the test is not whether the state law has a rational relationship, however slight, to safety and health, but whether the local interest in safety is so great as to outweigh the interference with commerce (see pp. 15–19, *supra*, and 53–60, *infra*). When examined from this point of view it seems clear that the state law does not result in sufficient protection to the health and well-being of its citizens, including railroad workmen, to warrant the burden upon commerce. The pertinent facts on this issue are set forth at length in the findings (R. 3974–4032).

In brief they show that although the shock which may result from slack action is undoubtedly greater as the length of a train increases (R. 4052), the number of casualties due to slack action is quite small, averaging about five per year both in Arizona and in Nevada (R. 3991; Ex. 280, R. 3375).[18] Since such accidents result from many

[18] Slack action and its causes are described in detail in the findings at R. 3969–74. The number of slack accident casualties referred to on this and the following pages is based upon casualties resulting from sudden applications of brakes and "sudden stopping, starting, lurch, or jerk * * * not elsewhere provided for" (R. 3990, 1951–1952). Inasmuch as all such sudden stops, etc., are not the consequence of slack action (R. 2159), the number of slack accident casualties given may be too large. It should be noted that the discussion of slack accident casualties relates to freight trains only; as to passenger trains, see pp. 39–40, *infra*.

other causes than the length of the train (R. 4052, 3971), the number attributable to the train being unduly long is necessarily considerably less. A comparison of the number of slack accidents in Arizona and Nevada indicates that with approximately the same amount of traffic (R. 3900), the number was substantially the same under long and short train operations (R. 3991).

The possible effect of a train length law in reducing slack accidents, however, is not the whole story. For there must also be thrown into the scales the effect of the Train Limit Law in *increasing* the number of railroad accidents and casualties generally. If a given amount of traffic is to be carried, the shorter the trains are, the more trains must be run. The result of the Arizona law was to require Southern Pacific to operate 30.8%, or 4,304, more freight trains in 1938 than otherwise would have been necessary (R. 4051, 3964). The record indicates that the frequency of accidents is directly related to the number of trains run (R. 4021–2).

That the number of accidents due to grade crossing collisions between trains and motor vehicles (R. 4013–4), to collisions between trains (R. 4020–4022), and to collisions between trains and pedestrians (R. 4020) will vary in proportion to the number of trains is obvious. Inasmuch as the number of locomotives increases with the number of trains run, accidents due to locomotive failure

will also increase with the number of trains (R. 4020, 4022). In 1939 the number of slack accident casualties in the United States—399—was only 6% of the number of train and train-service casualties to railroad employees—6,713. (Exhibits 262, 266, R. 3300, 3304.) The relative importance from the viewpoint of the public safety of slack accidents and grade crossing accidents alone is shown by the fact that in 1939 in the entire United States there were 399 slack accident casualties, 3 of which were fatal (R. 3979), whereas the average number of grade crossing casualties per year from 1935 to 1939 was 5,718, a large number of which were fatal (R. 4014).[19] And, as we have seen (p. 34, note 18), not all of the so-called slack accident casualties resulted from slack action, and many of those that did would not have been averted if the train had been reduced to the length required by the Arizona law.

In addition, the running of more trains means that there will be more starts and stops of freight trains, more meets and passes, more switching movements. Accidents frequently result from each of these operations (R. 4021–2). The result is that an increase in the number of trains used to carry a given amount of traffic increases the likelihood of injury not only to the men operat-

[19] In 1939 in the United States, 1,398 persons were killed and 3,999 injured in highway grade crossing accidents. (Interstate Commerce Commission, Bureau of Statistics, Accident Bulletin, No. 108, pp. 22–23.)

ing the train[20] but to other railroad employees, passengers, and any of the public likely to be injured by train operations.

The record indicates that this is what has actually occurred. However measured, whether absolutely, proportionally, or by trend, and whether in relation to all railroad casualties or just those affecting the trainmen whom the train limit is supposed to protect, the accident rate in Arizona is much higher than on comparable lines elsewhere. This is shown not only by comparison of Southern Pacific operations in Arizona with those in Nevada,[21] but also by comparing operations of the Southern Pacific and of the

[20] The Train Limit Law is designed to protect the conductors and brakemen at the rear of the train.

[21] During the six-year period 1935–1940, the casualties in Arizona to all employees sustained in train and train-service accidents in road freight train operations were two and one-half times as many as in Nevada (R. 3988), although the total volume of freight traffic was slightly greater in the latter state (R. 3990). The result on a car mile basis, which takes into account the amount of traffic handled, is substantially the same (R. 3989). Although there was a substantial decrease in the accident rate in both states since 1923, the decrease for 1935–1940 over 1923–1928 was 71.1 per cent in Nevada as compared with 52.3 per cent in Arizona (R. 4008). With respect to the freight conductors, brakemen, and flagmen whom the Train Limit Law was designed to protect, the total number of casualties to such employees from all causes, including slack accidents, between 1923 and 1940 was 1.69 times heavier in Arizona—449 to 268 in Nevada. On a car mile basis the casualty rate for 1935–1940 for such employees was 2.2 times as high in Arizona as in Nevada, and the rate of improvement in Arizona after 1923 was also considerably lower. (R. 3989–90.) See Ex. 277–279, R. 3372–3374.

Santa Fe in Arizona with those of the same roads in New Mexico (R. 4001–6).

On a national basis the record and findings show that while the national accident rate per 100,000,000 car miles for all railroad employees (R. 3977; Ex. 262, R. 3300) and for trainmen [22] (R. 3979; Ex. 265, R. 3303) decreased 70 per cent and 66 per cent respectively between 1923–1928 and 1935–1940, the rate for the Southern Pacific in Arizona declined 52.3 and 53.3 per cent (R. 4008). The rate for the Southern Pacific line in Nevada decreased 71.1 per cent and 69.1 per cent, slightly better than the national record (R. 4008).[23] We do not suggest that the difference in train lengths is alone responsible for the greater number and rate of accidents in Arizona.[24] But the growth in Nevada's advantage over Arizona as the disparity in average train length increased, without any other adequate explanation, would seem to indicate that the train length limitation has had the effect of causing accidents instead of preventing them.[25]

---

[22] Freight conductors, brakemen, and flagmen.

[23] The decline in slack accidents was 65 per cent nationally (R. 3979; Ex. 266, R. 3304), 57.5 per cent in Nevada (R. 4009; Ex. 280, R. 3375), and 47.7 per cent in Arizona (*ibid.*).

[24] Arizona's rate was higher in 1924, when the average train length in Nevada was slightly less than in Arizona. Cf. Ex. 178, R. 3067 with Exs. 277, 279, R. 3372, 3374.

[25] This is the case even if the years 1923 and 1924 are eliminated from consideration and the comparison begun with 1925. Exs. 277, 279, R. 3372, 3374. In 1924 the Southern Pacific acquired lines in Arizona which appellee has contended makes comparison with the years prior to the acquisition inappropriate.

The Arizona law limits the length of passenger as well as of freight trains. The total number of casualties on passenger trains is almost too small for statistical analysis to be meaningful (R. 4010); a single serious wreck may overbalance the experience of a number of years. Nevertheless, comparison between appellant's lines in Arizona and Nevada (where many long trains are run) shows that passenger casualties are considerably less in the latter state (R. 4010–13; Exs. 291–292, R. 3409–21). With passenger traffic in Nevada 78 percent as heavy as in Arizona, from 1923–1938 239 casualties were caused to persons other than trespassers by passenger trains in Arizona and 109 in Nevada—the latter figure including 53 persons killed or injured in a single wreck apparently caused by external malicious tampering with the track (*ibid.*). Inasmuch as passenger trains are much shorter than freight trains and have superior brakes which set almost simultaneously (R. 2484–5, 2474, 795–6, 2731), the portion of the small number of total casualties attributable to slack action would obviously be minute. The record shows only that between 1923 and 1939 five persons in Nevada and fourteen in Arizona were injured by sudden stops, starts or jerks on passenger trains, none of which in either state exceeded fourteen cars in length (Ex. 291–292, R. 3409–3411, 3414–3421); it does not indicate whether or not any of these accidents resulted from slack action or was affected by the

length of the train.[26] In any event the number of casualties from these causes in each State averaged under one per year, and was much less in the State in which longer trains were operated.

The fact that there are relatively few slack accidents, that their number is just as great under a train limit law, and that they are outweighed in the harm they cause the public by the increase in the accident rate which results from running a greater number of trains than necessary does not mean that steps should not be taken to eliminate them. But more effective remedies are already available to reduce the dangers and difficulties of long train operation without forcing the carriers to abandon it.

Slack accidents are commonly caused in large part by the progressive, rather than the simultaneous, setting of the brakes in a train. Since 1933 as a result of tests previously conducted by the American Railroad Association with the old K type brake and experimental models, a new type of air-brake, the AB brake, has been developed which sets the brakes throughout the train much more evenly.[27] This brake greatly reduces the

[26] Sudden stops or starts or jerks may, of course, occur entirely apart from slack action, as they do on busses or streetcars.

[27] The facts set forth in this paragraph have been obtained from the Bureau of Safety of the Interstate Commerce Commission. They are also disclosed in the testimony of Mr. F. C. MacDonald, of the Bureau of Safety before a subcom-

shock resulting from slack action, and when installed on all equipment should decrease accidents from this cause. All new freight cars since 1933 have been supplied with AB brakes and at the present time about one-half of the freight cars for interchange service are so equipped. On July 29, 1944 the Interstate Commerce Commission ordered the railroads to show cause why all freight cars should not be so equipped by January 1, 1946; the specifications provided for apparatus "based upon * * * train length of 150 cars".[28] A hearing was held on December 19, 1944, at which time the carriers sought an extension of time for installation but did not otherwise oppose the general provisions of the order.[29] On passen-

---

mittee of the Senate Committee on Interstate Commerce (Hearings on S. 2625, 73rd Cong., 2d sess., *Limiting the Car Length of Trains*, pp. 156–161), the statement submitted by G. H. Wood, Chairman of the Brake Committee of the American Railroad Association (*id.*, pp. 229–231), and the testimony of E. Von Bergen, of the Illinois Central System before the House Committee on Interstate and Foreign Commerce (Hearings on S. 69, 75th Cong., 3d sess., *Train Lengths*, pp. 1009–1011. See also American Railway Association, *Report of Road Tests with Type AB Freight Brake Equipment* (1933) (mimeographed); R. 991, 1005.

[28] See *Interstate Commerce Commission, Investigation of Power Brakes and Appliances for Operating Power-Brake Systems*, No. 13528, Order of July 29, 1944, printed in full in the appendix to Volume I of the appellant's brief. The Order contains a recital of many of the facts referred to in the text of this brief.

[29] See the notice of hearing and summary of pre-hearing conference, issued by the Interstate Commerce Commission in No. 13528, *supra*, October 19, 1944. At the hearing, the

ger trains brakes even superior to the AB and other devices, such as an improved draft gear in conventional equipment, and the completely integrated train, which has no slack, have largely eliminated the likelihood of injury from slack action. See p. 39, *supra*.

The appellee also has referred to the difficulty of signalling between the engine and the caboose of a long train. The trial court found that only one accident (on a train with 2 cars and a caboose) and no casualties had resulted from inability to observe or interpret signals in Arizona and Nevada during the 18-year period ending in 1940 (R. 4024–5).[30] Moreover, the problem of signalling can also be solved without resorting to a reduction in the length of trains by the installation of radio communication between the front and rear of trains.[31] The Interstate Commerce Commission has already approved an ap-

Brotherhood of Railroad Trainmen objected to the specifications as not sufficiently stringent. Briefs have not as yet been filed, and no final decision has been reached. An additional hearing is to be held on April 17, 1945.

[30] With respect to the inability to see signals, the court found that the only signal given from the rear of the train while it was moving was the stop signal, that if this were missed the conductor could and would stop the train through using the rear brake valve on the caboose, and that in 18 years no reportable casualty had resulted from the use of the valve. While the train is standing still a missed signal to proceed results only in repetition of the signal until the engineer sees it before he starts the train (R. 4023–5).

[31] The feasibility of radio communication for the railroads is disclosed in the Hearings before the Kilgore Subcommittee of the Senate Committee on Military Affairs. Part 13 of the

plication of the Pennsylvania Railroad to install a system of communication between trains and the wires alongside the track on a part of its main line.[32] The Federal Communications Commission has been advised that 40 railroads, representing 66.8 percent of the total mileage, will use end-to-end radio communication if frequencies are allocated to them.[33] In a recent report the Commission has approved the railroad use of radio and tentatively allotted frequencies substantially as requested.[34]

---

printed report of the Hearings contains a discussion and compilation of the material dealing with this problem. See Hearings before Subcommittee of the Senate Committee on Military Affairs pursuant to S. Res. 107 and on S. 702, 78th Cong., 2d sess., *Scientific and Technical Mobilization—Use of Radio for Railroad Communication and Signaling*, pp. 1559–1653.

[32] Interstate Commerce Commission, *In the Matter of Application for Approval of Proposed Modifications of Systems or Devices Under Paragraph (b) Section 25 of the Interstate Commerce Act as amended, The Pennsylvania Railroad Company*, BS–Ap–No. 6729, Order of December 2, 1944. A similar application from the Atlantic Coast Line is pending before the Commission.

[33] Federal Communications Commission, *In the Matter of: Allocation of Frequencies to the Various Classes of Non-Governmental Services in the Radio Spectrum from Ten Kilocycles to Thirty Million Kilocycles*, Docket No. 6651, Exhibit 481, pp. 4–5.

[34] *Id., Report of Proposed Allocation from Twenty-five Thousand Kilocycles to Thirty Million Kilocycles* (January 1945, pp. 149–170). At the close of hearings held in a related proceeding (Federal Communications Commission, *In the Matter of Investigation of the Establishment and Use of Radiocommunications Systems in Railroad Operations*,

These methods of eliminating the factors which make long train operations slightly more difficult do not require a departure from the modern method of train operations or increase the likelihood of injury from other causes. Inasmuch as the safety problem can be and is being solved in other ways, the burden on commerce imposed by the Arizona law is not justified.

4. *The Burden upon Commerce Imposed by the Train Length Limitation So Outweighs Its Value, If Any, in Preventing Accidents as to Require that it be Held Unconstitutional*

The effects of a state train length limitation, as disclosed in the preceding discussion, are to impede and delay interstate transportation, to require carriers to abandon the method of operations prevalent throughout the country, and to increase railroad accidents and casualties generally without decreasing the number of those resulting from slack action alone. The lack of uniformity in regulation which state control over this subject creates is in itself a primary cause of the interference with commerce.

Many decisions which this Court has rendered with respect to the validity of state laws affecting interstate commerce indicate that, whatever the method of expression or the result, the Court is guided largely by the practical effects of a statute

---

Docket No. 6593), Commissioner Walker stated (transcript, p. 989): "I think the testimony will clearly show the present utility and practicability of radio in yard operations and for front to rear communication in freight train service."

from the viewpoint both of its interference with national commerce and of the local benefit which will be derived from it. See pp. 15–19, *supra*. Each case stands on its own facts. There is none in which the relationship of a statute to commerce and to the public safety is precisely the same as in the case at bar. The cases are thus important because of the principles for which they stand, and not because any are controlling or directly in point.

The Court has both sustained and invalidated state laws regulating the construction, equipment and operation of vehicles or vessels engaged in interstate commerce. In the interest of safety statutes have been upheld requiring railroad passenger cars to be equipped with certain types of heaters (*New York, N. H. & H. R. Co.* v. *New York*, 165 U. S. 628), locomotives to be supplied with electric headlights (*Atlantic Coast Line R. Co.* v. *Georgia*, 234 U. S. 280), and freight trains to be equipped with cabooses (*Terminal Railroad Association* v. *Brotherhood of Railroad Trainmen*, 318 U. S. 1). In *South Covington & Cincinnati Railway Co.* v. *Covington*, 235 U. S. 537, the Court upheld the provisions of a Covington ordinance requiring an interstate street railway to keep its cars clean and fumigated and to prohibit passengers from riding on the front and rear platforms unless certain rails were provided. But in the same case the Court set aside other provisions of the ordinance prohibiting standing passengers in excess of one-third of the car seat-

ing capacity, and requiring the company to operate enough cars to accommodate the public on this basis. Such regulations, determining both the manner of carrying passengers and the number of cars to be operated between Covington and Cincinnati, governed car loadings and impeded traffic in the latter city and required more cars to be operated than Cincinnati permitted. With respect to these provisions the Court said (pp. 547–548):

> If Covington can regulate these matters, certainly Cincinnati can, and interstate business might be impeded by conflicting and varying regulations in this respect, with which it might be impossible to comply. On one side of the river one set of regulations might be enforced, and on the other side quite a different set, and both seeking to control a practically continuous movement of cars. As was said in *Hall* v. *De Cuir*, 95 U. S. 485, 489, "commerce cannot flourish in the midst of such embarrassments."

The benefit from the point of view of safety of the limitation upon overcrowding in cars was not sufficient to sustain these provisions, in view of the effect of the ordinance on the number of cars to be operated and the danger of diverse state regulations on that subject.[35] The *Covington*

[35] The Court also invalidated a provision of the ordinance requiring car temperature to be maintained at 50° Fahrenheit or above on the ground that this was impossible owing to the opening and closing of doors. 235 U. S., at 548–549.

case is important because it clearly recognizes the principle underlying the cases sustaining state police regulations relating to safety, because the effect of the ordinance in increasing the number of cars to be operated is analogous to that of the Arizona law, and because it shows the practical limits imposed upon a state's authority even when exercising its police powers.

Kelly v. *Washington*, 302 U. S. 1, sustained a state statute in so far as it provided for the inspection of the hulls and machinery of certain vessels; but the opinion definitely indicates that other portions of the state code establishing "standards and designs for the structure and equipment of vessels" and prescribing "rules for their operation * * * could not properly be left to the diverse action of the States" (p. 15). On this point the opinion further declared (*ibid.*):

> If, however, the State goes farther and attempts to impose particular standards as to structure, design, equipment and operation which in the judgment of its authorities may be desirable but pass beyond what is plainly essential to safety and seaworthiness, the State will encounter the principle that such requirements, if imposed at all, must be through the action of Congress which can establish a uniform rule. Whether the State in a particular matter goes too far must be left to be determined when the precise question arises.

The opinion thus stands for the proposition that state regulation of the "design, equipment and operation" of instrumentalities of interstate transportation cannot go beyond what is plainly essential to safety. The mere fact that the regulation is "desirable" "in the judgment of its [the state's] authorities" is not sufficient.

The same principle is illustrated by the decisions involving other types of state police regulations. *Erb* v. *Morasch*, 177 U. S. 584, upheld a local ordinance limiting the speed of interstate trains within city limits. But when the State of Georgia sought to require all trains so to check their speed at highway crossings as to stop in time should any person or thing be crossing the track it was held that this so impeded interstate commerce as to be beyond the state's power. *Seaboard Air Line Ry.* v. *Blackwell*, 244 U. S. 310. Each statute was a measure which, from the point of view of safety, was reasonably adapted to the public interest. But the actual interference with commerce resulting from requiring trains almost to stop at all grade crossings was regarded as outweighing the local interest in safety.

The same balancing of local and national interests has served as a guide to the decisions on state statutes requiring interstate trains to stop at small towns or county seats.[36] The Court has recog-

[36] *Illinois Central R. Co.* v. *Illinois*, 163 U. S. 142; *Gladson* v. *Minnesota*, 166 U. S. 427; *Lake Shore & M. S. Ry. Co.* v.

nized that the states may appropriately require carriers to maintain reasonable passenger service for such communities. But as long as other adequate service is provided, the courts will not permit the states to require interstate through trains to make local stops. It should be noted that the local laws involved in these cases were held to burden commerce because of their effect in slowing down interstate through service.

Some of the earlier cases in the groups just discussed seem to assume that if a statute is an exercise of the state police power, it cannot constitute a direct or undue burden on interstate commerce.[37] Although these decisions can be justified on their facts, the assumption is obviously not correct, as the *Blackwell* case demonstrates. In setting aside a state order that an interstate railroad bridge be removed in order to prevent overflows of flood waters into Kansas City, the Court, speaking through Mr. Justice Holmes, declared

(*Kansas Southern Ry.* v. *Kaw Valley Dist.*, 233 U. S. 75, 79):

> The decisions also show that a State cannot avoid the operation of this rule by simply invoking the convenient apologetics of the police power. It repeatedly has been said or implied that a direct interference with commerce among the States could not be justified in this way.

The Court's recent decisions in *Parker* v. *Brown*, 317 U. S. 341, *Illinois Nat. Gas Co.* v. *Central Ill. Pub. Serv. Co.*, 314 U. S. 498, *California* v. *Thompson*, 313 U. S. 109, and *Terminal Railroad Association* v. *Brotherhood of Railroad Trainmen*, 318 U. S. 1, have been more explicit than the earlier cases in their recognition that the validity of state laws regulating interstate commerce is to be determined "by the accommodation of the competing demands of the state and national interests involved" (*Parker* v. *Brown*, 317 U. S., at 362). See pp. 18–19, *supra*.

In none of the cases previously discussed in which state laws have been held valid was any actual interference with interstate commerce such as is disclosed by the present record shown to exist. Nor in any of them was there reason to doubt that the local regulation would be beneficial to the health and safety of the community.

Terminal Railroad Association v. *Brotherhood of Railroad Trainmen*, *supra*, and *South Carolina Highway Department* v. *Barnwell Bros.*, 303

U. S. 177, are entirely consistent with the suggested conclusion that state train length legislation is invalid. The former case indicates that states may, in the interest of safety, regulate the composition of interstate trains to some extent, even where the necessary effect may extend a short distance into adjoining states. But in upholding the Illinois caboose order, the Court was properly influenced by the "obvious relation [of the order] to the health and safety of local workers", and by the fact that the practice of requiring cabooses at the end of trains had been voluntarily adopted by nearby railroads without legal compulsion. 318 U. S., at 8. The opinion indicates that the cost to commerce must be weighed against the cost to health and safety, and that the absence of practical interference with customary methods of railroading will count heavily in the scales. The case thus shows that both in determining whether the subject requires uniformity of regulation in the national interest and whether interstate commerce is unduly burdened, the Court is guided largely by practical considerations.

A similar approach to the present case will, we believe, lead to the opposite conclusion. The extra-territorial effect of the Illinois order was trivial as compared to that of the Arizona train limitation. Here the actual obstruction to interstate commerce is serious, the limitation of train lengths prevents the uses of the methods of transportation which generally prevail throughout the

nation, and is not justified by its value in protecting the public safety.

The *Barnwell Bros.* case stressed the long-recognized power of the states and localities over the highways which they build, own and maintain, specifically contrasting the position of the highways with that of the railroads (303 U. S., at 186–187). Since the states maintain the highways, it is appropriate for them to determine what traffic can safely be carried. Furthermore, although interstate motor traffic is undoubtedly extensive, the proportion of local highway traffic is clearly much greater than on the railroads. The impact of state highway regulation on local trucking, which serves as a restraint upon legislative action, is relatively much heavier than that of the Arizona statute upon intrastate rail operations. Since control of the highways from the viewpoint of safety has long been left to the states it is an appropriate field for state action and perhaps for application of a rule that any rational legislative judgment will be given effect. But the Court's citation of *Seaboard Air Line Ry.* v. *Blackwell*, which involved a law undoubtedly relating to safety, indicates that it recognizes that the power of the states over the railroads cannot be tested in the same way.[38]

[38] The *Barnwell* opinion contained the following passage applicable to railroads (303 U. S., 186–187):

"The commerce clause has also been thought to set its own limitation upon state control of interstate rail carriers

Appellee's position is that the validity of the state law depends "entirely" on whether it has "a rational basis in safety" (Br., p. 88). If it "has no rational relation to safety, the burden on interstate commerce * * * is * * * *direct* and the law is unconstitutional" (Br., pp. 80, 88–89). But "a statute having a real relation" to safety only "indirectly burdens interstate commerce" and is therefore not invalid (Br., p. 21). Appellee candidly admits that under this theory "the extent of the burden [on interstate commerce] is *not* a question or element to be considered by the Court * * *" (pp. 80, 18). Once the rational relationship to safety appears, whether the state law burdens commerce and how much is said to be a matter solely for legislative, not judicial, consideration (Br., p. 81); the test of the validity of the commerce clause is said to be identical with that of the Fourteenth Amendment. Stated in another way, the proposition is that no matter how greatly interstate commerce is impeded, a state law en-

---

so as to preclude the subordination of the efficiency and convenience of interstate traffic to local service requirements.'" "* * * Although the states have usually been allowed to impose burdens on interstate railroads in the interest of local safety, *Smith* v. *Alabama*, 124 U. S. 465; *Nashville, C. & St. L. R. Co.* v. *Alabama*, 128 U. S. 96; *New York, N. H. & H. R. Co.* v. *New York*, 165 U. S. 628; *Chicago, R. I. & P. R. Co.* v. *Arkansas* 219 U. S. 453; *St. Louis, I. M. & S. R. Co.* v. *Arkansas*, 219 U. S. 518; cf. *Henningtón* v. *Georgia*, 163 U. S. 299, an unnecessarily harsh restriction, even though it is in the interest of safety, has been held to be unconstitutional. *Seaboard Air Line Ry.* v. *Blackwell*, 244 U. S. 310."

acted in the interest of safety is of local concern and valid so long as rational.

This Court's decisions have not turned on any such mechanical dialectic. The suggestion that in determining whether a state law—relating to safety or anything else—contravenes the commerce clause this Court must completely disregard its effect on interstate commerce is a novel one. Appellee does not deny that outside of the field of "police" or "safety" regulations this Court balances the national and local interests, including, of course, the burden on commerce, in determining validity. *South Carolina Highway Department* v. *Barnwell Bros.*, 303 U. S. 177, and earlier cases are cited, however, to show that this test may not be applied to safety measures. But the more recent statement of the controlling principle in *Parker* v. *Brown*, 317 U. S. 341, 362–363, which appellee claims is inapplicable here, cites the *Barnwell* case as one of the supporting authorities without differentiation between decisions involving safety and other cases. And *Terminal Railroad Association* v. *Brotherhood of Railroad Trainmen*, 318 U. S. 1, which unquestionably involved a state regulation of safety, declared that "the governing principles were recently stated in *Parker* v. *Brown*" (p. 8), and then proceeded to apply them.

Appellee's argument that the standard of rationality from the viewpoint of safety which has

been applied in determining validity under the Fourteenth Amendment is identical with the test under the commerce clause is predicated upon the soundness of its contention that the extent of the burden on interstate commerce is irrelevant. In a Fourteenth Amendment case the latter factor, of course, is not material. But if the effect on commerce is a factor of consequence in dealing with commerce problems—as we think must be clear—the nature of the question necessarily becomes different from that considered under the Fourteenth Amendment. The issue is not whether a legislature has acted arbitrarily or irrationally with respect to individual rights in life, liberty or property, but whether the impingement upon the national interest in commerce is too great to be warranted by the local benefits derived from the state law.

Appellee asserts (Br., pp. 86, 88) that it has found no cases supporting the view that the criteria under the two constitutional provisions are not the same. The point has probably been too obvious to elicit much comment. *Seaboard Air Line Railway* v. *Blackwell*, 244 U. S. 310 (*supra*, p. 48), and *South Covington & Cincinnati Ry. Co.* v. *Covington*, 235 U. S. 537 (*supra*, pp. 45–47), constitute square holdings that a state law rational from the standpoint of safety may still be unconstitutional under the commerce clause. As has been pointed out, *Termin Rail-*

road Association v. *Brotherhood of Railroad Trainmen* weighed the "costs to commerce * * * against the cost to * * * health and safety" of the order there involved, in a manner definitely inconsistent with appellee's position. And in his separate opinion in *International Harvester Co.* v. *Department of Treasury;* 322 U. S. 340, 353, Mr. Justice Rutledge recently said, in dealing with a similar problem:

> There may be more than sufficient factual connections, with economic and legal effects, between the transaction and the taxing state to sustain the tax as against due process objections. Yet it may fall because of its burdening effect upon the commerce.

Compare also *Schollenberger* v. *Pennsylvania,* 171 U. S. 1, 15–17, with *Powell* v. *Pennsylvania,* 127 U. S. 678, and *Leisy* v. *Hardin,* 135 U. S. 100, 121–124, with *Mugler* v. *Kansas,* 123 U. S. 623.[39]

Appellee asserts (Br., p. 34) that "whether the burden on interstate commerce by reason of the statute *is too great* is a legislative, and not a judicial question". This cannot mean that a state legislature is to be the final authority as to the validity of an interference with interstate

[39] See the excellent discussion in Dowling, *Interstate Commerce and State Power* (1940), 27 Va. Law Rev. 1, 21, in which the author states: "The test of reasonableness in interstate commerce cases is not the same as, for example, in due process cases."

commerce, even if limited by the requirement that it not act irrationally. The argument apparently is that only Congress can determine that an interference with commerce is so great as to require the invalidating of a state law. But in hundreds of decisions stemming from *Gibbons* v. *Ogden*, 9 Wheat. 1, this Court has been committed to the doctrine that the commerce clause, of its own force and in the absence of congressional action, precludes the states from interfering unduly with the national interest in the free flow of commerce. Although there may have been differences of opinion both as to the principle and its application, we do not think it necessary on this occasion to enter into a defense of so well established a doctrine. To the extent that appellee's argument rests on the supremacy of congressional power, it overlooks the effect of the long-established doctrine itself in furnishing a setting for determining the will of Congress. In view of the fact that matters of national concern demanding uniformity of regulation have for almost a century been treated as invalid except where Congress has indicated otherwise, Congress would normally assume that it was unnecessary for it to negative state legislation of that character.

In the light of these established principles appellee apparently limits its argument that the courts have no authority to look to the extent of

interference with interstate commerce to state laws relating to public safety. These are said invariably to be matters of peculiarly local concern. Although this may normally be true, it certainly does not inevitably follow. The law requiring stopping at grade crossings would, as the *Blackwell* case indicates, have more than doubled railroad running time. Indeed, a state might completely prohibit all railroad operations or air transportation on the ground that such a course would prevent accidents, a conclusion which certainly would be rational. Or a state might, with complete rationality from the viewpoint of safety, find that broader gauge cars and locomotives would not be overturned as easily as those presently used, and order that all railroads within the state widen their tracks and rolling equipment. Although such a regulation would bear a rational relationship to safety, it would completely disrupt the movement of interstate rail traffic through a state. To say that because such laws were reasonably related to the public safety they were of local rather than national significance would be to establish a fictitious standard entirely divorced from the hard-headed practicality embodied in the commerce clause. One cannot decide whether a matter is of national concern or demanding national uniformity if one looks only to its local impact and ignores all the facts which show its effect on the nation's commerce. As the

cases cited, *supra*, pp. 55–56, demonstrate, this Court has adopted no such automatic or inflexible formula in cases involving the public safety any more than elsewhere.

The alternative to a rigid formula is that the Court exercise a policy judgment. But this is implicit in the doctrine enunciated in *Parker* v. *Brown* that the national and local interests must be accommodated. This cannot be avoided unless the Court should take either the position that all state regulations of interstate commerce are bad, or that all are valid until Congress declares otherwise, extremes which have long been abandoned.[49]

The principle for which the cases as a whole stand is that a state safety regulation, even when applicable to interstate vehicles, is normally to be upheld, unless the actual interference with commerce resulting from it will be serious. In the cases which sustain state regulations there has always been a reasonably clear showing—if it was not obvious on the face of the statute—that the

[49] Even if, as has been suggested, the clause were regarded as invalidating only state laws which in some way discriminate against interstate commerce—

> the Court must make the same sort of value judgment that it has been making in performing its broader protective function. Discrimination exists or not, depending upon whether there is an economic justification for the difference in treatment which the state accords interstate commerce. Only by an evaluation of all the facts and circumstances can such an issue be decided by the Court. (Dowling, *supra*, p. 56 n., at p. 16.)

law bore a close relation to safety, and there was no burden upon commerce comparable to that demonstrated here. The latter alone, we think, would suffice to invalidate the Arizona statute. But in addition this is the first case in which it has definitely been proved that a state police regulation is not essential to protect health and safety. In such circumstances even less interference with interstate commerce should be permissible than would otherwise be the case.

In this connection it is important to note that our argument does not depend on whether the evidence affirmatively establishes that the effect of the train limitation is to increase railroad accidents generally, or that the limitation does not to some extent reduce the number of slack accidents. For if, instead of having the harmful effect on the public safety found by the trial court, the law had no effect one way or the other or even a slightly beneficial one—and that is certainly the most which can be said for it—this would not be sufficient to outweigh the interference with interstate commerce which results from state regulation of the subject of train lengths.

Our conclusion that the Arizona statute should be held to impose an undue burden upon commerce and to operate in a field exclusively reserved for Congress is supported by the only pertinent opinion of the Interstate Commerce Commission, which suspended the state train limit

statutes for the duration of the war. *In the Matter of Service Order No. 85*, 256 I. C. C. 523.[41] The Commission forbore from expressing an opinion on the legal question as to the validity of the state regulations. But its conclusions of fact—as well as the substance of its discussion—clearly indicate that it regards such laws as seriously burdening commerce. The following passages from the Commission's report speak for themselves (pp. 524, 530–531, 534, 536):

> Service Order No. 85 became effective September 15, 1942. It was designed to save manpower, motive power, engine-miles, and train-miles; to avoid delay in the movement of trains; to increase the efficient use

[41] The opinions of the lower courts, including that in the instant case, are evenly divided. We do not read the opinions of the court below in this case or of the federal district court in *M.-K.-T. R. Co.* v. *Williamson*, 36 F. Supp. 607 (W. D. Okla.), as contraverting any of the facts found by the trial court in the present case or the federal district courts in *Atchison, T. & S. F. Ry. Co.* v. *La Prade*, 2 F. Supp. 855 (D. Ariz.) and *Southern Pacific Co.* v. *Mashburn*, 18 F. Supp. 393 (D. Nev.). The three decisions last cited held that the subject of train lengths was one upon which uniformity in regulation was essential in the national interest; that the state limitation would seriously interfere with interstate rail operations, and that the statute could not be justified as a safety measure because in fact it would not tend to reduce the number of accidents. The same view was expressed by the Kansas Public Service Commission, quoted at p. 26, n. 11, *supra*. The opinion of the Arizona Supreme Court below and that in the *Williamson* case, on which it relies, proceed on the assumption that any state regulation reasonably related to safety must be held valid, irrespective of other considerations.

of locomotives and cars and to augment the available supply thereof; and to relieve congestion at terminals caused by setting out and picking up cars on each side of the train-limit law States.

* * * * *

If State laws limiting the number of cars in trains are to be held valid (a question we do not decide), it would be possible for each State to set a different number of cars as the maximum to be hauled in a train. A State might even limit the length of trains to one car, although such a law would be clearly arbitrary and unreasonable. Higher limits might be set by States and found reasonable, *but lack of uniformity would place a serious burden on interstate commerce.*

* * * * *

This language [from *California* v. *Thompson*] is significant because train-limit laws are not matters of local concern and the regulation of the number of cars which may be put in a train does infringe the national interest in maintaining the free flow of commerce under the present emergency war conditions.

* * * * *

* * * The fact that freight trains in excess of 70 cars and passenger trains in excess of 14 cars are safely operated in other States is convincing evidence of its safety, except where unusual operating conditions exist. * * * [Italics supplied.]

II

The Specific Intention of Congress as to State Train Length Legislation

The validity of state legislation regulating interstate commerce depends in the first instance on whether there has been any expression of congressional intention with respect to it. If Congress has enacted inconsistent legislation or "occupied the field" in such manner as to manifest an intention that state regulation of the subject be excluded, state regulation falls even though it would be valid in the absence of such congressional action.[42] If, on the other hand, Congress has manifested its intention to permit certain state regulations, the latter may be valid even though the field were otherwise subject to exclusive Federal control.[43] It is necessary to determine whether the state regulation contravenes the commerce clause in the silence of Congress only when Congress has not spoken.

Unsuccessful efforts have been made to procure the enactment of a Federal train limit law. In addition, the Interstate Commerce Act has been construed by the Interstate Commerce Commission as giving it authority, at least in some circumstances, to suspend state train-length lim-

itations. Our analysis of these matters has led us to the conclusion that no positive inference can be drawn from them that Congress had an intention one way or the other as to whether state legislation shall stand. We shall, however, summarize the pertinent material for the information of the Court.

A. FEDERAL TRAIN LENGTH BILLS

A number of bills for the limitation of train lengths were introduced in Congress between 1934 and 1937.[44] Hearings were held by subcommittees of the Senate Committee on Interstate Commerce in 1934 and 1935,[45] but the bills were not reported by the Committee. In 1937, on the basis of the prior hearings, the Senate Committee reported a seventy-car bill favorably[46] on the ground that such a limitation was conducive to safety, and would result in greater frequency of trains and thus improve transportation service; it was also noted (p. 9) that the "measure might result in some reemployment" of railway labor. The bill passed the Senate,[47] and was referred to the House

Committee on Interstate and Foreign Commerce.[48] Extensive hearings, totalling over 1100 pages in print, were then held by the House Committee.[49] Railway labor organizations introduced evidence as to the number of trainmen injured on long trains.[50] Railroad management countered with voluminous evidence, similar to that in the present record, minimizing the number of such accidents and to the effect that more accidents proportionally occurred where carriers were subjected to train length limitations than on comparable lines.[51] The Committee failed to report the bill, and it was not passed.

The attention of the committees was called to the history of state train length limitation statutes.[52] The experience of the carriers in Arizona, which up to that time was the only state in which such a law had been in operation, provided the basis for comparison with that where longer trains were operated.[53] The attention of the committees was also called to the fact that the state laws had

been held unconstitutional by each of the courts which had, up to that time, passed on their validity on the merits,[54] as well as to the fact that the carriers were making efforts to test the Arizona Act again in this Court.[55] In the two of these cases in which opinions were rendered, the courts had held that the subject of train length limitations was one requiring national uniformity and within the sphere of exclusive Federal regulation.[56]

The history of these bills does not, we think, afford the basis for deducing that Congress had any intention at all with respect to the validity of *state* train length legislation. No committee and no member of Congress expressed any views on that subject. The most that can be said is that Congress was informed that Arizona had such a law, that there was a question as to its constitutionality, and that some Congressmen favored a similar Federal regulation and that others apparently did not.

B. SECTION 1, PARAGRAPHS 10–17 OF THE INTERSTATE COMMERCE ACT

On September 11, 1942, the Interstate Commerce Commission issued Service Order No. 85,[57] which Order required the carriers to—

> operate their trains, when necessary for the prompt movement of freight and the clearing or avoidance of congestion by either freight or passenger trains, without regard to any rules, regulations, practices, or laws now in effect and being enforced in the various States limiting the length of freight trains to not more than one-half mile and limiting the number of cars in a railroad freight train to 70 cars, or limiting the number of cars in a railroad passenger train to 14 or 16.

The Order recited that—

> This order shall remain in effect during the war in which the United States is now engaged, unless sooner terminated by subsequent order of the Commission; and that this order, being based upon conditions of war emergency, shall not constitute a precedent for peace time operations.

The Order also recited briefly the facts upon which it was based, as follows—

> * * * compliance by railroads subject to the Interstate Commerce Act with such rules, regulations, practices, and laws, dur-

[57] 7 Fed. Reg. 7258. The Order is printed in full in Appendix C, pp. [redacted], *infra*.

99-101

ing the present emergency, may result in congestion of tracks and terminals, wasteful use of locomotives, and interference with the free flow of traffic necessary in the present emergency; and that railroad freight trains exceeding one-half mile in length, or exceeding 70 cars in length, and railroad passenger trains exceeding 14 or 16 cars in length may be operated in accordance with safety standards now applicable, during the present emergency, in and through such States, and that such operation will facilitate the free flow of traffic necessary during the present emergency.

The Order was entered without a hearing, as an emergency war measure, as permitted under Section 1 (15) of the Interstate Commerce Act.[58]

The four train service brotherhoods, representing engineers, firemen, conductors and brakemen, petitioned for a rehearing before the Commission. They indicated that they were not requesting that evidence be taken but only wished to file briefs attacking the legal authority of the Commission to make the Order.[59] After the filing of briefs by interested parties, including the Secretary of War in support of the Order, the Commission on November 18, 1943, issued a report (*In the Matter of Service Order No. 85*, 256 I.

[58] There were informal conferences with representatives of the States and of the railroad brotherhoods. 256 I. C. C., at 524.

[59] *Ibid.*

C. C. 523), in which it denied the application to set aside the Order.

The Commission found that the Order was authorized by Section 1, paragraphs 10–17 of the Interstate Commerce Act,[60] interpreted as required by the policy section. The harmful consequences of compliance with the Arizona and Oklahoma train length laws, as recited in the Commission's original order (*supra*, pp. 67–68), which had not been denied by the petitioning brotherhoods, were reaffirmed. In sustaining its own jurisdiction to suspend the operation of the state laws, the Commission found it unnecessary to decide whether the state laws were otherwise valid

[60] Paragraphs 14 and 15 permit the Commission to establish after a hearing, or in time of emergency to suspend without hearing, "rules, regulations and practices with respect to car service". Paragraph 10 defines car service as including "the use, control, supply, movement * * * of locomotives, cars, and other vehicles used in the transportation of property, * * * and the supply of trains". Paragraph 16 provides that:

"Whenever the Commission is of opinion that any carrier by railroad subject to this part is for any reason unable to transport the traffic offered it so as properly to serve the public, it may, upon the same procedure as provided in paragraph (15), make such just and reasonable directions with respect to the handling, routing, and movement of the traffic of such carrier and its distribution over other lines of roads, as in the opinion of the Commission will best promote the service in the interest of the public and the commerce of the people, and upon such terms as between the carriers as they may agree upon, or, in the event of their disagreement, as the Commission may after subsequent hearing find to be just and reasonable."

or whether Congress had occupied the field of legislation with respect to the operation and length of trains, (256 I. C. C., at 530, 539). But see pp. 61–62, *supra*.

The Commission's Order, issued in 1942, was not, of course, in effect in 1940 when the present suit was brought against the Southern Pacific for violation of the state law during that year. Thus, in so far as this case is concerned, there is no conflict between the state law and an exercise of jurisdiction by the Interstate Commerce Commission. The question here is whether the grant of power by Congress to the Commission, prior to such exercise, supersedes state legislation.

A question may be raised as to whether the Interstate Commerce Act does vest the Commission with the power it exercised in Service Order No. 85. That Order is currently under attack by the railroad brotherhoods in *Johnston* v. *United States*, Civil Action No. 1408, pending in the Western District of Oklahoma. This Court, of course, need not determine whether and to what extent the car service provisions of the Interstate Commerce Act have "occupied the field" unless the Commission is correct in concluding that the Act does reach the subject of train lengths. To that question we now turn.

1. *The Authority of the Commission*

Paragraphs 10–15 of Section 1 of the Inter-

state Commerce Act, *infra*, pp. [redacted]–97 deal with car service, and the Commission is empowered to make or suspend rules, regulations or practices "with respect to car service". "Car service" is defined in Paragraph 10 (*infra*, p. [redacted]) as including "the use, control, supply, movement, distribution, exchange, interchange, and return" of locomotives and cars, and the "supply of trains". A rule or practice whereby the operation of over a certain number of cars in a train is prohibited is one governing the "use" of locomotives and cars, as well as perhaps their "control" and "movement". In addition, since the regulation as to the number of cars permitted in a train determines the number of locomotives and trains required to move a given amount of traffic, the subject is one relating to the *"supply"* of locomotives and trains within the meaning of the definition. The language of these paragraphs is thus broad enough to enable the Commission to reach the subject of train lengths.

The Act contains its own criterion for the construction of its provisions. In the Transportation Act of 1940 Congress enacted the introductory section to the Interstate Commerce Act, already referred to (p. 33), which declared it

> to be the national transportation policy of the Congress * * * to promote safe, adequate, economical, and efficient service and foster sound economic conditions in transportation and among the several car-

> riers; * * * all to the end of developing, coordinating, and preserving a national transportation system by water, highway, and rail, as well as other means, adequate to meet the needs of the commerce of the United States, * * * and of the national defense:

The section then states that:

> All of the provisions of this Act shall be administered and enforced with a view to carrying out the above declaration of policy.

The facts upon which the Commission's order was based, which were not disputed and are confirmed by the present record, warranted the Commission in concluding that "adequate" and "efficient" transportation service will be promoted by a construction of the Act as empowering the Commission to suspend state train length limitations. Indeed, at the present time, "the needs of the commerce of the United States * * * and of the national defense" cannot be filled in time of war or emergency if train length limitations are in effect and obeyed. This appears from the uncontroverted facts upon which Service Order No. 85 was based; when traffic is at a maximum, the limitation wastes manpower and motive power, and causes delay and congestion. A construction of the Act which will enable the Commission to deal with such limitations, as it has, in periods of crisis, is thus in accord

with the basic purposes of the Act as expressed by Congress.

A similar conclusion can be reached with respect to paragraph 16 of Section 1, which provides that when a carrier is unable to transport the traffic offered it so as properly to serve the public, the Commission may make just and reasonable directions "with respect to the handling, routing, and movement of the traffic of such carrier and its distribution over other lines of roads, as in the opinion of the Commission will best promote the service in the interest of the public and the commerce of the people". Certainly an order relating to the number of cars in a train has to do with the "handling" and "movement" of the traffic. The reference to the distribution of such traffic over other lines of road is not a limitation upon what precedes it, but a specific authorization of one kind of order which the Commission may enter when necessary. The latter may well have been required in order to give the Commission power to render that type of relief. The language of paragraph 16 in itself, apart from the general policy section of the Transportation Act, imports that it be construed so as to accomplish its objective of eliminating obstructions to traffic in the interests of the public and of commerce. Even if the section can be more narrowly interpreted, it should be construed in the manner most consistent with these vital national interests.

As against these considerations it has been argued that paragraphs 10–17 of the Interstate Commerce Act cannot be construed as permitting the control of train length practices because this was not the evil at which those paragraphs were directed when they were passed. The contention is that Congress had in mind only rules, regulations and practices governing the interchange of cars between railroads and related matters, which are the subjects customarily treated in car service rules. It is true that there is no indication in the legislative history of either the original Car Service Act of 1917 (40 Stat. 101) or the amendments of 1920 (41 Stat. 476) that Congress was concerned as to the number of cars in a train. At that time the long-train method of operation was not generally prevalent, and although Arizona had its train limit statute the law might not then have been regarded as an impediment to commerce. The 1917 Act was prompted by a freight car shortage resulting in part from the misuse of interchanged cars, which often deprived the owning lines of necessary equipment for unduly long periods.[81] But other factors contributing to the shortage, as noted in the House Report,[82] were

[81] See H. Rep. No. 18, 65th Cong., 1st sess.; S. Rep. No. 43, 65th Cong., 1st sess.; Interstate Commerce Commission, Annual Report, 1916, p. 73; *Car Supply Investigation*, 42 I.C.C. 657.

[82] H. Rep. No. 18, *supra*, at p. 3.

insufficient trackage, cars and motive power and inefficient operations.

The original 1917 Act gave the Commission full power to deal with the interchange and distribution of cars between railroads. The "car service" which it subjected to the Commission's jurisdiction was defined as including "the movement, distribution, exchange, interchange and return of cars used in the transportation of property". All of these words except perhaps "movement" were concerned with the abuses responsible for the legislation, and the Act applied only to freight cars. But the Transportation Act of 1920 amended the car service provision by adding the words "use," "control," and "supply" to the definition, by making it applicable to locomotives as well as cars, and also by including "the supply of trains." 41 Stat. 476. Paragraph 16, which does not deal with car service at all, was also added at that time. 41 Stat. 477.

The House Report and debates state only that the amendment to the definition of "car service" was intended to give the Commission power to compel a carrier to supply itself with cars.[63] This would not, however, account for all of the changes, inasmuch as the words "use" and "control" were added in addition to the word "supply". A further amplification of what was in-

[63] H. Rep. No. 456, 66th Cong., 1st sess., p. 17; 58 Cong. Rec. 8315–8316.

tended appears in the statement of Commissioner Clark of the Interstate Commerce Commission at the hearing on the Bill.[64] He stated that the new language would enable the Commission to require the carriers to provide themselves with cars and locomotives, and also that "The use and supply of cars are new terms in the definition of 'car service,' and they largely expand the jurisdiction of the act and of the commission thereunder." With respect to the phrase "supply of trains" (which at that stage also included the words "movement" and "operation"),[65] he stated:

> The other new provision in this definition of "car service" is the extension of the jurisdiction to the supply, movement, and operation of trains. That, as will appear later, will come into play in times of emergency, car shortage, etc., and in connection with the common use of tracks or terminals, when the public interest demands such use.

The brief references to these changes made in 1920 are not sufficient to explain all of the new words added, such as the "use" and "control" of cars and locomotives; nor are the explanations at all clear as to the meaning of "supply of trains". Since these are broad terms incorporated in a statute designed to deal with emergencies, it would

[64] Hearings before H. Committee on Interstate and Foreign Commerce on H.R. 4378, 66th Cong., 1st sess., pp. 11-12.

[65] No explanation was made as to the reason why the conference committee deleted these words.

not seem that Congress intended them to be restricted, contrary to their literal meaning, to apply only to the exact kind of difficulty which had previously occurred. Congress was concerned with the basic problem of shortage of cars, locomotives and trains in time of emergency,[66] as the opening clauses of paragraph 15 plainly show. It is consistent with this purpose, as well as with the principles that all the words of a statute should be given effect and their normal meaning, that the Act not be limited in its scope to the causes of shortage envisaged by Congress at that time. "If Congress has made a choice of language which fairly brings a given situation within a statute, it is unimportant that the particular application may not have been contemplated by the legislators." *Barr* v. *United States*, No. 287, this Term, decided February 5, 1945 (slipsheet p. 5); *Dartmouth College* v. *Woodward*, 4 Wheat. 518, 644;[67] *Puerto Rico* v. *Shell Co.*, 302 U. S. 253, 257;

[66] Although the Commission's power was not limited to periods of emergency (Section 1 (14)), Congress was thinking in terms of emergency.

[67] In the *Dartmouth College* case, the Court declared with respect to a question of constitutional interpretation, in which the case before it seems to come within the words used (4 Wheat., at 644–645):

> It is not enough to say, that this particular case was not in the mind of the Convention, when the article was framed, nor of the American people, when it was adopted. It is necessary to go farther, and to say that, had this particular case been suggested, the language would have been so varied, as to exclude it, or it would have been made a special exception. The case being

Browder v. *United States*, 312 U. S. 335, 339; *Ozawa* v. *United States*, 260 U. S. 178, 195–196; *Pickhardt* v. *Merritt*, 132 U. S. 252, 257. If a shortage of locomotives and trains results from a train length limitation instead of from maldistribution of cars as between carriers, the Act will accomplish its objective if it permits the Commission to take steps to see that the shortage is overcome, not if it is limited to the difficulties confronting the nation and the carriers in 1917.

Paragraph 16 was added to the Interstate Commerce Act in 1920. The legislative history of the Act contains little or no mention of the paragraph, but we think it can be assumed that Congress had in mind the transportation of traffic by other roads when a carrier was unable properly to haul the traffic offered to it. But the object of the paragraph was to insure the movement of the traffic. This object might be attained by an order directing that the obstacle be removed by other means than requiring the traffic to be handled by other roads. Particularly would this be true when, as at the present time, the other roads are also operating to capacity; unless the Commission could in such instances use orders improving the handling by the road responsible for

---

within the words of the rule, must be within its operation likewise, unless there be something in the literal construction so obviously absurd, or mischievous, or repugnant to the general spirit of the instrument, as to justify those who expound the constitution in making it an exception.

the difficulty, the interference would not be overcome and the total carrying capacity of the nation would be impaired. Since a literal reading of the paragraph enables it to be construed broadly so as to achieve its underlying purpose, it should not be limited in its scope to the particular type of obstruction to commerce with which Congress was then familiar.

There are statements in several of this Court's opinions which support a narrower construction of the Act. In *Peoria & Pekin Union Ry. Co.* v. *United States*, 263 U. S. 528, the Court held that the definition of "car service" did not encompass the requirement that one railroad switch cars for another, saying (p. 533):

> * * * But "car service" connotes the use to which the vehicles of transportation are put; not the transportation service rendered by means of them. Cars and locomotives, like tracks and terminals, are the instrumentalities. To make these instrumentalities available in emergencies to a carrier other than the owner was the sole purpose of subparagraphs a, b, and c.

But this decision was limited in *United States* v. *Michigan Cement Co.*, 270 U. S. 521, which upheld a service order under paragraph 15 providing that coal was to be delivered to certain classes of consumers ahead of others. This order could not be sustained if the Court had followed the statement in the *Peoria & Pekin* case that "car service" included only rules relating to the exchange of

equipment between carriers, inasmuch as the service order in the *Cement* case governed the control of cars by the carriers without regard for any interchange. In upholding this order the Court limited the *Peoria & Pekin* decision to the facts there involved. (270 U. S., at 527.)

Railroad Commission of California v. *Southern Pacific Company*, 264 U. S. 331, 343, contains a brief summary of the car service provisions as related to distribution and exchange of cars and equipment, and states that "Paragraph 16 authorizes the Commission to provide transportation by other carriers if one carrier is unable to handle its traffic on terms fixed by the Commission". But these statements did not on their face purport to be exclusive, and they mention only those phases of the statute which were pertinent to the problem then before the Court, whether California could compel the carriers to build a union station in Los Angeles without the approval of the Commission under paragraphs 18–21 of Section 1. The portions of the opinion referred to were clearly dicta, and obviously were not intended to express an opinion on the general scope of the car service provisions.

A broad construction of the car service provisions is supported by the Commission's decision in 1926 in *Train Service on Northern Pacific*, 112 I. C. C. 191, where it held that it had jurisdiction to regulate a single carrier's supply of freight

trains for use on its own line—a subject having nothing to do with the interchange or distribution of equipment as between carriers. In addition the three-judge district court in the first Arizona train length case (*Atchison, T. and S. F. Ry. Co. v. La Prade*, 2 F. Supp. 855, 860 (D. Ariz.))[68] specifically held

> The power conferred by Congress upon the Interstate Commerce Commission to regulate the supply of trains must necessarily include authority to prescribe the number of interstate trains to be operated by the carrier. * * *

The conclusion we draw from the above analysis is that the Interstate Commerce Act does grant the Commission power over rules and practices which limit the number of cars in a train. But this conclusion does not determine the validity of state train length limitations before the Commission has acted. There remains to be considered the extent, if any, to which the Interstate Commerce Act has excluded the states from the field.

2. *Whether Section 1 (10)–(17) of the Interstate Commerce Act Has Occupied the Field*

The problem as to whether paragraphs 10–17 of Section 1 of the Interstate Commerce Act have "occupied the field" so as to exclude state train length legislation arises only if these paragraphs

[68] Reversed in this Court on jurisdictional grounds. *Ex parte La Prade*, 289 U. S. 444.

reach that subject. It will not arise, of course, if the Court should reject the construction of those paragraphs which we have advanced (*supra*, pp. 70–81) and should hold that the Commission does not possess the power which it has exercised. The validity of the state law would then be determined without regard for the Interstate Commerce Act, and would depend upon whether the statute contravened the limitations imposed by the commerce clause itself (see Point I). The remainder of the discussion here, therefore, will assume that Section 1 of the Interstate Commerce Act does authorize the Commission to control the subject of car lengths.

It is also necessary to assume for present purposes, contrary to the position we have taken in Point I, that the state law would be valid apart from the Interstate Commerce Act. For the problem of "occupation of the field" presupposes a state law which would be constitutional if there were no conflicting or superseding Federal statute. Except in rare instances, such as the Wilson and Hawes-Cooper Acts, Federal legislation does not enlarge the powers of the states, and this is clearly true here. Whether or not Congress intended the car service provisions to supersede state laws, nothing in their language or history even remotely suggests that Congress was expanding state authority over the subject beyond that previously allowable under the commerce clause. Indeed a proviso at the end of paragraph 17 (a) (considered, *infra*, pp. 85–86), which preserves the

right of the states as to *intrastate* matters—except where inconsistent with Commission orders—demonstrates that Congress was not preserving, and certainly not enlarging, state authority over interstate transactions.

In our discussion as to whether the Federal Act has superseded the state law we shall therefore assume, *arguendo,* both that the former should be construed as we have suggested and that the latter is otherwise constitutional.

There is no question, of course, as to the invalidity of state legislation affecting commerce where there is an inconsistent Federal statute. The problem as to whether Congress has occupied the field so as to preclude its regulation by the states presents difficulties when the Federal law regulates only in part and the state law deals with a different portion of the same subject.[69] The question in such cases is as to the extent of the field which Congress intended to occupy. Here we have no such problem, since by hypothesis paragraphs 10–17 of Section 1 do reach the subject of train lengths. The question here is as to the effect of a Federal regulation which requires administrative implementation before becoming operative.

Whether a federal regulation of commerce delegating to administrative officials authority which

[69] As in *New York Central R. Co.* v. *Winfield*, 244 U. S. 147; *Adams Express Company* v. *Croninger*, 226 U. S. 491; *Texas & Pacific Ry. Co.* v. *Abilene Cotton Oil Co.*, 204 U. S 426.

has not been exercised supersedes a state law depends upon the intention of Congress. If it was intended that the federal administrative agency be given exclusive authority over the subject,—that it go unregulated except when the agency found it necessary to act—the states may not establish a regulatory system of their own. If, on the contrary, Congress did not intend the subject to go unregulated in the absence of federal administrative action, state laws applicable to the subject are valid.

These principles have been frequently applied. In *Napier* v. *Atlantic Coast Line Railroad Co.*, 272 U. S. 605, the Court held that the states could not supplement the Federal Boiler Inspection Act, which authorized the Interstate Commerce Commission to require locomotives to be equipped with devices essential to safety, by compelling the use of safety devices in addition to those required by the Commission. See to the same effect *Oregon-Washington R. & Nav. Co.* v. *Washington*, 270 U. S. 87; *Alabama and V. Ry.* v. *Jackson and E. Ry.*, 271 U. S. 244; *Missouri Pacific R. Co.* v. *Porter*, 273 U. S. 341; *Northern Pacific Ry. Co.* v. *Washington*, 222 U. S. 370. On the other hand, in *Welch Co.* v. *New Hampshire*, 306 U. S. 79, the Court upheld a state maximum hours law for drivers of motor vehicles in the absence of action by the Interstate Commerce Commission under Section 204 of the Motor Carrier Act, on the ground that Congress did not intend state safety measures to be nullified before

the federal agency prescribed regulations on the subject. See to the same effect *Eicholtz* v. *Public Service Commission*, 306 U. S. 268; *Mintz* v. *Baldwin*, 289 U. S. 346; *Northwestern Bell Telephone Co.* v. *Nebraska State Ry. Commission*, 297 U. S. 471. Cf. *Allen-Bradley Local No. 1111* v. *Wisconsin Employment Relations Board*, 315 U. S. 740.

In determining the congressional intention as to state control over the subjects covered by the car service provisions, we are aided by a proviso, added to paragraph 17 (a) of Section 1 in 1920:

> *Provided, however,* That nothing in this Act shall impair or affect the right of a State, in the exercise of its police power, to require just and reasonable freight and passenger service for intrastate business, except in so far as such requirement is inconsistent with any lawful order of the Commission made under the provisions of this Act.

The Conference Committee Report [79] shows the deletion from the House bill, after the words "freight and passenger service", of the phrase "and the fair exchange and distribution of equipment", and the addition of the last clause, beginning with "except". This proviso is significant in three respects: (1) most obviously, since it preserves the state's right to regulate only intrastate business, it carries a strong negative implication that state authority was not to extend

[79] House Report No. 650, 66th Cong., 2d sess., p. 62.

to interstate matters and that the latter would be governed exclusively by Federal law; (2) the express provision that as to intrastate business the states must bow when the Commission acted inconsistently implies that as to interstate matters it is immaterial whether the Commission has taken affirmative action; (3) the deletion of the phrase "and the fair exchange and distribution of equipment" suggests that even as to intrastate commerce Congress may not have intended to give the states control over subjects requiring nationally uniform railroad practices.

The conclusion to be drawn from this proviso [71] closely confining the power of the states over car service is that Congress did not intend them to regulate car service in interstate commerce, whether or not the Commission had acted. This result is supported by the nature of the subject, which would seem to be one requiring national uniformity, and by decisions of this Court both preceding and following the enactment of the proviso. In *Chicago, R. I. & P. Ry. Co.* v. *Hardwick Elevator Co.*, 226 U. S. 426, the Court had held invalid a Minnesota requirement as to prompt car service to shippers on the ground that it infringed upon provisions of the Hepburn Act (now Interstate Commerce Act, Section 1 (4)) much more general than the subsequently enacted

[71] We have found nothing else in the Act or its history which throws any specific light on the intent of Congress as to the relevant state laws.

car service paragraphs.[72] In *Missouri Pac. R. Co. v. Stroud*, 267 U. S. 404, the Court held that a Missouri statute prohibiting discrimination in car service could not be applied to interstate shipments inasmuch as "Congress has enacted laws for the regulation of the furnishing of cars to shippers," citing paragraphs 10–14 of Section 1 of the Interstate Commerce Act, *inter alia*. It thus seems to have been the understanding both of Congress and of this Court that the field of car service regulation has been occupied by the Federal Government to the exclusion of the states.

We do not believe that it can be said, however, that this understanding necessarily extends to all the matters susceptible of regulation under paragraphs 10–17. These include, as we have shown, *supra*, pp. 70–81, both the subjects long covered in car service rules, such as arrangements for the interchange of cars, and also sweeping emergency powers to be exercised in periods of "shortage of equipment, congestion of traffic, or other emergency requiring immediate action" (Section 1 (15)), with respect to the use, control, supply and movement of equipment under paragraphs 10–15, and even broader powers under paragraph 16, which is not, strictly speaking, a car service regulation. These provisions would

[72] The *Hardwick* case was followed in *Hampton* v. *St. Louis, Iron Mountain & S. Ry.*, 227 U. S. 456; *Yazoo & Mississippi Valley R. Co.* v. *Greenwood Grocery Co.*, 227 U. S. 1; *St. Louis, Iron Mountain & Southern Ry. Co.* v. *Edwards*, 227 U. S. 265. See also *St. Louis Southwestern Railway Co.* v. *Arkansas*, 217 U. S. 136.

seem to have been intended to permit the Commission to cope with emergencies as best befitted the situation before it, and irrespective of whether the particular difficulty or the solution to it had been specifically contemplated by Congress when it passed the law. Although we think that Congress had a definite intention that power over the familiar types of car service regulation was to be reserved to the Federal Government exclusively, we doubt that it had a specific intention one way or the other as to other kinds of orders which the Commission might find necessary in dealing with the future contingencies capable of being reached under the broad language of the statute.

Congress undoubtedly did not, and probably could not, foresee what particular measures would have to be adopted under these powers.[73] We do not think that it can be assumed in the abstract that all steps which the Interstate Commerce Commission might take under such powers deal with subjects which the states could not previously have regulated. Thus, while in some circumstances the states may require an adequate supply of trains, including interstate trains, to meet local needs,[74] the Interstate Commerce Commission may supersede the state regulation in view of its authority to control the "supply of trains".

[73] See *Train Service on Northern Pacific Railway*, 112 I. C. C. 191, in which the Commission permitted the substitution of tri-weekly for daily mixed train service on an interstate branch line of the Northern Pacific Railway, contrary to a North Dakota statute.

[74] See cases cited, pp. 48–49, n. 36.

It is unlikely that Congress either intended the car service provisions to deprive the states of these powers prior to action by the Commission, or to expand their constitutional authority on the subject to matters which under this Court's decisions they could not otherwise have reached.

We do not suggest that the Commission's authority to issue orders with respect to the length of trains falls within the class of car service regulations specifically envisaged by Congress when the 1917 and 1920 Acts were passed. Accordingly, as to this subject, it cannot be said that Congress had an intention to supersede state laws apart from any steps taken by the Commission. In the absence of a showing that such an intention existed, the Federal statute by itself would not occupy the field. The validity of the state law would then depend upon its standing under the commerce clause, on the assumption that Congress had not specifically spoken.

CONCLUSION

For the reasons set forth in Point I of this brief, it is respectfully submitted that the judgment below should be reversed and the Arizona law held unconstitutional.

CHARLES FAHY,
Solicitor General.

ROBERT L. STERN,
Special Assistant to the Attorney General.

CAROLYN R. JUST,
Special Attorney.

APPENDIX A

Arizona Train Limit Law

Arizona Laws, Act of May 16, 1912.

AN ACT LIMITING THE NUMBER OF CARS IN A TRAIN

Be it enacted by the Legislature of the State of Arizona:

Section 1. It shall be unlawful for any person, firm, association, company or corporation, operating any railroad in the State of Arizona, to run, or permit to be run, over his, their, or its line of road, or any portion thereof, any train consisting of more than seventy freight, or other cars, exclusive of caboose.

Section 2. It shall be unlawful for any person, firm, association, company or corporation, operating any railroad in the State of Arizona, to run, or permit to be run, over his, their, or its line or road, or any portion thereof, any passenger train consisting of more than fourteen cars.

Section 3. Any person, firm, association, company or corporation, operating any railroad in the State of Arizona, who shall wilfully violate any of the provisions of this act, shall be liable to the State of Arizona for a penalty of not less than one hundred dollars, nor more than one thousand dollars, for each offense; and such penalty shall be recovered, and suits therefor brought by the Attorney General, or under his direction,

in the name of the State of Arizona, in any county through which such railway may be run or operated, provided, however, that this act shall not apply in cases of engine failures between terminals.

SECTION 4. All acts and parts of acts in conflict with the provisions of this act are hereby repealed.

622339—45——7

APPENDIX B

Pertinent Provisions of the Interstate Commerce Act

The National Transportation Policy declared by the Transportation Act of 1940 (54 Stat. 899) provides:

> It is hereby declared to be the national transportation policy of the Congress to provide for fair and impartial regulation of all modes of transportation subject to the provisions of this Act, so administered as to recognize and preserve the inherent advantages of each; to promote safe, adequate, economical, and efficient service and foster sound economic conditions in transportation and among the several carriers; to encourage the establishment and maintenance of reasonable charges for transportation services, without unjust discriminations, undue preferences or advantages, or unfair or destructive competitive practices; to cooperate with the several States and the duly authorized officials thereof; and to encourage fair wages and equitable working conditions;—all to the end of developing, coordinating, and preserving a national transportation system by water, highway, and rail, as well as other means, adequate to meet the needs of the commerce of the United States, of the Postal Service, and of the national defense. All of the provisions of this Act shall be administered and enforced with a view to carrying out the above declaration of policy.

Section 1 of the Interstate Commerce Act, Part I, provides in part:

* * * * *

(10) The term "car service" in this part shall include the use, control, supply, movement, distribution, exchange, interchange, and return of locomotives, cars, and other vehicles used in the transportation of property, including special types of equipment, and the supply of trains, by any carrier by railroad subject to this part.

(11) It shall be the duty of every carrier by railroad subject to this part to furnish safe and adequate car service and to establish, observe, and enforce just and reasonable rules, regulations, and practices with respect to car service; and every unjust and unreasonable rule, regulation, and practice with respect to car service is prohibited and declared to be unlawful.

(12) It shall also be the duty of every carrier by railroad to make just and reasonable distribution of cars for transportation of coal among the coal mines served by it, whether located upon its line or lines or customarily dependent upon it for car supply. During any period when the supply of cars available for such service does not equal the requirements of such mines it shall be the duty of the carrier to maintain and apply just and reasonable ratings of such mines and to count each and every car furnished to or used by any such mine for transportation of coal against the mine. Failure or refusal so to do shall be unlawful, and in respect of each car not so counted shall be deemed a separate offense, and the carrier, receiver, or operating trustee so failing or refusing shall forfeit

to the United States the sum of $100 for each offense, which may be recovered in a civil action brought by the United States.

(13) The Commission is hereby authorized by general or special orders to require all carriers by railroad subject to this part, or any of them, to file with it from time to time their rules and regulations with respect to car service, and the Commission may, in its discretion, direct that such rules and regulations shall be incorporated in their schedules showing rates, fares, and charges for transportation, and be subject to any or all of the provisions of this part relating thereto.

(14) (a) The Commission may, after hearing, on a complaint or upon its own initiative without complaint, establish reasonable rules, regulations, and practices with respect to car service by common carriers by railroad subject to this part, including the compensation to be paid and other terms of any contract, agreement, or arrangement for the use of any locomotive, car, or other vehicle not owned by the carrier using it (and whether or not owned by another carrier), and the penalties or other sanctions for nonobservance of such rules, regulations, or practices.

(b) It shall be unlawful for any common carrier by railroad or express company, subject to this part, to make or enter into any contract, agreement, or arrangement with any person for the furnishing to or on behalf of such carrier or express company of protective service against heat or cold to property transported or to be transported in interstate or foreign commerce, or for any such carrier or express company to continue after April 1, 1941, as a party

to any such contract, agreement, or arrangement unless and until such contract, agreement, or arrangement has been submitted to and approved by the Commission as just, reasonable, and consistent with the public interest: *Provided,* That if the Commission is unable to make its determination with respect to any such contract, agreement, or arrangement prior to said date, it may extend it to not later than October 1, 1941.

(15) Whenever the Commission is of opinion that shortage of equipment, congestion of traffic, or other emergency requiring immediate action exists in any section of the country, the Commission shall have, and it is hereby given, authority, either upon complaint or upon its own initiative without complaint, at once, if it so orders, without answer or other formal pleading by the interested carrier or carriers, and with or without notice, hearing, or the making or filing of a report, according as the Commission may determine: (a) to suspend the operation of any or all rules, regulations, or practices then established with respect to car service for such time as may be determined by the Commission; (b) to make such just and reasonable directions with respect to car service without regard to the ownership as between carriers of locomotives, cars, and other vehicles, during such emergency as in its opinion will best promote the service in the interest of the public and the commerce of the people, upon such terms of compensation as between the carriers as they may agree upon, or, in the event of their disagreement, as the Commission may after subsequent hearing find to be just and reasonable; (c)

to require such joint or common use of terminals, including main-line track or tracks for a reasonable distance outside of such terminals, as in its opinion will best meet the emergency and serve the public interest, and upon such terms as between the carriers as they may agree upon, or, in the event of their disagreement, as the Commission may after subsequent hearing find to be just and reasonable; and (d) to give directions for preference or priority in transportation, embargoes, or movement of traffic under permits, at such time and for such periods as it may determine, and to modify, change, suspend, or annul them. In time of war or threatened war the President may certify to the Commission that it is essential to the national defense and security that certain traffic shall have preference or priority in transportation, and the Commission shall, under the power herein conferred, direct that such preference or priority be afforded.

(16) Whenever the Commission is of opinion that any carrier by railroad subject to this part is for any reason unable to transport the traffic offered it so as properly to serve the public, it may, upon the same procedure as provided in paragraph (15), make such just and reasonable directions with respect to the handling, routing, and movement of the traffic of such carrier and its distribution over other lines of roads, as in the opinion of the Commission will best promote the service in the interest of the public and the commerce of the people, and upon such terms as between the carriers as they may agree upon, or, in the event of their disagreement, as the

Commission may after subsequent hearing find to be just and reasonable.

(17) (a) The directions of the Commission as to car service and to the matters referred to in paragraphs (15) and (16) may be made through and by such agents or agencies as the Commission shall designate and appoint for that purpose. It shall be the duty of all carriers by railroad subject to this part, and of their officers, agents, and employees, to obey strictly and conform promptly to such orders or directions of the Commission, and in case of failure or refusal on the part of any carrier, receiver, or operating trustee to comply with any such order or direction such carrier, receiver, or trustee shall be liable to a penalty of not less than $100 nor more than $500 for each such offense and $50 for each and every day of the continuance of such offense, which shall accrue to the United States and may be recovered in a civil action brought by the United States: *Provided, however,* That nothing in this part shall impair or affect the right of a State, in the exercise of its police power, to require just and reasonable freight and passenger service for intrastate business, except in so far as such requirement is inconsistent with any lawful order of the Commission made under the provisions of this part.

(b) It shall be unlawful for any person to offer or give or cause or procure to be offered or given, directly or indirectly, any money, property, or thing of value, or bribe in any other form whatsoever, to any person acting for or employed by any carrier by railroad subject to this part with intent to influence his decision or action, or because

of his decision or action, with respect to the supply, distribution, or movement of cars or other vehicles, or vessels, used in the transportation of property. It shall be unlawful for any person acting for or employed by any carrier by railroad subject to this part to solicit, accept, or receive, directly or indirectly, any money, property, or thing of value, or bribe in any other form whatsoever, with intent to be influenced thereby in his decision or action, or because of his decision or action, with respect to the supply, distribution, or movement of cars or other vehicles, or vessels, used in the transportation of property. Any person who violates the provisions of this subparagraph shall be deemed guilty of a misdemeanor and be subject for each offense to a fine of not more than $1,000, or imprisonment in the penitentiary for a term of not more than two years, or both such fine and imprisonment.

APPENDIX C

SERVICE ORDER NO. 85

At a Session of the Interstate Commerce Commission, Division 3, held at its office in Washington, D. C., on the 11th day of September, A. D. 1942.

The Commission having under consideration operating rules, regulations, and State laws limiting the length of railroad freight and passenger trains, the Commission is of the opinion that, due to the existing state of war, an emergency exists requiring immediate action within the meaning of Section 1, paragraphs (10) to (17), inclusive, of the Interstate Commerce Act.

It appearing that certain rules, regulations, practices, and laws are now in effect and are being enforced in certain States limiting the length of railroad freight trains to not more than one-half mile and limiting the number of freight cars in a railroad freight train to 70 cars, and limiting the number of cars in a railroad passenger train to 14 or 16, and that compliance by railroads subject to the Interstate Commerce Act with such rules, regulations, practices, and laws, during the present emergency, may result in congestion of tracks and terminals, wasteful use of locomotives, and interference with the free flow of traffic necessary in the present emergency; and that railroad freight trains exceeding one-half mile in length, or exceeding 70 cars in length, and railroad passenger

trains exceeding 14 or 16 cars in length may be operated in accordance with safety standards now applicable, during the present emergency, in and through such States, and that such operation will facilitate the free flow of traffic necessary during the present emergency;

Therefore, it is ordered, That:

Title 49—Transportation and Railroads.

Chapter I—Interstate Commerce Commission.

Subchapter A—General Rules and Regulations:

Part 95—Car Service

See.

95.1 Length of trains.

95.2 Effective period; emergency character.

Authority: §§ 95.1 and 95.2, issued under authority of 40 Stat. 101, 41 Stat. 476, 49 Stat. 543, 54 Stat. 901; 49 U. S. C. 1 (10)–(17).

§ 95.1. *Length of trains.*—From and after September 15, 1942, carriers by railroad subject to the Interstate Commerce Act shall operate their trains, when necessary for the prompt movement of freight and the clearing or avoidance of congestion by either freight or passenger trains, without regard to any rules, regulations, practices, or laws now in effect and being enforced in the various States limiting the length of freight trains to not more than one-half mile, and limiting the number of cars in a railroad freight train to 70 cars, or limiting the number of cars in a railroad passenger train to 14 or 16.

§ 95.2. *Effective period; emergency character.*—This order shall remain in effect during the war

in which the United States is now engaged, unless sooner terminated by subsequent order of the Commission; and that this order, being based upon conditions of war emergency, shall not constitute a precedent for peace-time operations.

It is further ordered, That this order shall be served upon each common carrier by railroad subject to the Interstate Commerce Act and upon each State railroad commission, and that notice of this order be given to the general public by depositing a copy thereof in the office of the Secretary of the Commission at Washington, D. C., and by filing it with the Director of the Division of the Federal Register, The National Archives.

By the Commission, division 3.

[SEAL] W. P. BARTEL,
Secretary.

OCTOBER TERM, 1944.

No. 56.

SOUTHERN PACIFIC COMPANY, a corporation, *Appellant*,

v.

STATE OF ARIZONA *ex rel.* JOE CONWAY, Attorney General of the State of Arizona, *Appellee*.

BRIEF FOR THE ASSOCIATION OF AMERICAN RAILROADS AS AMICUS CURIAE.

I.

SUMMARY STATEMENT OF INTEREST, POSITION AND ARGUMENT.

With consent of the parties, this brief is filed for the Association of American Railroads, as *amicus curiae*, in support of the position that the Arizona Train-Limit Law[1] is unconstitutional. That statute makes it unlawful to operate in the State of Arizona a freight train of more than 70 cars, exclusive of caboose, or a passenger train of more

[1] "An Act Limiting the Number of Cars in a Train." Section 69-119, Arizona Code Annotated, 1939.

than 14 cars, and provides a penalty of not less than $100, or more than $1,000, for each violation.

This brief should be regarded as supplementary to the comprehensive, detailed and closely documented brief of appellant, Southern Pacific Company. It will not deal with all features of the case but will confine itself to certain aspects of particular significance with respect to the national interest in safe, efficient and economical rail transportation, the national policy concerning such transportation as established and declared by Congress, and the conflict between that interest and policy, on the one hand, and drastic limitation of train lengths by state regulation, on the other.

The Association of American Railroads is a voluntary association whose members operate approximately 99 per cent of the mileage of Class I railroads,[2] and 95 per cent of the mileage of all railroads in the United States. The Association has to do with matters of general interest to the railroad industry. In important respects the operations of all railroads are interrelated and coordinated, and this gives rise to problems which fall within the special field of the Association.

As illustrating the coordination of railroad operations throughout the United States, it is familiar knowledge that established railroad routes and rates are available between all points in the country. Transportation over such routes often involves the use of lines and services of a large number of different railroads. The freight cars of one railroad are not restricted to its line but move freely over all lines throughout the Nation. There is also a considerable interchange of locomotives, passenger coaches and Pullman cars, mail, express, and other cars assigned to the passenger and allied services. If it were otherwise, "the efficacious carrying on of interstate commerce" would be impossible.[3]

---

[2] A Class I railroad, under the classification of the Interstate Commerce Commission, is one with an annual gross operating revenue of $1,000,000 or more.

[3] *St. Louis S. W. Ry.* v. *Arkansas*, 217 U. S. 136, 149.

Two members of the Association, appellant, Southern Pacific Company, and The Atchison, Topeka and Santa Fe Railway Company, conduct substantial railroad operations in Arizona and are subject to the full impact of the Arizona Train-Limit Law, except insofar as it may be suspended or set aside. All members of the Association participate in through transportation under through rates, which is performed in part through the State of Arizona, and all, therefore, are affected by the Arizona prohibition. If a railroad line in Arizona becomes congested or blocked, every route of which that line is a link becomes congested or blocked so that the movement of freight from coast to coast may be affected. An increase in the cost of performing transportation in Arizona means an increase in the cost of performing through transportation which moves across that state. Moreover, if the State of Arizona has the power to interfere with, obstruct, and seriously burden railroad operations by the prescribed limitations of train length, other states must possess like powers.

In all parts of the United States, with the exception of Arizona, and recently of Oklahoma, long-train operation is general and standard railroad practice. When we speak of long trains, we mean freight trains of more than 70 cars and passenger trains of more than 14 cars. When we speak of long-train operation,[1] we mean a method of operation which involves the use of long trains when they are justified by available traffic, service requirements, physical conditions, and other considerations, and the use of short trains when there is not sufficient traffic for long trains or when the operation of long trains is not indicated for other reasons. Long trains are used to a greater extent on lines of heavy traffic density than on lines of light density.

The obvious and fundamental fact with respect to long-train operation is that it permits the movement of a given volume of traffic in fewer trains than would otherwise be

[1] See the definition of "standard long-train operation" in the trial court's findings of fact. (R. 3888)

needed. As a result of fewer trains on the road, there are fewer meets and passes[5] and less interference and congestion. Fewer locomotives are required. The volume of freight which can be transported over a given track is increased and in this way track capacity is enlarged. These results bring about safer, more efficient, and more economical operation, and faster, more reliable and better service to the public.

During the first World War and the period immediately following, the capacity of the railroads of this country was overtaxed. Assurance was needed that the railroads would be able to meet the future requirements of commerce and of national defense. Both Congress and the railroads recognized this need, and took steps to meet it.

Prior to 1920, the policy of Congress concerning the railroads had been directed mainly to the correction of abuses, particularly those arising from unreasonable or discriminatory rates. But in the Transportation Act 1920,[6] new and important objectives were recognized. Emphasis was placed upon the public interest in adequate, economical and efficient railroad service.

Beginning in 1923, the railroads undertook and carried out a broad and continuing program for improvement of the national railroad plant. Vast expenditures were made for additions and betterments to facilities, which enabled the railroads to improve their operating methods and to develop practices now in general use, of which an important feature is long-train operation, and in that way to give better and cheaper service and to operate with much greater safety. Operating costs have been reduced, train speeds have been increased, and striking progress has been made toward safer operation, while at the same time the

[5] When two trains bound in opposite directions pass in single track operation, that is said to be a "meet." When one train passes another bound in the same direction, that is said to be a "pass."

[6] 41 Stat. 456, 474.

number of long trains and the average number of cars per train have increased. This progress in efficiency, economy and safety has been due in substantial part to long-train operation.

Severe state restrictions on train length, such as those in Arizona, to the extent they should become effective, would deprive the railroads of the most advantageous use of the facilities which they have provided at enormous expense and would reestablish outmoded, wasteful, and relatively hazardous operating practices. Service to the public would be slower and less dependable; costs of performing the service, which must ultimately fall upon the public, would pyramid; the financial stability of the national railway transportation system would be threatened; and the physical adequacy of that system to meet the needs of the national commerce and of the national defense would be endangered.

During the present war period, the railroads have made an outstanding record. But they have been under heavy strain as a result of the unprecedented volume of traffic. Problems of manpower and of motive power have been particularly urgent. Had it been necessary to run more trains to carry the same volume of traffic, more crews would have been required to man the trains and more locomotives to haul them, as well as more track space to accommodate them.

It is difficult to escape the conclusion that there would have been a physical collapse in transportation during this critical war period, with grave consequences to our national security, if train-length limitations, similar to the Arizona restriction, had been effective in a substantial number of states.

In order to avoid repetition and duplication, so far as possible, we shall not parallel the presentation in the Southern Pacific brief. There it is argued that the Arizona law is unconstitutional for the following reasons:

1. It is in conflict with the Commerce Clause because it invades the field of exclusive national regulation. The length and consist of interstate railroad trains is a subject of national and not local concern, as to which a national and uniform system of regulation is necessary, if any regulation should be desirable.

2. It is in conflict with the Commerce Clause because it necessarily, practically, and inevitably regulates and controls the length and consist of interstate trains, and other railroad operations, not only within Arizona but also with extraterritorial effect in adjoining states and for substantial distances beyond the boundary lines of Arizona.

3. It is in conflict with the Commerce Clause for the reason that, even if it should be considered that the regulation of length of interstate trains falls within the "concurrent" field of regulation, the Train-Limit Law, because it imposes direct and substantial burdens and restrictions upon, and directly and materially obstructs and interferes with, the free flow of interstate commerce, goes far beyond any powers which the state may have in the concurrent field.

4. It is in conflict with the Commerce Clause because, if considered as an attempted limitation of the length of trains for the sake of proper handling and safe control, the Train-Limit Law conflicts with, and attempts to supplement, existing federal legislation,[7] having the same or similar purposes.

5. It is in conflict with the Due Process Clause of the Fourteenth Amendment because it is arbitrary and unreasonable, has no rational basis as a police power regulation, and bears no reasonable relation to health and safety.

---

[7] Safety Appliance Act of March 7, 1893, Sec. 1; 27 Stat. 531; 45 U. S. C., Sec. 1. Amendatory Act of March 2, 1903, Sec. 2; 32 Stat. 943; 45 U. S. C., Sec. 9. Interstate Commerce Act, Sec. 25; 49 U. S. C., Sec. 26.

We are in entire accord with the contentions of appellant, as above outlined, but our discussion of the law will be confined to a much narrower compass.

We readily recognize, of course, that, in the absence of occupation of the field by Congress, there is open to the states, in the exercise of their police powers, a wide range of action which may affect interstate commerce. But it is equally clear that there are limitations upon state action of this character. As a broad rule, the validity of a state law is to be tested by the extent and degree of its consistency or inconsistency with "the principal objects sought to be secured by the Commerce Clause," which have been described as "the uniformity of control of the national commerce in matters of national concern and * * * the free flow of commerce."

A state can not prescribe a regulation affecting interstate commerce if the nature of the subject matter regulated and the nature of the regulation are such that "superior fitness and propriety" require uniformity of control by a single national authority rather than diversity of control by local, state authorities. The single, national control may, of course, take the form of affirmative regulation or the form of inaction. This field of regulation, having to do with matters primarily of national and not of local concern, is exclusively for the national government and within it a state can not assume authority under any condition.

Even as to regulation which falls outside the exclusive national field and into what is sometimes called the concurrent field, the Commerce Clause prohibits state action in contravention of well settled principles. The traditional test invokes the distinction between indirect and incidental effects on interstate commerce, which are permissible, and direct and substantial effects, which are forbidden. This test has disclosed difficulties of application in some cases and in recent years new guides, or guides stated in new language, have been formulated. It has been held that a state statute

is invalid if it infringes upon the national interest in commerce. And it has been held that the validity of a state law may be judged by weighing the competing demands of the national and state interests involved. If the burden upon or interference with interstate commerce is disproportionately heavy compared with the local benefits, the state law falls because irreconcilable with the Commerce Clause. It has also been held that state regulations affecting interstate commerce, whose purpose or effect is to gain for those within the state an advantage at the expense of those without, or to burden those out of the state without corresponding advantages to those within, impinge upon the constitutional provision even though Congress has not acted.[8]

The Arizona law fails to survive any of the tests above suggested.

It deals with a subject predominantly of national rather than local concern and one which requires uniform regulation, if any should be needed. Varying train-length limitations in different states could result only in obstructive and costly divergence and confusion in railroad operation and in obstructions to the free flow of interstate commerce.

The law strikes at the physical operation of railroads and interferes with and hampers that operation. Its effect on interstate commerce is not incidental or indirect but is direct, immediate, unavoidable, and serious. It demands that the railroads remove from freight trains entering the state all cars in excess of 70 and from passenger trains all cars in excess of 14. It requires the remaking of trains at points outside the state. It requires the running of additional trains within the state and for considerable distances in other states. It results in delays at terminals incident to the remaking of trains and the removal of cars from one train for hauling by a later train. It results in delays in road movement by reason of congestion and interference due to the operation of additional trains.

[8] *S. C. Hwy. Dept.* v. *Barnwell Bros.*, 303 U. S. 177, 185, and cases cited.

It places an exorbitant burden of expense on railroad transportation which must ultimately fall upon shippers and passengers, the great majority of whom are outside of the state; and it diminishes the capacity of railroad lines within the state and far beyond its borders, and thus imperils their ability to meet transportation requirements.

The Arizona law serves no local interest or objective which justifies the burden which it casts upon interstate commerce. The local purpose which it is claimed to serve is one of safety, but the record conclusively shows that it does not serve this purpose. On the contrary, the law has an adverse effect on safety. Even if it be assumed, however, that the law has sufficient relationship to safety to give it a rational basis as an exercise of police power, there can be no doubt that, at most, the local safety benefits are dubious and inconsequential. In contrast, the burden upon interstate commerce is great and continuous.

The state law impinges in a violent manner upon the national interest in commerce. This is apparent from what has been said concerning the nature and extent of the burden which it places upon interstate railroad transportation and upon the instrumentalities of such transportation. This burden is of special significance when viewed in the light of the part played by these great carriers in the life of the Nation and in the light of the National Transportation Policy manifested and expressly stated by Congress.

The railroads transport the bulk of the Nation's traffic. At all times they are indispensable, and in war time the failure of the railroads would imperil the Nation. It is almost impossible to overstate the importance of railroad transportation to the national well-being. The railroad system "is the most important single element in our social and economic life. * * * Both security and material welfare are involved in its continued efficient existence."[9] Again it has been said that "If our railroads fail, our en-

[9] Report of the National Transportation Committee, February 13, 1933, page 8.

tire world-wide military effort fails. We might suffer military reverses and still win this war—but we can't avoid defeat should our railroads fail."[10]

It follows that the efficiency and economy of railroad operation are matters of profound national concern. This has been expressly recognized by Congress. As amended by the Transportation Act of 1940,[11] the Interstate Commerce Act contains, preceding Part I, a specific declaration that it is the "National Transportation Policy"—

> "to promote safe, adequate, economical, and efficient service and foster sound economic conditions in transportation * * *."

This was a reaffirmation of the policy which has guided Congress since 1920 and which has been considered by this Court in a number of cases where it was pointed out that "avoidance of waste, in interstate transportation, as well as maintenance of service, has become a direct concern of the public,"[12] and that the public interest has "direct relation to adequacy of transportation service, to its essential conditions of economy, and to appropriate provision and best use of transportation facilities."[13]

The Arizona law is, therefore, squarely in conflict with the National Transportation Policy, and for that reason, cannot be upheld. There is a marked distinction between a state regulation which is in conflict with the national policy and one which is in accord with and in furtherance of the national policy.[14]

It has been said that even in the "joint field" of regulation, a state can take action which affects interstate com-

merce only under circumstances from which it can be reasonably inferred that Congress, by not occupying the field has "tacitly authorized"[15] such action, or has indicated its "acquiescence"[16] therein.

Whether or not such tacit authority or acquiescence is fairly to be inferred in a particular case must be gathered from all surrounding circumstances, including the nature of the subject matter which is regulated and the national interest in and policy concerning such subject matter, and including the effect of the regulation upon interstate commerce and upon any local, state interest which it may purport to serve.

In this case, a consideration of all surrounding circumstances negatives any possibility that the fact that Congress has not entered the field of train-length regulation, which fact we assume for purposes of argument, could be regarded as a tacit authorization for the State of Arizona arbitrarily to regulate the length of interstate trains with the results above outlined.

This Court has upheld many state statutes which affected interstate commerce, but none, so far as we can ascertain, which has placed so heavy a burden on such commerce as the statute now under consideration, and none which has infringed so deeply upon the national interest in transportation or conflicted so sharply with the National Transportation Policy. Nor has this Court upheld any state regulation which placed a burden on interstate commerce so grossly disproportionate to any possible local good to be accomplished. Indeed, the Court has struck down state statutes, as violative of the Commerce Clause, the effects of which on interstate commerce were much less obstructive and burdensome than those of the Arizona law.

In closing this summary, it should be said that the Supreme Court of Arizona failed to apply the governing prin-

ciples of law in that it wholly failed to consider or give weight to the findings of fact of the trial court or to the evidence of record, both of which show beyond dispute that the statute places a heavy burden on interstate commerce and serves no substantial purpose of local safety. It did not modify those findings of fact or set them aside, but seemed to proceed on the erroneous view that a state requirement claimed to be based upon considerations of local safety is protected by a presumption of validity which cannot be overthrown by any showing, even including the showing that no local safety benefits are actually involved and that interstate commerce is grievously burdened, contrary to the national interest and in conflict with the National Transportation Policy.

II.

IMPORTANCE OF THE RAILROAD TRANSPORTATION SYSTEM TO THE NATIONAL INTEREST.

In considering whether the subject matter regulated by the Arizona law, or by any similar state law restricting the length of trains, is one predominantly of national rather than of local concern, and one which should be regulated by a single authority, if at all, there must be taken into account the vital importance of railroad transportation, and of its adequacy and efficiency, to the Nation as a whole, and to those purposes, objectives and activities for which the responsibility rests with the Federal Government and not with the states.

This is also a factor of great significance in weighing the nature and extent of the burden imposed upon interstate commerce by a state regulation of train length which interferes with and obstructs railroad operation, impairs its efficiency, and threatens the adequacy of railroad service.

The railroads occupy a place in our national life too well known to require extended discussion. They are the principal instrumentality of transportation. They carry the bulk

of all goods which are moved. Their activities are preponderately interstate. Their lines extend and their trains operate to and from every part of the Nation without regard to state boundaries. They are indispensable to our economic life, our political unity, and our defense against foreign enemies. Their ability to perform well their great task is a matter of profound national concern.

All this has been stated repeatedly by the highest authorities of the Federal Government, as well as by others informed upon the subject of transportation. A few representative statements, selected from a large number, may be of interest to the Court.

President Franklin D. Roosevelt, then Governor of New York, in a public address at Salt Lake City on September 17, 1932, declared:[17]

> "The problem of the railroads is the problem of each and every one of us. No single economic activity enters into the life of every individual as much as do these great carriers. (p. 713.)
>
> • • •
>
> The individual railroads should be regarded as parts of a national transportation service. (p. 717.)
>
> • • •
>
> The economy and efficiency of railroad operations will depend upon the capacity of railroad management and its freedom from undue burdens and restraints when this is balanced by acceptance of public responsibilities. (p. 721.)
>
> • • •
>
> Every great economic interest in the Nation requires the continuous, efficient operation of the railroads. • • • So the constant improvement in the economy and efficiency of transportation is a matter of ever-present national concern. (p. 721.)
>
> • • •
>
> The railroad mesh is the warp on which our economic web is largely fashioned. It has made a continent into a Nation. It has saved us from splitting,

[17] The Public Papers and Addresses of Franklin D. Roosevelt, Random House, New York, 1938, Vol. I, pp. 711-723.

like Europe, into small, clashing, warring units. It made possible the rise of the West. It is our service of supply. These are not matters of private concern." (p. 722.)

The National Transportation Committee, composed of Calvin Coolidge, Chairman; Bernard M. Baruch, Vice-Chairman; Alfred E. Smith; Alexander Legge; and Clark Howell, made a report, under date of February 13, 1933, in which it was stated:[18]

> "At the foundation of our system of communication is the railroad web. It is the most important single element in our social and economic life. Its rapid extension enabled us to cover the greater habitable part of a continent with a cohesive form of liberal government of 125,000,000 people united in a common language, purpose and ideal and to maintain National solidarity through periods of stress. Both security and material welfare are involved in its continued efficient existence. The public interest is deeper than its investment or its need of good service. We are addressing a matter of National concern of the first magnitude. The railroad system must be continued and its efficiency preserved because of National necessity—economic, social and defensive."

Lieutenant General Brehon Somervell, Commanding General of the Army Service Forces, pointed out in a radio broadcast on July 17, 1944:[19]

> "Even though our own country is thousands of miles from the actual theaters of operation, the success or failure of our transportation system right here at home might mean the difference between success or failure in France or in the South Pacific. We in the armed forces of the United States think of transportation as a military tool—a weapon as important as the very

[18] Report of the National Transportation Committee, February 13, 1933, page 8.

[19] Broadcast from Station WRC, Washington, D. C., over National Broadcasting Company network.

tank or gun it transports from factory to fighting front. It is no exaggeration to say that railroads are war roads."

Major General Charles P. Gross, Chief, Transportation Corps, U. S. Army, in a radio broadcast on June 21, 1944, expressed the judgment that,[20]

> "Global war would be impossible without our modern means of transportation. Without the railroads, the war might of our country could not be mobilized."

The late Joseph B. Eastman, then a member of the Interstate Commerce Commission and Director of the Office of Defense Transportation, said on May 13, 1942, in an address at Chicago:[21]

> "Never in the history of the railroads has there been a time when efficient operation was of such prime importance, not only to the railroads but to the Nation and even to the world. * * *
>
> In modern production and even in modern battle, there is no factor which is of more vital and all-persuasive importance than adequate and efficient transportation. * * * We cannot fight without transportation, and we cannot do our best fighting unless the transportation is adequate and efficient."

In his 1934 report to the Congress as Federal Coordinator of Transportation, Mr. Eastman made the following statement:[22]

> "The railroads are still an essential, and by far the most important, form of public transportation, and the prospects are that they will continue so to be."

---

[22] Joseph B. Eastman, Report of the Federal Coordinator of Transportation on Transportation Legislation, 74th Congress, 1st session, House Document No. 89, 1934, page 5.

Colonel J. Monroe Johnson, then a member of the Interstate Commerce Commission and now Director, Office of Defense Transportation, in a radio speech on May 9, 1943, stated:[23]

> "We might suffer military reverses and still win the war, but we cannot avoid defeat should our railroads fail."

The Honorable Henry L. Stimson, Secretary of War, in a radio speech on December 28, 1943, said:[24]

> "The American nation has taken the greatest pride in the patriotic devotion which railroad men and women have displayed under unprecedented demands which this war has placed upon them. During the present emergency, the railroads have been bearing more than 90 per cent of the burden of all transportation. * * * The armed forces cannot discharge their responsibility for the national safety without the assistance of the railroads."

The Honorable Edward R. Stettinius, Jr., then Administrator, Office of Lend-Lease, and now Secretary of State, said in July, 1943:[25]

> "America is accustomed to efficient service from its railroads, but in this, our greatest emergency, the roads have written their brightest chapter. They have come through with a performance that sets a new mark for railroading. They are making a major contribution to our united war effort."

In its report of December 15, 1943, a special committee of the Senate investigating the national defense program, pursuant to S. Res. 71, 77th Congress, and S. Res. 6, 78th Congress, stated:[26]

[26] Report No. 10, Part 13.

"A break-down, or even a diminution in transportation service, would have incalculable repercussions on our war effort. (page 1.)

* * *

Transportation is so vital and a break-down would be so disastrous that we cannot afford to run the risk of even approaching the breaking point. (page 5.)

* * *

* * * the increased load of traffic in the war years has fallen most heavily upon the railroads." (page 6.)

The Honorable Oren Harris, of Arkansas, in a speech before the House of Representatives on May 23, 1944, said:[27]

"The railroad industry is one of the greatest. It has made and is making a tremendous contribution to the welfare of this great country. Its real worth has again been shown during this war."

III.

THE NATIONAL TRANSPORTATION POLICY.

In the light of what has been said, the deep, pervading national interest in the adequacy, efficiency and economy of rail transportation is self-evident. On this subject Congress has expressed itself in unmistakable terms. The Transportation Act of 1940[28] amended the Interstate Commerce Act by adding, immediately preceding Part I, a declaration of "National Transportation Policy", from which the following is quoted:

"It is hereby declared to be the national transportation policy of the Congress to provide for fair and impartial regulation of all modes of transportation * * *; to promote *safe, adequate, economical, and efficient service and foster sound economic conditions in transportation* * * *; to encourage the establishment

[27] Congressional Record, May 23, 1944, page 4998.

[28] 54 Stat. 899.

and maintenance of reasonable charges for transportation services, * * *;—all to the end of developing, coordinating, and preserving a national transportation system by water, highway, and rail, as well as other means, *adequate to meet the needs of the commerce of the United States, of the Postal Service, and of the national defense.* All of the provisions of this act shall be administered and enforced with a view to carrying out the above declaration of policy." (Emphasis supplied.)

The amendment of 1940 did not change but merely confirmed and strengthened the policy of Congress concerning railroads, which had been reflected in the Interstate Commerce Act since the amendments embodied in the Transportation Act of 1920.[20]

On many occasions this Court has been called upon to consider the policy of Congress concerning transportation. In *McLean Trucking Co.* v. *U. S.*, 321 U. S. 67, 80-81, it was pointed out that the National Transportation Policy is the product of a long history of trial and error by Congress in the regulation of the Nation's transportation facilities, beginning with the Interstate Commerce Act of 1887; that the Transportation Act of 1920 marked a sharp change in policies and objectives embodied in such regulation; that, theretofore, the efforts of Congress had been directed mainly to the prevention of abuses, but that the act of 1920 added "a new and important object to previous interstate commerce legislation" in seeking "affirmatively to build up a system of railroads prepared to handle promptly all the interstate traffic of the country". It was pointed out further that the objectives of the policy of Congress included "adequacy of transportation service . . . its essential conditions of economy and efficiency, and . . . appropriate provision and best use of transportation facilities."

In *Purcell* v. *United States*, 315 U. S. 381, 385, it was said:

[20] 41 Stat. 474.

> "This Court has recognized that operation of the national railway system without waste was one of the purposes the Transportation Act of 1920 was intended to further."

In *Texas* v. *United States*, 292 U. S. 522, 530, the Court stated that the Transportation Act of 1920 introduced into the federal legislation a new railroad policy:

> "* * * seeking to insure an adequate transportation service. To attain that end new rights, new obligations, new machinery were created. [citations omitted] It is a primary aim of that policy to secure the avoidance of waste. That avoidance, as well as the maintenance of service, is viewed as a direct concern of the public."

The railroads are under a "federal duty * * * efficiently to render transportation services in interstate commerce." *Colorado* v. *United States*, 271 U. S. 153, 165. It is the policy of Congress to prevent "an injurious waste" and to secure "more efficient transportation service." *N. Y. Central Securities Co.* v. *U. S.*, 287 U. S. 12, 26. That policy "recognized that preservation of the earning capacity, and conservation of the financial resources, of individual carriers is a matter of national concern", *Texas & Pac. Ry.* v. *Gulf, Etc. Ry.*, 270 U. S. 266, 277; and that "the public and the carriers are alike interested in maintaining adequate, uninterrupted transportation service at reasonable cost." See also *Davis* v. *Farmers Co-operative Co.*, 262 U. S. 312, 317; *Wisconsin R. R. Comm.* v. *C. B. & Q. R. R. Co.*, 257 U. S. 563, 585; *New England Divisions Case*, 261 U. S. 184, 189-192; *Dayton-Goose Creek Ry.* v. *U. S.*, 263 U. S. 456, 477-478; and *Florida* v. *United States*, 292 U. S. 1, 6-8.

The *Colorado* case, *supra* (271 U. S. 153), dealt with the abandonment, as respects both intrastate and interstate commerce, of an unprofitable branch line of railroad lying wholly within the state of the owning company's incorporation. The unified and interdependent character of interstate and intrastate railroad operations appear strikingly from a statement, at page 163, that harmful effects

upon interstate commerce may be caused "by excessive expenditures from the common fund in the local interest, thereby lessening the ability of the carrier properly to serve interstate commerce."

One of the burdensome features of the Arizona law is that it requires excessive expenditures for a purported local interest by railroads whose lines run through many states and whose activities are chiefly interstate.

If it should be contended that the National Transportation Policy has no purpose or effect except in connection with the administration of the Interstate Commerce Act, a ready and final answer is afforded by *Davis* v. *Farmers Co-operative Co., supra* (262 U. S. 312), and *Lehigh Valley R. R.* v. *Commissioners*, 278 U. S. 24, 35. In the *Davis* case, it was held that a Minnesota statute was invalid and obnoxious to the Commerce Clause, in its application to the particular facts presented, because it imposed a serious burden on interstate commerce, which unduly interfered with the policy of Congress as manifested in the Interstate Commerce Act. The statute under scrutiny in that case provided that any foreign corporation having an agent in the state for the solicitation of freight and passenger traffic over lines outside the state might be served with summons by delivering a copy thereof to such agent.

The issue in the case was the constitutionality of applying the statute in an action brought against a railroad company which neither owned nor operated a railroad within the state, by a plaintiff who did not reside there, upon a cause of action which arose elsewhere out of a transaction entered into elsewhere. The Court took judicial notice of the fact that there is a large volume of litigation against interstate carriers on personal injury and freight claims, and that a heavy expense, with a corresponding impairment of the carriers' efficiency, is involved when such litigation is conducted in jurisdictions remote from where the cause of action arose. The Court held that such expenses would involve waste in interstate transportation contrary to the purposes and objectives of Congress as reflected in

the Transportation Act of 1920, and that the state law, as applied by the state court, was accordingly invalid because it unreasonably obstructed and unduly burdened interstate commerce. The following quotation is from page 317 of the opinion (262 U. S. 312):

> "The public and the carriers are alike interested in maintaining adequate, uninterrupted transportation service at reasonable cost. This common interest is emphasized by Transportation Act, 1920, which authorizes rate increases necessary to ensure to carriers efficiently operated a fair return on property devoted to the public use. See *Railroad Commission of Wisconsin* v. *Chicago, Burlington & Quincy R. R. Co.*, 257 U. S. 563; *New England Divisions Case*, 261 U. S. 184. Avoidance of waste, in interstate transportation, as well as maintenance of service, has become a direct concern of the public. With these ends the Minnesota statute, as here applied, unduly interferes. By requiring from interstate carriers general submission to suit, it unreasonably obstructs, and unduly burdens, interstate commerce."

In view of the policy of Congress, as reflected in the Interstate Commerce Act since 1920, and as explicitly stated in that Act after the amendments of 1940, with respect to the adequacy, efficiency and economy of railroad transportation, the avoidance of waste, the interest of the public in reasonable rates, and the conservation of railroad resources, it would seem little less than fantastic to impute to Congress an intent to leave states free to enforce a burdensome, oppressive and improvident regulation of interstate commerce such as the Arizona Train-Limit Law.

On this point *Parker* v. *Brown*, 317 U. S. 341, throws light. That case involved the validity of a prorating marketing program under the California Agricultural Prorate Act, adopted by the state for regulating the handling, disposition and prices of raisins produced in California, a large part of which go in interstate commerce. The Court held that the state action dealt with a problem local in character, which urgently demanded state action.

for the economic protection of those engaged in one of its important industries. It held further that such effect as the operation of the California prorate program might have on interstate commerce was one "which it has been the policy of Congress to aid and encourage" (page 368), and that, therefore, it could not be said "that the effect of the state program on interstate commerce is one which conflicts with Congressional policy * * *." The reasons which led the Court to sustain the California marketing statute would lead to the conclusion that the Arizona Train-Limit Law should be set aside.

IV.

THE EFFECT OF THE ARIZONA LAW ON THE SAFETY OF RAILROAD OPERATION.

The effect of the Arizona law upon safety is discussed at length in the brief for appellant, Southern Pacific Company (Volume I, pp. 27-50; 202-205; 263-269. Volume II, pp. 125-203; and in the brief for the United States as *amicus curiae*, pp. 34-44). Accordingly, we shall restrict our discussion to certain outstanding features.

We think there is no doubt that a stringent train-length limitation, such as that of Arizona, is an affirmative, anti-safety measure which greatly increases the hazards incident to train operation. This is one of the reasons for the opposition by the railroads to a regulation of this character. Since the first World War extraordinary progress has been made in the field of railroad safety. Further progress should not be hampered, and even less should the progress already accomplished be sacrificed.

There are many causes of casualties[30] to persons incident to train operation. The only serious claim which has been

[30] Casualties include injuries and fatalities. Under the classification of the Interstate Commerce Commission an injury which incapacitates an employee for his ordinary work for more than three days, or incapacitates a person other than an employee for more than one day, is a reportable casualty. (R. 3975)

advanced in support of the Arizona law is that it has a beneficial effect with respect to slack-action casualties to employees.

The nature and cause of slack-action are dealt with at length in the findings of the trial court. (R. 3969-74) With respect to slack-action casualties the court found (R. 3990-1):

> "Plaintiff bases its contention that the train-limit law is a safety statute almost entirely on the theory that it will minimize or greatly lessen the so-called 'slack-action' or 'slack-surge' accident—a form of accident classified by the Interstate Commerce Commission as being caused by a shock incident to a sudden starting, stopping, lurch or jerk of the train. Casualties resulting from this type of accident are confined almost entirely to road freight conductors, brakemen and flagmen on duty, occur most frequently when they are in the caboose, occasionally when on top of the train, and infrequently when they are on the side of a car or caboose, or attempting to board or leave a car or caboose."

When we speak of slack-action casualties hereinafter it should be understood that the reference is to casualties of this character to road freight conductors, brakemen and flagmen on duty.

It seems plain that the Arizona law must be scrutinized in the light of its net effect on all hazards attendant upon train operation and not with reference to only one hazard, in disregard of the others.

From the findings and the evidence, the following facts stand out: Slack-action casualties are of relatively minor importance when compared with other classes of casualties incident to train operation. The Arizona law has no appreciable or perceptible beneficial effect even with respect to slack-action casualties. It has an extremely harmful effect with respect to practically all other classes of casualties, including those of the most serious character. The net effect of the law is to increase substantially the hazards of railroad operation.

The reason why casualties of practically all kinds are increased by restrictive train-length regulation is that they are related to the number of trains run. Casualties of some classes tend to increase in direct proportion to the number of trains run. (Examples are highway grade-crossing casualties, and casualties to persons struck and run over by engines or trains at places other than grade crossings.) Casualties of certain other classes tend to increase in greater proportion than the number of trains, because train meets and passes are a contributing factor to these casualties. We have seen that meets and passes multiply as the number of trains increases.[31] (Examples are casualties due to collisions between trains and casualties due to employees getting off and on trains.)

A. Slack-Action Casualties are of Relatively Minor Importance.

The trial court found that slack-action accidents are "of comparatively infrequent occurrence." (R. 3991) It also found that the "relative unimportance" of slack-action casualties was shown by a comparison of such casualties to employees with all casualties to employees; that in the period 1923-1939 slack-action casualties on all railroads in the United States represented only six per cent of all casualties to all employees; and that slack-action fatalities to employees amounted to less than one per cent of the total employee fatalities. (R. 3979, 3980, 4052. See also R. 3304) The trial court stated in its memorandum opinion that "slack-action casualties on passenger trains are of no significance whatever." (R. 4050)

The casualty figures referred to above relate only to railroad employees, but casualties incident to train

[31] As a result of the Arizona law it was necessary in 1938 to run 28 per cent more trains (4,304 more freight trains and 33 more passenger trains) between Yuma and El Paso than would have been necessary otherwise, but this increased the number of train meets and passes by 63 per cent or 16,500. (R. 3958, 3964-5, 4021, 4051)

operations occur to others as well. The relative unimportance of slack-action casualties to employees in the field of railroad accidents becomes unmistakable when such casualties are compared with all casualties to all persons incident to train operation. In the period 1935-1939, the number of slack-action casualties to employees on all Class I railroads was only 2.3 per cent of the number of casualties to all persons, and the number of employee fatalities from slack-action was less than one-tenth of one per cent (0.07%) of the number of all fatalities.[32]

Another sharp reminder of the comparatively minor importance of slack-action casualties is the fact that on all railroads in the United States during the period 1935-1939, the number of grade-crossing casualties alone was 11½ times the number of slack-surge casualties and the number of grade-crossing fatalities was considerably more than 400 times the number of slack-action fatalities. (R. 3304, 3306) In this connection, it will be recalled that "'long-train' operating practice is the customary and ordinary practice throughout the United States," as stated in the memorandum opinion of the trial court (R. 4046), and that the slack-action casualties and fatalities referred to above reflect operation of that character. (Neither will it be overlooked that a train-limit regulation results in more trains and in a corresponding increase in grade-crossing fatalities and injuries, as we shall show later in more detail.

---

[32] Statistics showing casualties to all persons in accidents incident to train operation are not in the record. They were taken from Accident Bulletin Nos. 104 through 108, published by the Interstate Commerce Commission and covering the years 1935 through 1939, respectively. The data appear in Table No. 55 of each issue of the Accident Bulletin, page 24 of Bulletin No. 104, page 26 of Bulletin No. 105, page 30 of Bulletin Nos. 106 and 107, and page 32 of Bulletin No. 108. They represent the "Grand total, non-trespassers and trespassers", killed and injured in "train accidents" and in "train service accidents", for Class I railways. The number of slack-action casualties is taken from the findings of the trial court. (R. 3980. See also R. 3304.)

B. Even with Respect to Slack-Action Casualties the Arizona Train Limitation Has No Perceptible or Appreciable Beneficial Effect.

In the memorandum opinion of the trial court, it was stated (R. 4052):

> "It must also be remembered that there are many factors besides length of train causing slack-action casualties, such as: grades, speed of train, consist of train and whether loaded or empty. The record shows many severe casualties of this type on short trains. *Limiting trains to the Arizona maxima has had no perceptible limiting effect on even that class of accidents,* * * *" (Emphasis supplied.)

The trial court found (R. 3973):

> "It is likewise not true that the Train-Limit Law, by restricting the lengths of freight trains, either eliminates or substantially reduces the number or severity of the casualties attributable to slack-action shocks in cabooses or other cars at or near the rear end of trains. The evidence indicates that in the operation of long trains, there have been many instances of severe jerks and jolts occurring at the rear end of the train because of slack-action, and that injuries have been suffered by brakemen and conductors as a result thereof. The record contains many similar instances occurring in connection with the operation of short trains."

The trial court also found (R. 3986):

> "It clearly appears that the enforcement of the Arizona Train-Limit Law has not been accompanied by any measurable decrease in so-called slack-action casualties, as compared with the standard long-train method of operation, but has been accompanied by a greater proportion or ratio of casualties to passengers, and to all employes, as well as to freight-train employes, from all causes that lead to train and train-service accidents."

The trial court further found (R. 3991):

> "The train-limit law has been observed long enough, and under such circumstances, as to afford a fair basis for judging whether a law limiting the length of a freight train to 70 cars, exclusive of caboose, can be said to be reasonably effective in the prevention or minimization of slack accidents and incident casualties. It clearly appears, and it is hereby found, that said law has not had that effect in Arizona, as to the defendant's freight-train operations in that state, either when they alone are considered, or when they are compared with defendant's freight-train operations in Nevada."

During the period 1923 to 1939, while there was an increase in the proportion of long trains operated in the United States, there was a very pronounced decrease in the number of slack-action accidents. The employee casualty rate per million train-miles for the period 1923-1928, for this type of accident, was 2.75, and for the period 1935-1939, it was 1.05. (R. 3979, 3304) For the year 1923, the rate was 2.88 and for the year 1939, 0.86. The average length of freight trains in the United States in 1922 was 38.4 cars; in 1926, 45.2 cars; in 1930, 48.9 cars; in 1934, 46.2 cars; in 1938, 47.7 cars, and in 1939, 49.1 cars. (R. 3937) The increase in average train length reflects only to a limited extent the increase in the relative number of long trains.

In Nevada, the Southern Pacific operates a large number of long freight trains in proportion to the total number of trains. During four representative months of 1939, 66.2 per cent of the Southern Pacific freight trains in Nevada were long trains. (R. 3916) The proportion of long trains so operated and the average number of cars per freight train have increased sharply since 1922. In that year there were 48.92 cars per train; in 1927, 69.17 cars; in 1932, 81.06 cars; in 1937, 74.43 cars; in 1938, 78.77 cars; and in 1939, 78.46 cars. (R. 3917)

In 1923 there were 7.97 slack-action casualties to employees per million train-miles on the Southern Pacific in Nevada, and in 1940 the rate was only 1.96. For the period 1923-1928, when the average number of cars per freight train on the Southern Pacific in Nevada was 58.51, the number of slack-action casualties to employees per million train-miles was 4.32; for the period 1929-1934, when the average number of cars per freight train in Nevada was 72.66, the number of slack-action casualties to employees per million train-miles was 3.25; and for the period 1935-1940, when the average number of cars per freight train in Nevada was 77.86, the number of slack-action casualties to employees per million train-miles was 2.45. (R. 3375) *It is highly significant that in the entire period from 1923 to 1940 there was only one employee fatality from slack-action on the Southern Pacific in Nevada, where long trains predominate, and that this occurred in 1927 on a short train of 60 cars.* (R. 3367, 3375, 3991) *During the same period there was also one employee fatality from slack-action in Arizona, where only short trains were run, and this occurred in 1926.* (R. 3375)

In a later section, dealing with the burden which the Arizona law imposes upon interstate commerce, we shall discuss Service Order No. 85 of the Interstate Commerce Commission, entered September 11, 1942, (7 Fed. Reg. 7258) and the subsequent report of the Commission with respect to that order, *In the Matter of Service Order No. 85*, 256 I. C. C. 523. The service order suspended state regulations limiting train length during the period of the war. At this time we wish merely to refer to a statement in the Commission's report concerning safety. At page 536 it was said:

> "The fact that freight trains in excess of 70 cars and passenger trains in excess of 14 cars are safely operated in other States is convincing evidence of its safety, except where unusual operating conditions exist."

The Interstate Commerce Commission is fully and currently informed about accidents and casualties incident to train operation. For many years, pursuant to the Accidents Report Act,[33] it has required monthly reports of such accidents and casualties on forms prescribed by it and filed under oath by the carriers. (R. 3974) Moreover, the Commission conducts investigations through its own representatives of serious accidents, including 90 per cent of those resulting in fatalities. As stated by the trial court in its memorandum opinion, "It is rather significant that they [the Commission] have failed to find or report in any one year that the length of trains had anything to do with the number of casualties." (R. 4051)

C. The Arizona Train-Limit Law Increases the Hazard of Practically All Kinds of Accidents and the Net Result of the Law is to Make Train Operation Much More Hazardous.

In the memorandum opinion of the trial court it was stated (R. 4052-3):

> "Thus the Arizona Train-Limit Law not only bears no reasonable relation to safety, but to the contrary, does, and if enforced will continue to, impair and lessen substantially the safety of defendant's train operations in Arizona and the adjacent affected territory."

In the memorandum opinion it was also stated (R. 4051):

> "Furthermore, this record contains exhibits comparing the defendant's freight-train operations in Arizona with its operations in Nevada and New Mexico, as well as the Class I roads of America. The element of speculation, as to the result of long and short-train operations, is therefore largely eliminated. From all of which it appears very definitely that there are more accidents and they occurred more frequently in pro-

[33] 36 Stat. 350, U. S. C., Title 45, Sec. 38 et seq.

portion to trains handled or traffic moved in short-train territory than in long-train territory. Reference is made to the findings of fact for details to support this statement."

The trial court found (R. 3981):

> "Although during the period 1923-1939, covered by the National statistics in evidence, there have been substantial improvements in the road-bed and equipment of American railroads, it is clear from a consideration of all of the evidence in the case that *a considerable part of the improvement in casualty rates on those railroads during the same period is directly attributable to the adoption and growth of the standard long-train method of handling freight and passenger traffic*, because thereby a substantially less number of train units was operated than would have been operated for the same volume of traffic had not the long-train policy been followed." (Emphasis supplied.)

The notable progress which the railroads have made in improving safety conditions for employees is clear from the statistics. In 1923, there were 32.15 casualties to all classes of employees per million train-miles on all Class I railroads, and in 1939 only 7.87. For the period 1923-1928, there were 26.02 employee casualties per million train-miles; for the period 1929-1934, the rate was 11.53; and for the period 1935-1939, the rate was only 8.59. (R. 3300)

With respect to certain important classes of casualties which are increased by train-length limitation and the resulting necessity of running more trains, the Court found (R. 4020):

> "Insofar as concerns safety of employment, all said train service employes, and as well all employes whose duties require them to be or go upon the tracks, are affected by the law; in that by increasing the relative number of trains run, said law increases the hazards of train and train-service accidents to which such employes are subject, and particularly (among others) the following hazards: (1) of being struck and run down while on or near the tracks in the course of duty,

(2) of being involved and injured in head and rear-end collisions; (3) of being involved in locomotive accidents; (4) of being injured in grade-crossing accidents; (5) of slipping or falling while getting on or off trains."

The trial court particularly pointed out in its findings the major importance of grade-crossing casualties and the relationship of such casualties to the number of trains run. It stated that during the period 1923-1939 there were 112,207 casualties on all railroads in the United States due to grade-crossing accidents and that 24.8 per cent, or 27,792, were fatal. It also pointed out that over the 17-year period the average rate of grade-crossing casualties per million train-miles was 6.45 and that in no year was there any substantial variation from this average.[34] (R. 4014) It is obvious that a substantial increase in the number of train-miles, as a result of the arbitrary limitation of train length, would result in a heavy increase in the number of grade-crossing fatalities.

The record shows that for the year 1937 the number of fatalities in the United States from grade-crossing accidents was 1,607 and that the total number of train-miles was 933,219,000. The rate of fatalities per million train-miles was 1.72. (R. 3306) At hearings on S. 69 before the Committee on Interstate and Foreign Commerce, House of Representatives, which were held from January 11 to March 18, 1938, 75th Congress, it was estimated by railroad spokesmen that a federal train limitation of 70 cars would have increased the train-miles in 1937 by more than 60,000,000.[35] On the basis of the statistical relationship above set forth, such an increase in train-miles would have

[34] The constant rate is presumably the result of two forces working in opposite directions: first, an increase in the number of automobiles which tended to increase the rate; and second, elimination of some crossings and improved protection at others which tended to reduce the rate.

[35] Printed transcript of hearings, pp. 370, 852.

increased fatalities from grade-crossing accidents in the United States by 103 during that year.

Grade crossings constitute a serious hazard in Arizona. In the period 1923 to 1939, there were 384 grade-crossing casualties in that state, of which 82 were fatalities and 302 were injuries. (R. 3422) It also appears that the Arizona Train-Limit Law resulted in 28.4 per cent excess freight and passenger trains in 1938. (R. 3958) This would seem to leave no doubt, in view of the relationship between the number of trains operated and the number of grade-crossing accidents, that the Arizona law has been responsible for a large number of deaths and injuries.

Among other important classes of casualties with respect to which train-length limitations are directly contributory is that of "casualties to persons struck or run over by cars or locomotives at places other than highway grade crossings." Casualties of this kind include a very high percentage of fatalities. In 1939, on all Class I railroads in the United States there were 2,347 such casualties, of which 1,536, or 65.4 per cent, were fatalities. Casualties of this kind, as would be expected, bear a very close relationship to the number of train-miles. During the period 1923-1939 there were 3.28 such casualties per million train-miles. For the year 1937, there were 3.08 casualties of this kind per million train-miles, of which 62.1 per cent were fatalities. It will be seen that if 60,000,000 additional train-miles had been run in 1937 approximately 185 additional struck-or-run-over casualties, including 115 fatalities, could have been expected.[36]

[36] Statistics showing casualties to persons struck or run over by cars or locomotives at places other than highway grade crossings are not in the record. They were taken from Accident Bulletins Nos. 92 through 108, published by the Interstate Commerce Commission, covering the years 1923 through 1939. The data appear in Table No. 55 of each issue of the Accident Bulletin. They represent the "Grand total, nontrespassers and trespassers", killed and injured in "train-service" accidents from the above-described cause for railroads of all classes. Train-miles used to compute the rate of such accidents were taken from exhibits in the record. (R. 3300)

D. If Any Beneficial Effects with Respect to Slack-Action Casualties Can Be Attributed to the Arizona Train-Length Limitations, They Are Overwhelmingly Offset by the Injurious Effects With Respect to Much More Important Classes of Casualties.

We have shown that, at most, any beneficial effects upon slack-action casualties of train-length limitations are inconsequential; that such casualties are of relatively minor importance; and that train-length limitations substantially increase the danger of practically all other kinds of casualties.

Among such other kinds of casualties are those from grade-crossing accidents, which included on all railroads an average of 1,413 fatalities per year for the period 1935-1939, and those to persons struck or run over by trains and engines at places other than grade crossings, which included on all Class I railroads an average of 1,712 fatalities per year, for the same period. *In contrast, slack-action casualties to road freight conductors, brakemen, and flagmen, during this period on all Class I railroads in the United States included an average of only three fatalities per year.* The number of grade-crossing casualties, and struck-or-run-over casualties, increases in close relationship to the increase in the number of trains. The conclusion cannot be avoided that, if train-length limitations, like those in Arizona, had been in effect generally during the period 1935-1939, there would have been a large increase in fatalities and injuries. On the basis of figures, to which attention has been called, the additional fatalities would have amounted to more than 200 per year.

It should be said that railroad employees, as well as others, are subject to grade-crossing casualties and to casualties from being struck or run over. During the period 1935-1939, the average number of railroad employees killed per year in grade-crossing accidents in the United States

was 21, and the average number of employees killed per year by being struck-or-run-over was 141.[37]

E. The Bearing of the Safety Feature on This Case.

The findings and evidence show that considerations of safety afford no rational basis for the Arizona law and that the effects of the law have not been and would not be to reduce hazards but greatly to increase them. But this conclusion is not necessary to a judgment that that law is invalid as in conflict with the Commerce Clause. Under the doctrine of balancing interests, national and state, it is necessary to weigh the local benefits against the burden upon interstate commerce. The fact that a state law might have some beneficial relationship to safety is not enough, therefore, to establish its validity. The question is one of the relative weight of the competing factors. Thus, if the state benefits are of little consequence and the burden upon commerce is heavy, the state law falls. We have discussed in this section the alleged state benefits and in the next we shall discuss the burden on interstate commerce.

There is one other consideration to which reference should be made before leaving the safety feature. In the brief for the Southern Pacific (pp. 209-233) it is argued, and we think soundly, that the Arizona law is unconstitutional because it operates in a field which has been occupied by Congress as a result of legislation and as a result of administrative action by the Interstate Commerce Commission. There it is shown that federal action relating to train control has been extensive. The point we wish to make here is that this federal action is a factor for consideration, insofar as it has the effect of eliminating or minimizing any state need for, or benefit from, train limitation.

[37] Statistics showing fatalities to employees in grade-crossing and struck-or-run-over accidents are not in the record. They were taken from Accident Bulletin Nos. 104 through 108, published by the Interstate Commerce Commission, covering the years 1935 through 1939. The data appear in Table No. 55 of each issue of the Accident Bulletin.

even if it should be thought that it falls short of an "occupation of the field" in a technical sense.

It is not without interest and significance that the Federal Government and the State of Arizona have been guided by wholly different and opposing philosophies. The action of the Federal Government looks to progress in the art of railroad operation and to improving safety conditions by improving facilities and devices. The state action, on the contrary, seeks to accomplish its purpose by freezing railroad practices and preventing or impeding progress.

V.

THE BURDEN ON INTERSTATE COMMERCE RESULTING FROM THE ARIZONA LAW.

The burden on interstate commerce resulting from drastic state regulation of train lengths is due to the interferferences with, and obstructions to, railroad transportation caused by such limitations. It follows that the importance of railroad transportation to interstate commerce and to the national interest is a factor always to be borne in mind in considering the degree and extent of the burden on interstate commerce. Under another heading, we have already discussed the place occupied by the railroads, as carriers, in the national life.

If the states have authority to limit train lengths, as Arizona has attempted to do, they have authority to interfere directly with the physical operation of railroads in their conduct of interstate transportation, in such a way as to make such operation more hazardous, less efficient and more costly, and to threaten the adequacy of railroad service in periods of heavy traffic. They have authority to do all this in the face of the National Transportation Policy declared by Congress, which emphasizes the national interest in the safety, efficiency and economy of rail transportation, and in spite of the fact that no local, state interests of safety, or other state interests, are served.

In the preceding section we have dealt with the effect of train-length limitations, such as those prescribed in Arizona, upon the safety of train operations. In this section, we shall discuss briefly the adverse effect of limitations of this kind upon the economy and efficiency of railroad operation, the free flow of interstate commerce, and the adequacy of railroad service.

There are two approaches to the subject. In the first place, consideration must be given to the actual effects of the Arizona limitations as shown by the long experience of the Southern Pacific in its operation under those limitations. In the second place, consideration must be given to the experience of railroads generally, including the Southern Pacific, in operations elsewhere, which have not been hampered by these or similar limitations.

The obstructive and oppressive effects of the Arizona law upon the operations of the Southern Pacific Company are discussed at length in the brief filed on behalf of that company. (Volume I, pp. 15-27, 110-113, 156-160, 197-202; Volume II, pp. 49-69, 85-125.) There is, accordingly, no occasion for a detailed discussion here of the Arizona situation.

With reference to the burden imposed upon the Southern Pacific operations by the Arizona law, the trial court, in its memorandum opinion stated (R. 4048-9):

> "The record here also amply discloses that the law causes real interference with, and delay to, interstate commerce, practically to the extent that Arizona operations create a bottle-neck. Actually ninety-three per cent of the freight traffic and ninety-five per cent of the passenger business of the defendant in Arizona is interstate commerce. Furthermore, the law certainly imposes a great, substantial and wholly unreasonable burden of expense upon this interstate traffic. To hold in this case that interstate commerce was only incidentally or indirectly involved would be less than realistic, for the interference and regulation is *substantial, continuous, direct and unavoidable*; as is pointed out in detail in the findings of fact. What is even more serious from

the standpoint of those who seek to uphold the Act is its extra-territorial effect. The challenged law lays hands upon interstate commerce moving over defendant's lines long before it reaches the physical boundaries of Arizona, and continues directly to affect and regulate that commerce long after it has left Arizona. As a practical matter, it nearly controls the length of passenger trains from Los Angeles to El Paso, and of freight trains from Yuma to Lordsburg, the latter point being twenty-three miles East of the State line, and frequently on to El Paso, 171 miles beyond Arizona's boundary."

In its memorandum opinion, the trial court stated further (R. 4051):

"Also it is clear that the reason defendant is unable to effect improvement in the efficiency and economy of its freight-train operations in Arizona comparable to those achieved in neighboring states, or upon its system generally, is primarily due to the restrictions imposed by the Arizona law."

The following is quoted from the findings of fact of the trial court (R. 3953):

"The enforcement of the train-limit law against defendant results and will continue to result in delay to and interference with the handling and movement of defendant's interstate trains, both freight and passenger, operated in the affected territory, and with the transportation and movement of the interstate passengers, cars and commerce contained therein, both within and without the boundaries of Arizona.

Such delays and interferences arise and will continue to arise in the following ways: (1) interferences with and delays to cars and trains at terminals, (2) delays to individual cars, as distinguished from trains, at terminals and other stations, and (3) interferences with and delays to trains while on the line between terminals."

The trial court also found (R. 3961):

> "The effect of the aforesaid delays and interferences occasioned by the law are and will continue to be directly, substantially and seriously to impede the prompt and efficient handling of the interstate freight and passenger traffic carried in the trains operating over defendant's lines in the affected territory, and to hamper seriously, and in many cases to prevent, the on-time delivery of said traffic at destinations and/or points of interchange with defendant's connections."

There was a further finding of fact by the trial court that the expenses incurred by the Southern Pacific in performing transportation services (almost wholly interstate) were increased as a result of the requirements of the Arizona law by $394,900[38] per year, of which $94,600 was incurred outside of the state by reason of the extraterritorial operation of the law. (R. 3966-8) The added costs reflected in these figures resulted in large part from the necessity of running unnecessary additional trains and of performing unnecessary additional switching.

The lines of the Southern Pacific in Arizona, as well as those of other railroad companies operating in that state, are links in the national railroad transportation system. Approximately 93 per cent of the freight traffic and 95 per cent of the passenger traffic of the Southern Pacific in Arizona is moving in interstate commerce. Approximately 68 per cent of the freight traffic and 74 per cent of the passenger traffic is "overhead" or "bridge" traffic, that is to say, traffic which originates outside of the state and moves across the state to destinations beyond. (R. 3897-9) Thus, it will be seen that the additional costs of operation due to

[38] This estimate was based on operations in 1938, a year of very light traffic. In a year of heavier traffic, the cost would, of course, be greater. The Atchison, Topeka and Santa Fe Railway Company also is engaged in railroad operation in Arizona. In *Atchison, T. & S. F. Ry. Co. v. LaPrade*, 2 Fed. Supp. 855, 862, decided in 1933, it appeared that the Arizona law increased the expenses of that company by more than $600,000 per year.

the Arizona Train-Limit Law, regardless of where they are incurred, fall in very large part on those outside of the state.

Delays and congestions on the railroad lines within Arizona, or the affected territory, mean, of course, delays and congestions on every through railroad route of which these lines form a part. Such routes extend from coast to coast and, indeed, from every part of the United States to every other part of the United States. Increased cost of railroad transportation in Arizona results in increased cost of transportation over all routes passing through that state. If railroad transportation in Arizona is blocked, transportation over all routes which include Arizona lines is blocked.

For many years the Southern Pacific has followed the practice of long-train operation on its entire system, with the exception of its lines in Arizona and the adjacent affected territory. Approximately 27 per cent of the total number of freight trains run by this company, excluding its operations in Arizona, are more than 70 cars in length. In Nevada, where conditions are closely similar to those in Arizona, except in so far as they are affected in the latter state by the Train-Limit Law, more than 66 per cent of the freight trains operated by the Southern Pacific are long trains. The Southern Pacific also operates a substantial number of long passenger trains—trains in excess of 14 cars—on its lines which are not affected by the Arizona law. On some routes more than 43 per cent of the passenger trains are long trains. (R. 3915-6) Long trains would be operated in large numbers over the lines of the Southern Pacific in Arizona and the adjacent affected territory, except for the state law. Over the main line between Yuma and Lordsburg, where no long trains can be operated under the law, more than 80 per cent of the freight trains would be long trains but for the restrictions of the law. The average number of cars per train on this part of the line of the Southern Pacific was about 65 in 1938 under the restricted operation, but, in the absence of the state restriction, the average number of cars per train would have been 87. (R. 3962-3)

The Arizona law interferes with and delays the movement of interstate commerce in many ways. A long train approaching the state must be broken down to the statutory length when or before it reaches the state line. This involves extra switching, substantial delays to trains, and additional delays to cars which must be cut out of long trains for storage and movement in later trains. When short trains have crossed the State of Arizona they must be remade into long trains at the first available point at or beyond the state line in order to avoid the disadvantages of short-train operation. This also requires additional switching and results in new delays.

Long freight trains entering Arizona from the West are ordinarily broken down into short trains at the Yuma yards and the westbound short trains which have moved through Arizona ordinarily are remade at those yards into long trains for further movement.[39] A quite different situation exists, however, with respect to long trains approaching Arizona from the East and short trains leaving Arizona for movement eastward. There is no terminal at the Arizona-New Mexico state line where long trains can be broken down into short trains or short trains built up into long trains, and it is impracticable to construct such a terminal at that point. As a result, westbound long trains from the East must be broken down and remade into short trains, which meet the requirements of the Arizona law, at Lordsburg, New Mexico, 23 miles east of the state line or at some terminal still further east. Likewise, eastbound short trains which have moved through Arizona cannot be built up to long trains before they reach Lordsburg or some terminal further east. As a practical matter, most trains must be broken down or built up as far east as El Paso, Texas, 171 miles from the Arizona state line.

[39] By sufferance of the state the operations between the California-Arizona line and the Yuma yards, which are in Arizona a short distance from the line, have never been treated as within the purview of the law. (R. 4043)

The extent of the extraterritorial interference with train operation by the Arizona law is shown by a special study covering June and August, 1938. This study disclosed that 30 per cent of the freight trains on the Southern Pacific between Lordsburg, New Mexico, and El Paso, Texas, were long trains, whereas 74 per cent of the trains between these points would have been long trains except for the restrictions of the statute. The average number of cars in freight trains actually operated between these points was 68. In the absence of the train-length limitations, the average number of cars would have been 89. (R. 3962-3)

The extraterritorial operation of the Arizona law affects passenger trains as well as freight trains and to a greater degree. It controls the length of passenger trains to a large extent from Los Angeles to El Paso. (R. 4049)

The delays caused by the Arizona law include not only terminal delays of the character above described but also delays in road movement. These are caused by the necessity of running more trains than would be required in the absence of the prescribed limitations. A careful redispatching study developed that in the year 1938 the Southern Pacific was required to operate 4,304 additional freight trains (or 638,569 additional train miles) over its main line between Yuma and El Paso, solely because of the restrictions of the law. It was also required to operate additional passenger trains. The running of these additional trains caused 16,512 additional train meets and passes. The law compelled an increase in the total number of trains run (both freight and passenger) in the affected territory of about 28 per cent and an increase in the number of train meets and passes of about 63 per cent. (R. 3958, 3964-5, 4021, 4051)

The operation of more trains to carry a given volume of traffic requires more locomotives and more crews to man the trains. It limits road track capacity and yard capacity because of additional train interference on the road and additional switching in the yards. In periods of heavy traffic

this can lead to paralyzing congestions. Clearly, the Arizona train-length limitations not only obstruct and delay interstate transportation and make it more costly, but also, at times of greatest need, actually restrict and prevent such transportation.

This is not a mere theoretical or hypothetical danger. Since the beginning of the present war, all transcontinental lines operating through Arizona and Oklahoma (where there is a similar train-length limitation) have frequently been congested and it has been necessary to divert traffic from these lines to other transcontinental lines. *In the Matter of Service Order No. 85*, 256 I. C. C. 523, 535. This led the Interstate Commerce Commission, on September 11, 1942, to issue its Service Order No. 85 (7 Fed. Reg. 7258) suspending state train-length laws for the duration of the war emergency.[40] The power of the Commission to enter the order was questioned by certain railway labor organizations, which did not seek to raise any issue of fact. With the consent of those organizations, the question was submitted on briefs. The Secretary of War and the principal railroads serving Arizona and Oklahoma filed briefs in support of the order, and the Attorney General of Arizona, the Attorney General of Oklahoma, and certain railway labor organizations filed briefs challenging the order. The Commission issued a report in due course in which it refused to set aside its service order. *In the Matter of Service Order No. 85, supra*, 256 I. C. C. 523. In that report it was said, at page 524, that the order:

> "was designed to save manpower, motive power, engine-miles, and train-miles; to avoid delay in the movement of trains; to increase the efficient use of locomotives and cars and to augment the available supply thereof; and to relieve congestion at terminals caused by setting out and picking up cars on each side of the train-limit law States."

[40] The Commission acted under the emergency powers granted to it in the Car Service Provisions of the Interstate Commerce Act, as amended (Part I, Sec. 1 (10)-(17)); 49 U. S. C., Sec. 1 (10)-(17).

It was further said, at page 534:

> "* * * train-limit laws are not matters of local concern and the regulation of the number of cars which may be put in a train does infringe the national interest in maintaining the free flow of commerce under the present emergency war conditions."

At page 535, it was said:

> "Service Order No. 85 recites in its preamble that the train-limit laws in question during the present emergency may result in congestion of tracks and terminals, wasteful use of locomotives, and interference with the free flow of traffic necessary in the present emergency. This shows the national interest involved. The brief of the Secretary of War shows that many trains carrying important and urgently needed war goods and exceeding in length the maximum prescribed by certain State laws are constantly being moved from interior points to points of embarkation. It also shows that military necessity requires that units of troops should not be divided while being transported and that trains carrying prisoners of war should not be split.
>
> Since the beginning of the present war, all transcontinental railroad lines operating through Oklahoma and Arizona *have frequently been congested*, and it has been *necessary to reroute traffic from these lines* to other transcontinental routes." (Emphasis supplied.)

It is helpful to an understanding of the true character and potentiality of the power which is being claimed by Arizona to consider the results which would follow the exercise of like powers by other states. What would be the effect on the national railroad transportation system?

As previously stated, Class I railroads formulated and inaugurated, in the Spring of 1923, a continuing program to rehabilitate and modernize the national railroad plant. In keeping with that program, new and heavier locomotives and stronger cars were acquired; heavier rail was laid, curves and grades were reduced; bridges, trestles and culverts were rebuilt; signal systems were extended and improved and new safety devices were installed. In many

ways the national railroad plant was remodeled and improved to permit the use of trains of greater capacity and to bring about higher speeds between terminals. During the first year of this improvement program, 1923, more than a billion dollars of gross expenditures were made on capital account, and during the 17 years ending with 1939, the total was approximately nine billion dollars. (R. 187-190, 3934-6)

In connection with and as a result of this program of plant improvement, improved methods of operation were developed and adopted, including the practice of long-train operation. Long-train operation, both freight and passenger, is the standard practice which is followed today, as a customary and ordinary method of operation upon substantially every major railroad system throughout the United States. (R. 3937)

Since 1923, and coincident with development of long-train operation, there has been a marked improvement in the efficiency and economy of operations upon the railroads of the United States generally. The trial court found (R. 3940):

> "During the period since 1923, and coincident with the substantial increase in train lengths during that period, there has been a marked improvement in the efficiency and economy of operations upon the railroads of the United States generally."

In its memorandum opinion the trial court further stated (R. 4046):

> "As a part of its comparative showing as to costs and methods of operation, casualties, etc., the defendant presented the National picture of railroading by witnesses, who are outstanding in their respective fields, from sixteen of the Class I roads of the United States. • • • This evidence clearly establishes that 'long-train' operating practice is the customary and ordinary practice throughout the United States and *that improvements in efficiency, economy and safety are an accomplishment and necessary result of the adoption of that*

practice. This type of operation is unquestionably more economical and efficient than 'short-train' operations. Freight train expenses vary inversely with train length. Furthermore, long-train operations permit improved schedules and performance by elimination of short-train interference." (Emphasis supplied.)

In passing, we refer briefly to a few indicia of the progress which has been made in the economy and efficiency of railroad operation.

The average terminal-to-terminal speed of all freight trains on all Class I railroads, which was 11.1 miles per hour in 1922, increased steadily through the succeeding years until it reached 16.7 miles per hour in 1939, an improvement of 50.5 per cent. (R. 3940)

The average amount of freight train service produced per ton of fuel consumed on freight trains of Class I railroads increased during the same period by 44.4 per cent. In 1922, there were 10,750 gross ton-miles of transportation per ton of fuel consumed, and in 1939, 15,528 gross ton-miles. (R. 3941)

The average freight operating expense for all Class I railroads, per thousand revenue ton-miles, was $8.71 for the period 1922-1925 and $6.49 for the period 1936-1939, or 25.5 per cent less. The average passenger transportation expense, per passenger train car-mile, was 20.06 per cent lower in the period 1936-1939 than in the period 1922-1925. (R. 3941)

As a direct result of the increased efficiency and economy brought about by the aforesaid 1923 betterment program, including the development of long-train operation, the rates for freight and passenger transportation paid by the railroad patrons have shown continuously decreasing trends. The average revenue per ton-mile received by all Class I railroads in the United States was 1.177 cents in 1922 and 0.973 cents in 1939, a decrease of 17.4 per cent. The average revenue per passenger-mile, received by all Class I railroads in the United States, was 3.027 cents in

1922 and 1.840 cents in 1939, a decrease of 39.2 per cent. (R. 3943).

State train-length limitations, in so far as they might become applicable, would undo, in large part, the progress which has been made over the years in improving the safety and efficiency of railroad operation and would impair the use of facilities which have been provided at huge expense.

Moreover, and more important, the evil results would extend beyond delays to transportation, increased hazards, and the loss of efficiency and economy. The physical adequacy of the national railway system would be threatened. Paralyzing congestions would result during times when transportation demands were most urgent.

Congestion in railroad operation is a menacing evil and one which develops its own momentum. When a yard is overtaxed, switching operations become slower and more difficult and this in turn leads to greater congestion and a further slowing down in switching operations. When a railroad line becomes congested, the speed of trains is retarded and this leads to greater congestion. When one route is blocked, additional and perhaps intolerable burdens are thrown upon other routes.

It is difficult to conceive of a greater calamity than a collapse of transportation or a serious transportation shortage. The volume of railroad traffic has reached unprecedented levels during this war and the railroads have carried the load successfully, but there has been no surplus margin of capacity, and serious manpower and motive power problems have presented themselves.[41] Extensive

[41] 57th Annual Report of the Interstate Commerce Commission dated November 1, 1943, at page 1. Testimony of Col. J. Monroe Johnson, then Interstate Commerce Commissioner and now also Director, Office of Defense Transportation, at hearings before a Subcommittee of the Committee on Interstate Commerce, United States Senate, pursuant to S. Res. 185, 78th Congress (Jan. 5, 1944)—Printed Transcript of Hearings, Part 2, at page 284 *et seq.* Address of Honorable Joseph B. Eastman, then Director, Office of Defense Transportation, delivered Oct. 15, 1943, before the Seventh Annual meeting of the National Association of Shippers Advisory Boards. (Printed transcript "Proceedings" of the meeting, page 34.)

interferences with effective operating practices would have brought disaster.

We have had a practical demonstration of the effect of the Arizona and Oklahoma laws in a time of heavy traffic. The lines operating in those states "have been frequently congested, and it has been necessary to reroute traffic from these lines to other transcontinental routes." *In the Matter of Service Order No. 85*, 256 I. C. C. 523, 535. What would have happened when the routes through Arizona and Oklahoma became congested if other transcontinental routes had also been congested as a result of train-length limitations and had been unable to absorb the overflow?

The power of the Interstate Commerce Commission to suspend state limitations upon train length during emergencies, as it did in Service Order No. 85, is now under challenge by railway labor organizations in *Johnston* v. *United States*, pending in the United States District Court for the Western District of Oklahoma. Even if that power should be upheld, however, plainly it could not offer protection against or remedy for the injurious effects of state limitations of train length.

Long-train operation cannot be initiated successfully overnight. It depends upon suitable railroad plant and equipment, as well as upon freedom from statutory restrictions. Engines must be of sufficient power, and cars, bridges, and track structures of sufficient strength. Sidings must be of appropriate length, and turntables, roundhouses and repair facilities must be suitable. If train-length limitations were of widespread application, railroad plant and equipment would ultimately have to be conformed to such limitations in order to minimize wasteful use of facilities and to provide a plant designed to meet the conditions created by the state laws. Under such circumstances, the temporary lifting of state limitations during a period of emergency would necessarily have only a very limited effect. The physical limitations would control.

An example is afforded by this case. Because of the Arizona law, the sidings of the Southern Pacific in that state are long enough only for short trains and the locomotives assigned to service in that state are generally not such as would be appropriate for long-train operation. (R. 3947) These difficulties in Arizona can be and will be overcome by extending sidings, reassigning locomotives, and reconstructing turntables, roundhouses, and repair facilities, at a cost of some $1,352,272. But this will take time, as well as money. (R. 3948-9)

It will be realized at once that the task of converting the Southern Pacific facilities in Arizona to long-train operation, under existing conditions, would not be comparable, in difficulty or magnitude, with the task which would confront the railroads of the country if they should attempt to reestablish long-train operations after such operations had been prohibited by law and after their facilities and equipment had been accommodated to short-train operation.

VI.

THE REGULATION OF TRAIN LENGTH CANNOT BE SUBJECTED APPROPRIATELY TO THE DIVERSE REQUIREMENTS OF THE SEVERAL STATES.

State action affecting interstate commerce is not permissible when the nature of the subject matter regulated and the nature of the regulation demonstrate that "superior fitness and propriety" demand uniformity of control by a single authority rather than diversity of control by local authorities. The single control may take the form of affirmative regulation or it may take the form of lack of regulation. The question here is not whether Congress has acted or whether actual diversity has manifested itself in the action of different states. The question is simply whether or not the subject to be regulated and the character of regulation are such as require, when tested by the standard of superior fitness and propriety, that diverse and

possibly conflicting local commands be avoided in the national interest.

In applying this standard, there are many helpful guides. Is the subject matter to be regulated predominantly of national or of local concern? Would diversity of state regulation conflict with or unduly interfere with the National Transportation Policy or injuriously affect the national interest in commerce? Would the diversity of state requirements operate to burden interstate commerce or to obstruct its free flow? Would such state requirements interfere with the essential unity and continuity of interstate train operation? Would such diversity result in flagrant extraterritorial operation of state requirements and in inflicting on one state the unwise or dubious policy of another?

While the need for control by a single authority affords a separate and independent ground for holding a state statute invalid, it is ordinarily, as in the case at bar, associated with and interrelated with other grounds.

Diversity of the requirements of different states with respect to train length would add to the interferences with and obstructions to interstate transportation beyond the simple accumulation of such interferences and obstructions in the several states.[42] It would also accentuate the extraterritorial operation of the local mandates, and it would destroy or gravely impair the essential physical continuity of train operation, which is necessary in the national interest.

---

[42] *In the Matter of Service Order No. 85*, 256 I. C. C. 523, 530-531, it was said:

> "If State laws limiting the number of cars in trains are to be held valid (a question we do not decide), it would be possible for each State to set a different number of cars as the maximum to be hauled in a train. A State might even limit the length of trains to one car, although such a law would be clearly arbitrary and unreasonable. Higher limits might be set by States and found reasonable, *but lack of uniformity would place a serious burden on interstate commerce.*" (Emphasis supplied.)

In the next section of this brief, dealing with "Controlling Constitutional Considerations," we shall discuss further the doctrine of uniform control by a single authority and shall refer to precedents and authorities, but it is our purpose at this stage merely to state the rule and to direct attention to certain facts which must serve as a background for its application.

If the states are possessed with power to regulate the length of trains, one may fix a limitation of 70 cars, another of 60 cars, and still another of 80 cars. The possibility of variety is endless. What would be the effect of such variety?

There is no occasion to repeat here what we have already said with respect to the predominant national concern in adequate and efficient transportation or what has been said with respect to the burdens and obstructions inflicted upon efficient railroad transportation by a single state train-limit law. We refer to them again, however, for the light they throw upon imperative considerations opposing diversity of control and regulation.

We have shown the serious interferences with railroad operation caused by the passing of a train from a state in which train length is not regulated to a state in which a maximum train length is prescribed, and by the passing of a train from a state in which a limitation prevails to a state in which no limitation is applicable. Interferences of the same kind would result whenever a train passed from one state in which a restriction obtained to another state in which a different restriction obtained. It would be necessary to break down long trains and build up short ones at the state boundaries, so far as possible, with attendant delays, extra switching, and other hardships to which we have referred, unless the most drastic limitation should be observed in all states through which the trains operate.

The nature and extent of the effects of the diversity of control over train length can be appraised only when it is remembered that the location of railroad lines has no relation whatever to political state lines, but has been dictated

by considerations of traffic and commerce and by considerations of topography. The lines of most railroads extend through a large number of states and often they cross and re-cross state boundaries. It is quite common for an important main line to include only a relatively small mileage in one state, or in each of a number of states. Railroad terminals and division points are not to be found on state lines, except in rare cases as a result of coincidence. They have been located, and have been long established, to meet the necessities of efficient railroad operation.

As illustrating what has been said in the next preceding paragraph, a few concrete examples may be helpful.

The Chicago, Milwaukee, St. Paul and Pacific Railroad, the Pennsylvania Railroad, and the Chicago Rock Island and Pacific Railway each operates in 14 states. The Illinois Central, the Baltimore and Ohio and the Union Pacific Railroad each operates in 13 states. The Southern Railway and the Atchison, Topeka and Santa Fe Railway each operates in 12 states. The Chicago, Burlington & Quincy Railroad operates in 11 states. The Southern Pacific Company, appellant herein, operates in 7 states. For the purposes of this paragraph the District of Columbia has been considered as a state.

The main line of the Pennsylvania between Washington and New York extends through 5 states and the District of Columbia, although the entire distance is only 225 miles. In New York the distance from the state line to the passenger station is only 1.1 miles, and in the District of Columbia the corresponding distance is only 4.4 miles. In Delaware there are only 23 miles of line and in Pennsylvania only 48.

The main line of the New York Central between New York and Chicago includes only a few miles in Illinois, (and this is true of all east-west railroads with their western termini in Chicago) and only 40 miles in Pennsylvania.

The main line of the Michigan Central (operated by the New York Central) between Chicago and Detroit includes only a few miles in Illinois and only about 40 miles in Indiana.

The main line of the Atchison, Topeka and Santa Fe between Chicago and the west coast includes only about 20 miles in Iowa.

The main line of the Kansas City Southern Railway from Kansas City, Missouri, to Port Arthur, Texas, affords an excellent illustration of a line which crosses and re-crosses state lines, as shown by the following table:

Main line of Kansas City Southern Ry. from Kansas City, Missouri, to Port Arthur, Texas.

From Kansas City, Mo. to Mo.-Kans. line	120.23	miles in Mo.
From Mo.-Kans. line to Kans.-Mo. line	18.39	miles in Kans.
From Kans.-Mo. line to Mo.-Ark. line	65.22	miles in Mo.
From Mo.-Ark. line to Ark.-Okla. line	28.83	miles in Ark.
From Ark.-Okla. line to Okla.-Ark. line	127.64	miles in Okla.
From Okla.-Ark. line to Ark.-Tex. line	118.76	miles in Ark.
From Ark.-Tex. line to Tex.-Ark. line	31.42	miles in Tex.
From Tex.-Ark. line to Ark.-La. line	6.42	miles in Ark.
From Ark.-La. line to La.-Tex. line	222.46	miles in La.
From La.-Tex. line to Port Arthur, Tex.	49.61	miles in Tex.
From Kansas City, Mo. to Port Arthur, Tex.	788.98	miles

Another illustration of the same kind is to be found in the main line of the Nashville, Chattanooga & St. Louis Railway between Nashville, Tennessee, and Atlanta, Georgia, as shown in the following table:

Main line of Nashville, Chattanooga & St. Louis Ry. from Nashville, Tennessee, to Atlanta, Georgia.

From Nashville, Tenn. to Tenn.-Ala. line	102.65	miles in Tenn.
From Tenn.-Ala. line to Ala.-Tenn. line	24.11	miles in Ala.
From Ala.-Tenn. line to Tenn.-Ga. line	13.43	miles in Tenn.
From Tenn.-Ga. line to Ga.-Tenn. line	1.71	miles in Ga.
From Ga.-Tenn. line to Tenn.-Ga. line	0.69	miles in Tenn.
From Tenn.-Ga. line to Ga.-Tenn. line	1.02	miles in Ga.
From Ga.-Tenn. line to Tenn.-Ga. line	23.53	miles in Tenn.
From Tenn.-Ga. line to Atlanta, Ga.	121.10	miles in Ga.
From Nashville, Tenn. to Atlanta, Ga.	288.24	miles

These examples leave no doubt that "superior fitness and propriety" preclude local state control of the length of interstate trains and require that such control be vested in a single authority. Any other conclusion is unrealistic and must ignore the essential conditions which control train operations.

Diverse state regulations would, in many instances and with respect to many routes, result in the application of the regulation of a particular state far more extensively in neighboring states than in the regulating state. Is one state empowered not only to place grievous burdens on interstate transportation, as conducted in other states as well as within its boundaries, but also to impose upon sister states, and not necessarily adjacent states only, its own peculiar views respecting safety, especially when such views are contrary to those prevailing in the Nation and will greatly increase the hazard of serious accidents, such as those occurring at highway-railroad grade crossings?

From what has been said it clearly appears that the limitation of train length by one state necessarily spreads its effects over conduct and standards in other states, not in a minimal fashion but in a substantial and extensive manner.

The lack of fitness and propriety of local control of train length can be appreciated vividly if we assume that the power here claimed by Arizona had been delegated by it to counties, municipalities, and villages to exercise as they might choose over transportation within their political areas. So far as matters really local are concerned, such local units of Government may properly be vested with the power of local control, as they often are. Yet, if under a broadly delegated power from the state to take action for the promotion of health and safety within their limits, they should venture to do what Arizona has done, it can not be conceived that anyone would have the hardihood to argue that such action was not obnoxious to the Commerce Clause.

While such a possibility may seem fanciful, it would, in numerous instances, be no more absurd in application than

the exercise of power by a state over train length. State lines, as dividing points for train operation, are hardly less arbitrary than county lines. As we have shown by examples, there are numerous cases in which that part of an important through railroad route which lies within a single state is much less in length than the distance across many a county. If diversity of regulation by counties would destroy essential unity and uniformity in train operation, so would diversity of regulation by states.

VII.

CONTROLLING CONSTITUTIONAL CONSIDERATIONS.

Under the various formulae which have expressed the underlying canons for determining the constitutional scope of state power over interstate commerce, the different questions which must be asked and answered as the basis of judgment in each particular case may from a practical standpoint be put as a single crucial question. This is whether the local end which the state law may be found to serve is a sufficient justification for the burden on and obstruction to commerce which the law imposes. These formulae, however expressed, are not self-executing. These questions, however framed, do not answer themselves. In each case the judicial duty can be performed only by consideration of the relevant facts in the situation which calls for judgment.

While the fundamental issue can be put as a single crucial question, the answer in each case depends upon the conclusions reached about practical considerations which by further questions can be put in sharper focus. This leads to narrower tests which are stated in various ways. In their application to some situations, they may be substantially the same test, with the differences of statement chosen for the aptness of each particular inquiry to special features of the combination of elements requiring adjudication.

With respect to other situations, the differently-stated tests may be more independent of each other, and the application of some one of them may be determinative of the issue. Nevertheless in any but the simplest circumstances, the canons of judgment to be invoked are bound to be interdependent and cooperating. Strands which may be separated for analysis are interwoven in reality with a cumulative strength beyond what they would have in isolation from each other.

The primary question, primary both in the time of its formulation by this Court and in its importance, is this. Is the enterprise which spans or embraces "more states than one," of the type which, if not "imperatively demanding a single uniform rule" (*Cooley* v. *Board of Port Wardens*, 12 How. 299, 319), clearly exemplifies the "superior fitness and propriety" (*Id.* at 320) of such a uniform rule rather than that of "different systems of regulation drawn from local knowledge and experience, and conformed to local wants"? If such is the nature of the subject with which the state law interferes, state power is excluded because the diverse commands of different states cannot yield a single uniform rule. In considering this, attention must be directed both to the type of enterprise being regulated and to the type of regulation involved. Moreover, in determining the superior necessity of a single uniform rule, whether of freedom or of some restriction, the most useful criterion is usually, if not always, an estimate of the adverse effects on the unitary national interest in the freedom of commerce, if this freedom is curtailed by barriers set up by each state according to some local preference. It is not to be forgotten that the advancement of this interest of national unity was the primary purpose of substituting the Constitution for the loose tie of the Articles of Confederation.

When the answer to this primary test is that the national interest in uniformity will be defeated or unduly embarrassed by subjection to the diverse regulations of different

states, then the state law must fail because the local end which it may be found to serve is not a sufficient justification for the burden on interstate commerce which the law imposes. This, however, is not the only situation in which state regulations of interstate commerce are unconstitutional. Even if the evils to commerce do not arise from diversity of state requirements but follow rather from the unjustified severity of the particular imposition with the possibility of cumulation by the like action of other states, the state law is unconstitutional unless it can be condoned because its service to a local need outweighs its injury to interstate commerce and to those who conduct it. While a judgment of the same relative character enters into the determination of the respective merits of uniformity or diversity of regulation, the comparison of benefit and burden is not confined to the solution of that issue. There are limits to the exercise of state power where state power is not wholly excluded. If every state imposed the same rule so that uniformity were achieved, state power would still be precluded when the disadvantage to commerce is without compensation in the advantage to some local interest of the state.

The relative weighing of state and national interests must necessarily vary with the different situations in which they conflict. In estimating the weight of the national interest, it is essential to bear in mind the authoritatively declared national policy toward that interest. This policy with respect to the national railroad system has been set forth in a preceding section of our brief. Similarly we have set forth the recognition by national authorities of the indispensability of the most efficient rail transportation which can be provided and of the effectiveness of the carriers in recent years in furnishing such transportation. No one doubts for a moment that here is a national interest of the first magnitude. Any state interference with that interest must face judgment in the light of the magnitude of national concern. It must face judgment in the light of

what Congress and the Interstate Commerce Commission have done to secure and promote the very interest adduced as a justification for the state law. The alleged state need cannot be estimated in a vacuum. In weighing the assumed local justification for the state prescription, consideration must be given to the situation if the state law is denied application. Existing national regulation is an element in weighing the extent and degree of the local need.

As in weighing the interest and need of the state, account must be taken of safeguards already established, so in weighing the burden on interstate commerce, account must be taken of the extent and the degree of indispensability of the enterprise on which the burden falls. Heavier burdens may be imposed on the trivial than on the essential. It is difficult to conceive of anything more essential to national welfare than expeditious and economical long range transportation. Impediments imposed by a single state adversely affect the interests of neighboring states. If one state is permitted to prefer its assumed interest to that of others and of the Nation, sister states may claim a corresponding preference. Variations in the preferences of different states with the possibility of conflict or opposition between them would burden the national interest in effective transportation even more than by mere cumulation. When such burdens fall on the physical operations of an articulated national railroad system, the weight of the burden is not confined to the stress at any single point of immediate impact. A clot in the arteries of commerce is not to be regarded as isolated and local in its incidence. It affects the whole system. Hence obstructions to the physical operations of railroads are grievous burdens on interstate commerce.

These comparisons of diversity with uniformity and of burden with benefit almost inescapably involve analysis and estimation of many, and often of all, of the same factual elements in any subject and any state regulation thereof. While the obstruction to commerce may be unjustifiable

even where diversity is permissible, the extent of the burden and the obstruction is often intimately related to the need of uniformity. This interrelation finds striking illustration in state laws imposing on interstate transportation an interference which is not confined to the transportation in the regulating state. If compliance with the law of one state necessarily controls conduct in another, the burden is thereby enhanced and the menace of diversity and the need for uniformity are correspondingly greater. Such effects are not confined to the application of state laws which in express terms forbid and penalize conduct in other states. They are equally inevitable if such extrastate conduct is compelled and coerced by the practicalities of railroad operation which do not permit change of methods at the precise imaginary line which is the political boundary between two states. The inescapable extraterritorial incidence of a state train-limit law adds greatly to the burden on commerce, to the evil of diversity, and to the imperative need of uniformity.

So interwoven are all these considerations in the case at bar and in numerous decisions on the same general problem that separate and independent treatment of each is not desirable and is hardly feasible without an excess of repetition. The case before us as well as most of those which have preceded is a composite of various elements which have their full significance only in their interrelation and their cumulation. The canons and rules that have been announced and applied in the precedents are approaches from different angles to the same goal. Different canons are applicable to the same facts. Their bearing in any case is dependent upon their application to the facts of that case. The bearing of the precedents is dependent upon a careful comparison between the facts to which they are applied and the facts in the case at bar. "Whether state action unduly impinges upon interstate commerce depends more and more upon the particularities of fact in individual cases." (Frankfurter, "Mr. Justice Brandeis and the Con-

stitution," XLV. Harvard L. Rev. 33, 77.) For this reason the familiar doctrinal generalities need to be supplemented by subordinate and ancillary canons that give more realistic guides for the process of applying them and for determining the bearing of the precedents on issues that differ from any previously adjudicated.

The recognition of this is manifest in the analysis given by the present Chief Justice in his dissenting opinion in *Di Santo* v. *Pennsylvania*, 273 U. S. 34, a case now overruled by *California* v. *Thompson*, 313 U. S. 109, in which there is amplification of the considerations set forth in the earlier opinion. Both cases involved state requirements on transportation agents which included the furnishing of a bond to guarantee faithful performance of contracts. In the *Di Santo* opinion, Mr. Justice Stone said:

> "As this Court has many times decided, the purpose of the commerce clause was not to preclude all state regulation of commerce crossing state lines, but to prevent discrimination and the erection of barriers or obstacles to the free flow of commerce, interstate or foreign.
>
> The recognition of the power of the states to regulate commerce within certain limits is a recognition that there are matters of local concern which may properly be subject to state regulation and which, because of their local character, as well as their number and diversity, can never be adequately dealt with by Congress. Such regulation, so long as it does not impede the free flow of commerce, may properly be and for the most part has been left to the states by the decisions of this Court.
>
> In this case the traditional test of the limit of state action by inquiring whether the interference with commerce is direct or indirect seems to me too mechanical, too uncertain in its application, and too remote from actualities, to be of value. In thus making use of the expressions, 'direct' and 'indirect interference' with commerce, we are doing little more than using labels to describe a result rather than any trustworthy formula by which it is reached.

> It is difficult to say that such permitted interferences as those enumerated in Mr. Justice Brandeis' opinion are less direct than the interference prohibited here. But it seems clear that those interferences not deemed forbidden are to be sustained, not because the effect on commerce is nominally indirect, but because a consideration of all the facts and circumstances, such as the nature of the regulation, its function, the character of the business involved and the actual effect on the flow of commerce, lead to the conclusion that the regulation concerns interests peculiarly local and does not infringe the national interest in maintaining the freedom of commerce across state lines." (*Id.* at 43-44.)

Thus among the questions to be answered in the affirmative before the Arizona Train-Limit Law can be sustained are these: Is the limitation of train length a matter of local rather than of national concern? Are there peculiar local conditions in Arizona which require different treatment from that needed or given elsewhere? Are the number and the diversity of the problems of train length and of train operation generally such that these problems could "never be adequately dealt with by Congress"? And even if those questions could be answered in the affirmative, the state law could not be sustained unless these further questions could be answered in the negative: Does the Arizona Train-Limit Law erect "barriers or obstacles to the free flow of commerce"? Does it "infringe the national interest in maintaining the freedom of commerce across state lines"?

The answers to the questions so phrased are obvious. A state train-limit law erects "barriers or obstacles to the free flow of commerce" and "infringes the national interest in maintaining the freedom of commerce across state lines." The safety of train operation gives rise to no peculiar problems presented by the crossing of a state boundary. Such operation gives rise to no diversities that could be classified by states. No one can doubt that if in the view of Congress there existed any conditions which made limitation of train length desirable, the problems thus arising

could be dealt with adequately by Congress with the expert collaboration of the Interstate Commerce Commission.

Though the distinction between direct and indirect burdens on commerce cannot alone offer a single and conclusive canon of judgment, there are situations in which what may be called the directness of the burden or obstruction is an important factor. There is a decided difference between requiring security for the performance of a commercial undertaking (*Di Santo* v. *Pennsylvania*, 273 U. S. 34; *California* v. *Thompson*, 313 U. S. 109) and imposing a prohibition against bringing into the state a train which complies fully with the law of Congress and with the laws of neighboring states. Such a prohibition hits directly the physical operation of interstate trains. Even on its own highways, a state is not wholly free to limit the number of trucks and busses that shall be run in interstate commerce. (*Buck* v. *Kuykendall*, 267 U. S. 307; *Bush Co.* v. *Maloy*, 267 U. S. 317.) A direct obstruction to train service is in sharp contrast to some mere repercussion from a law dealing with something else than train service. It is in sharp contrast to requirements which, when complied with, leave the continuation of full service unfettered.

The contrasts between what the states may and may not do to interstate commerce are set forth again in the opinion of the Chief Justice in *California* v. *Thompson*, 313 U. S. 109. The Train-Limit Law can meet few, if any, of the conditions there listed as favoring the condonation of state regulations affecting interstate commerce. It does not deal with conduct "beyond the effective reach of Congressional action." Such conduct need not go largely unregulated "unless some measure of local control is permissible." The Train-Limit Law cannot be condoned because it does not involve "prohibiting interstate commerce or licensing it on conditions which restrict or obstruct it." It does not apply "to one who is not himself engaged in the transportation." It cannot be permitted because its requirement "is not conditioned upon any control or restriction of the

movement of the traffic interstate," or because "It does not appear that the regulation will operate to increase the cost of the transportation." Its character cannot be said to bring it within the class for which "there is wide scope for local regulation without impairing the uniformity of control of the national commerce in matters of national concern and without materially obstructing the free flow of commerce which were the principal objects sought to be secured by the Commerce Clause."

We do not contend that no state regulation of interstate commerce can be permitted unless it meets all conditions which cumulatively have been the basis of sanctioning the application of some other state statute. Nevertheless these recitals of types of state statutes and of situations and effects which do not run counter to "the principal objects sought to be secured by the Commerce Clause" are clear affirmations of what those objects are. The validity of a state train-limit law is to be tested by the extent and degree of its consistency or inconsistency with those objects. It is to be tested by the extent and degree of its consistency or inconsistency with the national policy toward transportation declared by Congress and advanced by various provisions of its statutes. If conformity with a declared national policy militates in favor of a state statute (*Parker* v. *Brown*, 317 U. S. 341), nonconformity to such a policy, when manifestly it impairs efficient transportation service, discourages improvement of facilities and denies the benefits of improvements already made, should certainly tip the scales against a statute offending in these various particulars.

It is largely because of the absence of state endeavors to impose any serious obstructions to efficient train operation that the considerations militating against the validity of restrictions in that field appear chiefly in distinctions drawn in the opinions of this Court in sanctioning moderate or justified regulations of other matters. The considerations which determine judgment are set forth and applied in the

analysis by Mr. Chief Justice Stone in *S. C. Hwy. Dept.* v. *Barnwell Bros.*, 303 U. S. 177. In sanctioning a state limitation on the size and weight of trucks on the public highways provided and maintained by the state, emphasis was placed on the difference between state power over such highways and state power over railroads. Both the proprietary power over the highways and the dominantly local interest in their use justify the exercise of a state control over them which is much greater than any state power applicable to railroads:

> "Few subjects of state regulation are so peculiarly of local concern as is the use of state highways. There are few, local regulation of which is so inseparable from a substantial effect on interstate commerce. Unlike the railroads, local highways are built, owned and maintained by the state or its municipal subdivisions. The state has a primary and immediate concern in their safe and economical administration. The present regulations, or any others of like purpose, if they are to accomplish their end, must be applied alike to interstate and intrastate traffic both moving in large volume over the highways. The fact that they affect alike shippers in interstate and intrastate commerce in large number within as well as without the state is a safeguard against their abuse.
>
> . . . . . .
>
> With respect to the extent and nature of the local interests to be protected and the unavoidable effect upon interstate and intrastate commerce alike, regulations of the use of the highways are akin to local regulation of rivers, harbors, piers and docks, quarantine regulations, and game laws, which, Congress not acting, have been sustained even though they materially interfere with interstate commerce." (303 U. S. at 187-188.)

The essentially local nature of highway regulation is indicated by the great diversity in highway conditions. This is diversity within a single state and not merely diversity between states. Supersession of state power over the use

of the facilities which the state furnishes is hardly conceivable. To deprive the state of power over the weights and sizes of trucks would leave the highways largely subject to the uncontrolled choice of the users of them. A state train-limit law is not for the protection of facilities afforded by the state. It is not regulation of the right-of-way except as it adversely affects its use by equipment already under various national prescriptions to ensure the safety of operations, and as it increases the number of all types of accident that inevitably are the result of an increased number of trains.

The safeguard against abuse of a power on the part of the state to limit the size and weight of trucks is found in the fact that the regulations hit large numbers of resident truck owners and intrastate shippers whose interest in moderation will be a factor in legislative deliberations. This is without parallel in a law limiting train length where the interests adversely affected are so largely those of interstate railroads and extrastate shippers and consignees. Unlike large capacity trucks which are as serviceable in short local transport from distributor to retailer, from factory to freight station, as in long interstate operations, long trains are a special and compelling need of nationwide interstate carriage. In its effect on shippers and consignees, restriction of train length bears most heavily on those in other states. Enterprise in intermediate or "bridge" states suffers little, if any, compared with enterprise in terminal states. Thus the adverse effect on local interests of a train-limit law in a "bridge" state is not such as to afford the safeguards against abuse of power on which the opinion in the *Barnwell Brothers* case in part relies.

Thus both in its burden on extrastate operations and in the fact that those most adversely affected are without the political participation and representation whereby a moderating influence might be directed toward mitigating the severity of local restrictions, the Train-Limit Law is obnoxious to the condemnatory canons recognized in the *Barn-*

well Brothers case, and belongs to the class of statutes denied application to interstate transportation, which the opinion in the *Barnwell Brothers* case summarizes by saying:

> "The commerce clause, by its own force, prohibits discrimination against interstate commerce, whatever its form or method, and the decisions of this Court have recognized that there is scope for its like operation when state legislation nominally of local concern is in point of fact aimed at interstate commerce, or by its necessary operation is a means of gaining a local benefit by throwing the attendant burdens on those without the state. * * * It was to end these practices that the commerce clause was adopted. * * * The commerce clause has also been thought to set its own limitation upon state control of interstate rail carriers so as to preclude the subordination of the efficiency and convenience of interstate traffic to local service requirements." (303 U. S. 185-186.)

In further review of fundamental considerations which militate against the application of state power to interstate commerce, this same opinion adds:

> "State regulations affecting interstate commerce, whose purpose or effect is to gain for those within the state an advantage at the expense of those without, or to burden those out of the state without any corresponding advantage to those within, have been thought to impinge upon the constitutional prohibition even though Congress has not acted. [Citations omitted.]
>
> Underlying the stated rule has been the thought, often expressed in judicial opinion, that when the regulation is of such a character that its burden falls principally upon those without the state, legislative action is not likely to be subjected to those political restraints which are normally exerted on legislation where it affects adversely some interests within the state." [Citations omitted.] (303 U. S. pp. 184-185, note 2.)

Even state power over state-owned and state-maintained highways is not sufficiently strong to permit a state to re-

quire a certificate of convenience and necessity to operate interstate trucks and busses. (*Buck* v. *Kuykendall*, 267 U. S. 307; *Bush Co.* v. *Maloy*, 267 U. S. 317.) The purpose of the legislation condemned in the cases cited was so to restrict the number of entrants into the carrying enterprise as to encourage the development of service and facilities by those already established therein and to protect them from such severe competition as would threaten their ability to continue to serve. The state regulation, though limiting the number of those who could engage in the service, was designed for the promotion of adequate and effective service. Nevertheless, since the subject dealt with was interstate transportation, it was held that it was national in character and that state restrictive action was excluded notwithstanding the proprietorship of the state over its own highways. A state train-limit law, instead of promoting adequate and effective train service, obstructs and delays it and increases its cost. Transportation by rail is certainly more distinctly national in character than is transportation by truck, and therefore has a correspondingly stronger constitutional protection against state interferences with physical operations.

Because of the physical unity of railroad operations from state to state, any state law which breaks that unity is in sharp contrast to laws which leave it unimpaired. The essentially local matters which the states may control and the protective regulations which they may apply are those which involve no such material physical disturbance to the commerce between the states. Such are the matters which permit of diversity of regulation by the several states without impairment of harmony among the states. There are problems of protection against deceit and fraud and harmful substances and pecuniary loss which are peculiarly the problems of terminal states. Such are the matters which can fairly be deemed of special local concern over which state regulatory power is permissible so long as the protective prescriptions of the state are as local in application

as the malady they seek to relieve. No such exclusively or dominantly local considerations can be adduced to justify a requirement by an intermediate state that interstate trains must be broken in two before they may enter.

In our constitutional federalism it is fundamental that it is Congress and not the states which has power over interstate commerce *because* it is interstate commerce. Such power as the states enjoy over interstate commerce derives *aliunde*, and the fact that interstate commerce is thereby regulated is a hurdle or barrier rather than a justification. The judgment as to the height of the barrier and as to the desirability of being permitted to surmount it is not a judgment which the state is free to make as it chooses. When there is a conflict between the state's power in its reserved field and the power delegated to the Nation, the line of demarcation is to be drawn by national and not by state authority. Only when a state is confining itself to the legislative realm which is exclusively its own can it claim judicial tolerance toward its supposed knowledge of local conditions and its choice of policy. When it leaves its exclusive province, its preference to favor what it conceives to be its local interest in disregard of consequent burdens and impediments suffered by the commerce of the Nation must submit itself to the considered judgment of the judicial authority of the Nation.

The controversy now in issue is to be determined in the light of the same standards of judgment which this Court has heretofore announced and applied. Emphasis is here placed on these standards because, since "decision depends * * * upon the particularities of fact in individual cases", and these particularities have so little in common with each other, there may be for a novel issue no close parallel in the precedents. It may be said with confidence that no such serious physical obstruction to interstate transportation as is here involved has ever been sanctioned and that much less serious interferences and burdens have

been condemned. Among the relatively lighter burdens that have been prevented by judicial interposition is that involved in seeking to compel carriers to fight lawsuits in a forum which has no adequate relationship to the parties or to the cause of action. In condemning such an exercise of state authority in *Davis* v. *Farmers Co-operative Co.*, 262 U. S. 312 at p. 317, this Court summarized the national interests thus adversely affected as follows:

> "The public and the carriers are alike interested in maintaining adequate, uninterrupted transportation service at reasonable cost. This common interest is emphasized by Transportation Act, 1920, which authorizes rate increases necessary to ensure to carriers efficiently operated a fair return on property devoted to the public use. See *Railroad Commission of Wisconsin* v. *Chicago, Burlington & Quincy R. R. Co.*, 257 U. S. 563; *New England Divisions Case*, 261 U. S. 184. Avoidance of waste in interstate transportation as well as maintenance of service, has become a direct concern of the public."

From a practical standpoint, what the state sought to achieve and was prevented from achieving in *Kansas Southern Ry.* v. *Kaw Valley Dist.*, 233 U. S. 75, would have been a less serious burden on commerce and a less serious obstruction to interstate transportation than are the results of a state train-limit law. In that case the state sought to require the railroad to elevate bridges over a river in order to leave more room for flood waters to flow below. However, since the regulation of the height of bridges was by Congress delegated to the Secretary of War, the state supreme court sanctioned the order and this Court condemned it, not as one to elevate the bridges, but as one "to remove the bridges as they stand." (*Id.* at 78.) Such a command, independently considered, was one to break the railroad in two, which is a more serious interference with interstate transportation than a requirement to break all long trains in two. Its condemnation by this Court is a precedent against serious state obstructions to

interstate commerce, but the particular obstruction was so extreme that we can invoke the case in its legal aspects only as a bench mark. Had not state power to order the elevation of the bridges been precluded by the authority vested in the Secretary of War, the extent to which the state might go would have turned on issues of degree. *State of Pennsylvania* v. *The Wheeling & Bridge Co., et al.*, 13 How. 518; *Escanaba Co.* v. *Chicago*, 107 U. S. 678. So must the question before us turn on issues of degree.

The interrelation between train operations in local service with those in interstate service is the underlying basis of *Missouri, Kans. & Tex. Ry. Co.* v. *Texas*, 245 U. S. 484, which condemned a state law requiring passenger trains to leave on scheduled time, and of *St. Louis S. W. Ry.* v. *Arkansas*, 217 U. S. 136, which condemned a state statute and orders issued thereunder which required the furnishing of cars to shippers under specified conditions. Compliance with such train-service and car-service commands had its forbidden effect on interstate commerce because obedience, as does obedience to a train-limit law, would inevitably disturb operations in another state. In the latter case Mr. Justice White said:

> "Coming to the merits, we think it needs but statement to demonstrate that the ruling of the court below involved necessarily the assertion of power in the State to absolutely forbid the efficacious carrying on of interstate commerce, or, what is equivalent thereto, to cause the right to efficiently conduct such commerce to depend upon the willingness of the company to be subjected to enormous pecuniary penalties as a condition of the exercise of the right." (217 U. S. at 149.)

So far as we are aware, the only decisions of this Court which have sanctioned the application to interstate commerce of state laws directly imposing delays in train service are those sustaining the Georgia suspension of Sunday labor in *Hennington* v. *Georgia*, 163 U. S. 299, and sustaining statutes or administrative orders requiring the slowing down of trains at crossings and the furnishing of

train service to local stations. The considerations underlying Sunday observance laws are of an order which has no counterpart in a train-limit law. The decisions on curbing speed at crossings turn on questions of degree. The very statute sustained in *Southern Railway Co.* v. *King*, 217 U. S. 524, in the absence of facts showing an unreasonable burden on train operation, was denied application in *Seaboard Air Line Ry.* v. *Blackwell*, 244 U. S. 310, when an unreasonable burden was found on the basis of facts conceded by demurrer. This latter case is cited in the *Barnwell Brothers* case in support of the statement that "an unnecessarily harsh restriction, even though it is in the interest of safety, has been held to be unconstitutional." (303 U. S. 186-187, note 4.)

Statutes and commission orders compelling train service at local stations are of two main types. One merely requires that the service be furnished and can be satisfied by putting on additional local trains. The other compels service from interstate trains. The enforceability of either type depends upon whether the need for additional local service justifies the burden on commerce. The fact that the carrier has an option to put on additional local trains rather than to stop interstate trains does not foreclose inquiry or determine the answer. "Undoubtedly the alternative can be required, but only if the local facilities be inadequate. In other words, to justify the requirement the local conditions must justify the extra facility." So it was declared in *Chi. B. & Q. Ry.* v. *Wisconsin R. R. Com.*, 237 U. S. 220, 231, which held such an alternative order invalid.

Other statutes or orders have attempted to compel all trains to stop at a given station, as that condemned in *Illinois Central Railroad Co.* v. *Illinois*, 163 U. S. 142, or to compel all regular passenger trains to stop at county seats, as that condemned in *Cleveland &c Ry. Co.* v. *Illinois*, 177 U. S. 514, or to stop at junction points for service to passengers changing to or from branch lines, as that condemned

in *Herndon* v. *Chi. Rock Island & Pac. Ry.*, 218 U. S. 135, or they may apply to particular trains, as those condemned in *Atlantic Coast Line* v. *Wharton*, 207 U. S. 328; *Mississippi R. R. Com.* v. *Illinois Cent. R. R.*, 203 U. S. 335; *St. Louis & S. F. Ry.* v. *Pub. Serv. Comm.*, 254 U. S. 535; and *St. L.-S. F. Ry.* v. *Pub. Serv. Comm.*, 261 U. S. 369. In this latter case Mr. Justice McKenna, after quoting from an earlier opinion to the effect that it is for the Supreme Court to determine "the fact of local facilities", added that "There is, however, no inevitable test of the instances; the facts in each case must be considered." (261 U. S., at 371.) These facts deal with the adequacy of local facilities on the one hand, and the interruptions and delays to interstate service on the other.

In this comparison, some orders are sanctioned and others are condemned. As Mr. Justice Brown puts the issue in *Cleveland etc. Ry.* v. *Illinois*, *supra* (177 U. S. 514, 518):

> "Several acts in *pari materia* with the one under consideration have been before this court, and have been approved or disapproved as they have seemed reasonable or unreasonable, or bore more or less heavily upon the power of railways to regulate their trains in the respective and sometimes conflicting interests of local and through traffic."

Of the interests of the public and of the carriers adversely affected by unreasonable and excessive slowing down of passenger train service, Mr. Justice Brown adds:

> "We are not obliged to shut our eyes to the fact that competition among railways for through passenger traffic has become very spirited, and we think they have a right to demand that they shall not be unnecessarily hampered in their efforts to obtain a share of such traffic. It is evident, however, that neither the greater safety of their tracks, the superior comfort of their coaches or sleeping berths or the excellence of their tables would insure them such share, if they were unable to compete with their rivals in the matter of

> time. The great efforts of modern engineering have been directed to combining safety with the greatest possible speed in transportation, both by land and water. The public demand this; the railway and steamship companies are anxious in their own interests to furnish it, and local legislation ought not to stand in the way of it." (*Id.* 522.)

The demand and need for speed apply to freight trains as well as to passenger trains. Certainly even more applicable to a train-limit law than to a law requiring service at designated local stations is the further judgment of the Court as expressed by Mr. Justice Brown on the extraterritorial application of the statute there before it:

> "While the statute in question is operative only in the State of Illinois, it is obnoxious to the criticism made of the Louisiana statute in *Hall* v. *DeCuir*, 95 U. S. 485, that 'while it purports only to control the carrier when engaged within the State, it must necessarily influence his conduct to some extent in the management of his business throughout his entire voyage. * * * If each State was at liberty to regulate the conduct of carriers while within its jurisdiction, the confusion likely to follow could not but be productive of great inconvenience and unnecessary hardship.'" (*Id.* at 522.)

A state law which cannot be complied with except by conduct in another state is a more serious burden on interstate transportation than one which merely causes delay in reaching another state. A statute which forbids a widely-approved method of conducting interstate transportation is more of an obstruction to interstate commerce than one which merely requires interstate trains to add a local service by stopping at a local station. Such obstructions to interstate transportation fall on the shoulders of shippers and consignees throughout the country, with repercussions on all who are dependent on the product carried. Laws imposing such obstructions are in striking contrast and opposition to laws which facilitate interstate commerce by requiring qualified and sufficient operatives.

and adequate headlights or by forbidding heating appliances capable of starting fires in passenger cars on normal trips as well as in contingencies of collision or derailment.

State laws condemned because of their extraterritorial impact are not confined to laws which actually command or forbid conduct in other states. The steamboat regulation condemned in *Hall* v. *DeCuir*, 95 U. S. 485, did not command any action outside the state. It merely compelled it if the statute were to be complied with within the state. As Mr. Chief Justice Waite pointed out:

> "While it purports only to control the carrier when engaged within the State, it must necessarily influence his conduct to some extent in the management of his business throughout his entire voyage." (95 U. S. 489.)

While in *Wabash &c Railway Co.* v. *Illinois*, 118 U. S. 557, it was only because of conduct in Illinois that the carrier came within the terms of the state statute, the interstate transportation involved was said to be a unit and Illinois was denied the power to regulate the charge therefor, although the discrimination involved in the violation of its long-and-short-haul law was between two points in Illinois. After quoting from *Hall* v. *DeCuir*, *supra*, Mr. Justice Miller said:

> "The applicability of this language to the case now under consideration, of a continuous transportation of goods from New York to Central Illinois, or from the latter to New York, is obvious, and it is not easy to see how any distinction can be made. Whatever may be the instrumentalities by which this transportation from the one point to the other is effected, it is but one voyage, as much so as that of the steamboat on the Mississippi River. It is not the railroads themselves that are regulated by this act of the Illinois Legislature, so much as the charge for transportation, and, in language just cited, if each one of the States through whose territories these goods are transported can fix its own rules for prices, for modes of transit, for times and modes of delivery, and all the other incidents of

transportation to which the word 'regulation' can be applied, it is readily seen that the embarrassments upon interstate transportation, as an element of interstate commerce, might be too oppressive to be submitted to." (118 U. S. at 572.)

The vice of extraterritoriality was the essential basis of the decision in *Baldwin* v. *G. A. F. Seelig*, 294 U. S. 511, which held that a state may not forbid the local sale in less than the original package of milk purchased in other states at a price less than the regulated price to be paid to producers in the regulating state. New York did not punish any one for acts in Vermont nor dictate any conduct in Vermont. It admitted Vermont milk for local sales in New York on the same basis on which it permitted the sale of New York milk. It imposed no discrimination on the differentiating factor of state lines or of interstate commerce. It merely made conduct that was wholly lawful in the state of its occurrence a ground for denying a local market within its own borders. Similarly a state train-limit law has the mischief of spreading the practical effects of its prescription across its borders into neighboring states and requiring, even though not commanding, compliance there with the dictate which in terms is applicable only within its territory. Still more widespread are the practical effects of such a law on all enterprise in the country which would otherwise enjoy advantages of speedier and less costly interstate transportation service.

Even where there is no physical obstruction to interstate transportation, states are forbidden to extend their powers in practical effect beyond their borders to the prejudice of interstate carriers. Before Congress enacted provisions with respect to the charges of telegraph companies for the transmission of interstate messages, the application of state laws of liability was restricted to defaults occurring within the state. The state of destination could apply its rule of damages for defaults in delivery (*Western Union Telegraph Co.* v. *James*, 162 U. S. 650), but the state of

origin could not (*W. U. Telegraph Co.* v. *Pendleton*, 122 U. S. 347). In the *James* case, as noted in *West. Un. Tel. Co.* v. *Milling Co.*, 218 U. S. 406, at 420,

> "The principle determining the validity of the respective statutes was declared to be whether they could be 'fully carried out and obeyed without in any manner affecting the conduct of the company with regard to the performance of its duties in other States' ".

If it should be suggested that from some standpoints there is a technical legal distinction between dictating or penalizing conduct in other states and imposing for conduct within the state a requirement that can be complied with only by conforming thereto in other states, this cannot obscure the fact that, from a practical standpoint, what is coerced without being commanded may have the more disruptive effect on interstate commerce. This is particularly true when what is disrupted is such a physical unity as railroad transportation through intervening states between points of origin and of destination in widely separated states. Only in a few sporadic instances would there be a failure in delivery of an interstate message which would give occasion to invoke the statute of the state of origin as a basis of liability. The Train-Limit Law of Arizona by its necessary operation has extraterritorial effect whenever it applies to an interstate train. This extraterritorial effect is not only on the composition of trains in bordering states but on the efficiency and cost of service of transportation through many states. Looking at commerce among the states as a "practical conception" and exercising a practical judgment, we must recognize that Arizona undertakes to project her power beyond her borders by the necessary operation of her Train-Limit Law, and far more seriously than does a state undertaking to penalize delay in delivering a message in another state.

The same vice of extraterritoriality in the practical, though not in the legal, sense is the basis of the application of the canon of *forum non conveniens* to protect interstate

carriers from subjection to suit on causes of action which by reason of the locus of the transaction and the residence and activities of the parties are deemed to be unduly alien to the forum. (*Davis* v. *Farmers Co-operative Co.*, 262 U. S. 312; *Michigan Central* v. *Mix*, 278 U. S. 492; *Atchison Ry. Co.* v. *Wells*, 265 U. S. 101; *Denver & R. G. W. R. Co.* v. *Terte*, 284 U. S. 284.) In the territorial sense courts have jurisdiction over transitory causes of action, and the cases in which the exercise of this jurisdiction is denied do not involve issues of the application of the law of a sister state. The principle of the cases is that it is an undue burden on interstate commerce to compel a carrier to defend lawsuits in a jurisdiction without a justifiable relationship to the parties or to the cause of action. Such impediments to the efficient conduct of commerce are sporadic and minimal compared with the impediments to interstate transportation both within and without the state which inexorably result from obedience to a state train-limit law.

The considerations which determine whether the suit is alien to the forum are considerations of degree, as are those throughout the law of state burdens on interstate commerce. This, it is recognized, is true even with respect to the extraterritorial repercussions of a state regulation of the composition of trains. "Local climatic conditions" and "hazards created by the particular local physical structures" may justify a state order to provide cabooses in switching operations in terminal yards located within the state even though the terminal services extend to a point on the near border of an adjoining state (*Terminal Assn.* v. *Trainmen*, 318 U. S. 1), while more onerous and less justifiable requirements on a street car line, as recognized in the *Terminal* case, would exceed a state's power. *South Covington Ry.* v. *Covington*, 235 U. S. 537. The fact that these two cases fall on different sides of the line establishes that the line is there and must be drawn in each case upon a consideration of all the circumstances.

The conditions faced by trainmen in the switching operations of the Terminal Railroad Association of St. Louis, if they must ride on the tops and sides of cars in all kinds of weather and with the hazards of structures along and over the tracks, are so different from the conditions faced by trainmen who ride in a caboose at the end of trains of more than seventy cars that from a practical standpoint they are not comparable. Equally remote from anything approaching comparability are the burdens or the extraterritorial effects of continuing a caboose across a boundary river and the burdens and extraterritorial effects of a state train-limit law. Such wide differences and others even more serious, it is submitted, inevitably call for a difference of judgment if the principle of relative benefit and burden which runs through all the cases is to find application here.

The concern of the Commerce Clause with the inevitable extraterritorial effects of the operation of a state train-limit law is not confined to the resulting burden and confusion on the physical operations of the carriers. It extends to the relations between the states in the federal system. No state is entitled to impose its policy on its neighbors where their concern is as great as that of the one which would set a standard not only for itself but for others. The overwhelming majority of the states have positively rejected or have failed to adopt the idea of Arizona with respect to long-train operation. They have preferred such operation to the imposition of an arbitrary limit. The advantages accruing to safety from the reduction in the number of trains and train operations, as established by the record here, are impelling considerations in favor of such a preference. States which feel the force of such considerations are entitled to their choice in leaving train operations within their borders to the standard methods obtaining generally throughout the country. This choice is foreclosed if such standard methods must be departed from because of the inescapable necessity of running more

trains for a shorter or longer part of the route within the state in order to comply with the conditions set by barriers at the boundary of a neighboring state.

Any reliance by the state on the precedents which have permitted the application of so-called "full-crew" laws to interstate trains (*St. L. & Iron Mtn. Ry.* v. *Arkansas*, 240 U. S. 518; *Chicago, R. I. & Pac. Ry. Co.* v. *Arkansas*, 219 U. S. 453; *Missouri Pacific R. Co.* v. *Norwood*, 283 U. S. 249) neglects the vital distinction between the effect on transportation of such laws and that of a train-limit law. We have no inclination to minimize the serious financial burdens imposed by a so-called "full-crew" law or to accept that, as a practical matter, the considerations of safety advanced in its support are sufficient to warrant those burdens. A fuller presentation of all the factual elements than has heretofore been given to this Court might conceivably invite the same reconsideration as was given to the effects of the law requiring the drastic slowing down of trains at highway crossings. (See *Southern Ry.* v. *King* and *Seaboard Air Line Ry.* v. *Blackwell*, *supra*.) However that may be, a law prescribing an increase in the number of operatives is not an obstruction to physical operation of trains.

In contrast with a train-limit law, a full-crew law deals not with any physical characteristics of trains but with the number of the crew to operate them. It adds no other expense to operations than the wages of the extra employees. It has no extraterritorial operation beyond that incident to picking up and dropping the additional employees at the nearest stations or division points outside the state. It involves no extra switching and incident delays. It breaks no trains and leaves no cars standing on the track. It does not prevent the use of facilities to their best advantage. It involves no waste of expensive equipment and construction. It causes no delay between terminal and terminal, between division point and division point. It upsets no schedules. It does not multiply the

number of meets and passes, either within or without the state. It adds no hazards to other trains or to persons on highways which cross the tracks. It does not discourage improvement of structure and equipment to facilitate service and promote safety. It does not delay or interfere with the movement of persons or goods in interstate commerce. It does not lessen the carrying capacity of the railroad facilities and threaten the adequacy of the railroads to meet transportation requirements in times of heavy traffic.

In all these respects a train-limit law differs from a full-crew law. A train-limit law dictates the physical makeup of interstate trains. It blocks the entry from without the state of trains lawful under the legislation of Congress and of neighboring states, of trains consisting of cars complying with detailed specifications set forth in orders of the Interstate Commerce Commission under authority delegated by Congress. It increases the hazards of train operation by multiplying the number of trains, the number of meets and passes, the number of couplings and uncouplings of cars and locomotives, the number of fatalities at highway crossings. The only adverse effect on safety which can be caused by a full-crew law is that more employees may be affected by some single accident. A train-limit law multiplies the number of accidents and correspondingly both the number and the variety of the persons injured by them. Despite great improvement achieved by the railroads in recent years in the reduction of the accident rate, accidents must still occur when human beings operate trains. The fewer the trains needed to carry the commerce of the country, the fewer must be the number of accidents.

Quite aside from the increase in physical hazards caused by a train-limit law as contrasted with a full-crew law, there is another distinction equally vital. A regulation of physical operations deals with a subject more completely and exclusively national in character than a regulation con-

fined to the number of personnel. This is a fundamental difference from the standpoint of the obstruction and disorder which would be inflicted by diversities and contradictions in the regulations of different states. Checkerboard variation in permissible length of trains, with the alternating areas bounded only by political lines which have no natural relation to the conditions or the needs of transcontinental railroad operation, is obviously fatal to the desirable operation of a national railroad system on which the welfare of the Nation depends. The subject on which a train-limit law impinges is so controllingly national in character that, as the cases and the opinions make clear, if any restriction at all is needed, it should be embodied in a single uniform rule prescribed and administered by a single hand.

The contrast between a train-limit law and a full-crew law is reinforced by a consideration of the precedents invoked in the first full-crew case. The Court clearly adjudged the burden of the full-crew law to be a minimal one, so far as its obstruction to train operations is concerned, when it classed it with the group of laws requiring the licensing of engineers to guard against those of reckless or intemperate habits (*Smith* v. *Alabama*, 124 U. S. 465) or afflicted with color blindness (*Nashville, &c Railway* v. *Alabama*, 128 U. S. 96), and forbidding the use of stoves inside passenger cars except in emergencies or when the car is standing still (*N. Y., N. H. and H. Railroad* v. *New York*, 165 U. S. 628). Compliance with such laws, like compliance with a full-crew law which is grouped with them, leaves the efficiency and economy of interstate railroad operation free from any such invasions as that projected by a train-limit law. Similarly, a requirement of adequate headlights on locomotives (*Atlantic Coast Line* v. *Georgia*, 234 U. S. 280) has no obstructive effect on efficient transportation and has the special local justification of safeguarding the approaches at highway crossings—a result quite the opposite from that ensuing from an enforced

increase in the number of trains needed to carry the same volume of traffic.

We might multiply indefinitely the references to precedents which, on the issue whether state interferences with interstate commerce are moderate or excessive, have found some on one side of the line and others on the other. We have confined ourselves to those which seem to us to involve subject matters most nearly analogous to the one at bar. Since each case must turn on the particularities of its own special facts, we submit the issue here on the basis of the facts established by the findings, recorded in official reports, and known to this Court from experience and familiar sources of which it may take judicial notice. We can find no obstruction to interstate commerce that has been sanctioned because of so illusory a local advantage. We can find few cases in which so serious an interference with a vital national interest has been involved and none in which it has been sustained.

This case, we believe, rests solidly on the underlying basis of *Gibbons* v. *Ogden*, 9 Wheat. 1, in which an attempted state frustration of the benefits of invention and of improvement in methods of transportation was first condemned. The frustration here may be thought less serious, except that it cannot be avoided by payment to a licensee, but what is frustrated is of the same order and in various respects of greater magnitude. From the standpoint of essential service to the Nation, the improvements in railroading in recent years, in view of the scope of the railroad enterprise, are on a par with the early application of steam as motive power for vessels on inland waterways. The national interest in this increased effectiveness has been recognized, emphasized, and fostered by the National Congress vested with power over the instrumentalities on which the welfare of the Nation depends.

There can be no doubt that to this national interest the Arizona Train-Limit Law is opposed. The contrary can hardly be seriously urged. Can it be said that there is

adverse local interest strong enough to justify the damage to the national interest? Not only is there nothing peculiarly local to Arizona in its claim in support of its statute, but the interest in safety which it shares with other states and with the carriers and with the Nation is in its totality infringed rather than conserved by the restriction it has imposed. We submit, therefore, that on a realistic weighing of any possible local advantages to be derived therefrom, the Arizona Train-Limit Law must fall as an unconstitutional obstruction to interstate commerce.

VIII.

THE ARIZONA SUPREME COURT WHOLLY DISREGARDED THE DETERMINATIVE FACTS.

Throughout our consideration of constitutional principles and of the precedents applying them, we have emphasized that the legal doctrines and canons of judgment point to the necessity of determining each case on the basis of a consideration and comparison of all the relevant facts. In careful compliance with these appropriate canons for passing on the constitutional issues raised by the Arizona Train-Limit Law, the trial court in deciding this case in favor of the appellant made elaborate findings of fact. These covered the effect of the statute on the safety of all train operation in Arizona, the burden on the appellant in complying with the law and the consequent physical obstruction and delays imposed on interstate transportation both within and without the state. These findings of fact were not contested in the opinion of the State Supreme Court in reversing the judgment of the trial court. The State Supreme Court made no new findings, drew no contrary inferences of fact from the evidence in the record, and passed no criticism on the proof received. Instead of this, its reversal of the judgment of the trial court seems to have been based solely on the assumption of a rule of law that the statute was justified by the police power of the state notwithstand-

ing its effects on interstate commerce, and that in determining this, no consideration need be given to the facts found by the trial court or shown by the evidence. Its idea seemed to be that the only question to be passed upon was whether it might rationally be assumed that the Arizona statute bore some reasonable relation to safety.

Therefore we have in this case no judgment on the basis of a factual determination other than the judgment of the trial court in favor of the appellant.

This analysis of the action of the State Supreme Court is confirmed by the position taken by the appellee in its brief. The only factual judgment which that brief attributes to the State Supreme Court is a conclusion that the Train-Limit Law has a rational relation to safety. Such a conclusion the appellee calls the "ultimate fact" in the case, and by this it means that it is the only fact which need be determined. In regarding the action of the court below as a sufficient performance of judicial duty, appellee necessarily relies upon the assumption that the sole constitutional issue in the case is whether one can find in a train-limit law some rational relation to safety. Appellee excludes from consideration and concedes that the State Supreme Court excluded from consideration all questions of degree and all questions of fact as to the resulting burden on interstate commerce.

This raises the basic question whether the facts as to burden and benefit are pertinent to judicial judgment on the constitutional issue. On this question, the decisions and the opinions of this Court, in cases sustaining state laws as well as in those holding their application unconstitutional, are uniformly contrary to the action and lack of action of the Arizona Supreme Court.

This basic question is of more far-reaching concern in the interpretation and application of the Commerce Clause of the Federal Constitution than is the decision of any single specific controversy. In view of the mode of disposing of this controversy by the Arizona Supreme Court, the

authoritative pronouncement of this Court is essential to protect the national interest in the due freedom of interstate commerce from decisions of state courts sanctioning the application of state statutes on a theory or assumption that the competing factual considerations are not a matter for judicial inquiry and determination and judgment.

The invalidity of any such action by a state court is established by *Nashville, C. & St. L. Ry.* v. *Walters*, 294 U. S. 405, in which a state supreme court was reversed for a failure to give consideration to facts found by the trial court as material to the determination of a contention founded on the Fourteenth Amendment. More imperative still is a full consideration of facts bearing on the appropriate disposition of a Commerce Clause issue. The only objection relied on by the carrier in the *Walters* case was that it could not under the canons set by the requirement of due process of law be subjected to the expense of contributing to the cost of an underpass constructed primarily for the convenience of fast, long-haul motor carriage of passengers and goods. When, as here, the constitutional objections extend far beyond expense and embrace grievous impediments to efficient service by the railroads to the Nation, a state court clearly cannot be permitted to discountenance those objections in complete disregard of the facts.

This raises a question as to the proper disposition of an appeal from a judgment by a state supreme court which has thus acted in disregard of a constitutional requirement. In the *Walters* case, this Court required the State Supreme Court to consider the significance and persuasiveness of the findings and whether they were supported by the evidence, which, like the Arizona Supreme Court here, it had previously failed to undertake. The facts there in issue were for the most part peculiar to the locality of the underpass and to the particular rail and motor traffic involved. Thus there were special reasons why this Court in its discretion sent that case back to the State Supreme Court to do what it had left undone.

Here, however, there is no need for a similar remand. The subject matter of dispute in this case is no single, isolated and peculiar situation such as was involved in the *Walters* case. The pertinent facts already here in the record are drawn largely from official government reports. These reports contain the statistics on accidents and afford sufficient basis for weighing the claim on behalf of the statute that it is justified by considerations of promoting safety. On the other side of the scale, it is for this Court to weigh the national interest in superior efficiency in conducting interstate transportation and to give effect to the policies of Congress in promoting this national interest. It is for this Court to compare the evils of diversity of regulation by different states with the superiority of a uniform rule coming from the single hand of national authority if at any time Congress should deem it desirable to withdraw from interstate carriers the full freedom over train length which it has thus far not disturbed. On such matters, no further light from the State Supreme Court is needed for the correct disposition of this controversy.

On the ultimate weight to be accorded to duly established facts, neither the State Legislature nor the State Supreme Court can foreclose independent consideration and judgment by this Court. "This Court will determine for itself what is the necessary operation and effect of a state law challenged on the ground that it interferes with or burdens interstate commerce." *Lacoste* v. *Dept. of Conservation*, 263 U. S. 545, at 550. The "accommodation of the competing demands of the state and national interests involved" (*Parker* v. *Brown*, 317 U. S. 341, at 362) is for the ultimate judgment of this tribunal. Fully open to the consideration of this Court are both the "examination of the evidence" and the use of "available data" of which it "may take judicial notice." *Id.* at 363. In a case in which the facts found by the trial court are not questioned by the State Supreme Court and in which the pertinent data are derived largely from official government reports, there is available

in the record here an ample basis for the orderly and final disposition of this litigation through the exercise by this Court of its judgment in weighing the competing demands of state and national interests.

The contention of the appellee that the judiciary is powerless to afford a remedy against even the most extreme obstructions to interstate commerce flies in the face of a century of constitutional history from *Gibbons* v. *Ogden*, 9 Wheat. 1, to date. The contention that only Congress can grant relief is revolutionary. It asks this Court to wipe from the books every decision in which state statutes have been judicially condemned for their unjustified burden on commerce and to render inapposite and superfluous scores of opinions in which the degree of burden has been considered and weighed. "Continuity with the past" may, as Mr. Justice Holmes observed, be "only a necessity and not a duty," ("Law in Science and Science in Law," 12 Harv. Law Rev. 443, 444, Collected Legal Papers, 210, 211), but it is none the less imperative for that. As pointed out in the brief for the United States as *amicus curiae*, Congress for a century has been warranted in relying on the established doctrine and thus in assuming that no action on its part is necessary to foreclose the application to interstate commerce of state regulations which fall within the description of those which have been judicially condemned.

Such occasional suggestions of judicial impotence as have been put forth *arguendo* in dissenting opinions have recognized that state laws which discriminate against interstate commerce must be held invalid by judicial condemnation. Such recognition removes whatever support appellee's position might invoke from the language or absence of language in the Constitution, since there is no more express condemnation of discriminatory state regulations than of excessive and unjustified ones. As Mr. Justice Holmes observed in *Missouri* v. *Holland*, 252 U. S. 416, 433, "The case before us must be considered in the light of our whole experience and not merely in that of what was said a hun-

dred years ago." And in direct application to the precise problem now before us, the same Justice said in an address:

> "I do not think the United States would come to an end if we lost our power to declare an Act of Congress void. I do think the Union would be imperiled if we could not make that declaration as to the laws of the several States. For one in my place sees how often a local policy prevails with those who are not trained to national views and how often action is taken that embodies what the Commerce Clause was meant to end." (Holmes, "Law and the Court," Collected Legal Papers, 295-296.)

In this respect there is a vital distinction between state police regulations questioned only as violations of the Fourteenth Amendment without any feature of extraterritorial application or repercussions and state police regulations questioned as obstructions to the free flow of commerce among the several states. The Fourteenth Amendment, unlike the Commerce Clause, does "not express a necessary adjustment in the distribution of powers in the federal system." (Frankfurter, "Mr. Justice Holmes and the Constitution," 41 Harv. Law Rev. 121, 126.) As to the Commerce Clause issues, the same authority declares:

> "In a federated nation, especially one as vast in its territory and varied in its interests as ours, the authority must be lodged somewhere to make necessary accommodations between states and the central government. The Supreme Court is that ultimate arbiter, and it relies largely on the commerce clause for its control. But to believe that this power is exercised by distilling meaning out of the words of the Constitution would be sheer illusion. Decisions under the commerce clause, whether allowing or confining state action, whether sanctioning or denying federal power, are inevitably exercises in judgment." (*Id.* at 125.)

So revolutionary is the appellee's assertion of judicial impotence to enforce the canons of the Commerce Clause that necessarily no precedents are or can be invoked in its

support. Familiar expressions in judicial opinions that certain issues are legislative in character mean something quite different from appellee's contention that a state may do what it pleases to interstate commerce so long as what it does has some rational relation to safety. They mean that within the realm in which the state is free to act, its choice of expedients is for the determination of its legislature. They do not mean that it is for the state legislature to determine the constitutional scope of state powers to regulate interstate commerce.

The significance of the contrary contention of the appellee is not confined to its concurrence in our interpretation of the disposition of the issue by the State Supreme Court. To its recognition that the State Supreme Court did not give any consideration to the extent of the burden imposed on interstate commerce by the Arizona Train-Limit Law, the appellee adds its insistence that no such consideration is necessary. Such insistence may fairly be thought to imply a recognition and confession that the acceptance of such a position is indispensable to the affirmance of the judgment below. Only desperation on the basis of well established principles would seem an adequate explanation of reliance on a contention that this Court and all others are in duty bound to close their eyes to the relation between the contribution of a Train-Limit Law to safety on the one hand and its obstruction to interstate commerce on the other.

IX.

CONCLUSION.

This case presents an extraordinary combination of circumstances and considerations leading surely to the conclusion that the Arizona Train-Limit Law is repugnant to the Commerce Clause of the Constitution.

Certain of these considerations, standing alone and without regard to the others, might well be sufficient to establish the invalidity of the state statute. There is, however,

no occasion here to confine reliance to any single, isolated practical or legal factor. What is combined in reality cannot in law rightly be dismembered and dispersed into disconnected fragments. The statute must be judged in the light of the cumulation and association of all surrounding facts, circumstances and conditions.

It is respectfully submitted that the judgment of the Arizona Supreme Court should be reversed and that the Arizona Train-Limit Law should be held unconstitutional.

Respectfully submitted,

J. Carter Fort,
Thomas Reed Powell,
Chauncey G. Austin, Jr.,
Attorneys for the Association of American Railroads.

Washington, D. C.,
March 8, 1945.

SUPREME COURT OF THE UNITED STATES.

No. 56.—October Term, 1944.

Southern Pacific Company, Appellant, vs. State of Arizona, *ex rel.* John L. Sullivan, Attorney General of the State of Arizona. } Appeal from the Supreme Court of the State of Arizona.

[June 18, 1945.]

Mr. Chief Justice Stone delivered the opinion of the Court.

The Arizona Train Limit Law of May 16, 1912, Arizona Code Ann., 1939, § 69-119, makes it unlawful for any person or corporation to operate within the state a railroad train of more than fourteen passenger or seventy freight cars, and authorizes the state to recover a money penalty for each violation of the Act. The questions for decision are whether Congress has, by legislative enactment, restricted the power of the states to regulate the length of interstate trains as a safety measure and, if not, whether the statute contravenes the commerce clause of the federal Constitution.

In 1940 the State of Arizona brought suit in the Arizona Superior Court against appellant, the Southern Pacific Company, to recover the statutory penalties for operating within the state two interstate trains, one a passenger train of more than fourteen cars, and one a freight train of more than seventy cars. Appellant answered, admitting the train operations, but defended on the ground that the statute offends against the commerce clause and the due process clause of the Fourteenth Amendment and conflicts with federal legislation. After an extended trial, without a jury, the court made detailed findings of fact on the basis of which it gave judgment for the railroad company. The Supreme Court of Arizona reversed and directed judgment for the state. — Ariz. —, 145 Pac. 2d 539. The case comes here on appeal under § 237(a) of the Judicial Code, appellant raising by its assignments of error the questions presented here for decision.

The Supreme Court left undisturbed the findings of the trial court and made no new findings. It held that the power of the

state to regulate the length of interstate trains had not been restricted by Congressional action. It sustained the Act as a safety measure to reduce the number of accidents attributed to the operation of trains of more than the statutory maximum length, enacted by the state legislature in the exercise of its "police power". This power the court held extended to the regulation of the operations of interstate commerce in the interests of local health, safety and well-being. It thought that a state statute, enacted in the exercise of the police power, and bearing some reasonable relation to the health, safety and well-being of the people of the state, of which the state legislature is the judge, was not to be judicially overturned, notwithstanding its admittedly adverse effect on the operation of interstate trains.

Purporting to act under § 1, paragraphs 10-17 of the Interstate Commerce Act, 24 Stat. 379 as amended (49 U. S. C. § 1 *et. seq.*), the Interstate Commerce Commission, as of September 15, 1942, promulgated as an emergency measure Service Order No. 85, 7 Fed. Reg. 7258, suspending the operation of state train limit laws for the duration of the war, and denied an application to set aside the order. *In the Matter of Service Order No. 85*, 256 I. C. C. 523. Paragraph 15 of § 1 of the Interstate Commerce Act empowers the Commission, when it is "of opinion that shortage of equipment, congestion of traffic, or other emergency requiring immediate action exists in any section of the country", to make or suspend rules and practices "with respect to car service," which includes by paragraph 10 of § 1 "the use, control, supply, movement, distribution, exchange, interchange, and return" of locomotives and cars, and the "supply of trains". Paragraph 16 of § 1 provides that when a carrier is unable properly to transport the traffic offered, the Commission may make reasonable directions "with respect to the handling, routing, and movement of the traffic of such carrier and its distribution over other lines of roads." The authority of the Commission to make Order No. 85 is currently under attack in *Johnston* v. *United States*, Civil Action No. 1408, pending in the Western District of Oklahoma.

The Commission's order was not in effect in 1940 when the present suit was brought for violations of the state law in that year, and the Commission's order is inapplicable to the train operations here charged as violations. Hence the question here is not

of the effect of the Commission's order, which we assume for purposes of decision to be valid, but whether the grant of power to the Commission operated to supersede the state act before the Commission's order. We are of opinion that, in the absence of administrative implementation by the Commission, § 1 does not of itself curtail state power to regulate train lengths. The provisions under which the Commission purported to act, phrased in broad and general language, do not in terms deal with that subject. We do not gain either from their words or from the legislative history any hint that Congress in enacting them intended, apart from Commission action, to supersede state laws regulating train lengths. We can hardly suppose that Congress, merely by conferring authority on the Commission to regulate car service in an "emergency", intended to restrict the exercise, otherwise lawful, of state power to regulate train lengths before the Commission finds an "emergency" to exist.

Congress, in enacting legislation within its constitutional authority over interstate commerce, will not be deemed to have intended to strike down a state statute designed to protect the health and safety of the public unless its purpose to do so is clearly manifested, *Reid* v. *Colorado*, 187 U. S. 137, 148; *Missouri Pacific Ry.* v. *Larabee Mills*, 211 U. S. 612, 621, *et seq.*; *Missouri, K. & T. Ry. Co.* v. *Harris*, 234 U. S. 412, 418-419; *Welch Co.* v. *New Hampshire*, 306 U. S. 79, 85; *Allen-Bradley Local* v. *Board*, 315 U. S. 740, 749, or unless the state law, in terms or in its practical administration, conflicts with the Act of Congress, or plainly and palpably infringes its policy. *Sinnot* v. *Davenport*, 22 How. 227, 243; *Missouri, K. & T. Ry.* v. *Haber*, 169 U. S. 613, 623; *Savage* v. *Jones*, 225 U. S. 501, 533; *Carey* v. *South Dakota*, 250 U. S. 118, 122; *Atchison Ry. Co.* v. *Railroad Comm.*, 283 U. S. 380, 391; *Townsend* v. *Yeomans*, 301 U. S. 441, 454.

The contention, faintly urged, that the provisions of the Safety Appliance Act, 45 U. S. C. §§ 1 and 9, providing for brakes on trains, and of § 25 of Part I of the Interstate Commerce Act, 49 U. S. C., § 26(b), permitting the Commission to order the installation of train stop and control devices, operate of their own force to exclude state regulation of train lengths, has even less support. Congress, although asked to do so,[1] has declined to

[1] See Senate Report No. 416, 75th Cong., 1st Sess.; 81 Cong. Rec. 7596; and Hearings before House Committee on Interstate and Foreign Commerce, 75th Cong., 3d Sess., S. 69, Train Lengths.

pass legislation specifically limiting trains to seventy cars. We are therefore brought to appellants principal contention, that the state statute contravenes the commerce clause of the Federal Constitution.

Although the commerce clause conferred on the national government power to regulate commerce, its possession of the power does not exclude all state power of regulation. Ever since *Willson* v. *Black-Bird Creek Marsh Co.*, 2 Pet. 245, and *Cooley* v. *Board of Wardens*, 12 How. 299, it has been recognized that, in the absence of conflicting legislation by Congress, there is a residuum of power in the state to make laws governing matters of local concern which nevertheless in some measure affect interstate commerce or even, to some extent, regulate it. *Minnesota Rate Cases*, 230 U. S. 352, 399-400; *South Carolina Highway Dept.* v. *Barnwell Bros.*, 303 U. S. 177, 187, *et seq.*; *California* v. *Thompson*, 313 U. S. 109, 113-14 and cases cited; *Parker* v. *Brown*, 317 U. S. 341, 359-60. Thus the states may regulate matters which, because of their number and diversity, may never be adequately dealt with by Congress. *Cooley* v. *Board of Wardens*, *supra*, 319; *South Carolina Highway Dept.* v. *Barnwell Bros.*, *supra*, 185; *California* v. *Thompson*, *supra*, 113; *Duckworth* v. *Arkansas*, 314 U. S. 390, 394; *Parker* v. *Brown*, *supra*, 362, 363. When the regulation of matters of local concern is local in character and effect, and its impact on the national commerce does not seriously interfere with its operation, and the consequent incentive to deal with them nationally is slight, such regulation has been generally held to be within state authority. *South Carolina Highway Dept.* v. *Barnwell Bros.*, *supra*, 188 and cases cited; *Lone Star Gas Co.* v. *Texas*, 304 U. S. 224, 238; *Milk Board* v. *Eisenberg Co.*, 306 U. S. 346, 351; *Maurer* v. *Hamilton*, 309 U. S. 598, 603; *California* v. *Thompson*, *supra*, 113-4 and cases cited.

But ever since *Gibbons* v. *Ogden*, 9 Wheat. 1, the states have not been deemed to have authority to impede substantially the free flow of commerce from state to state, or to regulate those phases of the national commerce which, because of the need of national uniformity, demand that their regulation, if any, be prescribed by a single authority.[2] *Cooley* v. *Board of Wardens*, *supra*, 319; *Leisy*

[2] In applying this rule the Court has often recognized that to the extent that the burden of state regulation falls on interests outside the state, it is unlikely to be alleviated by the operation of those political restraints normally exerted when interests within the state are affected. Cooley v. Board

v. *Hardin*, 135 U. S. 100, 108, 109; *Minnesota Rate Cases*, *supra*, 399-400; *Edwards* v. *California*, 314 U. S. 160, 176. Whether or not this long recognized distribution of power between the national and the state governments is predicated upon the implications of the commerce clause itself, *Brown* v. *Maryland*, 12 Wheat. 419, 447; *Minnesota Rates Cases*, *supra*, 399, 400; *Pennsylvania* v. *West Virginia*, 262 U. S. 553, 596; *Baldwin* v. *Seelig*, 294 U. S. 511, 522; *South Carolina Highway Dept.* v. *Barnwell Bros.*, *supra*, 185, or upon the presumed intention of Congress, where Congress has not spoken, *Welton* v. *Missouri*, 91 U. S. 275, 282; *Hall* v. *DeCuir*, 95 U. S. 485, 490; *Brown* v. *Houston*, 114 U. S. 622, 631; *Bowman* v. *Chicago, etc. Ry.*, 125 U. S. 465, 481-2; *Leisy* v. *Hardin*, *supra*, 109; *In re Rahrer*, 140 U. S. 545, 559-60; *Brennan* v. *Titusville*, 153 U. S. 289, 302; *Covington &c. Bridge Co.* v. *Kentucky*, 154 U. S. 204, 212; *Graves* v. *New York ex rel. O'Keefe*, 306 U. S. 466, 479, n., Dowling, Interstate Commerce and State Power, 27 Va. Law Rev. 1, the result is the same.

In the application of these principles some enactments may be found to be plainly within and others plainly without state power. But between these extremes lies the infinite variety of cases, in which regulation of local matters may also operate as a regulation of commerce, in which reconciliation of the conflicting claims of state and national power is to be attained only by some appraisal and accommodation of the competing demands of the state and national interests involved. *Parker* v. *Brown*, *supra*, 362; *Terminal Railroad Ass'n* v. *Brotherhood*, 318 U. S. 1, 8; see *DiSanto* v. *Pennsylvania*, 273 U. S. 34, 44 (and compare *California* v. *Thompson*, *supra*); *Illinois Gas Co.* v. *Public Service Co.*, 314 U. S. 498, 504-5.

For a hundred years it has been accepted constitutional doctrine that the commerce clause, without the aid of Congressional legislation, thus affords some protection from state legislation inimical to the national commerce, and that in such cases, where Congress has not acted, this Court, and not the state legislature, is

---

of Wardens, *supra*, 315; Gilman v. Philadelphia, 3 Wall. 713, 731; Escanaba Co. v. Chicago, 107 U. S. 678, 683; Robbins v. Shelby County Taxing Dist., 120 U. S. 489, 499; Lake Shore & M. S. R. Co. v. Ohio, 173 U. S. 285, 294; South Carolina Highway Dept. v. Barnwell Bros., *supra*, 185, n.; McGoldrick v. Berwind-White Co., 309 U. S. 33, 46, n.; cf. McCulloch v. Maryland, 4 Wheat. 316, 428; Pound v. Turck, 95 U. S. 459, 464; Gloucester Ferry Co. v. Pennsylvania, 114 U. S. 196, 205; Helvering v. Gerhardt, 304 U. S. 405, 412.

under the commerce clause the final arbiter between the competing demands of state and national interests. *Cooley* v. *Board of Wardens, supra; Kansas Southern Ry.* v. *Kaw Valley District*, 233 U. S. 75, 79; *South Covington Ry.* v. *Covington*, 235 U. S. 537, 546; *M., K. & T. R. Co.* v. *Texas*, 245 U. S. 484, 488; *St. Louis & S. F. Ry.* v. *Public Service Comm'n*, 254 U. S. 535, 537; *Foster-Fountain Packing Co.* v. *Haydel*, 278 U. S. 1, 10; *Gwin, etc. Inc.* v. *Henneford*, 305 U. S. 434, 441; *McCarroll* v. *Dixie Lines*, 309 U. S. 176.

Congress has undoubted power to redefine the distribution of power over interstate commerce. It may either permit the states to regulate the commerce in a manner which would otherwise not be permissible, *In re Rahrer, supra*, 561-62; *Adams Express Co.* v. *Kentucky*, 238 U. S. 190, 198; *Rosenberger* v. *Pacific Express Co.*, 241 U. S. 48, 50, 51; *Clark Distilling Co.* v. *Western Maryland Ry. Co.*, 242 U. S. 311, 325-6; *Whitfield* v. *Ohio*, 297 U. S. 431, 438-40; *Kentucky Whip & Collar Co.* v. *Illinois Central R. Co.*, 299 U. S. 334, 350-51; *Hooven & Allison* v. *Evatt*, No. 38, 1944 Term, decided April 9, 1945, slip opinion p. 20, or exclude state regulation even of matters of peculiarly local concern which nevertheless affect interstate commerce. *Addyston Pipe & Steel Co.* v. *United States*, 175 U. S. 211, 230; *Louisville & Nashville R. R. Co.* v. *Mottley*, 219 U. S. 467; *Houston & Texas Ry.* v. *United States*, 234 U. S. 342; *American Express Co.* v. *Caldwell*, 244 U. S. 617, 626; *Ill. Cent. R. R. Co.* v. *Public Utilities Comm'n*, 245 U. S. 493, 506; *New York* v. *United States*, 257 U. S. 591, 601; *Commission* v. *Texas & N. O. R. Co.*, 284 U. S. 125, 130; *Penn. R. Co.* v. *Illinois Brick Co*, 297 U. S. 447, 459.

But in general Congress has left it to the courts to formulate the rules thus interpreting the commerce clause in its application, doubtless because it has appreciated the destructive consequences to the commerce of the nation if their protection were withdrawn. *Gwin, etc. Inc.* v. *Henneford, supra*, 441, and has been aware that in their application state laws will not be invalidated without the support of relevant factual material which will "afford a sure basis" for an informed judgment. *Terminal Railroad Ass'n* v. *Brotherhood, supra*, 8; *Southern Railway Co.* v. *King*, 217 U. S. 524. Meanwhile, Congress has accommodated its legislation, as have the states, to these rules as an established feature of our

constitutional system. There has thus been left to the states wide scope for the regulation of matters of local state concern, even though it in some measure affects the commerce, provided it does not materially restrict the free flow of commerce across state lines, or interfere with it in matters with respect to which uniformity of regulation is of predominant national concern.

Hence the matters for ultimate determination here are the nature and extent of the burden which the state regulation of interstate trains, adopted as a safety measure, imposes on interstate commerce, and whether the relative weights of the state and national interests involved are such as to make inapplicable the rule, generally observed, that the free flow of interstate commerce and its freedom from local restraints in matters requiring uniformity of regulation are interests safeguarded by the commerce clause from state interference.

While this Court is not bound by the findings of the state court, and may determine for itself the facts of a case upon which an asserted federal right depends, *Hooven & Allison* v. *Evatt*, *supra*, slip opinion p. 5, and cases cited, the facts found by the state trial court showing the nature of the interstate commerce involved, and the effect upon it of the train limit law, are not seriously questioned. Its findings with respect to the need for and effect of the statute as a safety measure, although challenged in some particulars which we do not regard as material to our decision, are likewise supported by evidence. Taken together the findings supply an adequate basis for decision of the constitutional issue.

The findings show that the operation of long trains, that is trains of more than fourteen passenger and more than seventy freight cars, is standard practice over the main lines of the railroads of the United States, and that, if the length of trains is to be regulated at all, national uniformity in the regulation adopted, such as only Congress can prescribe, is practically indispensable to the operation of an efficient and economical national railway system. On many railroads passenger trains of more than fourteen cars and freight trains of more than seventy cars are operated, and on some systems freight trains are run ranging from one hundred and twenty-five to one hundred and sixty cars in length. Outside of Arizona, where the length of trains is not restricted, appellant runs a substantial proportion of long trains. In 1939 on its com-

parable route for through traffic through Utah and Nevada from 66 to 85% of its freight trains were over 70 cars in length and over 43% of its passenger trains included more than fourteen passenger cars.

In Arizona, approximately 93% of the freight traffic and 95% of the passenger traffic is interstate. Because of the Train Limit Law appellant is required to haul over 30% more trains in Arizona than would otherwise have been necessary. The record shows a definite relationship between operating costs and the length of trains, the increase in length resulting in a reduction of operating costs per car. The additional cost of operation of trains complying with the Train Limit Law in Arizona amounts for the two railroads traversing that state to about $1,000,000 a year. The reduction in train lengths also impedes efficient operation. More locomotives and more manpower are required; the necessary conversion and reconversion of train lengths at terminals and the delay caused by breaking up and remaking long trains upon entering and leaving the state in order to comply with the law, delays the traffic and diminishes its volume moved in a given time, especially when traffic is heavy.

To relieve the railroads of these burdens, during the war emergency only, the Interstate Commerce Commission, acting under § 1 of the Interstate Commerce Act, suspended the operation of the state law for the duration of the war by its order of September 15, 1942, to which we have referred. In support of the order the Commission declared: "It was designed to save manpower, motive power, engine miles and train miles; to avoid delay in the movement of trains; to increase the efficient use of locomotives and cars and to augment the available supply thereof; and to relieve congestion of terminals caused by setting out and picking up cars on each side of the train limit law States." *In the Matter of Service Order No. 85*, 256 I. C. C. 523, 524. Appellant, because of its past compliance with the Arizona Train Law, has been unable to avail itself fully of the benefits of the suspension order because some of its equipment and the length of its sidings in Arizona are not suitable for the operation of long trains. Engines capable of hauling long trains were not in service. It can engage in long train operations to the best advantage only by rebuilding its road to some extent and by changing or adding

to its motive power equipment, which it desires to do in order to secure more efficient and economical operation of its trains.

The unchallenged findings leave no doubt that the Arizona Train Limit Law imposes a serious burden on the interstate commerce conducted by appellant. It materially impedes the movement of appellant's interstate trains through that state and interposes a substantial obstruction to the national policy proclaimed by Congress, to promote adequate, economical and efficient railway transportation service. Interstate Commerce Act, preceding § 1, 54 Stat. 899. Enforcement of the law in Arizona, while train lengths remain unregulated or are regulated by varying standards in other states, must inevitably result in an impairment of uniformity of efficient railroad operation because the railroads are subjected to regulation which is not uniform in its application. Compliance with a state statute limiting train lengths requires interstate trains of a length lawful in other states to be broken up and reconstituted as they enter each state according as it may impose varying limitations upon train lengths. The alternative is for the carrier to conform to the lowest train limit restriction of any of the states through which its trains pass, whose laws thus control the carriers' operations both within and without the regulating state.

Although the seventy car maximum for freight trains is the limitation which has been most commonly proposed, various bills introduced in the state legislatures provided for maximum freight train lengths of from fifty to one hundred and twenty-five cars, and maximum passenger train lengths of from ten to eighteen cars.[3] With such laws in force in states which are interspersed with those having no limit on train lengths, the confusion and difficulty with which interstate operations would be burdened under the varied system of state regulation and the unsatisfied need for uniformity in such regulation, if any, are evident.[4]

[3] One hundred sixty-four bills limiting train lengths have been introduced in state legislatures since 1920, of which only three were passed, in Nevada, Louisiana and Oklahoma. The Nevada and Louisiana laws were held unconstitutional and never enforced. Southern Pacific Co. *v.* Mashburn, 18 Fed. Supp. 393; Texas & New Orleans R. Co. *v.* Martin (No. 428—Equity, E. D. of La. 1936), unreported. The Arizona law, passed in 1912, was held unconstitutional in Atchison, T. & S. F. Ry. Co. *v.* La Prade, 2 Fed. Supp. 855, reversed on other grounds, 289 U. S. 444.

[4] Had these bills been passed a freight train running over established routes (from Virginia to Michigan for example) would normally proceed through states with a seventy-five car maximum (Virginia), a one hundred and twenty-five car maximum (West Virginia), a three thousand foot maximum

At present the seventy freight car laws are enforced only in Arizona and Oklahoma, with a fourteen car passenger car limit in Arizona. The record here shows that the enforcement of the Arizona statute results in freight trains being broken up and reformed at the California border and in New Mexico, some distance from the Arizona line. Frequently it is not feasible to operate a newly assembled train from the New Mexico yard nearest to Arizona, with the result that the Arizona limitation governs the flow of traffic as far east as El Paso, Texas. For similar reasons the Arizona law often controls the length of passenger trains all the way from Los Angeles to El Paso.

If one state may regulate train lengths, so may all the others, and they need not prescribe the same maximum limitation. The practical effect of such regulation is to control train operations beyond the boundaries of the state exacting it because of the necessity of breaking up and reassembling long trains at the nearest terminal points before entering and after leaving the regulating state. The serious impediment to the free flow of commerce by the local regulation of train lengths and the practical necessity that such regulation, if any, must be prescribed by a single body having a nation-wide authority are apparent.

The trial court found that the Arizona law had no reasonable relation to safety, and made train operation more dangerous. Examination of the evidence and the detailed findings makes it clear that this conclusion was rested on facts found which indicate that such increased danger of accident and personal injury as may result from the greater length of trains is more than offset by the increase in the number of accidents resulting from the larger number of trains when train lengths are reduced. In

(Ohio), and a seventy car limit (Michigan). A train from Arkansas to Wisconsin might be subjected to a fifty car maximum (Arkansas), one half mile (Mississippi), three thousand feet (Iowa), one and a half miles (Minnesota), and thirty three hundred feet (Wisconsin). A train running from Nebraska to California might be subject to a sixty, seventy five or eighty five maximum in Nebraska, to a limit fixed by commission in Kansas, to a sixty five car limit in Colorado, to a seventy five car limit in New Mexico, to a seventy car limit in Arizona, and to a seventy four car limit in California. A passenger train might be limited to fourteen cars in New Jersey, ten in Pennsylvania and eighteen in West Virginia.

[5] In Oklahoma three lines running from Chicago or Kansas City westpass through Oklahoma for distances of sixty, one hundred and seventeen and one hundred and forty three miles. Since no other state through which the traffic passes (except Arizona) restricts train lengths in any way, the effect of the Oklahoma law is to require through trains to be broken up for the short distances they pass through that state.

considering the effect of the statute as a safety measure, therefore, the factor of controlling significance for present purposes is not whether there is basis for the conclusion of the Arizona Supreme Court that the increase in length of trains beyond the statutory maximum has an adverse effect upon safety of operation. The decisive question is whether in the circumstances the total effect of the law as a safety measure in reducing accidents and casualties is so slight or problematical as not to outweigh the national interest in keeping interstate commerce free from interferences which seriously impede it and subject it to local regulation which does not have a uniform effect on the interstate train journey which it interrupts.

The principal source of danger of accident from increased length of trains is the resulting increase of "slack action" of the train. Slack action is the amount of free movement of one car before it transmits its motion to an adjoining coupled car. This free movement results from the fact that in railroad practice cars are loosely coupled, and the coupling is often combined with a shock-absorbing device, a "draft gear", which, under stress, substantially increases the free movement as the train is started or stopped. Loose coupling is necessary to enable the train to proceed freely around curves and is an aid in starting heavy trains, since the application of the locomotive power to the train operates on each car in the train successively, and the power is thus utilized to start only one car at a time.

The slack action between cars due to loose couplings varies from seven-eighths of an inch to one and one-eighth inches and, with the added free movement due to the use of draft gears, may be as high as six or seven inches between cars. The length of the train increases the slack since the slack action of a train is the total of the free movement between its several cars. The amount of slack action has some effect on the severity of the shock of train movements, and on freight trains sometimes results in injuries to operatives, which most frequently occur to occupants of the caboose. The amount and severity of slack action, however, are not wholly dependent upon the length of train, as they may be affected by the mode and conditions of operation as to grades, speed, and load. And accidents due to slack action also occur in the operation of short trains. On comparison of the number of slack action accidents in Arizona with those in Nevada, where the length of

trains is now unregulated, the trial court found that with substantially the same amount of traffic in each state the number of accidents was relatively the same in long as in short train operations. While accidents from slack action do occur in the operation of passenger trains, it does not appear that they are more frequent or the resulting shocks more severe on long than on short passenger trains. Nor does it appear that slack action accidents occurring on passenger trains, whatever their length, are of sufficient severity to cause serious injury or damage.

As the trial court found, reduction of the length of trains also tends to increase the number of accidents because of the increase in the number of trains. The application of the Arizona law compelled appellant to operate 30.08%, or 4,304, more freight trains in 1939 than would otherwise have been necessary. And the record amply supports the trial court's conclusion that the frequency of accidents is closely related to the number of trains run. The number of accidents due to grade crossing collisions between trains and motor vehicles and pedestrians, and to collisions between trains, which are usually far more serious than those due to slack action, and accidents due to locomotive failures, in general vary with the number of trains.[6] Increase in the number of trains results in more starts and stops, more "meets" and "passes", and more switching movements, all tending to increase the number of accidents not only to train operatives and other railroad employees, but to passengers and members of the public exposed to danger by train operations.

Railroad statistics introduced into the record tend to show that this is the result of the application of the Arizona Train Limit Law to appellant, both with respect to all railroad casualties within the state and those affecting only trainmen whom the train limit law is supposed to protect. The accident rate in Arizona is much higher than on comparable lines elsewhere, where there is no regulation of length of trains. The record lends support to the trial court's conclusion that the train length limitation increased rather than diminished the number of accidents. This is shown

[6] The record shows that in 1939 the number of slack accident casualties in the United States, 399, was only 6% of the number of train and train service casualties to railroad employees; 6,713. In that year three of the 399 slack accident casualties were fatal, whereas the average number of grade crossing casualties per year from 1935 to 1939 was 5,718. And in 1939, 1,394 persons were killed and 3,999 were injured in highway grade crossing accidents. I. C. C., Bureau of Statistics, Accident Bulletin No. 108, pp. 22–23.

by comparison of appellant's operations in Arizona with those in Nevada,[7] and by comparison of operations of appellant and of the Santa Fe Railroad in Arizona with those of the same roads in New Mexico,[8] and by like comparison between appellant's operations in Arizona and operations throughout the country.[9]

Upon an examination of the whole case the trial court found that "if short-train operation may or should result in any decrease in the number or severity of the 'slack' or 'slack-surge' type of accidents or casualties, such decrease is substantially more than offset by the increased number of accidents and casualties from other causes that follow the arbitrary limitation of freight trains to 70 cars . . . and passenger trains to 14 cars."

We think, as the trial court found, that the Arizona Train Limit Law, viewed as a safety measure, affords at most slight and dubious advantage, if any, over unregulated train lengths, because it results in an increase in the number of trains and train operations and the consequent increase in train accidents of a character generally more severe than those due to slack action. Its undoubted effect on the commerce is the regulation, without securing uniformity, of the length of trains operated in interstate commerce, which lack is itself a primary cause of preventing the free flow of commerce by delaying it and by substantially increasing its cost and impairing its efficiency. In these respects the case differs from those where a state, by regulatory measures affecting the commerce, has removed or reduced safety hazards without substantial interference with the interstate movement of trains. Such are measures abolishing the car stove, *New*

[7] With passenger traffic in Nevada 78% as heavy as in Arizona, from 1923 to 1938 two hundred and thirty-nine casualties were caused to persons by passenger trains in Arizona and one hundred and nine in Nevada. Between 1923 and 1939 five persons in Nevada and fourteen in Arizona were injured by sudden stops or jerks on passenger trains.

[8] Casualties to employees, occurring in freight train operations in New Mexico, have been substantially less in both number and frequency than in Arizona. From 1930 to 1940 there were one hundred and twenty-nine casualties to all classes of employees in New Mexico at the rate of 7.97 per million train miles, 12.84 per hundred million car miles. In Arizona there were two hundred and fifty-one casualties to employees, at the rate of 10.03 per million train miles, and 18.10 per hundred million car miles.

[9] On a national basis the findings show that while the national accident rate per hundred million car miles for all railroad employees and for trainmen decreased 70% to 66% respectively between 1923-1928 and 1935-1940, the rate for the Southern Pacific in Arizona declined 52.3% and 53.3%. Appellant's rate in Nevada decreased 71.1% and 69.1%

York, N. H. & H. R. Co. v. *New York*, 165 U. S. 628; requiring locomotives to be supplied with electric headlights, *Atlantic Coast Line* v. *Georgia*, 234 U. S. 280; providing for full train crews, *Chicago, R. I. & Pac. Ry. Co.* v. *Arkansas*, 219 U. S. 453; *St. Louis & Iron Mtn. Ry.* v. *Arkansas*, 240 U. S. 518; *Missouri Pacific R. Co.* v. *Norwood*, 283 U. S. 249; and for the equipment of freight trains with cabooses, *Terminal Railroad Ass'n* v. *Brotherhood*, *supra*.

The principle that, without controlling Congressional action, a state may not regulate interstate commerce so as substantially to affect its flow or deprive it of needed uniformity in its regulation is not to be avoided by "simply invoking the convenient apologetics of the police power," *Kansas Southern Ry.* v. *Kaw Valley District*, *supra*, 79; *Buck* v. *Kuykendall*, 267 U. S. 307, 315. In the *Kaw Valley* case the Court held that the state was without constitutional power to order a railroad to remove a railroad bridge over which its interstate trains passed, as a means of preventing floods in the district and of improving its drainage, because it was "not pretended that local welfare needs the removal of the defendants' bridges at the expense of the dominant requirements of commerce with other states, but merely that it would be helped by raising them." And in *Seaboard Air Line Ry.* v. *Blackwell*, 244 U. S. 310, it was held that the interference with interstate rail transportation resulting from a state statute requiring as a safety measure that trains come almost to a stop at grade crossings, outweigh the local interest in safety, when it appeared that compliance increased the scheduled running time more than six hours in a distance of one hundred and twenty-three miles. Cf. *Southern Rail-Way Co.* v. *King*, *supra*, where the crossings were less numerous and the burden to interstate commerce was not shown to be heavy; and see *Erb* v. *Morsch*, 177 U. S. 584.

Similarly the commerce clause has been held to invalidate local "police power" enactments fixing the number of cars in an interstate train and the number of passengers to be carried in each car, *South Covington Ry.* v. *Covington*, *supra*, 553; regulating the segregation of colored passengers in interstate trains, *Hall* v. *DeCuir*, *supra*, 488-9; requiring burdensome intrastate stops of interstate trains, *Illinois Central Railroad Co.* v. *Illinois*, 163 U. S. 142; *Cleveland, etc. Ry. Co.* v. *Illinois*, 177 U. S. 514; *Mississippi R. R. Com.* v. *Illinois Central R. R.*, 203 U. S. 335; *Herndon* v. *Chi., R. I. & Pac. Ry.*, 218 U. S. 135; *St. Louis S. F. Ry.* v. *Pub. Serv. Comm'n*, 261 U. S. 369; requiring an in-

terstate railroad to detour its through passenger trains for the benefit of a small city, *St. Louis & S. F. Ry.* v. *Public Service Comm'n, supra;* interfering with interstate commerce by requiring interstate trains to leave on time, *Missouri, K. & T. Ry. Co.* v. *Texas,* 245 U. S. 484; regulating car distribution to interstate shippers, *St. Louis S. W. Ry.* v. *Arkansas,* 217 U. S. 136; or establishing venue provisions requiring railroads to defend accident suits at points distant from the place of injury and the residence and activities of the parties, *Davis* v. *Farmers Cooperative Co.,* 262 U. S. 312; *Michigan Central* v. *Mix,* 278 U. S. 492; cf. *Denver & R. G. W. R. Co.* v. *Terte,* 284 U. S. 284; see also *Buck* v. *Kuykendall, supra; Foster-Fountain Packing Co.* v. *Haydel, supra; Baldwin* v. *Seelig, supra,* 524; *South Carolina Highway Dept.* v. *Barnwell Bros., supra,* 184-5 n., and cases cited.

More recently in *Kelly* v. *Washington,* 302 U. S. 1, 15, we have pointed out that when a state goes beyond safety measures which are permissible because only local in their effect upon interstate commerce, and "attempts to impose particular standards as to structure, design, equipment and operation [of vessels plying interstate] which in the judgment of its authorities may be desirable but pass beyond what is plainly essential to safety and seaworthiness, the State will encounter the principle that such requirements, if imposed at all, must be through the action of Congress which can establish a uniform rule. Whether the state in a particular matter goes too far must be left to be determined when the precise question arises."

Here we conclude that the state does go too far. Its regulation of train lengths, admittedly obstructive to interstate train operation, and having a seriously adverse effect on transportation efficiency and economy, passes beyond what is plainly essential for safety since it does not appear that it will lessen rather than increase the danger of accident. Its attempted regulation of the operation of interstate trains cannot establish nation-wide control such as is essential to the maintenance of an efficient transportation system, which Congress alone can prescribe. The state interest cannot be preserved at the expense of the national interest by an enactment which regulates interstate train lengths without securing such control, which is a matter of national concern. To this the interest of the state here asserted is subordinate.

Appellees especially rely on the full train crew cases, *Chicago, R. I. & Pac. Ry. Co.* v. *Arkansas*, *supra*; *St. Louis & Iron Mtn. Ry.* v. *Arkansas*, *supra*; *Missouri Pacific R. Co.* v. *Norwood*, *supra*, and also on *South Carolina Highway Dept.* v. *Barnwell Bros.*, *supra*, as supporting the state's authority to regulate the length of interstate trains. While the full train crew laws undoubtedly placed an added financial burden on the railroads in order to serve a local interest, they did not obstruct interstate transportation or seriously impede it. They had no effects outside the state beyond those of picking up and setting down the extra employees at the state boundaries; they involved no wasted use of facilities or serious impairment of transportation efficiency, which are among the factors of controlling weight here. In sustaining those laws the Court considered the restriction a minimal burden on the commerce comparable to the law requiring the licensing of engineers as a safeguard against those of reckless and intemperate habits, sustained in *Smith* v. *Alabama*, 124 U. S. 465, or those afflicted with color blindness, upheld in *Nashville, &c. Railway* v. *Alabama*, 128 U. S. 96, and other similar regulations. *New York, N. H. & H. R. Co.* v. *New York*, *supra*; *Atlantic Coast Line Ry.* v. *Georgia*, *supra*; cf. *County of Mobile* v. *Kimball*, 102 U. S. 691.

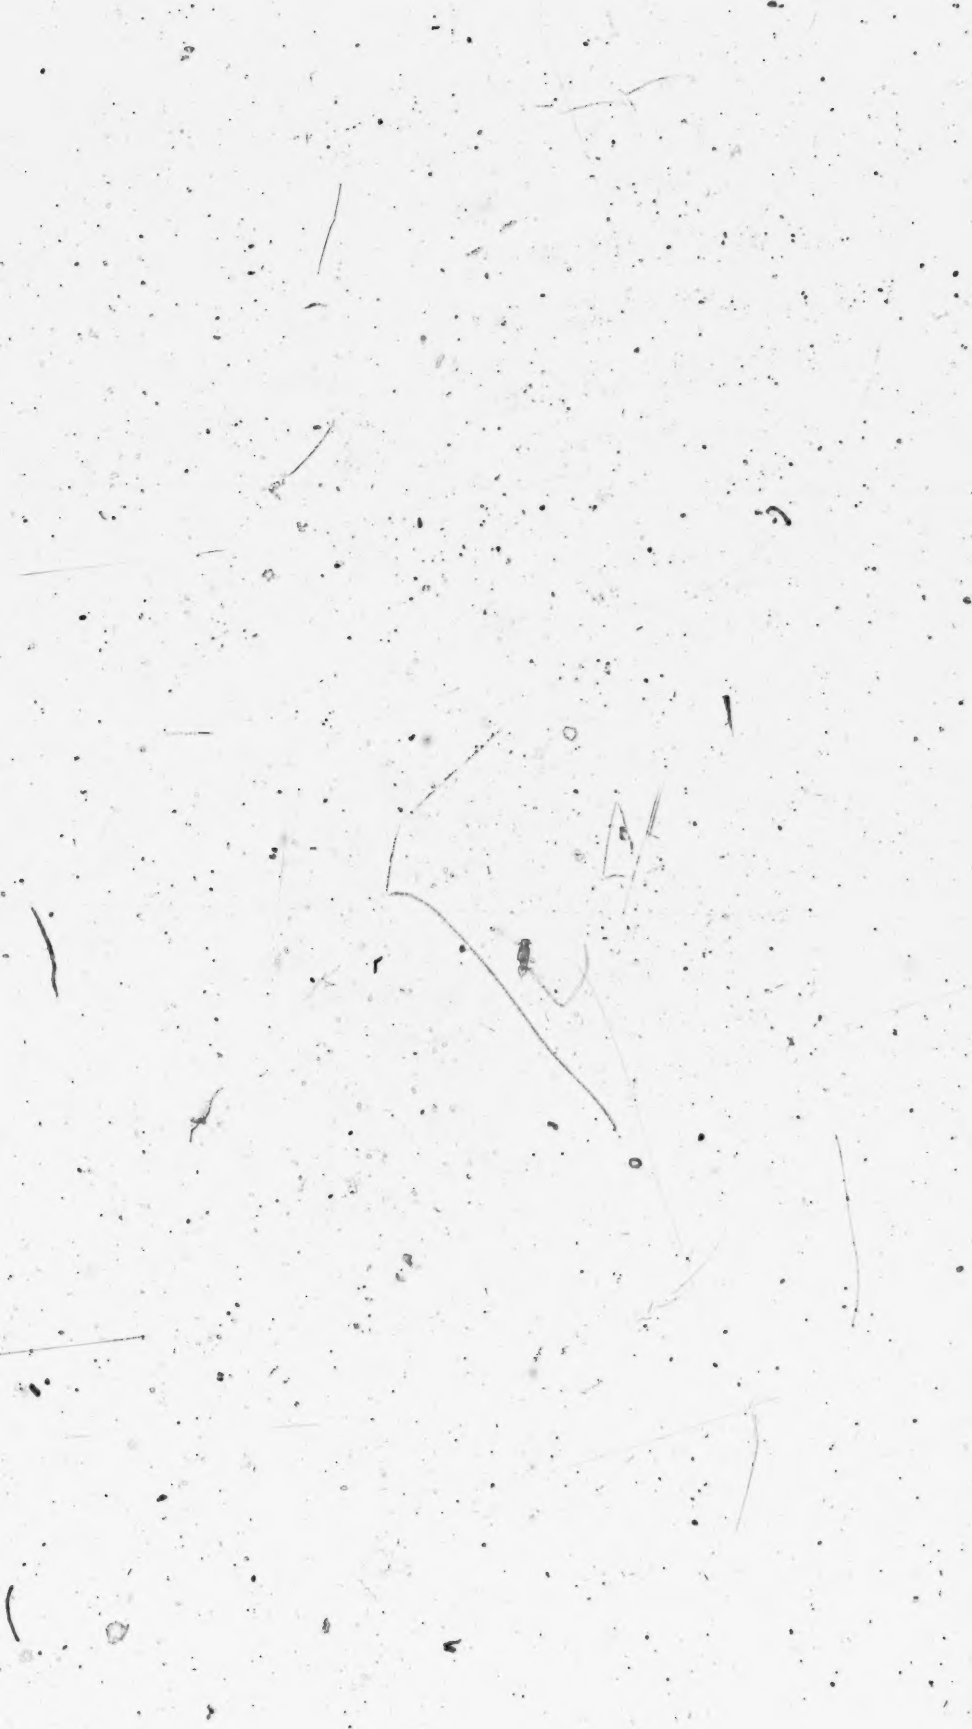
South Carolina Highway Dept. v. *Barnwell Bros.*, *supra*, was concerned with the power of the state to regulate the weight and width of motor cars passing interstate over its highways, a legislative field over which the state has a far more extensive control than over interstate railroads. In that case, and in *Maurer* v. *Hamilton*, *supra*, we were at pains to point out that there are few subjects of state regulation affecting interstate commerce which are so peculiarly of local concern as is the use of the state's highways. Unlike the railroads local highways are built, owned and maintained by the state or its municipal subdivisions. The state is responsible for their safe and economical administration. Regulations affecting the safety of their use must be applied alike to intrastate and interstate traffic. The fact that they affect alike shippers in interstate and intrastate commerce in great numbers, within as well as without the state, is a safeguard against regulatory abuses. Their regulation is akin to quarantine measures, game laws, and like local regulations of rivers, harbors, piers, and docks, with respect to which the state has exceptional scope for

the exercise of its regulatory power, and which, Congress not acting, have been sustained even though they materially interfere with interstate commerce (303 U. S. at 187-188 and cases cited).

The contrast between the present regulation and the full train crew laws in point of their effects on the commerce, and the like contrast with the highway safety regulations, in point of the nature of the subject of regulation and the state's interest in it, illustrate and emphasize the considerations which enter into a determination of the relative weights of state and national interests where state regulation affecting interstate commerce is attempted. Here examination of all the relevant factors makes it plain that the state interest is outweighed by the interest of the nation in an adequate, economical and efficient railway transportation service, which must prevail.

Reversed.

Mr. Justice RUTLEDGE concurs in the result.



SUPREME COURT OF THE UNITED STATES.

No. 56.—October Term, 1944.

Southern Pacific Company, Appellant,
vs.
State of Arizona *ex rel.* John L. Sullivan, Attorney General of the State of Arizona.

On Appeal from the Supreme Court of the State of Arizona.

[June 18, 1945.]

Mr. Justice Black, dissenting.

In *Hennington* v. *Georgia*, 163 U. S. 299, 304, a case which involved the power of a state to regulate interstate traffic, this Court said, "The whole theory of our government, federal and state, is hostile to the idea that questions of legislative authority may depend . . . upon opinions of judges as to the wisdom or want of wisdom in the enactment of laws under powers clearly conferred on the legislature." What the Court decides today is that it is unwise governmental policy to regulate the length of trains. I am therefore constrained to note my dissent.

For more than a quarter of a century, railroads and their employees have engaged in controversies over the relative virtues and dangers of long trains. Railroads have argued that they could carry goods and passengers cheaper in long trains than in short trains. They have also argued that while the danger of personal injury to their employees might in some respects be greater on account of the operation of long trains, this danger was more than offset by an increased number of accidents from other causes brought about by the operation of a much larger number of short trains. These arguments have been, and are now, vigorously denied. While there are others, the chief causes assigned for the belief that long trains unnecessarily jeopardize the lives and limbs of railroad employees relate to "slack action." Cars coupled together retain a certain free play of movement, ranging between 1½ inches and 1 foot, and this is called "slack action." Train brakes do not ordinarily apply or release simultaneously on all cars. This frequently results in a severe shock or jar to cars, particularly those in the rear of a train. It has always been the

position of the employees that the dangers from "slack action" correspond to and are proportionate with the length of the train. The argument that "slack movements" are more dangerous in long trains than in short trains seems never to have been denied. The railroads have answered it by what is in effect a plea of confession and avoidance. They say that the added cost of running long trains places an unconstitutional burden on interstate commerce. Their second answer is that the operation of short trains requires the use of more separate train units; that a certain number of accidents resulting in injury are inherent in the operation of each unit, injuries which may be inflicted either on employees or on the public; consequently, they have asserted that it is not in the public interest to prohibit the operation of long trains.

In 1912, the year Arizona became a state, its legislature adopted and referred to the people several safety measures concerning the operation of railroads. One of these required railroads to install electric headlights, a power which the state had under this Court's opinion in *Atlantic Coast Line R. Co. v. Georgia*, 234 U. S. 280. Another Arizona safety statute submitted at the same time required certain tests and service before a person could act as an engineer or train conductor, and thereby exercised a state power similar to that which this Court upheld in *Nashville, etc., R. Co. v. Alabama*, 128 U. S. 96. The third safety statute which the Arizona legislature submitted to the electorate, and which was adopted by it, is the train limitation statute now under consideration. By its enactment the legislature and the people adopted the viewpoint that long trains were more dangerous than short trains, and limited the operation of train units to 14 cars for passenger and 70 cars for freight. This same question was considered in other states, and some of them, over the vigorous protests of railroads, adopted laws similar to the Arizona statute.[1]

This controversy between the railroads and their employees, which was nation-wide, was carried to Congress. Extensive hearings took place. The employees' position was urged by members of the various Brotherhoods. The railroads' viewpoint was presented through representatives of their National Association.

[1] A resume of these laws and their reception by the Courts is set out in the opinion of the Supreme Court of Arizona in this case, — Ariz. —, 145 Pac. 2d 530.

In 1937, the Senate Interstate Commerce Committee after its own exhaustive hearings unanimously recommended that trains be limited to 70 cars as a safety measure.[2] The Committee in its Report reviewed the evidence and specifically referred to the large and increasing number of injuries and deaths suffered by railroad employees; it concluded that the admitted danger from slack movement was greatly intensified by the operation of long trains; that short trains reduce this danger; that the added cost of short trains to the railroad was no justification for jeopardizing the safety of railroad employees; and that the legislation would provide a greater degree of safety for persons and property, increase protection for railway employees and the public, and improve transportation services for shippers and consumers. The Senate passed the bill,[3] but the House Committee failed to report it out.

During the hearings on that measure, frequent references were made to the Arizona statute. It is significant, however, that American railroads never once asked Congress to exercise its unquestioned power to enact uniform legislation on that subject, and thereby invalidate the Arizona law. That which for some unexplained reason they did not ask Congress to do when it had the very subject of train length limitations under consideration, they shortly thereafter asked an Arizona state court to do.

In the state court a rather extraordinary "trial" took place. Charged with violating the law, the railroad admitted the charge. It alleged that the law was unconstitutional, however, and sought a trial of facts on that issue. The essence of its charge of unconstitutionality rested on one of these two grounds: (1) the legislature and people of Arizona erred in 1912 in determining that the running of long cars was dangerous; or (2) railroad conditions had so improved since 1912 that previous dangers did not exist to the same extent, and that the statute should be stricken down either because it cast an undue burden on interstate commerce by reason of the added cost, or because the changed conditions had rendered the Act "arbitrary and unreasonable." Thus, the issue which the Court "tried" was not whether the railroad was guilty of violating the law, but whether the law was unconstitutional either because the legislature had been guilty of mis-

[2] Senate Report No. 416, 75th Cong., 1st Sess.

[3] 81 Cong. Rec. 7596. The record does not show any dissenting votes cast against the bill. The debate on the measure appears at pp. 7564-7595.

judging the facts concerning the degree of the danger of long trains, or because the 1912 conditions of danger no longer existed.

Before the state trial judge finally determined that the dangers found by the legislature in 1912 no longer existed, he heard evidence over a period of 5½ months which appears in about 3000 pages of the printed record before us. It then adopted findings of fact submitted to it by the railroad, which cover 148 printed pages, and conclusions of law which cover 5 pages. We can best understand the nature of this "trial" by analogizing the same procedure to a defendant charged with violating a state or national safety appliance act, where the defendant comes into court and admits violation of the act. In such cases, the ordinary procedure would be for the court to pass upon the constitutionality of the act, and either discharge or convict the defendants. The procedure here, however, would justify quite a different trial method. Under it, a defendant is permitted to offer voluminous evidence to show that a legislative body has erroneously resolved disputed facts in finding a danger great enough to justify the passage of the law. This new pattern of trial procedure makes it necessary for a judge to hear all the evidence offered as to why a legislature passed a law and to make findings of fact as to the validity of those reasons. If under today's ruling a court does make findings as to a danger contrary to the findings of the legislature, and the evidence heard "lends support" to those findings, a court can then invalidate the law. In this respect, the Arizona County Court acted, and this Court today is acting, as a "super-legislature."[4]

---

[4] The Court today invalidates the Arizona law in accordance with the identical "super-legislature" method (so designated by Justices Brandeis and Holmes) used by the majority to invalidate a Nebraska statute regulating the weights of loaves of bread. Burns Baking Co. v. Bryan, 264 U. S. 504, 535. For here, as there, this Court has overruled a state legislature's finding that an evil existed, and that the state law would not impose an unconstitutional "burden" upon those regulated. The dissent in the *Burns* case said:

"To decide, as a fact, that the prohibition of excess weights 'is not necessary for the protection of the purchasers against imposition and fraud by short weights'; that it 'is not calculated to effectuate that purpose'; and that it 'subjects bakers and sellers of bread' to heavy burdens, is, in my opinion, an exercise of the powers of a super-legislature—not the performance of the constitutional function of judicial review."

That decision rested on the Due Process Clause while today's decision rests on the Commerce Clause. But that difference does not make inapplicable here the principles invoked by the dissenters in the *Burns* case.

The use of the "super-legislature" technique has been repeated to strike

Even if this method of invalidating legislative acts is a correct one, I still think that the "findings" of the state court do not authorize today's decision. That court did not find that there is no unusual danger from slack movements in long trains. It did decide on disputed evidence that the long train "slack movement" dangers were more than offset by prospective dangers as a result of running a larger number of short trains, since many people might be hurt at grade crossings. There was undoubtedly some evidence before the state court from which it could have reached such a conclusion. There was undoubtedly as much evidence before it which would have justified a different conclusion.

Under those circumstances, the determination of whether it is in the interest of society for the length of trains to be governmentally regulated is a matter of public policy. Someone must fix that policy—either the Congress, or the state, or the courts. A century and a half of constitutional history and government admonishes this Court to leave that choice to the elected legislative representatives of the people themselves, where it properly belongs both on democratic principles and the requirements of efficient government.

I think that legislatures, to the exclusion of courts, have the constitutional power to enact laws limiting train lengths, for the purpose of reducing injuries brought about by "slack movements." Their power is not less because a requirement of short trains might increase grade crossing accidents. This latter fact raises an entirely different element of danger which is itself subject to legislative regulation. For legislatures may, if necessary, require railroads to take appropriate steps to reduce the likelihood of injuries at grade crossings. *Denver and R. G. R. R. Co.* v. *Denver*, 250 U. S. 241. And the fact that grade crossing improvements may be expensive is no sufficient reason to say that an unconstitutional "burden" is put upon a railroad even though it be an interstate road. *Erie R. R. Co.* v. *Public Utilities Commission*, 254 U. S. 394, 408-411.

---

down other statutes. See, e. g., Chicago, M. & St. P. R. R. v. Wisconsin, 238 U. S. 491, 499; Weaver v. Palmer Bros. Co., 270 U. S. 402, dissent at 415. See also dissents in Schlesinger v. Wisconsin, 270 U. S. 230, 241, 242; New State Ice Co. v. Liebman, 285 U. S. 262, 284-285. For a case in which this Court declined to review the "economics or the facts" behind a legislative enactment, see Central Lumber Co. v. South Dakota, 226 U. S. 157, 161; cf. Standard Oil Co. v. Marysville, 279 U. S. 582, 586. See also Powell v. Pennsylvania, 127 U. S. 678, 686; dissenting opinion, Polk Company v. Glover, 305 U. S. 5, 10-19.

The Supreme Court of Arizona did not discuss the County Court's so-called findings of fact. It properly designated the Arizona statute as a safety measure, and finding that it bore a reasonable relation to its purpose declined to review the judgment of the legislature as to the necessity for the passage of the act. In so doing it was well fortified by a long line of decisions of this Court. Today's decision marks an abrupt departure from that line of cases.

There have been many sharp divisions of this Court concerning its authority, in the absence of congressional enactment, to invalidate state laws as violating the Commerce Clause. See e. g., *Adams Manufacturing Co.* v. *Storen*, 304 U. S. 307; *Gwin, etc., Inc.* v. *Henneford*, 305 U. S. 434; *McCarroll* v. *Dixie Greyhound Lines*, 309 U. S. 176. That discussion need not be renewed here, because even the broadest exponents of judicial power in this field have not heretofore expressed doubt as to a state's power, absent a paramount congressional declaration, to regulate interstate trains in the interest of safety. For as early as 1913, this Court, speaking through Mr. Justice Hughes, later Chief Justice, referred to "the settled principle that, in the absence of legislation by Congress, the states are not denied the exercise of that power to secure safety in the physical operation of railroad trains within their territory, even though such trains are used in interstate commerce. That has been the law since the beginning of railroad transportation." *Atlantic Coast Line* v. *Georgia*, 234 U. S. 280, 291. Until today, the oft-repeated principles of that case have never been repudiated in whole or in part.

But, it is said today, the principle there announced does not apply because if one state applies a regulation of its own to interstate trains, "uniformity" in regulation or rather non-regulation, is destroyed. Justice Hughes speaking for the Court in the *Atlantic Coast Line* case made short shrift of that same argument. He there referred to the contention that "if state requirement conflicts it will be necessary to carry additional apparatus and to make various adjustments of state lines which would delay and inconvenience interstate traffic." In answer to this argument he reiterated a former declaration of this Court in *New York, New Haven and Hartford R. R. Co.* v. *New York*, 165 U. S. 628, on this subject, and added that "If there is a conflict in such local

regulation, by which interstate commerce may be inconvenienced —if there appears to be need of standardization of safe appliances and of providing rules of operation which will govern the entire interstate road irrespective of state boundaries—there is a simple remedy; and it can be assumed that it can not be readily applied if there be real occasion for it. That remedy does not rest in a denial to the state, in the absence of conflicting federal action, of its power to protect life and property within its borders, but it does lie in the exercise of the paramount authority of Congress in its control of interstate commerce to establish such regulations as in its judgment may be deemed appropriate and sufficient. Congress, when it pleases, may give the rule and make the standards to be observed on the interstate highway." p. 292.

That same statement has in substance been made in many other decisions of this Court, a number of which are cited in the *Atlantic Coast Line* case, and all of them are today swept into the discard. In no one of all these previous cases was it more appropriate than here to call attention to the fact that Congress could when it pleased establish a uniform rule as to the length of trains. Congress knew about the Arizona law. It is common knowledge that the Interstate Commerce Committees of the House and the Senate keep in close and intimate touch with the affairs of railroads and other national means of transportation. Every year brings forth new legislation which goes through those Committees, much of it relating to safety. The attention of the members of Congress and of the Senate have been focused on the particular problem of the length of railroad trains. We cannot assume that they were ignorant of the commonly known fact that a long train might be more dangerous in some territories and on some particular types of railroad. The history of congressional consideration of this problem leaves little if any room to doubt that the choice of Congress to leave the state free in this field was a deliberate choice, which was taken with a full knowledge of the complexities of the problems and the probable need for diverse regulations in different localities. I am therefore compelled to reach the conclusion that today's decision is the result of the belief of a majority of this Court that both the legislature of Arizona and the Congress made wrong policy decisions in permitting a law to stand which limits the length of railroad

trains. I should at least give the Arizona statute the benefit of the same rule which this Court said should be applied in connection with state legislation under attack for violating the Fourteenth Amendment, that is, that legislative bodies have "a wide range of legislative discretion, . . . and their conclusions respecting the wisdom of their legislative acts are not reviewable by the Court." *Arizona Employers' Liability Cases*, 250 U. S. 400, 419.

When we finally get down to the gist of what the Court today actually decides, it is this: Even though more railroad employees will be injured by "slack action" movements on long trains than on short trains, there must be no regulation of this danger in the absence of "uniform regulations." That means that no one can legislate against this danger except the Congress; and even though the Congress is perfectly content to leave the matter to the different state legislatures, this Court, on the ground of "lack of uniformity", will require it to make an express avowal of that fact before it will permit a state to guard against that admitted danger.

We are not left in doubt as to why, as against the potential peril of injuries to employees, the Court tips the scales on the side of "uniformity." For the evil it finds in a lack of uniformity is that it (1) delays interstate commerce, (2) increases its cost and (3) impairs its efficiency. All three of these boil down to the same thing, and that is that running shorter trains would increase the cost of railroad operations. The "burden" on commerce reduces itself to mere cost because there was no finding, and no evidence to support a finding that by the expenditure of sufficient sums of money, the railroads could not enable themselves to carry goods and passengers just as quickly and efficiently with short trains as with long trains. Thus the conclusion that a requirement for long trains will "burden interstate commerce" is a mere euphemism for the statement that a requirement for long trains will increase the cost of railroad operations.

In the report of the Senate Committee, *supra*, attention was called to the fact that in 1935, 6,351 railroad employees were injured while on duty, with a resulting loss of more than 200,000 working days, and that injuries to trainmen and enginemen increased more than 29% in 1936.[5] Nevertheless, the Court's action

[5] These figures appear to be considerably less than those later reported. See Tiller v. Atlantic Coast Line Railroad Co., 318 U. S. 54, 58, note 4.

in requiring that money costs outweigh human values is sought to be buttressed by a reference to the express policy of Congress to promote an "economical national railroad system." I cannot believe that if Congress had defined what it meant by "economical", it would have required money to be saved at the expense of the personal safety of railway employees. Its whole history for the past 25 years belies such an interpretation of its language. Judicial opinions rather than legislative enactments have tended to emphasize costs. See *Tiller* v. *Atlantic Coast Line Railroad Co., supra*, 58-60. A different congressional attitude has been shown by the passage of numerous safety appliance provisions, a federal employees' compensation act, abolition of the judicially created doctrine of assumption of risk and contributory negligence, and various other types of legislation. Unfortunately, the record shows, as pointed out in the *Tiller* case, that the courts have by narrow and restricted interpretation too frequently reduced the full scope of protection which Congress intended to provide.

This record in its entirety leaves me with no doubt whatever that many employees have been seriously injured and killed in the past, and that many more are likely to be so in the future, because of "slack movement" in trains. Everyday knowledge as well as direct evidence presented at the various hearings, substantiates the report of the Senate Committee that the danger from slack movement is greater in long trains than in short trains. It may be that offsetting dangers are possible in the operation of short trains. The balancing of these probabilities, however, is not in my judgment a matter for judicial determination, but one which calls for legislative consideration. Representatives elected by the people to make their laws, rather than judges appointed to interpret those laws, can best determine the policies which govern the people. That at least is the basic principle on which our democratic society rests. I would affirm the judgment of the Supreme Court of Arizona.

SUPREME COURT OF THE UNITED STATES.

No. 36.—October Term, 1944.

Southern Pacific Company, Appellant,
vs.
State of Arizona, *ex rel.* John L. Sullivan, Attorney General of the State of Arizona.

Appeal from the Supreme Court of the State of Arizona.

[June 18, 1945.]

Mr. Justice Douglas, dissenting.

I have expressed my doubts whether the courts should intervene in situations like the present and strike down state legislation on the grounds that it burdens interstate commerce. *McCarroll* v. *Dixie Greyhound Lines*, 309 U. S. 176, 183-189. My view has been that the courts should intervene only where the state legislation discriminated against interstate commerce or was out of harmony with laws which Congress had enacted. p. 184. It seems to me particularly appropriate that that course be followed here. For Congress has given the Interstate Commerce Commission broad powers of regulation over interstate carriers. The Commission is the national agency which has been entrusted with the task of promoting a safe, adequate, efficient, and economical transportation service. It is the expert on this subject. It is in a position to police the field. And if its powers prove inadequate for the task, Congress, which has paramount authority in this field, can implement them.

But the Court has not taken that view. As a result the question presented is whether the total effect of Arizona's train-limit as a safety measure is so slight as not to outweigh the national interest in keeping interstate commerce free from interferences which seriously impede or burden it. The voluminous evidence has been reviewed in the opinion of the Court and in the dissenting opinion of Mr. Justice Black. If I sat as a member of the Interstate Commerce Commission or of a legislative committee to decide whether Arizona's train-limit law should be superseded by a federal regulation, the question would not be free from doubt for me.

If we had before us the ruling of the Interstate Commerce Commission (*In the Matter of Service Order No. 85*, 256 I. C. C. 523, 534) that Arizona's train-limit law infringes "the national interest in maintaining the free flow of commerce under the present emergency war conditions," I would accept its expert appraisal of the facts, assuming it had the authority to act. But that order is not before us. And the present case deals with a period of time which antedates the war emergency. Moreover, we are dealing here with state legislation in the field of safety where the propriety of local regulation has long been recognized. See *Atlantic Coast Line R. Co.* v. *Georgia*, 234 U. S. 280, 291, and cases collected in *California* v. *Thompson*, 313 U. S. 109, 113-114. Whether the question arises under the Commerce Clause or the Fourteenth Amendment, I think the legislation is entitled to a presumption of validity. If a State passed a law prohibiting the hauling of more than one freight car at a time, we would have a situation comparable in effect to a state law requiring all railroads within its borders to operate on narrow gauge tracks. The question is one of degree and calls for a close appraisal of the facts.[1] I am not persuaded that the evidence adduced by the railroads overcomes the presumption of validity to which this train-limit law is entitled. For the reasons stated by Mr. Justice BLACK, Arizona's train-limit law should stand as an allowable regulation enacted to protect the lives and limbs of the men who operate the trains.
